With the second phase of the Ballghtenment, marked by the deepening influence of France, are associated Hedvig (Bahelotta Nordenflycht (1718–63), Count Gustaf Creutz (q.n.) (1731–82) and Count Gustaf Gylenhorg (1731–1888) Fru Nordenflycht published in 1743 Den sorjande turturdufusus (The 'Sorrousung Turtitedove), in which she lamented the death of her husband in short lyrics. Creutz was a more sophisticated peisonality He wrote bittle, devoting his life after 1703 to diplomacy, but his few writings, of which Afts soch Camullo is the most important, reveal a mastery of form and Epicurean views Gyllenborg did not achieve his french? formal elegance, but his best poems, Varläsforaktaren and Visiterkvade, have nobility and feeling for nature.

Prose—particularly the novel—developed more slowly. The first genuine novel was Adalth's old Glothild (142s-44) by J Mork and A. Torngren, showing the influence of the Icelande sags and of Madeleme de Scuddry. But the nexiest prose of this penod is found in J. Wallenberg's Min son ph galegan (My Son on a East Indiaman. The most notable historian was S. Lagerbung, and J. Ihre entired historical philology with his Glossarium svio-golikecum (1769). The only two 18th-century Swedes with European reputations were scientists: Carl von Linde (Linnaeu; qu) (1707-78) and the versatile and mystic Emanuel Swedenborg (qv) (1768-772) Linné's work at Uppsala much enhanced the prestige of the university, and his Swedish travel books were later praised for their understanding of nature and freshness of style

The Gustavan perod (1771–7809) takes it name from the brillant Gustavus III (1746–99) and his intolerant son Gustavus IV Gustavus III saw himself as the patron of art and letters, at his court he collected the best writers of the turn, and by founding the Swedish academy he gave them official status. He was especially interested in drama and opera; thanks to his patronage a proper theatrical tradition was begun and the leading authors—often against their will—land to produce texts for performance. Gustavus himself sketched out some of these works, of which the opera Gustafy Ivaz, thanks to Johan Kellgren's versee, has vivived longest. The comedies of the Gustavian era were modelled on the French, the tragedies were pseudoclassical.

Johan Henrik Kellgren (q v.) (1751-95) was the greatest academic poet of this epoch and the arbiter of taste. In his best poems, such as Den nya skapelsen (The New Creation), thought and emotion are fused. In Stockholmsposten, the main organ of hterary opinion in the capital, Kellgren used his polemical wit against Thomas Thorsld (1759-1808), the truculent champion of individual genius, who wrote a long poem, Passionerna (1781), but is chiefly remembered for his polemical prose. After Kellgren's death the controversy was continued by C. C af Leopold (1756-1829), who still imposed pseudoclassical standards on the academy and applied them in his rhetorical odes and his plays. Johan Gabriel Oxenstierna (1750-1808) did his most original work in 1770-74 while a diplomat in Vienna; Skördarne (The Harvests) and Ode till Camilla reveal an elegiac, pre-Romantic feeling for the beauty of nature. Unfortunately he revised these poems before publishing them. Bengt Lidner (1759-93) was a follower of Thorild but showed much more poetic inspiration than Thorsld in his play Erik XIV, his opera Medea-both lyrical rather than dramatic in tone-and in his most successful work. the ode Grevman Spastaras död (1783). The influence of both Milton and the Bible may be traced in his use of language.

Carl Mikael Bellman (q, v).  $(r_1q_0-g_5)$  stands apart from the conflicting ideals of his time. A poet and muscian, he fused his gifts in the lyrics of Predmans epistlar  $(r_1q_0)$  and Predmans edited ending of  $r_1q_0$ . His combination of stylight endism with humour and the most delicate sense of language and rhythm is unique in Swedish. He is the greatest Swedish lyricist of the  $r_1q_0$  century

The dissertation Om upplysning (On Enlightenment) by Nils

von Rosenstein, the first secretary of the academy, nobly expressed the highest teleals of the Gustavan apoch; and various memors, by G G Adlerbeth, G J Ehrensvard, Count Fredrik Acel Feren, Duckess Hedwig Ehzabeth and others, evoke the writty but artificial atmosphere of Gustavus III's court and illustrate the development of pose Gustavus IVI do not encourage literature, however, the energetic Anna Maria Lenngren (1754–1821), wife of Stockholmspostarie editor, worte some of he hest verse satures between 1795 and 1800, many of her annoymous shafts being simed at anistocratic foolkes. The sentimental dylels of F M Franzén (q v), (1773–1847) also belong to these years; they are full of a pre-Romantic dielasm imbled from German and English sources and later toned down under pressure from the academy.

### LITERATURE, 1800-70

The Romantic Movement—The loss of Finland in 1808, the deposition of the king and the new constitution of 1809 all greatly affected Swedish literature, for out of them an ardent national spirit emerged as one of the motifs of Swedish romanticism. The teaching of B. Hoigier (1705–1821), admirer of Immanuel Kant and F. W. J. von Schelling, at Uppsala land the basis for the idealism which soon became the core of Swedish romanticism.

Then the impact of Goethe and Schiller and of the German Romantics was felt, and Swedish romanticism became as much dominated by German culture as the previous era had been by French Student societies became the focuses of the new movement, and the periodicals issued by them and their adherents-e g., Polyfem (1809-12) and Fosforos (1810-13)-attacked the academy Fosforos, from which the Fosforister took their name. played an especially important initial role in the controversy between the old school and the new during 1810-20, in it Per Daniel Amadeus Atterbom (1790-1855), the most gifted poet of the Fosforister, first revealed his talents in his *Prolog*. V. F Palmblad, publisher and prose writer, led the practical polemics at Uppsala, L. Hammarsköld, with J. C. Askelof and C. J. Livijn, carried on the frav at Stockholm, while I. D. Valerius and P. A. Wallmark championed the old school, as for a time did J. O. Wallin, who later became the greatest hymn writer of the century (hymnbook of 1819).

Meanwhie another society, Gotiska Forbundet, had been founded in Stockhohm in 1810, with the object of raxing the moral tone of society by study of the heroic, "Gother" past. Enk Gustaf Geljer (q v v)  $(r g s_0 - 1 s_0 v)$ , one of the founders, suggested the publication of a periodical, and the first issue of I dame consisted largely of his own poems, Visingen, Odalbonden, etc. Most of Geljer's poetry, including the first Swedish translation of Shakespeare (Macbeth), was written before 1816. Esains Tegnér (q v)  $(r 1 g s_0 - 1 s_0 v)$ , professor of Greek at Lund, also contributed to Idana, though he refused to engage in literary controversy, and P. Ling  $(r 1 g - 1 s_0 v)$ , to was associated with it.

A brief golden age of Swedish letters occurred in the 1820s. Atterbom published his most remarkable work, the verse drama Lycksalighetens O (The Isle of Bliss) in 1824-27; here, in often obscure but beautiful language, he expressed his philosophy in the allegory of Astolf and Felicia. His other verse drama, Fagel blå (The Blue Bird), was never finished, and his later years were devoted to a lyric cycle called Blommorna, to university work and to Svenska Stare och skalder (1841-55), which in a sense laid the foundations of literary history in Sweden. In 1820-25 Tegnér published Frithiofs saga, an epic on an Icelandic theme; this became the most popular poem of the first half of the century, and Tegnér, poet, orator and letter writer, who combined Gustavian wit and sense of form with idealism, was the greatest personality of the age. Erik Stagnelius (1783-1823), a complex and brilliant writer, published his Liljor i Saron in 1821 and his verse drama Bacchanterna in 1822, but most of his work appeared posthumously. Though influenced by the Romantics, Stagnelius held aloof from them and died in deliberately sought isolation.

A number of minor Romantic writers should be mentioned e.g., A. Törneros (1794–1839); P. Elgstrom (1781–1810); S. Hedbom (1783–1849), author of several attractive hymns and bal-

von Rosenstein, the first secretary of the academy, nobly expressed the highest ideals of the Gustavann epoch; and various 1871, collector of folk songs (Svenska folkwar från forntiden, memorrs, by G G Adlerbeth, G J Ehrensvard, Count Fredrik 1814-16), and E. Sjoberg (Vitalis).

The Romantic cultivated verse rather than prose, though Palmbiad certainly contributed something to prose with his long short story Amala (1817) and his novels, including Fomilien Falhersuisaid Mail Montgomery Silverstolpe's Memoarer (published 1908-11) gives a naive picture of the Romantic circle at Uppsala Geijer's cumbersome histonical works—Svoze Rikes Hafder (1829), etc.—do not reveal his stimulating personality, but Mimen (Memoris) of 1834 are full of the fresh charm of his

The Coming of Realism .- The most complex personality among the later Romantics was Karl Jonas L Almqvist (q v.) (1703-1866), who combines an extravagant imagination, as in Drottningens pivelsmycke (The Queen's Jewel), with the realism which is increasingly prominent in his works after 1836. Almqvist, a master of prose style, was at his best in the long short story (the novell), of his works in this genre Det går an (1839), an outspoken attack on marriage, foreshadows Strindberg's method of raising problems for debate. Almqvist was enormously productive and versatile, most of his works were published in the volumes of Tornrosens bok (1832-51). Meanwhile the realistic novel had made some headway. F. Cederborgh (1784-1835) wrote Uno von Trasenberg (1800-10) and Ottar Tralling, light-hearted satures on life and manners; but the novel as an accepted genre was really established by Fredrika Bremer (qv.) (1801-65), whose "sketches from ordinary life" appeared from 1828 Her novels, Grannarne, etc., have dated considerably, but were formerly very popular in both Europe and America. Sofie von Knorring (1797-1848) wrote novels principally about aristocratic families, and the very popular Emilie Flygare-Carlén (1807-92) produced a long series of stories, including Rosen pa Tistelon (1847), usually dealing with life on the west coast.

Realism, then, made only slow headway, in spite of the social consciousness of the liberal paper Aftonbladet and the example of the great Finnish-Swedish poet J. L. Runeberg (q.v.) The literature of the 1840s and 1850s is mainly an aftermath of romanticism, though the critic B. E. Malmstrom imagined that he opposed this movement. His elegy Angelica (1840) had kinship with the graceful but insipid poetry of his contemporary C. V Bottiger and the older K. A. Nicander. There was a fresher feeling about G Wennerberg's Gluntarne (1847-50), songs about Uppsala student life, but there is nothing new in them The movement known as Scandinavianism produced a good deal of verse. C V. A. Strandberg (Talis Qualis, 1818-77) was the fieriest poet of this type. Later he did excellent translations of Byron. O. P. Sturzen-Becker (Orvar Odd, 1811-69) was a versatile writer with talents in verse and the short story (Samlade Arbeten, 7861-62). Popular reading was provided by August Blanche (1811-68), particularly in the successful Bilder ur verkligheten (1863-65), which depicts Stockholm life with humour and vivacity. He also wrote popular dramas. Frans Hedberg (1828-1908) held the field at the Royal theatre with pompous historical plays such as Brollopet på Ulfåsa. The quasi-historical novels of M. I. Crusenstolpe (1795-1865), a brilliant and unscrupulous polemical writer, were much appreciated in their day. The most influential historian was A. Fryxell (1795-1881), with his Bilder ur svenska historien; and the dominating philosopher was the idealistic C. Boström (1797-1866).

Poetic realism became the official program of Signaturesladerus (the "Pseudonym Peets"), a small group of the 1860s influenced by the Norwegian critic L. Dietrichson. They included C. D. at Wirsen, E. Bickström and P. Wilmer, but only Count C. Snoilsky (1847-1903) had sufficient temperament and poetic gift to carry out the program. Some of Snoilsky's best work is found n Dikter (1869) and Sometter (1871). Meanwhile Wirsen had established insself as the conservative literary critic, and from his post as secretary of the academy he laumched formidable opposition against all innovators, including Snoilsky. A V. Rydberg (q.n.) (1828-95) exemplifies this rather uneasy transition from idealism on anturalism even more patently than does Snoilsky, Novelist,

poet and critic, he began as a radical journalist and ended as a professor and as author of the philosophical Dikter (1882-89) His most important early work was the ideological novel Den siste Athenaren (1859), and his treatise Bibelns lara om Kristus (1862) had considerable influence through its attack on the narrow orthodoxy of the Swedish Church and prepared the way for scientific rationalism

## LITERATURE FROM 1870

Strindberg.-Four influences combined to free Swedish literature from its petrifying conventions. English thought in the writings of Charles Darwin, Heibert Spencer and J S Mill, French naturalism as taught and practised by Émile Zola, the drama of the Norwegians Henrik Ibsen and B Bigrison, and the criticism of Georg Brandes Modern Swedish literature begins with the work of Johan August Strindberg (qv) (1840-1912), for the modern drama dates from his Master Olof (1872) and the modern novel from his Roda rummet (The Red Room, 1879). By his originality, his mastery of prose and dialogue, his great energy and the influence of his work and personality on Swedish, not to say European, literature he is by far the greatest writer Sweden has yet produced

The 1880s .- Strindberg overshadowed all other writers of the 1880s G af Geijerstam (1858-1909), author of Erik Grane (1885) and of several other novels and short stories, longed to lead his age, but could not do so. A. M. Edgren-Leffler (1849-02), later duchess of Cajanello, wrote a number of stories called Ur livet (From Life) in which she satirized conventions adversely affecting women. The more gifted Viktoria Benedictsson ("Ernst. Ahlgren," 1850-88) died-by her own hand-before she had fulfilled her promise; she too, but more boldly, was concerned with the position of women in society. Her stories, Från Skåne (1884). have lasted better than her novels, Pengar and Fru Marsanne, and reveal how much regional characterization had entered into the new style of literature. With her was associated Axel Lundegard (1861-1031), who soon turned his talents to the historical novel Alfhild Agrell (1849-1923) wrote her best stories about Norrland. Regional poetry was written by A. U. Bååth (1853-1912) of Skåne, it was surpassed in beauty and originality by the work of another Skåning, Ola Hansson (1860-1925), novelist, critic and poet Hansson's early poems (Notturno, 1885) and his sketches. Sensuiva Amorosa (1887), reveal the boldness in imagery and the interest in psychological nuances which are more typical of the next decade.

interest in psychological nuances which are more typical of the next decade.

1899–1910.—Though, except for the work of Strindberg, little of lating value was achieved in the 1880s, it must be remembered that the generation just discussed accustomed the public to the debating of lating value was achieved in the 1880s, it must be remembered that the generation just discussed accustomed the public to the debating of the 1881 strength of the 1881 st

Meanwhile Selma Lagerlof (1858-1940) had developed the prose tale Het long series of novels and short stories, beginning with Gosta Berlings saga (1891), reached an international public, she was, mideed, the first Swede to win the Nobel prize for literature (1909) mdeed, the first Sweede to wan the Nobel prize for literature (1990). She often used oid Varimhand tales for material, though one of her notice of the state of t numan passions, often against a mediaeval or Renaissance background. human passons, often against a mediaeval or Kenaissance background. Romantic, too in his love for the skerries, was Albert Engstrom (1867— 1910), story write, cartoonist, founder of the popula humorous papel Sfrrs and one of the most beloved of Swedish witters To Hedberg, son of Frans Hedberg (see above), began with the style of the 1868s, his most lasting work was in the tragedy Johan Ullsjærne (1997) and in the lyric

Both Hjalmar Soderbeig (1869-1941) and Bo Bergman (1869-) had links with the rationalism of the 1880s and with the aestheticism of the 1890s, yet both stand apart from the neo-Romantics Both, like Strindberg, loved Stockholm, which perpetually recurs as the setting of their works. Soderberg's forte was the short story (Historietter), in which his psychological subtlety and irony are happily combined, but his novels, including Martin Bircks ungdom (1901) and Doktor Glas (1905), have an appreciation of mood and an awareness of the faults of contemporary society which make them unique in Swedish fiction Soderberg, especially, is one of the masters of Swedish prose Beigman Soderberg, especially, is one of the masters of Swedish prose Reigman also achieved memorable short stones (Prommen, 1904, Skeppet, 1915, etc.), but his real medium was the lyric, he developed and refined his talent in a series of collections from Manonetteria (1903) to Ribet (1944) Like Soderberg, he is a passionate enemy of hypocrisy and brutality, but his characteristic tone is subdued reality, but his characteristic tone is subdued reality.

and bruilalty, but his characteristic tone is slubtuced reasism modutant, and the state of the s 1949) and Sigfrid Siwertz (1882- ) Hellstrom's work as journalist took him to the continent and to the United States, and long residence in England greatly influenced him. His irony and careful realistic deon England greatly influenced hm. His romy and careful realistic clear lill emerge in his best-known wovel, Snormabar, Likholin fit en uid still emerge in his best-known wovel, Snormabar, Likholin fit en uid Siwertz is a mose elegant stylist—like so many Swedes he began as a yrickis—and a declavie influence upon hum was the philosophy of Henri Bergson, reflected in En Flanor (1914). His weightest works are the Bergson, reflected in En Flanor (1914). His weightest works are the Bergson, reflected in En Flanor (1914). His weightest works are the ling World War 1, and Ionas and Deposit of Steckholin duri writer of short stories. Nordiston came from Nortand, and his birth-place—Hainosand—is preprietated in his works as "Obacka" Overplace—Hanosand—ss perpetuated in his work as "Obacka" Over-llowing with vitality and grifed with keen but grotesque humoun, he did some of his best work in Landsorts-bohème (1911) and Planeten Mrkstafan (1927), but his most satisfying productions are the short stories in Fishere (1907), Obackabor (1921), etc. Eim Wagner was an ardent paddist and feminist, her horror of militarism is shown he ne noved Sakten Jernaphogos framgång and her feminism in many of her witty, short stories Her most powerful work is the peasant novel witty, short stories Her most powerful work is the peasant novel Asa-Hanna (1918).

The outstanding novelist of the second decade of the 20th century The outstanding novellst of the second decade of the 20th entury in Hjanna Berman (1885–1931). Gittlet with a fantastically word stores many of which are set in "Wastloping" (his native Orebo) and stores many of which are set in "Wastloping" (his native Orebo) and to sturroundings, others in Halv. In Lovenshinsteric (1931), as in other words, Bergman depicts an irrational, impulsave, unsuccessful other words, Bergman depicts an irrational, impulsave, unsuccessful other control of the control of the control of the control of the control of the few irrans beginning of the few irrans and Swedsh consciences, are his most wadely known works. Bergman's witty dialogue and rapid characterization, and his inventiveness, both tragic and burlesque, make him one of the most original of Swedish writers, and as dramatist the only native successor to Strindberg.

Meanwhile the "proletarian" novel had been developed-not always Meanwhile the "proietariah" novel had been developed—not always by working-class writers—by G. Hedenwind-Eliksson (1880—), M. Koch (1888—1940) and I. Lo-Johansson (1907—), who is particularly concerned with the miscres of the stataens (fram labourer's) life. There is particularly harsh and telling criticism of wisking-class life in Lars Hard and other stories by Jan Fridegård (1879—). V. Moberg (1898— ) wrote both realistic and historical novels of peasant life. The autobiographical element, strong in many of these von Krusenstjerna (1894-1940) in her novel cycles (e.g., Tonyo-böckerna and Fróknarna von Pahlen) she describes her own arnsto-COCKETING AND CYCRIGATING VON Pahlen) she describes her own aristocratic and upper-middle-class environment, and analyzes a degenerate and perverted psychology. Her works constituted a new departure in Swedish literature.

The greatest Swedish writer of this period is undeniably Pär Fabien Lagerkvist (1891—), who won the Nobel prize in 1951. He was a wital force in literature after World War I and influenced both form and

content. His angushed search for a personal philosophy iscalls Strendberg, it is the heads of plays such as *Strenders demighed* (1970) and the semipled (1970) and the semipl

) were self-educated profesarians who turned more and mose to experiment with form Johnson's best work was probably his auto-bographical Romanes on Olof (1934-37) Martinson wrote both poetry and prose but achieved his most straing efficies in prose, in Rag-Parvail (Cape Farewall) and in Veges till Rokerhie (1940) Wittels of gest oppolisaty; too, were Old Hedders (1855— 1, a witty novelst of middle-class like, F Nilsson-Piraten (1855— 1, a skine) humorist, and his lellow-Lundensian Prants G Bengstons, author of the historical-humorous novel Rode orm (1941-45) and a masterly essayist Of the youngest authors, Stig Dagerman (1943-45) lar promise in his play Skuggan av Mart (1948) ) showed particu-

(B. M. E. M.)

SWEELINCK or SWELINCK, JAN PIETER (also known as Jan Pieterszoon) (1562-1621), Dutch organist and composer, was probably born at Amsterdam, although his family came from Deventer. It has been persistently stated that he was a fellow pupil with Giovanni Gabrieli and Leo Hassler of the great Andrea Gabrieli in Venice, but this was disproved by F H. J. Tiedeman in the Vereeniging voor Nederlandsche Muziekgegeschiedenis (Amsterdam, 1876). Sweelinck was the son of the organist of the Old church, Amsterdam, and lived in Holland from about 1577 onward

At a date not later than 1581 he was appointed organist to the Old church, his father having died in 1573, and this post he held until his death on Oct. 16, 1621,

A complete edition of his works, edited by Max Seiffert with prefaces,

was brought out by Breitkopf and Hartel in 1894-1901. See also Grove's Dictionary of Music and Musicians.

SWEET, HENRY (1845-1912), English philologist, was born in London on Sept 15, 1845 Educated at King's college, London, Balliol college, Oxford, and Heidelberg university, he was a recognized authority on phonetics, and a readership in phonetics was specially created for him in 1901 by the University of Oxford

Sweet died at Oxford on April 30, 1912.

Sweet used at UNIORI on April 30, 1912.
His works include Anglo-Saxon Reader (1866); Student's Dictionary of Anglo-Saxon (1807); A Short Historical English Grammar (1865); He History of Language (1900); and many editions of Old and Middle English texts. The Collected Papers of Henry Sweet were edited by H C. Wyld (1921).

SWEETBREAD, a popular term for certain glands of animals, particularly when used as articles of food; these are usually the pancreas, the stomach sweetbread of butchers, and the thymus, or neck sweetbread. The term is also sometimes used to include the salivary and lymphatic glands. (See LYMPHATIC SYSTEM; PANCREAS.

SWEETBRIER (Rosa eglanteria or R. rubiginosa), a tall, stiff-stemmed rose, called also eglantine, native to Europe, widespread in Great Britain and extensively naturalized in eastern 41h-AA

North America The erect, somewhat branching stem, aimed with stout hooked prickles, grows usually from 5 to 8 ft high It bears fragrant leaves, of five to seven leaflets, and solitary white or pinkish flowers, I to 2 in across. While the sweetbrier is infrequently grown for ornament, various hybrids with other roses are in cultivation (See Rose )

SWEET CLOVER, the common name for plants of the leguminous genus Melilotus (except M. indica, which is called sour clover) comprising about 20 species, native of southeastern Europe and Asia Minor They are annual or biennial, erect herbs, with trifoliolate leaves of usually small narrow leaflets and small yellow or white flowers, borne in slender axillary clusters (racemes) Most of the species contain coumarin resulting in a

sweet-smelling odour and bitter taste.

Biennial white sweet clover (M alba), biennial yellow sweet clover (M. officinalis) and sour clover (M indica), a winter annual adapted only to the southern and southwestern United States are of agricultural importance for pasture, soil improvement and hay in the United States and Canada. The first two species have become widely naturalized throughout the United States and Canada, while sour clover is widely scattered where adapted. M. suaveolens, a yellow-flowered species, is grown in a limited way in the southern prairies of Canada, and occasional plants of M, altissima have been collected in the eastern states. Annual forms of many of the biennial species have been found and several new varieties have been developed,

See "Sweetclover," leaflet no. 23, and the 1937 Yearbook of Agri-culture, US Department of Agriculture (E. A. H) SWEET CORN: see MAIZE; VEGETABLE.

SWEET FLAG: see Acorus Calamus.

SWEET GALE (Myrica gale), a shrub of the family Myricaceae, called also gale, sweet willow, bog myrtle and Dutch myrtle, widely distributed in the north temperate zone It grows usually from 2 to 4 ft high, with numerous twiggy branches. narrow, short-stalked, fragrant leaves; inconspicuous, unisexual flowers, borne in short spikes, and small, waxy-resinous, drupelike fruits attached to the persistent flowering bracts. The sweet gale occurs extensively on bogs and moors in the British Isles and widely also throughout the northern United States and Canada. The leaves are used as tea and as a country medicine.

(See WAX MYRTLE.)

SWEET GUM (Liquidambar styraciftua), a handsome North American tree of the witch hazel family (Hamamelidaceae), called also red gum, liquidambar (q.v.) and bilsted, found from Connecticut to Missouri and southward to Florida and Mexico It has a straight trunk, sometimes 140 ft, high and 5 ft in diameter, with rough bark, corky-winged branches, large, deeply lobed leaves, and drooping, spiny, globose, capsular fruiting heads containing winged

seeds. The hard reddish-brown wood is known to the lumber trade as red gum or satin walnut. In 1936 the cut of red gum lumber in the United States amounted to 606,000,000 bd.ft.,

SWEET POTATO (Ipomoea batatas), a food plant of the family Convolvulaceae (q.v.), a native of tropical America, widely cultivated in tropical and the warmer temperate climates. It is a

tender perennial grown as an annual in regions where frost occurs. The stems are long, trailing, sometimes short, with entire to palmately-lobed leaves of quite variable shape. The flowers, horne in cymes in the axis of the leaves, are funnel-shaped, tanged with rose-volet or pink, and are similar in size and shape to those of the common bindwed. The edible part is the much enlarged tuberous root, varying in shape from fusiform to oblong or pointed oval Root colours inage from white through cream to crange, and occasionally purple inside, and from light buff to brown or rose, copper and purplish red outside The solids of the root consist largely of starch and the orange-fleshed varieties are high in caroties.

The sweet potato rarely produces flowers under common cultural conditions in latitudes higher than about 35°, and produces no seed above about 30° except under special cultural treatment

The seeds produce plants that are unlike the parent plant, therefore the sweet potato as propagated vegetatively by sprouts arising from the roots, or by cuttings of the vines Seeds, however, are produced commonly in the field in the tropics. They have a very hard seed-coat that may retard germination as much as a year, unless the seed coat is nicked or abraded, after which the seeds germinate promptly.

The sweet potato is extensively grown in the United States, in tropical America, the warmer islands of the Pacific, in Japan, and from 1730 its culture increased rapidly in the U S R I is best adapted to the lighter, more frishles coils such as sandy Jounns and sandy soils, producing excessive vine growth and small yields or irregularly shaped roots on very roft, heavy soils. At least four to five months of warm weather are required for large yields. In Japan the crop long has been grown for drying and for manufacture of starch, but starch manufacture was initiated in the United States only after 1935, and up to 1942 only one factory remained in operation. The crop has been grown cheefy for use as a vegetable but in the United States is henge grown to an increasing extent (1943) as stock feed, either freshly harvested or shiedded and dired.

In the United States the sweet potato is propagated usually by bedding the roots close together in sand or light soil in a hot-bed heated by manure, by flues or electricity, about 4 or 5 weeks before the frost-free date. The sprouts which emerge are pulled from the roots and transplanted to the field about 1 to 11 ft apart on ridges 8 to 12 in. high, 3 ft. apart, after the weather and soil have become warm. The roots are harvested mostly about the time of the first frost in autumn since cold soils cause them to deteriorate. The crop responds well to heavy applications of chemical fertilizers low to medium in nitrogen and high in phosphorus and potash Heavy applications of animal manures or green manures are conducive to the formation of elongated, irregular roots and to root surface injury by scurf, a fungous disease. If the roots are to be stored, they should be placed in the storage house immediately upon harvesting, at a temperature of 85° F. and a relative humidity of 85% to 90% which is maintained for a week to 10 days. Then the temperature 1s lowered to 50-55° where it is kept as long as the roots are in storage. The "curing" period at high temperature and humidity is essential to hasten the healing of wounds caused in harvesting, thus reducing danger of loss from decay The eating quality-and also the market quality and storage life—are greatly improved by curing. If diseases are controlled, roots that are properly cured and stored remain in good edible condition 6 to 7 months The sweet potato is very susceptible to several diseases, control of which requires great care in field and store house sanitation and management, seed-stock treatment with disinfectants, and crop rotation

In the United States from 1930-42 about 800,000 ac. annually, vielding about 190000,000 bu, were grown for commercial purposes. The principal producing states were Georgia, Louisiana, Alabama, North Carolina, Mississippi, Texas, South Carolina and Tennessee The crop is grown commercially as far north as New Jersey and Iowa Average yields per acre range from 60 to 140 bu, among the several states.

SWEET-SOP or SUGAR APPLE, botanical name Annowa symmotox (family Annonaceae), a small tree or shrub with the solutions of the solution of the solution of the solution speem fruit, like a shortened pine cone in shape with a tubercle corresponding to each of the carpels from the aggregation of which it has been formed The fruit is 3 to 4 in, in diameter and contains a sweet creamy-yellow custard-like pulp It is a native of the West Indies and tropical America, it is much praced as a fruit, and has been widely introduced into the eastern hemisphere A muricata is the sour-sop (q v) A seticulata is the custard apple (q v), and A palutists the alligator apple.

SWEETWATER, a city of western Texas, USA., on federal highways 80 and 84, county seat of Nolan county.

Population in 1950 federal census was 13,610, (1940) 10,367. The district specializes in blooded Hereford stock, and has gas and oil fields. Sweetwater was founded in 1882 and charteted as a city in 1897. It adopted a commission-manager form of government. South of the city are the ruins of Fort Chadbourne, built in 1832.

SWELLENDAM, town, South Africa, in the valley of the Breede river, 192 m. E by S of Cape Town by rail; 33° 59' S, 20° 23' E, altitude 500 ft

Swellendam is one of the older Dutch settlements in the Cape, dating from 1745, and was named after Hendrik Swellengrebel, then governor of the Cape, and his wife, whose maiden name was Damme

Early in 1795 the burghess of the town and district rose in revolt against the Dutch East India company, proclaimed a "free tepublic," and elected a so-styled national assembly. At the same time the burghers of Graaff Reinet also rebelled against the Cape authorities, who were powerless to suppress the insurrectionary movement. One of the claims of the "free republic" was "the absolute and unconditional slavery of all Hottentots and Bushmen" In September of that year Cape Town surrendered to the British and the "National" party at Swellendam quietly accepted British rule. The town thereafter lost much of its former importance. The total population of 4,003 in 1346 included 2,331 whites, 1,631 "coloured" (mixed), 38 natives and 3 Assattis

SWETCHINE, MADAME (1782-1857), Russian mystic, whose maden name was Soymanof, was born in Moscow, and under the influence of Joseph de Maistre became a member of the Roman Catholic Church in 1815. In the following year she settled in Paris, where, until her death, she maintained a famous salon remarkable no less for its high courtesy and intellectual brillance than for its religious atmosphere Though not physically beautiful, she had a personality of rare spiritual charm, untrured in the private chapel of her house Her husband, General Swetchine, was 35 years her senior.

Her Life and Works (of which the best known are "Old Age"

and "Resignation") were published by M. de Falloux (2 vols, 1860) and her Letters by the same editor (2 vols, 1861).

See Sainte-Beuve, Nouveaux lundis, vol. i; and E. Scherer, Études sur la littérature contemporame, vol i.

SWETE, HENRY BARCLAY (1835—1917). English theologian, was born at Bustol on March 14, 1835, and educated at King's college, London, and Caius college, Cambridge He was ordained in 1858, and became in 1865 dean of Caius college In 1877 he accepted the college living of Ashdon, Essex, and 1832 was made professor of pastoral theology at King's college. London

In 1890 he succeeded Westcott as regius professor of divinity at Cambridge, retiring with the title of emeritus professor in 1915. He died at Hitchin on May 10, 1917.

Swetch works on Biblical texts are of the highest importance. In 1889 he published the first volume of his edition of the Greek text of the Old Testament, completing the series in 1894 (4rd ed., 1907-197); in 1898 the Greek text of the Gospiel OS K Mark with notes and of St. John (and ed., 1907). He was the editor of Combridge Theodogical Europy (1905) and Contributed to Smith and Wace's Dictionary of Christian Bugraphy (1808-67) and Hasting's Dictionary of the Buble (1809-1900). His

hatorical and critical works include The Apoullet' Creed in Relation for the Recommendation of the Recommendat

Bluetooth, the christianizer of Denmark, by his peasant mistress Aesa, according to the Jomsvikinga Saga, though more probably his mother was Queen Gunild, Harold's consort. The lad was a born champion and buccaneer His first military expedition. m alliance with the celebrated Jomsborg Viking, Palnatoke, was against his own father, who perished during the struggle (c o86). Six years later he conducted a large fleet of waishins to England. which did infinite damage, but failed to capture London During his absence, Denmark was temporarily occupied by the Swedish king. Eric Sersel, on whose death (c 994) Sweyn recovered his patrimony, About the same time he repudiated his first wife Gunild, daughter of duke Mieszko of Poland, and married King Eric's widow, Sigrid This lady was a fanatical pagan of a disquicting strength of character Two viceroys, earlier wooers, were burned to death by her orders for their impertinence, and she refused the hand of Olaf Trygvesson, king of Noiway, rather than submit to baptism, whereupon the indignant monarch struck her on the mouth with his gauntlet and told her she was a worse pagan than any dog. Shortly afterwards she married Sweyn, and easily persuaded her warlike husband to unite with Olaf, king of Sweden, against Olaf Trygvesson, who fell in the famous seafight off Svolde (1000) on the west coast of Rugen, after a heroic resistance immortalized by the sagas, whereupon the confederates divided his kingdom between them. After his first English expedition Swevn was content to blackmail England instead of ravaging it, till the ruthless massacre of the Danes on St Brice's day, Nov. 3, 1002, by Ethelred the Unready (Swevn's sister was among the victims) brought the Danish king to Exeter (1003). During each of the following eleven years, the Danes, materially assisted by the universal and shameless disloyalty of the Saxon ealdormen, systematically ravaged England, and from our to your the wretched land is said to have paid its invaders in ransoms alone £158,000. Sweyn died suddenly at Gainsborough on Feb 13, 1014

The data relating to his whole history are scanty and obscure, and his memory has suffered materially from the fact that the chief chroniclers of his deeds and misdeeds were ecclesiastics

His most remarkable exploit, Svolde, was certainly won at the expense of Christianity, resulting, as it did, in the death of the saintly Olaf. It is not surprising, therefore, that Adam of Bremen, and the monkish annalists who follow him, describe Sweyn as a grim and bloody semi-pagan, perpetually warring against Christian states But there is another side to the picture. Viking though he was, Sweyn was certainly a Christian viking

He built churches, he invited English bishops to settle in Denmark (notably Godibald, who did good work in Scania), and on his deathbed he earnestly commended the Christian cause to his son Canute. He was cruel to his enemies but he never forgot a benefit. Thus he rewarded the patriotism of the Danish ladies who sacrificed all their jewels to pay the heavy ransom exacted from him by his captors, the Jomsborg pirates, by enacting a law whereby women were henceforth to inherit landed property in the same way as their male relatives.

Of his valour as a captain and his capacity as an administrator there can be no question His comrades adored him for his liberality, and the frequent visits of Icelandic skalder to his court testify to a love of poetry on his part. Indeed one of his own strophes has come down to us.

He had a long cleft beard, whence his nickname of Tiugeskaeg or Fork-Beard

SWEYN II or ESTRITHSON, King of Denmark (d. 1976), was the son of Estrith, sister of Canute the Great, and of the Earl Ulf When his father was murdered by Canute, Sweyn fled to Sweden, where he remained until the accession of Magnus the Good to the throne of Norway, at which time Magnus named

him earl of Jutland and viceroy of Denmark. Sweyn, however, was not satisfied with this position, aspiring to become king of Denmark He therefore involved Denmark and Norway in a war which was only terminated in 1047 with Magnus' death, caused by a fall from a horse as he rode in pursuit of the defeated and fleeing Sweyn His dying wish, however, was that Sweyn be made king of Denmark, and Swevn thus began the Estrith dynasty. known as the second or middle Danish dynasty, which ruled for nearly 200 years.

Sweyn was almost immediately embroiled in conflict with Harald Haardraade, Magnus' heir to the throne of Norway, who wished also to become king of Denmark. For 17 years, until 1064, the battle between the two countries was pursued sporadically and at the end of that time, although the Norwegians had decisively defeated the Danes in the naval battle of Nissa, the two monarchs declared a truce and the boundaries of Norway and Denmark were declared to be the same as when the war started After Harald's death in 1066, Sweyn felt free to turn his attention to some other project than the defense of his country. In 1060, therefore, he sent a fleet to assist an internal rebellion against William I of England, a country which he, as nephew of Canute. felt he was entitled to rule. William, however, was able to bribe Sweyn's lieutenant and thus to forestall that threat. In 1075 Swevn made another similar effort which proved equally abortive

Sweyn was a devout Roman Catholic, and although he was at one time embroiled with the aichbishop of Bremen over Sweyn's marriage to his own stendaughter, he did much to encourage the development of the church in Denmark He died in 1076 He left numerous sons, perhaps as many as 14, all illegitimate. Five of

them subsequently became kings of Denmark

SWIFT, GUSTAVUS FRANKLIN (1839-1903), U.S industrialist, was born June 24, 1839, at Sagamore, then known as West Sandwich, Massachusetts When he was 14 he left school to take a position at a salary of \$1 a week working for his brother, a butcher. By 1859, at the age of 20, he had gone into business for himself as a buyer and slaughterer of cattle on a small scale. In that year he opened his own butcher shop in Eastham and soon became the manager of a number of small shops, which he opened himself and placed in charge of other men In 1872 he became the partner of James A. Hathaway in the firm of Hathaway and Swift. Three years later Swift, who was the cattle buyer for the firm, transferred his headquarters to Chicago, where the centre of the cattle market had shifted He soon determined that the meat packing business would be substantially more profitable than the meat selling business if some method were devised for shipping fresh meat from Chicago to the east, instead of sending live cattle to be slaughtered on arrival, as was the custom. He therefore hired an engineer to design a refrigerator car which would make this possible, and in 1877 he successfully shipped the first refrigerator carload of fresh meat to the east. In 1878 he formed a partnership with his brother and in 1885, with a capitalization of \$300,000, the firm of Swift & Company came into being, with Swift as first president. At his death less than 20 years later, the capitalization had increased to \$25,000,000, more than 80 times the original size. In addition to his promotion of refrigerator cars, which was one of the most important factors in the development of the meat packing business, Swift was a leader in the field of turning previously unused parts of slaughtered animals into valuable by-products He died March 29, 1903, in Chicago.

See Louis F. Swift and Arthur Van Vlissingen Jr., Yankee of the

Yards (1927). SWIFT, JONATHAN (1667-1745), dean of St. Patrick's, Dublin, British satırist, was born at No. 7 Hoey's court, Dublin, on Nov. 30, 1667, a few months after the death of his father, Jonathan Swift (1640-1667), who married about 1664 Abigaile Erick, of an old Leicestershire family. His grandfather, Thomas Swift, vicar of Goodrich near Ross, appears to have lost his possessions by taking the losing side in the Civil War and died in 1658 before the restoration could bring him redress. He married Elizabeth, niece of Sir Erasmus Dryden, the poet's grandfather. The young Swift was supported by his uncle Godwin, a Tipperary 662 SWIFT

official, at the age of six he entered Rilkenny school, where Congreve was a fellow student, and he completed his education at Tranty college, Dublin Here he exhibited few signs of preconcus genus, and it was only by special act of midulgence that he obtained his degree, then, on the death of his uncle, he left Ireland and sought counsel of his mother in Lecester.

His first employment commenced towards the close of r689, when he became secretary to Sir William Temple, who had returd to Moor Park, near Farnham, after the rapid decline of this indicate to Moor Park, a sear Farnham, after the rapid decline of this indicate during the critical petied of Charles IT's regn. It was there that Swift's ocquantance with Esther Johnson, the "Stella" of the famous Journal, was begun Stella's mother was living at Moor Park, as servant of Temple's astert, Lady Giffard Swift was 22 and Esther S years old at the time, and a curious friendship sprang up between them He taught the hitle garl how to write and gave her advice in reading On his arrival at Moor Park, Swift's duties were merely those of account-keeper and amanuensis, but his ability gradually won him the confidence of his employer and he was entrusted with some important missions.

In 1644, however, Swift (who had in the meantume obtained the degree of M A ad eundem at Oxford) quitted Temple, who had, he considered, delayed too long in obtaining him preferrents, but it was only after five months' delay, when Swift had unwillingly begged the favour of a testimonial from his discarded patron, that he was able to obtain the small prebend of Kilroot near Belfast (Jan 1695).

In the meantime he had grown tired of Irish life and was glad to accept Temple's proposal for his return to Moor Park, where he continued until Temple's death in Jan, 1600. During this period he wrote much and burned most of what he had written He read and learned even more than he wrote Moor Park took him away from brooding in Ireland and brought him into the corridor of contemporary history, an intimate acquaintance with which became the chief passion of Swift's life. His Pindaric Odes. written at this period or earlier, in the manner of Cowley, indicate the rudiments of a real satirist, but a satirist struggling with a most uncongenial form of expression. Of more importance was his first essay in satiric prose, which arose directly from the position which he occupied as domestic author in the Temple household. Temple had in 1692 published his Essay upon Ancient and Modern Learning, transplanting to England a controversy begun in France by Fontenelle Incidentally Temple had cited the letters of Phalaris as evidence of the superiority of the ancients over the moderns William Wotton's criticism of Temple's general conclusions caused Swift to write Battle of the Books in 1697 in refutation Boyle's Vindication and Bentley's refutation of the authenticity of Phalaris came later. Swift's aim was limited to co-operation in what was then deemed the well-deserved putting down of Bentley by Boyle, with a view to which he represented Bentley and Wotton as the representatives of modern pedantry, transfixed by Boyle in a suit of armour given him by the gods as the representative of the "two noblest of things, sweetness and light," Though written in 1697, the satire remained unpublished until 1704, when it was issued with The Tale of a

After Temple's death, Swift suffered several disappointments in attempting to find employment, but he eventually secured the rectory of Agher in Meath with the united vicarages of Laracor and Rathbeggan, to which was added the prebend of Dunlavin in St. Patrick's-the total value being about £230 a year. He was now often in Dublin, at most 20 mi. distant, and through Lady Berkeley and her daughters-Lord Berkeley was now a lord justice of Ireland-he became the familiar and chartered satirist of the fashionable society there. But he very soon began to grow tired of Ireland again and to pay visits in Leicester and London His resolution to exchange divinity for politics must appear fully justified by the result. The Discourse on the Dissensions in Athens and Rome (Sept 1701), written to repel the tactics of the Tory commons in their attack on the Partition treaties "without humour and without satire," and intended as a dissuasive from the pending impeachment of Somers, Orford, Halifax and Portland, received the honour of being generally

attributed to Somers himself or to Burnet, the latter of whom found a public disavowal necessary. In April or May 1704, appeared a more remarkable work Clearness, cogency, masculine simplicity of diction, are conspicuous in the pamphlet, but true creative power told the Tale of a Tub Although it lacks coherence and attains no conclusion, it is the most strikingly original of Swift's saturical works In his kindred productions he relies mainly upon a single element of the humorous-logical sequence and unruffled gravity bridling in an otherwise frantic absurdity, and investing it with an air of sense. In the Tale of a Tub he lashes out in all directions. The humour, if less cogent and cumulative, is richer and more varied, the invention, too, is more daringly original and more completely out of the reach of ordinary faculties The book is throughout a mine of suggestiveness At the same time, it lacks unity and coherence, it attains no conclusion, and the author abuses his digressive method of composition and his convenient fiction of hiatuses in the original manuscript

In Feb. 1701, Swift took his D D degree at Dublin, and before the close of the year he had taken a step destined to exercise a most important influence on his life, by inviting two ladies to Laracor Esther, daughter of a merchant named Edward Johnson, a dependant, and legatee to a small amount. of Sir William Temple's (born in March 1680), whose acquaintance he had made at Moor Park in 1689, and whom he has immortalized as "Stella," came over with her companion Rebecca Dingley, a poor relative of the Temple family, and was soon permanently domi-ciled in his neighbourhood. Meanwhile the sphere of his intimacies was rapidly widening. He had been in England for three years together, 1701 to 1704, and counted Pope, Steele and Addison among his friends In 1708 he wrote the finest example of his irony, the Argument to prove that the abolishing of Christianity in England may, as things now stand, be attended with some inconveniencies, and about this time, too (Nov. 1707), he produced his best narrative poem, Baucis and Philemon.

The next few months witnessed one of the most amusing hoaxes ever perpetrated against the quackery of astrologers, the victim being a Protestant alarmist and plot vaticinator styled John Partridge, In Jan 1708, Swift, under the name of Isaac Bickerstaff, issued a solemn prediction that the notorious almanac maker, Partridge, would die at 11 o'clock P.M. on March 29, and on March 30 he published a letter confirming this prophecy Partridge's fatuous denial and reply to Bickerstaff elicited Swift's musing Vindeaction of Isaac Bickerstaff, Sag, in April 1700. The episode has left a permanent trace in literature, for when, in 1709, Steele was to start the Tailer, it occurred to him that could secure the public car in no surer way than by adopting the name of Bickerstaff.

From Feb 1708, to April 1709, Swift was in London, urging upon the Godolphin administration the claims of the Irish clergy to the first-fruitis and twentieths ("Queen Anne's Bounty"), already granted to their brethren in England His having been selected for such a commission shows that he was not yet regarded as a deserter from the Whigs, although the ill success of his representations probably helped to make him one. By Nov 1710, he was again domiciled in London, and writing his Journal to Stella, that unique exemplar of a giant's playfulness In the first pages of this minute record of a busy life we find him depicting the decline of Whig credit and complaining of the cold reception accorded of Whig credit and complaining of the cold reception accorded

of Wang creant and companising or the color reception accorded in by Godolphin, whose penetration had doubtless detected the precariousness of his allegiance. Within a few weeks he had become the lampooner of the fallen treasurer, the bosom friend of Oxford and Bolingbroke, and the writer of the Examiner, a journal established as the exponent of Tory views (Nov 1710). He was now a power in the state and the associate of ministers on a footing of perfect cordiality and familiarity For a brief time he seemed to resume the whole power of the English press in his own pen and to guide public opinion as he would—his services to his party as writer of the Examiner, which he quitted in July 1711, were even surpassed by those which he rendered as the author of telling pamphlets. We need not suppose that he was consulted respecting the great Tory strokes of the creation of

663 SWIFT

the twelve new peers and the dismissal of Marlborough (Dec. 1711), but they would hardly have been ventured upon if The Conduct of the Allies and the Examiners had not come first

Generous men like Oxford and Bolingbroke cannot have been unwilling to reward so serviceable a friend, especially when their own interest lay in keeping him in England. Swift still had formidable antagonists in the archbishop of York, whom he had scandalized, and the duchess of Somerset, whom he had satirized. Anne was particularly amenable to the influence of priestly and female favourites, and it must be considered a proof of the strong interest made for Swift that she was eventually persuaded to appoint him to the deanery of St Patrick's, Dublin In June 1713 he set out to take possession of his dignity, and encountered a very cold reception from the Dublin public. The dissensions between the chiefs of his party speedily recalled him to England. He found affairs in a desperate condition. The queen's demise was evidently at hand and public opinion was turning towards the Whigs when the Tories manifestly could not be trusted to maintain the Protestant succession Bolingbroke's brain teemed with the wildest plans. Swift's mediation was unavailing

When the discord of Oxford and Bolingbroke had become patent to all the nation, Swift, foreseeing, as is probable, the impending fall of the former, retired to Upper Letcombe, in Berkshire, and there spent some weeks in the strictest seclusion. This leisure was occupied in the composition of his remarkable pamphlet, Some Free Thoughts on the Present State of Affairs, which indicates his complete conversion to the bold policy of Bolingbroke The utter exclusion of Whigs as well as Dissenters from office, the remodelling of the army, the imposition of the most rigid restraints on the heir to the throne—such were the measures which, by recommending, Swift tacitly admitted to be necessary

to the triumph of his party.

Bolingbroke's daring spirit, however, recoiled from no extreme, and, fortunately for Swift, he added so much of his own to the latter's ms that the production was first delayed and then, upon the news of Anne's death, immediately suppressed This incident only just anticipated the revolution which, after Bolingbroke had enjoyed a three days' triumph over Oxford, drove him into exile and prostrated his party Almost the first acts of Bolingbroke's ephemeral premiership were to order him £1,000 from the exchequer and despatch him the most flattering invitations. The same post brought a letter from Oxford, soliciting Swift's company in his retirement, and, to the latter's immortal honour, he hesitated not an instant in preferring the solace of his friend to the offers of Bolingbroke. When, a few days later, Oxford was in prison and in danger of his life, Swift begged to share his captivity; and it was only on the offer being declined that he finally directed his steps towards Ireland, where he was very ill received. The draft on the exchequer was intercepted by the queen's death.

During these four busy years of London life, Swift had entered deeply into the literary life of the period. He was treasurer and a leading member of the Brothers, a society of wits and statesmen which recalls the days of Horace and Maecenas. He promoted the subscription for Pope's Homer, contributed some numbers to the Tatler, Spectator, and Intelligencer, and joined with Pope and Arbuthnot in establishing the Scriblerus Club, contributing to Martinus Scriblerus, his share in which can have been but small, as well as John Bull, where the chapter recommending the education of all blue-eyed children in depravity for the public good must surely be his. His miscellanies, such as A Meditation upon a Broomstick, and the poems Sill Hamet's Rod, The City Shower, The Windsor Prophecy, The Prediction of Merlin, and The History of Vanbrugh's House, belong to this period. A more laboured work, his Proposal for Correcting, Improving and Ascertaining the English Tongue (1712), in a letter to Harley, suggesting the regulation of the English language by an academy, is chiefly remarkable as a proof of the deference paid to French taste. His History of the Four Last Years of the Reign of Queen Anne is not on a level with his other political writings.

To Swift the change from London to Dublin, meant for the time the fall from unique authority to absolute insignificance. All share in the administration of even Irish affairs was denied him:

every politician shunned him, and his society hardly included a single author or wit Before and after his elevation to the deanery of St Patrick's, Esther Johnson and Mrs. Dingley continued to reside near him, and superintended his household during his absence in London. He had offered no obstacle in 1704 to a match proposed for Stella to Dr William Tisdall of Dublin, Whatever the cause, his conduct proved the fatal embitterment of his life and Stella's and yet another's. He had always been unlucky in his relations with women Esther Vanhomrigh, "Vanessa" Feb 14, 1690), the daughter of a Dublin merchant of Dutch origin, had become known to Swift at the height of his political influence He lodged close to her mother, and Vanessa insensibly became his pupil, while he became the object of her impassioned affection

But Swift was devoid of passion Of friendship, even of tender regard, he was fully capable, but not of love, and Vanessa's ardent and unreasoning display of passion was beyond his comprehension Yet Vanessa assailed him on a very weak side. The strongest of all his instincts was the thirst for imperious domina-Vanessa hugged the fetters to which Stella merely submitted. Flattered to excess by her surrender, yet conscious of his binding obligations and his real pieference for Stella, he could neither discard the one beauty nor desert the other. When Vanessa's mother died (1714), she followed him to Ireland, taking up her abode at Celbridge within ten miles of Dublin. Unable to marry Stella without destroying Vanessa, or openly to welcome Vanessa without destroying Stella, he was thus involved in the most miserable embarrassment; he continued to temporize Had the solution of marriage been open Stella would undoubtedly have been Swift's choice, but some mysterious obstacle intervened.

Meanwhile Swift's efforts were directed to soothe Miss Van-

homrigh, to whom he addressed Cadenus [Decanus] and Vanessa, the history of their attachment and the best example of his serious poetry, and for whom he sought to provide honourably in marriage, without succeeding either in his immediate aim or in thereby opening her eyes to the hopelessness of her passion Worn out with his evasions, she at last (1723) took the desperate step of writing to Stella or, according to another account, to Swift himself, demanding to know the nature of the connection with him, and this terminated the melancholy history as with a clap of thunder. Stella sent her rival's letter to Swift, and retired to a friend's house Swift rode down to Marley Abbey with a terrible countenance, petrified Vanessa by his frown, and departed without a word, finging down a packet which only contained her own letter to Stella. Vanessa died within a few weeks She left the correspondence for publication, but it was suppressed until it was published by Sir Walter Scott. Five years after Vanessa's death Stella died, on Jan. 28, 1728.

Between the death of Vanessa and the death of Stella came the greatest political and the greatest literary tnumph of Swift's life Although he was not an Irish patriot in the strict sense of the word, his pride and sense of equity alike revolted against the stay-at-home Englishmen's contemptuous treatment of their own garrison, and he delighted in finding a point in which the triumphant faction was still vulnerable. His Proposal for the Universal Use of Irish Manufactures, published anonymously in 1720, urging the Irish to disuse English goods, became the subject of a prosecution, which at length had to be dropped. A greater opportunity was at hand. A patent for supplying Ireland with a coinage of copper halfpence was accorded to William Wood on such terms that the profit accruing from the difference between the intrinsic and the nominal value of the coins, about 40%, was mainly divided between him and George I.'s favourite duchess of Kendal, by whose influence Wood had obtained the privilege Swift now had his opportunity, and the famous six letters signed M. B. Drapier (April to Dec. 1724) soon set Ireland in a flame Every effort was used to discover, or rather to obtain legal evidence against, the author, but none could be procured; the public passion swept everything before it; the patent was cancelled.

The noise of the Drapier Letters was followed by the anonymous publication of Travels Into Several Remote Nations of the World, in four parts, by Lemuel Gulliver, first a surgeon and then a captain of several ships (Benjamin Motto, Oct 1726), the work being well advanced it would seem, by 1720 The keenness of the satue on courts, parties and statesmen certainly suggests that it was planned while Swift's disappointments as a public man were still rankling and recent. Although he was afraid of the reception the book would meet with, especially in political circles, the world chose to be diverted by it. In the first two parts the misanthropy is quite overpowered by the fun. The third part, equally masterly in composition, is less felicitous in invention, and in the fourth Swift has indeed carried out his design of vex-

ing the world at his own cost Swift's grave humour and power of enforcing momentous truth by ludicrous exaggeration were next displayed in his Modest Proposal for Preventing the Children of Poor People from being a Burden to then Parents or the Country, by fattening and cating them (1729) The Directions to Servants, a satire on domestics, was first published in 1745, while Polite Conversation, written in 1731 was published in 1738 Little beyond occasional verses— trivial and often indecent—followed, but the delightful Hamilton's Bawn, and the verses on his own death (1721) are exceptions, and in The Legion Club of 1736 he composed the fiercest of all his verse satires. His popularity remained as great as ever (he received the freedom of Dublin in 1729), and he governed his cathedral with great strictness and conscientiousness, but the attacks of giddiness to which he had always been subject increased upon him, and he grew more and more capricious and morbidly suspicious In March 1742 it was necessary to appoint guardians of Swift's person and estate In September of the same year his physical malady reached a crisis, from which he emerged a helpless wreck, with faculties paralysed rather than destroyed, and he eventually sank into the dementia which preceded his death on Oct 10, 1745 He was interred in his cathedral at midnight in a coffin by the side of Stella's His epitanh was written by himself.

An object of pity as well as of awe, Swift is one of the most tragic figures of English literature. His master passion was imperious pride-lust for despotic dominion, place, profit and literary fame were comparatively indifferent to him Contemptuous of the opinion of his fellows, he hid his virtues, paraded his faults, affected some failings from which he was really exempt, and, since his munificent charity could not be concealed from the recipients, laboured to spoil it by gratuitous surliness. "To think of him," says Thackeray, "is like thinking of the ruin of a great empire." Among those influenced by Swift may be mentioned Chesterfield, Smollett, Cobbett, Hazhtt, Scott, Borrow, Newman, Relloc

Belloc.

Binizogaphy —The contemporary lives of Switt, most of which contum a certain amount of apocrypha, are those of Lord Orrey (1971), Dr. Delany's Observations on Orrey's (1974), Dena Switt's Essay upon the Life of Swift (1975), and Thomas Sherdan's Life (1976), and Thomas Sherdan's Life (1976), and Thomas Sherdan's Life in the Control of the C uabb in many respects, it exhibited the process as well as the result of biography, and never got beyond 1711. The Life by St Heinry Craik (1883 and resissues) now holds the field Valuable monographs have been produced by St Leilis Stythen (Men of Letters and the have been produced by St Leilis Stythen (Men of Letters and the Manuscritt, by W. R. Wilde, in his Cloting Feory, Diese Style (Life, by Lecty, in his Leaders of Pablic Opinion, by G. P. Mornary, J. Churton Collins (1883), Max Simon (1893), Hernrette Cordiel (1997) and Sophis Shilletto Smith (1990). The ancelotes of Swift related in Spence, Lestilia Phisington, Wilson's Swiftlana, Delany's Autobiography, Let, though often amusing, can hardly be accepted and the produced of the control of as authentic

as authentic.

SWIFT, a bird so called from the speed of its flight Despite its appearance, the swift (Apus apus) is in no way related to the swallow and is not even a Passerine bird, its affinities being with

the humming birds The common swift is a summer visitor to Europe, arriving in May and returning to Africa at the end of August It nests in holes in buildings, less frequently in cliffs and quarries On the wing it gives the idea of a bow and arrow, it is a larger bird than the swallow and its flight is swifter and steadier Except for a greyish-white patch under the chin, the plumage is entirely sooty black Near sunset the birds often sweep round in screaming bands, and sometimes then ascend out of sight. It has been stated that they may spend the night on the wing at great heights, further CHIMNEY SWIFTS (CHAETURA PE- observation on this point is need-LAGICA), SHOWN WITH NESTS AND ed, as also on the assertion that swifts actually pair in mid-air A

larger species, A. melba, with white under parts, inhabits the mountains and cliffs of southern Europe and is very numerous in the old water tower at Lucerne

The allied genus Collocalia construct nests of saliva and these are used by the Chinese for soup. The birds breed in caves, and range from north Madagascar to the Marquesas, one species occurring in the hill country of India The chimney swallow of the United States (Chaetura pelagica) is also a swift, cementing its nest with saliva. It is migratory.

SWIFT & COMPANY.—Gustavus Franklın Swift (1839-1903), founder of Swift & Company, entered business for himself at West Sandwich, his home village on Cape Cod, with \$20 borrowed capital That was in 1855 when he was 16. By 1875 he had developed an extensive live stock and meat business and had moved to Chicago to buy cattle for his eastern firm. He recognized the mefficiency of shipping live animals to the East, and foresaw and helped to bring about a revolution of methods in the live stock and meat industries of the United States and of the world Giving up his eastern business to enter meat packing at Chicago, G. F. Swift experimented immediately with refrigerator-car shipments of dressed beef to New England, succeeded, and then worked to overcome eastern prejudice against western beef. For his part in making the western dressed beef trade a year-round commercial success he is regarded as one of the true pioneers of the modern packing industry.

Incorporation of Swift & Company in 1885 with capital of \$300,000 marked the beginning of a phenomenally rapid growth. Capitalization reached the present \$150,000,000 in 1018. Sales have exceeded a billion dollars in a single year. Ownership in 1939 was distributed among 59,000 shareholders, of whom more than 8,500 were employes and 26,000 were women Employes totaled 60,000 men and women Swift & Company processes hvestock and sells meat and by-products at wholesale Butter, eggs cheese, poultry, gelatin, soap, glue, animal feeds and tertilizer are among other leading products The company operates 50 packing plants, 100 produce plants, 375 branch selling houses, and 1,000 plant sales routes, all using 6,000 refrigerator cais, 33 cotton oil mills, 20 fertilizer plants, 9 refineries, 2 soap factories and more than 100 foreign sales agencies (G F Sw)

SWIMMING, the action of self-support and self-propulsion on or in the water, though used by analogy of manimate objects. the term is generally connected with animal progression and especially with the art of self-propulsion in the water as practiced by man Natation (the synonym derived from Lit nature) is one of the most useful of the physical accomplishments of man There have been many cases in which beginners have demonstrated some ability in the art upon their first immersion in the water, but generally speaking it is an art which has to be acquired

Swimming was rated highly in the days of Greece and Rome. practised widely and stressed in the training of warriors But the art fell into almost complete disuse throughout Europe in the middle ages, when the belief became general that outdoor bathing helped to spread the scourging epidemics which so often swept the continent It was not until the second half of the 19th century that the prejudice was overcome sufficiently for aquatic activities to be resumed. Competition was resumed, first in Great Britain. then elsewhere, and the study of swimming technique led to gradual improvement in methods

As knowledge grew, there came steadily increasing appreciation of the value of swimming in protecting life, as well as in physical education, for it had gained recognition as the most beneficial of all forms of exercise. Physical educators agreed that there is no physical activity that can contribute as much as swimming to an individual's well being from the physical, the psychological, the recreational and the safety standpoint. The teaching of it was taken up by the schools, sectional and national learn-to-swim campaigns were fostered in most countries, during World War II nearly all belligerent nations conducted thorough courses in functional swimming as a part of the battle training of service men. After World War II the gains in swimming instruction and promotion made by the demands of the war were consolidated and furthered by national organizations such as the U.S. Conference for National Cooperation in Aquatics. This organization, operating informally and meeting annually, sought to further the cause of swimming specifically because of the safety value of aquatics m a national emergency, but also, because of the value of swim-ming as an "all around" exercise The US Conference for National Cooperation in Aquatics included all of the outstanding national organizations Young Men's Christian association; Young Women's Christian association: Boy Scouts of America: American Association for Health, Physical Education and Recreation; American Camping association; American National Red Cross, American Recreation society; Boys' Clubs of America; Girl Scouts of America, Amateur Athletic Union of the U.S., National Collegiate Athletic association, National Jewish Welfare board; National Safety council, United States office of education; and the armed services.

Progression in methods of swimming was marked by apparently separate and unrelated findings. The over-all picture discloses a series of sequent and connected steps in the evolution of the competition, the standard racing style was the side stroke in which both arms remain submerged throughout, while the legs execute a wide scissor kick, opening and closing in movements resembling those of walking. The first advance was made when swimmers conceived the idea of minimizing resistance by thrusting the upper arm forward above the surface, instead of underwater The new stroke was called single overarm. The double overarm followed, with both arms recovering above the surface. This stroke was made prominent in 1893 by an Englishman, J. Trudgen, who told of picking it up in South America. It took his name, misspelled Trudgeon in some countries, and served later to introduce the basic arm action of the crawl, most efficient mode of swimming de- line from hands to pointed toes. The orthodox stroke may be

veloped so far

The changes in leg drive were marked by a consistent trend toward narrower and faster movements Following the advent of the trudgen, the wide seissor kick of the side stroke, originally performed with legs bent excessively, was reduced in scope and executed with the legs a good deal straighter. Then, with the introduction of the crawl, the legs began to whip up and down alternately in a gradually quickening and diminishing thrash, speeding up by degrees from 2 to 10 proportionately smaller scissors to each cycle of the two aims

The Teaching of Swimming .- Many methods of swimming instruction were tested as changes in stroke took place, but in the long run the great majority of teachers enrolled in two predominant schools, the European, whose protagonists believe the breast stroke should be taught first, and the US whose followers assert the crawl is mastered far more readily than any other stroke. Both schools favour preliminary drills on land or in shallow water, that the beginners may gain some knowledge of the required move-

ments before attempting to swim

The greatest handicaps in learning are failure to relax and haste in performing the action Fear of the water, or the mere nervousness experienced by most nonswimmers, generally causes muscle tension and engenders the feeling that it is necessary to thrash wildly with arms and legs in order to keep afloat Every effort must be made to overcome these natural tendencies, for rapid progress is dependent upon complete relaxation and unhurried movements Instructors usually help pupils to become accustomed to immersion by having them play in shallow water, ducking the head and trying to pick up objects from the bottom, before starting schooling

During World War I and World War II, when great numbers of older troops in then late 20s and early 30s had to be taught and where time was of the essence, a method of starting the pupil on his back was developed. In this position floating was facilitated, developing confidence in the water; normal breathing was utilized in contrast to the breathing difficulty in face-down strokes, and a very simple propulsive action was taught-a frog kick with a synchronous short arm stroke, the arms being under water to prevent splash, moving from side, horizontal, downward to the thighs. This beginning stroke is a definitely advantageous one to be used with adults

The Breast Stroke.-Two styles of breast stroke have been evolved, the ancient and orthodox variety, believed to be the oldest of all strokes, and the butterfly, a racing adaptation brought out in 1935 by Henry Myeis, of the U.S. The orthodox, used for teaching beginners, is a stroke of great practical value. It affords the means to assist a tired swimmer or support a drowning person with comparatively little effort, it enables one to advance safely, head up, through waters littered with flotsam or wreckage; it is the only stroke which makes it possible for soldiers to swim under the burden of heavy packs and arms. It also has the advantage as a wartime stroke of being noiseless, as the arms and legs are under water in recovery and propulsion. The butterfly is a competitive style only.

The two styles are distinguished by differences in the action of the arms. In both the arms start their drive from full extension in front, hands close together on the surface, palms down But in the orthodox they propel by pressing down and outward at a slant which places them at an angle of about 80° on reaching the shoulder line, when the elbows are brought to sides, the hands to chest, again palms down, and the arms shot forward underwater to original position. In the butterfly the arms pull under the body all the way to the thighs, then emerge and fling forward above surface in circular motion. The leg action of both, known as the frog kick, is performed by drawing up the legs in a manner somewhat like that of squatting, knees apart, feet close and pointed. then the feet are turned outward and, with a continuous sweep, the legs are kicked vigorously back and out to an angle of about 90° and snapped sharply together. The closing movement occurs as the arms shoot forward in recovery. After the kick the body is allowed to glide motionless for a brief spell, forming a straight used comfortably head up, but greater speed is attained in both styles by raising the head to inhale during the drive of the arms and dipping the face to exhale underwater during their recovery. The butterfly is the faster by a wide margin

The butterfly was revised by the Federation Internationale de Natation Amateur (Helsinki congress, 1952) to permit a synchronous up and down action of the legs characterized by the term

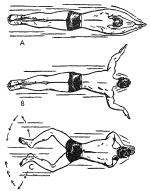

FIG. 1 — THE BREAST STROKE

A. Position at start and finish of stroke B. Drive of arms, swimmer inhaling. C Start of recovery of arms; legs ready for kick, swimmer exhaling under water. Arrows indicate continuation of leg drive.

"fishtail kick," which further increases the speed of this type of breaststroke

The Side Stroke.-The side stroke is valued chiefly for lifesaving purposes, as it is used in the most efficient carries devised for the rescue of the drowning But it is liked for openwater pleasure swimming also, because it is faster than the breast stroke and the face remains constantly above water. The body stays steadily on its side, as the name implies, and the arms propel alternately. The underarm starts from comfortable extension overhead and pulls below the body to the waist, then bends upward and pushes forward; the upper arm drives a little outside the body line, sweeping to the thigh, and recovers close to the surface. The legs open slowly for the scissor kick, the under moving backward, the upper forward, both knees bent a little, feet pointed; when at an angle of about 50° they whip smartly together, the closing movement timed with the finish of the upper arm drive. This stroke is also an excellent one for survival swimming or for emergency situations where it is imperative that the arms in all actions be kept underwater.

The Crawl Stroke—The crawl is the fastest of all known strokes, yet it requires little effort, as attested by the fact that many of the greatest feats of, endurance achieved by men and women stand to its credit, including the crossing of the English channel and the Panama canal. Its remarkable speed not only has made it supreme in the compelitive field, but extremely valuable in such emergencies as burrying to the aid of drowning people, getting away from a sinking ship and battling strong tides or currents in the effort to reach select or craw for the contract of the

There is evidence that the crawl was well known in some of the South Sea islands long before Richard Cavill of Australia introduced it about 1900 and broadcast its merits by breaking the world

recoid for roc yd with it. It is also a matter of knowledge that alloing before the introduction of the crawl stroke in Australia sportsmen in Honolulu frequently arranged swimming taces for young Hawaian swimmers at Walkiki beach in which the boused a stroke very similar to the one later demonstrated with such success by Duke Kahnamnokik.

It was soon revealed that Cavill had acquired the crawl from Alex Wickham, son of a Solomon Islands planter, then residing in Sydney, and this led the Australians to undertake inquiries. They ascertained that the stooke had been popular in the Solomons is far back as the oldest natives could remember. The strange name of crawl was comed as the result of a press account or the mittal showing of the stroke. The writer stated that Cavill appeared literally to "crawl" over the water. Somehow the word captured the pubble fancy, and the christening was the outcome

Cavill performed two kicks per full stroke, and his action was adopted universally in Australia, so the leg drive remained unchanged until the stroke made its way to the US

The earliest knowledge of the crawl obtained in the US was gleaned by hay newspaper accounts and descriptions of Cavill's strokes. In attempting to imitate the action, US swimmers unitingly developed a faster leg drive, executing four escasioning lacks per stroke instead of the two performed by Cavill. The new leg drive was combined with the double overarm action of the trudgen, and the resulting stroke was called the four-beat crawl, to distinguish if from the two best variety.

Meanwhile, experiments had led to the belief that the four-beat leg thrash was most effective when composed of one comparatively wide and three very narrow scissoring motions. This style, termed the four-beat trudger crawl or the four-beat single rhythm crawl became the accepted racing stroke. The combination of movements was responsible for so notable an improvement in average performances that technical experts conceived the possibility of obtaining still greater speed from a six-beat drive set to a double rhythm—two major and four minor kicks—which would minimize resistance and afford more even distribution of propelling power. But coaches were unanimous in declaring that the swift thrash would prove entirely too laborious for distances longer than 100 yd., and the subject was dropped temporarily.

Late in 1917, two young swimmers of the New York Women's Swimming association, Chailotte Boyle and Claire Galligan, determined to give the sax-beat crawl a trial and by the summer of 1918 they broke records with it over the longer regulation courses, 88 yd and one mile. So convincing was this demonstration that it caused a sudden change of mind among the coaches and competitors. The sax-beat crawli immediately won favour in the U.S, presently in other countries, and within a few years it had become the recognized stroke the world over, not only for racing but also

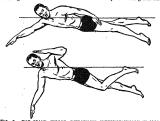

FIG. 2 -THE CRAWL STROKE, INTRODUCED INTERNATIONALLY IN 1908

for all around purposes. Another Women's Swimming association member, Ethel McGary, successfully developed in turn the eight- and ten-beat varieties of the crawl.

As the eight- and ten-beat strokes were found to require excep-

tonally lmbet legs and in time the su-beat crawl came to be accepted as the standard action. Nevertheless, a great many women and some men used the eight-beat successfully. It enabled Gertrude Edderle of the US to cross the English channel in 1; hr 34 min and break the men's record for the ourse, 16 hi 33 min. No men and very few women have made their mark with the ten-beat craw.

The extent of the progress made in the U S through the adoption and development of the crawl is best illustrated by the lowering of the U S records in regulation competitive events-the 100 vd., 220 yd., 440 yd in 25 yd pools, and 880 vd. and 1 mi over long courses (50 yd and upward) By 1953 the men's record in the 100 yd had dropped from 58 6 sec to 49 2 sec , in the 220 yd. from 2 min. 254 sec to 2 min 55 sec, in the 440 vd from 5 min 22.2 sec to 4 min 28 I sec, in the 880 yd from II min. 24 2 sec to 9 min 37 5 sec, and in the mile from 25 min. 24.4 sec. to 10 min. 40 4 sec The answer to what will be the ultimate in speed swimming, a question asked often because of the frequency of record breaking seems to be that the development of speed swimming is still in its infancy as witnessed by the rapid advances made in skill since the introduction of the crawl stroke fifty years ago The surface of development has only been scratched With increased facility in water propulsion by humans due to widespread and ever expanding instruction and facilities, it is difficult even to guess what the future holds for a skill of such recent development.

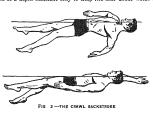

The correct position for swimming the crawl is like that assumed in standing erect on tiptoe. The arms move alternately, so timed that one will start pulling just before the other has completed its drive, thereby making the propulsion continuous Each arm catches in front of the body in line with the shoulder on the same side, almost fully extended with elbow and shoulder slightly flexed Such slight flexion affords greater strength and arm position than does full extension. The elbow on catch should be slightly higher than the hand, forearm turned slightly inward, wrist straight, hand palm down, fingers and thumb close but not cupped. The power of the arm stroke can be thought of as pressing downward and backward during the first third of the stroke, pulling the middle third and pushing through and backward but not upward during the final third of the action, completing an arc of roughly 180°. The direction of pull should be on a line from the shoulder moving slightly under the body and out past the thigh on recovery. On recovery the elbow is bent, the elbow quickly flexes and the forearm circles quickly out and around until it points toward the place of entry. Then the elbow is extended for the catch of the arm on a line with the shoulder The legs are held fairly straight but fully relaxed The legs whip up and down alternately in an undulating action so that in both the up kick and down kick there will be a backward push against the water with the lower leg and more so with the foot. The scope of the thrash must vary somewhat according to the individual length of leg, the number of beats used per stroke and the distance to be covered.

Breathing is effected by turning the head to either side during the recovery of the upper arm, for the purpose of a gasing inhalation, and then dropping the head squarely face downward, exhaling through the nose or nose and mouth. One breath is taken for every full stroke (right and left arm). The skilled swimmer learns to breathe on either side, but the regular breathing puttern is established on one side or the other.

Crawl balance is attained by working the arms independently of the shoulders so that the hody lies perfectly flat even during the action of inhalation, when the head turns without distorting the tunk position. The shoulders are level at all times; the water line of the head as the eyebrows when the face is down, and any distortion of the trunk in the shoulder or pelvic girdle should be avorded.

The Backstroke.—The style of the backstroke in vogue prior to 1912 was aptly described as an inverted breaststroke. But that year Harry Hebert, the U.S. champion, annaed spectators in the Olympic race at Stockholm with his supine crawl, never before seen in Europe, winning in record time. That exhibition son drove the old stroke (double overam on the back with a from the old stroke (double overam on the back with a from the control of th

lack) into discard, for the back crawl is a good deal faster, requires less effort and is case it to learn. In the back crawl the swimmer's position is such that the body is in a horizontal plane, head lifted slightly upward looking at the feet, with hips slightly lower than the shoulders. The arms work alternately and are intertuned as in the pione crawl or free style. Each arm stretches above the head and enties the nater six nucles to a foot outside the shoulder line, pulling and driving to the thigh with a circular outward morn at a debth sufficient only to keep the arm under water in a

plane parallel to the surface of the water. The arms in ecovery, are carried straight or with a partially flexed elbow to the cetth, either in line with the shoulder or in a semicircular motion sideward and upward. The shoulders and trunk are kept flat without any rolling The legs execute an alternate thrash as in the prone crawly. The knoses bend more but are kept under water at all times in makes for a much deeper leg kack (leg and foot) than in the prone crawl. In the back crawl, with the face out of water all of the time, the breathing presents no difficulties as it does in the breast stroke and prone crawl.

The back crawl appeared on the scene last of all of the competitive styles and has undoubtledly made the greatest strides in record breaking. For roo m the 1912 time was 1 min 18,4 sec, and has dropped to 1 min 3,5 sec; for 150 yd from 1 min 5,8 sec to 2 min 29 sec.; and for 200 m from 2 min 48,4 sec to 2 min 18,4 sec 10 2 min 18,4 se

Competitive Swimming .- Swimming joined the ranks of standardized competitive athletics in 1869, when the Amateur Swimming association was founded in England Other countries followed the lead at intervals, the U S. launching the Amateur Athletic union in 1878, and before many more years nearly all progressive nations had formed governing bodies and taken measures to promote the sport. Eventually, national championships for men and women, as well as intervarsity and interscholastic title tests, were instituted everywhere. International competition was inaugurated with the holding of the revived Olympic games at Athens in 1896. Swimming events were placed on the program and Great Britain earned high honours. Activities grew apace thereafter and frequent intercountry encounters were added to the quadrennial Olympiads, making increasingly evident the desirability of unifying rules and regulations. To this end, the Federation Internationale de Natation Amateur, composed of controlling national organizations, was formed in London in 1908. It undertook to draft a code, supervise and register world's records, and outline programs for Olympic games. As membership was made conditional to the observance of all F.I.N.A. rules, universal standards were established in time, for nearly 50 nations became affiliated. The federation chose swimming, diving and water polo as the branches of the sport over which it would assume authority. The three classes of swimming events already popular were retained free style, permitting the use of any kind of stroke; backstroke, regulated by the one provision that the entire course must be covered in supine position; and breast stroke, confined to this mode of swimming and governed by strict rules concerning the execution of the action. Free-style races have always furnished the bulk of the competition. The Olympus schedule for men consists of three induvdual free-style letsys and one free-style lety, against one backstroke and one breast-stroke event. In national championships, free-style predominance is even greate. Although long distance races are an integral part of summen activities, most of the competition takes place in pools. Enclosed and heated pools are being built in ever-increasing numbers speeding the growth of aquatic contests during the winter months

Great Britain maintained for some time the world leadership gained at Athens in 1896, but the Olympiad at Stockholm in 1912, marked by the initial appearance of women contenders saw Germany forge to the fore decisively World War I caused the 1916 games to be cancelled By 1920, at Antwerp, the US was ready to put to profit the earnest study given the crawl by the home technicians Its men and women, the latter competing for the first time in the Hellenic tests, swept to conclusive victories They again triumphed in both fields at Paris in 1924 and Amsterdam in 1928 But the meet at Los Angeles in 1932 brought a startling unset While the U.S. women successfully defended then laurels, the men went down to crushing defeat at the hands of the vastly improved Japanese, winners of all but one of the contested swims The competition was close in Berlin in 1936, with the US coming up a bit in the men's swimming, which resulted in three victones for Japan, two for the US and one for Hungary In the women's competitions, the US team suffered as outstanding a reversal as the men had in Los Angeles The powerful team from the Netherlands won four of the five races-the 100 and 400 m. free style, the backstroke and the relay losing only the breaststroke event to Japan This was the first time that Japan had taken a first place in the Olympic games in women's swimming Also, for the first time since World War I, the U.S. women's team was unable to win a first place. The Olympic games were abandoned during World War II

Great Butain conducted the London Olympic games in 1948, and the US mes' team won first place in all six events. This was the first time since the Olympic games revival in 1896 that any nation had achieved such a sweep. In women's swimming, the team from Denmark which had been sharing top-flight bonous with the Dutch team in international swimming circles after 1936, won two first places—the Ico m. free style and the buckstoke. The team from the Netherlands won the breast-stroke event; and the US team with the great Ann Curlis won the

400 m. free-style race and the relay

At the Helsinki Olympic games, 1952, the international swimming competition reached an all-time high. Seventy-one nations at that time held membership in the FINA Fifty-one were represented at Helsinki by 649 competitors, compared with 36 nations with 341 competitors at London in 1948. In men's swim-ming the U.S maintained its leading position, winning four races -the 100 and 1,500 m free style, the backstroke and the relay. France, after great advances during several Olympiads, won a magnificent victory in the 400 m free style, and Australia, the cradle of the modern racing stroke and long a leader in swimming, won the breast stroke At Helsinki, women's swimming supremacy saw another great shift, from northern Europe, the Netherlands and Denmark to central Europe. The women's team representing Hungary won four of the five races in a most outstanding and convincing manner-the 100 and 400 m free style, the breast stroke and the relay. The backstroke race was won by South Africa, the first time this team had ever won an Olympic swimming competition.

With increased facilities the world over and means of communication and transportation making possible more and more international meetings in addition to the Olympic game gatherings, it is easy to understand that excellence in performance follows no one pattern or nation, which a checking of the record books will clearly indicate.

The summary of first places in swimming in the Olympic games undicates the broad spread and scope of the sport since the first of the modern games in 1896. In men's swimming the order through 1952 was as follows: U.S. 33, Germany 8, Japan 8; Great Brialin 7; Hungary 6, Australia 5, Sweden 3; Canada 2; Argentina

1; Austria 1, France 1 In women's swimming first place results were US 16, the Netherlands 6, Hungary 4, Australia 2, Den-

mark 2, Great Bittain 2, Germany 1, Japan 1, South Africa 1 In Olympic water polo competitions, victories were as follows Great Britain 3, Hungary 3, France 1, Germany 1, Italy 1, and US 1. In the early days of Olympic competition, Great Britain, which developed and fostered so many games, was outstanding in the spott. After World War 1, Hungary had the outstanding teams

In diving, springboard and platform, the US monopolized the first places beginning in 1920. Before that time the Swedish and German divers divided the honouis, but with the introduction of aerobatics and increasing difficulty into the diving program, the US divers took and manitamed the top position in both men's and women's diving. In springboard diving (3 m.) championships, the US thingth 1952 led with 8. In plain and fancy diving from the platform, now combined with plann and fancy diving from the platform, now combined with plann and fancy diving from the platform, the score was Sweden 3, Australia T. The total of all Olymper diving contests for men was US 15, Sweden 4, Germany 3, and Australia T. The first place score in women's diving was US 15, Demmark 1, and Sweden 1.

The last of swimmers officially credited with breaking international records is a long one, but not many earned lasting fame Athletic skill and training methods in all sports improved so much in the first half of the 20th century that it is difficult to keep up with the pogress constantly being made. This is especially true in the sport of swimming, as the modern speed stroke, the crawl, is of iectent ouigin. As a result improvement in records is inevi-

table and great advances are yet to be made.

Channel Swimming—Much interest has centered in the many attempts to swim across the English channel, the first seconded attempt was made on Aug 24, 1872, by J. B Johnson, who started from Dover, but remained in the water only 65 min On Aug 12, 1875, Capit Matthew Webb made his first attempt. He started from Dover and remained in the water 6 hr 49 min, until the weather became too rough for him to continue It is estimated that he was about 13½ mi across when he had to give up

On Aug. 24 and 25, 1875, Webb swam across the English channel, diving from the Admiralty pier, Dover, and touching Calais sands, after swimming for 21 hi 45 min, at the time this accomplishment created a great sensation in England

Open Water Swimming.—The enjoyment and pleasure that is derived from bathing and swimming in salt or lake waters make it among the most popular of all sports and recreational activity the world over, but proper caution in water activities should be taken.

Swimming in unsupervised areas should be avoided. One should never swim outward from shore for any great distance without an accompanying hoat. If caught in sen grass or weeds, do not struggle against it but rather gently shake the arms and legs until the grass floats free. Riptides, undertow and tides must be noted in offshore swimming, and knowledge of safety skills in such circumstances can save lives. Riptides are truer-like masses of water caused by the contour of the bottom. They are bound on both sides by eddies that swing back toward shore. A swimmer should never attempt to fight a riptide but rather swim diagonally with it and to its edge, then swing into the eddy and be carried in toward shore.

Undertow or backwash is simply the receding portion of the water that has been carried in by the breakers Because of its movement outward from the shore, it is very disconcerting Fortunately the water travels in two directions at two levels. The upper level travels inward and the swimmer should push off the bottom and energo at the surface and go with the breakers toward shore

Tides may cause currents running diagonally toward the beach, and the best procedure is to swim across or with it until shallow water is reached.

Due to the increased activities such as sailing, boating, underwater spear fishing, water skiing and surfboarding, more people are taking to the open water as a form of recreation. A large percentage of drownings could be eliminated if caution were exercised and a thorough understanding of the individual's abilities realized before engaging in these sports Common sense should be applied in order to enjoy these activities

Floating .- One of the most useful accomplishments of a swim-

Doction

ILLUSTRATIONS FROM OFFICIAL A M M SUIN HING HANDROOK BY COURTESY OF AMA YEUR ATHLETIC UNION OF UNITED STATES

where detonations may occur, the percussion danger is minimized. facilitating survival with fewer internal injuries

The movement of the legs in an alternating walking motion and the downward pressure of the hands and torearms is the only motion required to keep the body comfortably affoat in the back floating position.

Diving .- The method of entering the water with either head foremost or feet foremost is known as diving Shortly after man learned to swim, the dive became closely related to swimming, perhaps only as a quick way of getting into the water as a refuge from wild animals or fire Diving for pleasure and exercise. as it is done today, can most easily be performed by standing on the edge of a pool or dock, holding the arms overhead, bending forward at the hips, until the balance is lost The entry into the water will be smooth and without ill effect

Diving, plain and fancy, which is today a part of all aquatic contests, developed rapidly through the first half of the 20th century. Many gymnastic and tumbling stunts can be performed before the entry is made into the water and the thrill of this combination HINTER ANDBOOK OF COURTER OF MANTEUR ATMLETIC UNION OF UNITED STATES has been a challenge to young Fig. 5.-BACKWARD HEADER DIVE people to achieve perfection in

this stimulating sport. Diving became a part of the swimming program of the Olympic gumes as early as 1904. The program at that time was plain high at the edge of a platform and rotates backward } a turn to 21/2

mer is that of floating It is a matter of buoyancy which has a varying degree in individuals Buoyancy cannot be taught, but body balance in the water can be accoured through knowledge In learning to float, the heginner experiences difficulty in keeping the legs in the horizontal plane, and this can be remedied by the counterbalance of extending the arms beyond the head, whether in face down or back floating

Floating motionless is an ait which floaters can perform with proper breath control and body balance Bending the knees to shorten the axis will very often permit better balance in the water Supine or back floating with a minimum of motion of the arms and legs has become one of the most valuable of personal safety skills for the swimmer, as well as for the novice. Wartime research by naval authorities con-Fig. 4 -- FORWARD HEADER DIVE cluded that this type of floating

NING conserves energy, and in areas nent in the diver's repertoire, and a forward 14 somersault is often

> German athletes, the US divers dominated international competition Perhaps this supremacy can be credited to two great coaches

on the American scene, Ernst Brandsten, an outstanding Swedish diver in the 1912 games, and Fred Cady, a sports-minded art-

Brandsten's contribution was his thoroughness in teaching fundamentals and his success in standardizing equipment. Fred Cady, through his artistic sensitiveness to grace and poise, was a great influence This combination of ideas and tuitions produced U.S diving champions in all of the Olympic games beginning in 1920.

The competitive dives are divided into five groups which encompass springboard dives and fixed platform dives, with the addition of armstand dives which are done from fixed platforms The first includes the forward dives (fig 4) in which case the person will dive out away from the platform and rotate 1 a turn to 3½ turns before entering the

FIG 6 -- HALF GAINER DIVE (RUN-

diving and variety high diving, with contestants performing from both the 5 m and 10 m firm platforms The contest was composed of compulsory dives and voluntary dives Springboard diving, plain and variety, was performed from a board of elastic character at heights of 1 m and 3 m above the water. It was necessary to have judges to mark the dives performed, with at-

tention paid to the take off, the bearing of body in the air and the entrance into the water

The Olympic committee composed a table which listed the type of dives allowed, their description and a value for each dive based on the difficulty of performance. These early tables comprised a mere 14 dives from the high firm platform and 20 from the springboard, as compared with the 42 and 50 of to-

To inducate the advances made in diving, it can best be described by comparing the dives of yesteryear with today's complex stunts The report following the 4th Olympiad suggested elimination of the double somersault because it was believed that the divers could not control the execution of such numerous spins without chance of murv Today, divers Chance of injury Today, divers time authorized to courtey of Martens from most sections of the world Atherications of united to the confidently compared the confidently confidently compared the confidently compared the confidently compared the confidently confidently confidently compared the confidently compared the confidently are confidently somersaulting

somersaults. The third group (fig. 6), the forward motion and reverse spin dows is commonly called the gainer group. In this form of diving the diver can rotate in reverse from  $\frac{1}{2}$  a turn to  $\frac{1}{2}$  turns. The fourth group is that of cutaway dives (fig. 7). In this category, the diver studies on the outer edge of the platform and jumps backward with a forward rotation from  $\frac{1}{2}$  a turn to  $\frac{1}{2}$  somersaults. The fifth and last classification is that of twarting (fig. 8). In this movement the diver rotates the body on the long axis, from  $\frac{1}{2}$  a twist to  $\frac{1}{2}$  twists, while evolving on the short x axis from  $\frac{1}{2}$  turns to  $\frac{1}{2}$  somersaults. With the possibilities of combining all groups with twisting, it, can easily be seen why the last grouping offers more dives than any other from which the diver

can choose his optional dives The majority of dives which are included in the present roster may be executed in three distinct positions, namely, straight, pike or tuck. In the first position (straight), the body must be held extended, and no flexion at the hips or knees shall be allowed. In the second position (pike), there may be a bend at the hips, with no knee flexion. In the third position (tuck), both the knees and hips are flexed and the position of the body resembles a ball. In all positions the feet must be pointed.

The surfaces of diving boards, whether firm or flexible, must be covered with cocoa matting or some other nonskid material the full length of the run. Spring-boards may be made of wood, aluminum, steel or other resilient material. Standard equipment for springboards is the adjustable fulerum. Such a fulcrum enables the diver to adjust the flexibility of the control of the control of the control of the control of the control of the control of the country of the control of the control of the control of the control of the control of the control of the country of the control of the contro

the diver to adjust the flexhility but (Rubning) of the board to his liking.

Surface diving is the act of descending below the surface of the water while swimning. It is most easily executed by forcing the head and upper body downward by a quick bend at the hips, followed by aligning the less with the descending torso. It is a most

useful technique in lifesaving work.

With very httle effort the swimmer may descend to 10 ft. The
return to the surface can be made by lifting the head backward,
eyes upward and the swimming with the breaststroke movement
of the arms and legs.

Bulloomarux—The literature on the subject of swimming is considerable; the most useful work of general reference is Ralph Thomas' (1704), which contains a bibliography from the earliest time. Other chief works on this technique of swimming that may be mentioned are: chief works on this technique of swimming that may be mentioned are: made of the swimming that the swimming the swimming that the swimming the swimming that the swimming the swimming that the swimming that the swimming that the swimming the swimming that the swimming the swimming that the swimming that the swimming the swimming that the swimming the swimming the swimming that the swimming the swimming that the swimming the swimming that the swimming the swimming the swimming that the swimming the swimming the swimming the swimming the swimming the s

SWINBURNE, ALGERNON CHARLES (1837-1909), English poet and critic, was born in London on April 5, 1837. He was the son of Admiral Charles Henry Swinburne (of an old Northumbrian family) and of Lady Jane Henrietta, a daughter

DIVE (RUNNING)

of George, 3rd earl of Ashburnham It may almost be said to have been by accident that Swinburne owned London for his birthplace, since he was removed from it immediately, and always felt a cordial dislike for the surroundings and influences of life in the heart of a great city His own childhood was spent in a very different environment. His grandfather, Sir John Edward Swinburne, bart , owned an estate in Northumberland, and his father. the admiral, bought a beautiful spot between Ventnor and Niton in the Isle of Wight, called East Dene, together with a strip of undercliff known as the Landslip. The two homes were in a sense amalgamated Sir Edward used to spend half the year in the Isle of Wight, and the admiral's family shared his northern home for the other half, so that the poet's earliest recollections took the form of strangely contrasted emotions, inspired on the one hand by the bleak north, and on the other by the luxuriant and tepid south. Of the two, the influences of the island are, perhaps naturally, the stronger in his poetry, and many of his most beautiful pieces were actually written at the Orchard, an exquisite spot by Niton bay, which belonged to relatives of the poet, and at which he was a constant visitor.

After some years of private tuition, Swinburne was sent to Eton, where he remained for five years, proceeding to Balhol college, Oxford, in 1857. He was three years at the university, but eit without staking a degree. Clearly he must have cultivated while there his passionate and altogether unacademic love for the interature of Greece; but his undergraduate career was unattended by university successes, beyond the Taylorian prize for French and Italian, which he gamed in 1858. He contributed to the "Underground Papers," published during his first year, under the editorship of John Nichol, and he wrote a good deal of poetry from time to time, but his name was probably regarded without much favour by the college authorities. He took a second class in classical moderations in 1858, but his name does not occur in any of the "final" honour schools. Jowet was his firm friend after he left Oxford, and Swinburne visited him repeatedly at the seaside and in the country.

He left Oxford in 1860, and in the same year published the two dramas, The Queen Mother and Rosamond, a wonderful performance for so young a poet, fuller of dramatic energy than most of his later plays, and rich in harmonies of blank verse

After spending some time with the Bell Scotts at Newcastle, Swinburne came to London, and began the intimate friendship with D G. Rossetti which was to last for the next ten years. In 1861 he was introduced to Monckton Milnes (Lord Houghton, q.v.), who took an interest in his work and invited him to Fryston. There Swinburne created an unforgettable impression in the brilliant circle which gathered there, by his wide and varied acquaintance with ancient and modern literature and his astonishing memory In 1862 he met Meredith, and a review of one of Victor Hugo's books resulted in correspondence. In the autumn of that year he lived with Meredith and the Rossettis at 16 Cheyne Walk Swinburne showed symptoms of something approaching epilepsy, and it was thought better that he should be with friends. In 1864 he made a tour in France and Italy. At Florence he met Mrs. Gaskell and Walter Landor. For Landor he had a great admiration, but their meetings were few and short. On his return to London he took lodgings in Dorset street, where he made his home for many years.

In 1865, appeared the lyrical tragedy of Atalants in Calydon, followed by Chacsteard, and the famous Poems and Ballads in 1866. The Poems and Ballads were vehemently attacked, but Dolores and Resultsine were on everyone's lips: as a poet of the time has said, "We all went about chanting to one another these new, astonishing melodies" By the close of his 30th year, in spite of hostility and detraction, Swinburne had placed himself in the highest rank of contemporary poets, and had even established himself as leader of a choir of singers to whom he was at once master and prophet.

Meanwhile, his life was disturbed by domestic sorrow. A favourite sister died at East Dene, and was buried in the church-yard of Bonchurch. Her loss overwhelmed Admiral Swinburne with grief, and he could no longer tolerate the house that was so

full of tender memories. So the family moved to Holmwood, in house, The Pines, Putney, where the last 30 years of his life were the Thames Valley, near Reading Swinburne entered on a course of gasety in London which seriously aftected his health and alarmed his friends At the same time he saw much of the Pie-Ranhaelite movement, and for the next few years he was involved in a rush of fresh emotions and rapidly changing loyalties

Works .- It is indeed necessary to any appreciation of Swinburne's genius that one should understand that his inspiration was almost invariably derivative. His first book is deliberately Shakespearian in design and expression, the Atalanta, of course, is equally deliberate in its pursuit of the Hellenic spirit. Then, with a wider swing of the pendulum, he recedes, in Poems and Ballads, to the example of Baudelaire and of the Pre-Raphaelites themselves, with the Song of Italy (1867) he is drawing towards the revolt of Mazzini (whom he had met at the house of George Howard, afterwards earl of Carlisle); by the time Songs before Sunrise are completed (in 1871) he is altogether under the influence of Victor Hugo, while Rome has become to him "first name of the world's names" But, if Swinburne's inspiration was derivative, his manner was in no sense imitative; he brought to poetry a spirit entirely his own, and a method even more individual than his spirit. It is well to distinguish clearly between the influences which touched him and the original, personal fashion in which he assumed those influences, and made them his own The spirit of Swinburne's muse was always a spirit of revolution In Poems and Ballads the revolt is against moral conventions and restraints, in Songs before Sunrise the arena of the contest is no longer only the sensual sphere, but the political and the ecclesiastical The detestation of kings and priests, which marked so much of the work of his maturity, is now in full swing, and Swinburne's language is sometimes tinged with extravagance and an almost virulent animosity

With Bothwell (1874) he returned to drama and the story of Mary Stuart The play has fine scenes and is burning with poetry, but its length transcends all possibilities of harmonious unity, Erechtheus (1876) was a return to the Greek inspiration of Atalanta; and then in the second series of Poems and Ballads (1878) the French influence is seen to be at work, and Victor Hugo begins to hold alone the place possessed, at different times. by Baudelaire and Mazzini. At this time Swinburne's energy was at fever height; in 1879 he published his eloquent Study of Shakespeare and Poems and Ballads (second series) and in 1880 no fewer than three volumes, The Modern Heptalogia, a brilliant anonymous essay in parody, Songs of the Springtides, and Studies in Song It was shortly after this date that Swinburne's friendship for Theodore Watts-Dunton (then Theodore Watts) grew into one of brotherly intimacy After 1880 Swinburne's life remained without disturbing event, devoted entirely to the pursuit of literature in peace and leisure.

The conclusion of the Elizabethan trilogy, Mary Stuart, was published in 1881, and in the following year Tristram of Lyonesse, a wonderfully individual contribution to the modern treatment of the Arthurian legend, in which the heroic couplet is made to assume opulent, romantic cadences of which it had hitherto seemed incapable. Among the publications of the next few years must be mentioned A Century of Roundells, 1883; A Midsummer Holiday, 1884; and Miscellanies, 1886. The current of his poetry, indeed, continued unchecked; and though it would be vain to pretend that he added greatly either to the range of his subjects or to the fecundity of his versification, it is at least true that his melody was unbroken, and his resplendent torrent of words inexhaustible. His Marino Faliero (1885) and Locrine (1887) have passages of power and intensity unsurpassed in any of his earlier work, and the rich metrical effects of Astrophel (1894) and The Tale of Balin (1896) are inferior in music and range to none but his own masterpieces. In 1899 appeared his Rosamund, Queen of the Lombards; in 1903 his Duke of Gandia; and in 1904 was begun the publication of a collected edition of his poems and dramas in 11 volumes.

Later Years .- Meanwhile, in the autumn of 1879 the state of his health seriously alarmed his friends, and, with the consent of housing and local government to accept overspill population and Lady Jane Swinburne, Watts-Dunton took him to live at his industry from the Greater London area. Planning approval was

spent in complete retirement. He very rarely made the short journey into London, although his health was gradually restored The friends visited Paris in 1882 In 1888 a flash of his old excitability involved him in a quarrel with Whistler.

Besides this wealth of poetry, Swinburne was active as a critic, and several volumes of fine impassioned prose testify to the variety and fluctuation of his literary allegiances His Note on Charlotte Bronte (1877) must be read by every student of its subject, the Study of Shakespeare (1880)-followed in 1909 by The Age of Shakespeare-is full of vigorous and arresting thought, and many of his stattered essays are rich in suggestion and appreciation His studies of Elizabethan literature are, indeed, full of "the noble tribute of praise," and no contemporary critic did so much to revive an interest in that wonderful period of dramatic recrudescence, the side-issues of which have been generally somewhat obscured by the pervading and dominating genius of Shakespeare His prose work also includes an early novel in the form of letters. Love's Cross-currents, which had appeared serially in the Tatler and was revised for publication in 1005

Place in Literature.-The service which Swinburne rendered

to the English language as a vehicle for lyrical effect is simply incalculable. He revolutionized the entire scheme of English prosody Nor was his singular vogue due only to this extraordinary metrical ingenuity The effect of his artistic personality was in itself intoxicating, even delirious. He was the poet of youth insurgent against all the restraints of conventionality and custom The young lover of poetry, when first he encounters Swinburne's influence, is almost bound to be swept away by it; the wild, extravagant license, the apparent sincerity, the vigour and the verve, cry directly to the apparent sincerity, the vigour and the verve, ness. But, while this is mevitable, it is also true that the critical lover of poetry outgrows an unquestioning allegiance to the Swinburnian mood more quickly than any other of the diverse emotions aroused by the study of the great poets. It is impossible to acquit his poetry entirely of the charge of an animalism which wars against the higher issues of the spirit—an animalism sometimes of love, sometimes of hatred, but, in both extremes, out of centre and harmony.

Yet, when everything has been said that can be said against the unaesthetic violences of the poet's excesses, his service to contemporary poetry outweighed all disadvantages No one did more to free English literature from the shackles of formalism; no one, among his contemporaries, pursued the poetic calling with so sincere and resplendent an allegiance to the claims of absolute and unadulterated poetry Some English poets have turned preachers; others have been seduced by the attractions of philosophy; but Swinburne always remained an artist absorbed in a lyrical ecstasy. a singer and not a seer. His personality was among the most potent of his time, and his artistic influence was both inspiring and beneficent He died at Putney on April 10, 1909

and heneficent He died at Putney on April 1c, 1909

SWINDON, a municipal borough and parliamentary division of north Wiltshire, England, 78 mi, W. of London by road. Pop. (1951) 68,932. Area 9.9 sq.mi. Until 1841 it was a small market town (now Old Swindon) with a population of less than 2,000, but after the Great Western railway had built its main engineering works to the north the population rapidly increased to 45,000, and in 1900 it received its charter. More than 21,000 people are employed in the railway works and other industries include engineering, clothing and tobacco. Under the Town Development act. 1952, provisional approval was obtained from the ministry of

given to expand the population to 92,000 within the existing borough boundaries and a 75-ac trading estate has been developed close to the Swindon-Gloucester railway In 1947 the first mu-nicipally owned arts centre in the country was opened, combining a small concert hall, a stage and an art gallery

SWINE, a name applied to the domestic pig, but also used to

include its wild relatives. The animals constitute the family Suidae (see Artionactyla). The swine are found only in the old world. They are characterized by elongated head and mobile snout, with an expanded, truncate, terminal surface in which the nostrils open, narrow feet with four toes, the outer pair not reaching the ground when walking canines in both jaws curve upward, forming large tusks, best developed in boars The hair is coarse and bristly, while the THE DENTITION OF THE skin is thick, underlaid by thick fat The BOAR 12 INCISORS, 4 tail is moderately long, generally tufted. The typical genus Sus is exemplified by

CANINES 16 PREMOLARS AND 12 MOLARS TOTAL 44

the domesticated pigs (see Pig) and the wild boar (See Boar ) Allied to these are the pygmy hog of Nepal (Porcula salvama), a little larger than a hare, and the African river hogs (q v) (Potamochoerus)

Linking these genera with the wart-hogs is the African Hylochoerus, a forest-dwelling form with a thick coat of coarse black

han. The remaining forms are the wart-hogs (q v.) (Phacochoerus, and the babirusa (q v) Extinct swine, some of gigantic size, are know from strata as far back as the Phocene of Europe and Asia, many of these belonged to the genus Sus SWINE FEVER (hog chol-

era) is a devastating acute general

infection of swine, caused by a filterable virus, in which high fever and prostration are outstanding symptoms. The disease has a wide distribution throughout Europe, North America and Africa It is not uncommon in the British Isles Canada controls the disease by slaughter of all hogs on infected premises, the cleansing and disinfection of premises, and the serum treatment of all hogs in the vicinity of an outbreak. In the United States the average annual loss from hog cholera from 1885 to 1952, including vaccination costs after 1914, was esti-

mated to be \$20,000,000-\$30,000,000. By mid-20th century it was still the cause of 90% of the deaths in swine, although an estimated 40% to 45% of all hogs raised were vaccinated

Natural infection results from immediate or mediate contagion The disease may be acquired by healthy herds by the introduction of infected pigs. Exposure of swine in markets in infected areas is a fertile source of infection, so are vehicles and trucks in which pigs are conveyed from place to place, dealers, castrators who journey from farm to farm, and attendants may serve as agencies whereby contagion is conveyed.

Outbreaks are likely to recur in premises where the disease has existed previously, as the virus appears to retain its vitality for fairly long periods outside the animal body. Within a space of time which rarely extends to three weeks after exposure to infection, and may not be more than four days, the disease is ushered in by fever, the subsequent symptoms varying somewhat with the form the disease assumes. The animal has no appetite, is depressed, ill and separates itself from its companions; the conjunctivae are reddened and congested and may secrete a mucopurulent discharge; vomiting is common, and constipation and diarrhoea are both met with; sometimes the faeces become dysenteric and the odour is peculiar and disagreeable.

In many cases a skin rash develops, the parts principally involved being the region of the ears, the axilla, groin and the skin covering the abdominal area. The mucous membrane lining the mouth, fauces and pharvnx may become inflamed: later ulcers form and become covered with a diphtheritic exudation. As a re-

sult the animal is unable to feed and respiration is difficult. The lungs may be the seat of pneumonic changes and the animal has then a short, dry and paroxysmal cough, a nasal discharge, difficulty in respiration, and the other symptoms characteristic of acute lung infection Gastritis and enteritis are common. The animal lies about and if compelled to move does so reluctantly and sometimes with a staggering gait and an arched back, later it is unable to use and becomes comatose

As in other acute septicaemic diseases, a hyperacute form may develop and death supervenes within a few days, or a less acute form may set in where one or more groups of organs become involved A chronic type is also encountered, life drags on over a considerable period and the animal becomes more debilitated and emaciated and remains a possible source of infection to other pigs Recovery occurs in some cases, the virulence and the mortality varying widely in different outbreaks

The great toll that hog cholera exacted in the United States stimulated efforts to develop vaccines The first active vaccination method used, dating from 1907, was the simultaneous method, using active virus simultaneously with hyperimmune serum By the 1950s, about 90% of all hog vaccinations in the United States were by the simultaneous method. The remaining were vaccinated with nonvirulent types, such as blood-origin vaccine attenuated by crystal violet, tissue-origin vaccine attenuated with crystal violet, virus modified by passage through rabbits and tissue culture modified virus The later types of vaccines offered hope that virulent virus might be discontinued as a commercial product, with the additional hope that eradication of hog cholera might eventually (A R S . SWINGING, a radio term denoting variation in intensity of a received radio signal resulting from changes in the frequency of the transmitted waves

SWINOUJSCIE (Ger. SWINEMUNDE), a fishing port and seaside resort in the province of Szczechin, Poland, at the east end of the island of Usedom, and on the Swine river which connects the Stettiner Haff with the Baltic Swinemunde, which was founded in 1748, was fortified and raised to the dignity of a town by Frederick the Great in 1765 It was an important German naval base during World War II About 70% of the city was destroyed during the war Its population declined from 30,056 in 1939 to 5,771 in 1946 It was transferred to Poland in 1945

SWINTON, 181 VISCOUNT, see CUNLIFFE-LISTER, PHILIP SWINTON, SIR ERNEST DUNLOP (1868-1951), British soldier, was born Oct 21, 1868, and commissioned in the royal engineers in 1888. In the South African War he was first adjutant and later commander of the 1st railway pioneer regiment. In 1904 he produced The Defence of Duffer's Drift, a tactical study which became an unofficial textbook in the British and Indian army and an official one in the US army In 1900, when an instructor at Woolwich, he wrote, under the pseudonym of Ole-Luk-Oie. The Green Curve, a book of short stories of great literary power and mulitary imagination Appointed secretary of the historical section. Committee of Imperial Defence, in 1910, he compiled the history of the Russo-Japanese War In 1914 he went to France as the official military correspondent ("Eyewitness"). His proposals in Oct 1914 became the first link in the evolution of the tank (see TANKS). In 1915 he became assistant secretary to the war committee of the cabinet Created K B E. in 1923, he was Chichele professor of military history at Oxford from 1925 to 1939 From 1034 to 1038 he was colonel commandant of the tank corps. Major General Swinton died at Oxford, Jan. 15, 1951.

SWINTON, an urban district in the West Riding of Yorkshire.

England, 104 mi N E. of Sheffield by road, at the junction of the Don navigation with the Dearne and Dove navigation Pop. (1951) 11,922. Area 2 7 sq mi. Formerly renowned for its Rockingham ware, it has coal mines, iron foundries, steel and glass

SWINTON AND PENDLEBURY, a municipal borough of Lancashire, England, 5 mi. NW of Manchester, contiguous with Salford. Pop. (1951) 41,294. Area 5.2 sq mi A great part of the Clifton rural area was added in 1933 Cotton spinning and weaving, coal mining, the manufacture of electric batteries, and

1038 Anciently parts of Swinton were held by the Knights of the Order of the Hospital of St John of Jerusalem Swinton and Pendlebury, incorporated in 1934, forms with Eccles the Eccles parliamentary division of Lancashire, leturning one member

SWISS LITERATURE. From the point of view of lanmage and literature the various nationalities of the Swiss confederation project into those of the neighbouring countries-Germany (Austria), France and Italy This unusual aspect becomes narticularly significant in relation to literary production before the existence or outside the boundaries of the Ewiger Bund (the Everlasting league) of 1201 Literatures produced exclusively in Switzerland are those written in the Raeto-Romance language or in one of the numerous varieties of local Swiss dialects Latin literature, of course, chronologically precedes all the others. In the following survey all these literatures are considered both on their own account and as parts of a Swiss literature in an over-all

Latin Swiss Literature.-The oldest document relating to what is now Switzerland was not produced within its territory, for the first notable description of Helvetia and the Helvetians is to be found in the first book of Caesar's Commentain, commonly referred to as Bellum Helvetscum After the humanists rediscovered this text, it gradually rose in the historical consciousness of the Swiss to the rank and dignity of a Great Charter Among the Latin chronicles of the middle ages the Casus Sancts Galls, written by Ekkehart IV in the 11th century, gives an impressive description of the highly developed culture of the abbey of St Gall, founded by Irish Benedictines Another chronicle, the Johannis Vitodurani Chronicon, contains the world picture as seen by a Franciscan of Winterthur in the first part of the 14th century The Swiss humanists who expressed themselves in Latin devoted most of their prose and verse to a description of their own country, eg, Albrecht von Bonstetten, dean of the abbey of Einsiedeln, in his Superioris Germanie Confoederationis descriptio (1479) and Heinrich Loriti Glareanus in his Helvetiae descriptio (1514). An important position in the history of general linguistics is taken up by the Zurich polyhistorian Konrad Gesner, who in his Mithridates (1555) undertook a survey of all languages known to him For three centuries to come the two volumes entitled De Republica Helvettorum (1576) by the Zurich clergyman Josias Simler remained the standard work in the constitutional law and politics of the older Swiss confederation

The final phase in Latin Swiss literature belongs to the Age of Reason and is largely connected with natural science An outstanding example of it is the description of Switzerland given by the city physician of Zurich, J J Scheuchzer, and entitled Uresiphoites helveticus sive itineia alpina tria (1708). It was printed in London as a publication of the Royal society with the imprimatur of Isaac Newton

German Swiss Literature,-In bulk, the most important literature of Switzerland is written in the German language. It first flourished in the age of the Minnesingers, of whom more than 30, se. practically one-fifth of the total number, lived on what is now Swiss territory The identity of the Codex Manesse with the famous manuscript of that name in Heidelberg has traditionally been accepted The Codex Manesse is an example of how specimens of prenational literature may be incorporated in a national literature in the 18th century J J. Bodmer was the first to have the Codex printed, and in the 19th century Gottfried Keller made it the subject of one of his Zuricher Novellen. In this way the poetry of the Minnesingers became part of the history of Swiss letters

The first literary productions with national characteristics were popular ballads and popular chronicles The popular ballads commemorate especially the great battles fought by the Swiss from the 14th to the 16th century and later on The most effective and influential of these is the ballad of William Tell, which through its moral and political aspects maintained an important position as a narrative and a play from the late 15th century onward The popular chronicles, occasionally written on behalf of some local authority and often illustrated, flourished especially in Berne, Lu-

engineering are the chief industries. The town hall was opened in cerne and Zunich. The most famous chronicle, however, was written by Giles (Aegidius) Tschudi, a leading magistrate of The contents of his Chroncon Helveticum was widely known after its completion in the 16th century, although it was only printed in the years 1732 and 1734 at Basel In it Johann von Schiller found the material for his drama Wilhelm Tell and Walter Scott the text for his translation of the ballad "The Battle of Sempach "

The reformation activities of Zwingli had only an indirect influence on literature Zwingli himself wrote mainly in Latin. The so-called Zurich Bible was soon replaced by the Luther Bible, which actually made for a closer connection between the writings produced in Switzerland and in Germany. One of the most important results of the work done by Zwingli was that the Protestant majority of German-speaking Switzerland established a permanent connection with the Protestant parts of western Switzerland and with Protestant countries abroad. Thus one of the earliest Swiss accounts of England was produced by the Zurich clergyman and lexicographer Josua Maler (c 1550), and in the 18th century the first German translations of Shakespeare were published in Zanich

The beginning of 18th-century literature in German-speaking Switzerland is marked by the works of a Bernese poet and the end by those of a historian from Schaffhausen. The poetry of Albrecht von Haller, especially Die Alben (1728), helped to bring about a new awareness in poetic experience in Germany and belongs to the earliest specimens of German poetry appreciated in France Iohannes von Muller's Geschichten schweizerischer Eidgenossenschaft (1786-1808), though a fragment, became the most representative piece of historical writing in German classicism and had a far-reaching influence on the style of historical writing in general Between these two cornerstones appears what is occasionally referred to as the Zurich school of criticism. Two members of the "Carolinum," J J Bodmer and J. J Breitinger opposing the critical views of French rationalism and classicism, strongly promoted the reception and appreciation of English literature from John Milton to Thomas Percy in Germany In this connection a revival of religious and national conceptions was prepared which had its special effect in the succeeding generations Salomon Gessner had a European success with his revival of the idyll, for predominantly moral reasons I K. Lavater turned to physiognomy and became one of its innovators, J C Hirzel surprised the reading public with the description of the village Socrates Kleinjogg In importance, however, they were surpassed by Johann Heinrich Pestalozzi, who not only wrote the first village story in German, entitled Lienhard und Gertrud (1781), but included in it the nucleus of his later meditations, covering the entire field of the nature and destiny of man It is indicative of the profound impression his ideas made on his contemporaries that his private institute of education at Yverdon was visited by philanthropists from all over Europe including, for instance, Robert Owen.

In the 19th century international fame and critical estimate at home did not always concur Thus The Swiss Family Robinson (1812-27) by Johann David Wyss, and Heids (1881) by Johanna Spyri are examples of a world-wide success though their purely literary merits were never considered very high at home From the first to the second half of the 19th century the significance of German Swiss literature gradually increased Berne produced its greatest novelist in the person of Jeremias Gotthelf (pseudonym for Albrecht Bitzius), whose epic power was combined with a profound knowledge of human nature. The series of his great novels, most of which describe village hie, opened with the Bauernspiegel oder Lebensgeschichte des Jeremias Gotthelf (1837) and ended in the year of his death (1854) with Erlebnisse eines Schuldenbauers. Fiction and poetry are the fields in which the Zurich writers Gottfried Keller and Conrad Ferdinand Meyer achieved fame. Both realized their own possibilities and destinies comparatively late, a phenomenon frequently observed in the history of Swiss thought. Gottfried Keller reached the first peak of his creative powers with Der grune Heinrich in 1854 when he was 35 and Meyer with his verse epic Huttens letzte Tage in 1871 when he was 46. Meyer drew moon the mountains and the princely courts of the past, and as a writer of fiction he succeeded in giving the Renaissance cult original expression. Keller in some of his best stories devoted himself to subjects corresponding to those of Cervantes and Shakespeare and brought the art of the Novelle to perfection The love he had for his country appears in all shades from hymns of praise to pungent social criticism. His understanding of the human soul is seen at its height in the description of odd characters of both sexes and of unforgettably charming young women. His prose is both homely and delicate and is matched by the quality of his fundamentally human attitude. Many of his admirers believe that his work is the one real contribution of Switzerland to would literature. The importance of this period is emphasized by the writings of the Basel historian Jakob Burckhardt, whose statements about the past, the present and even the future have since become increasingly impressive and valid. His greatest disciple was Heinrich Wolfflin, who continued and completed that work of his master which was interrelated with the history of fine arts The last poet of international repute was Carl Spitteler who was distinguished for epics in verse and prose

French Swiss Literature .- Though the French-speaking part of the Swiss population is only one-fifth of the total, the literature it has produced carries considerably more than the proportionate weight This is due partly to the immigration of a number of highly talented Huguenot families, partly, though to a lesser degree, to the fact that occasionally writers born in the Germanspeaking part of the country would decide to express themselves in the French idiom. This applies especially to the Bernese. The beginnings of French Swiss literature proper coincide with the Reformation. Jean Cauvin from northern France fashioned Geneva into the "csté de Calvin." From Geneva he exercised his influence on French literature through his diction and on the Anglo-Saxon world through his theology In this connection it is significant that one of the first important interpreters of England in France was the Bernese B. L. von Muralt, whose stay in England in 1694 resulted in his Lettres sur les Anglas et les Français (1725) His work was admired by J J. Rousseau, the father of continental romanticism. The formative influences at work on the Genevese philosopher have usually been connected with the comparatively narrow strip of country between the Alps and the Jura He was, however, not only a "citoyen d'un état libre," as he described himself in the opening chapter of the Contrat social, but obviously shared the political and psychological conceptions of all Switzerland to such a degree that one is tempted to consider him its most brilliant publicity agent (see, for example, his Considérations sur le gouvernement de Pologne) Obviously Swiss subject material was dealt with by H. B. de Saussure, one of the founders of modern geology, in his Voyages dans les Alpes (1779-96).

At the beginning of the 70th century, however, French Swiss literature om the whole preferred international themes and was largely connected with the militential circle of Mme. de Stall, who was born in Paris but was of German and Swiss extraction. Of her books setting forth the qualities of the various nations of Europe the one cnitited De I-Allemagne had the wides influence. Her friend Benjamin Constant, though less prolific, expressed himself all the more pointedly, his adaptation of Schiller's trilogy Wellenstein contains the memorable cessay Sur le théâtre allemand. Another member of the circle of Mme. de Stale, who in her manor house on the Lake of Geneva entertained a great many of the total contains the memorable cessay Sur le théâtre allemand. Another member of the circle of Mme. de Stale, who in her manor house on the Lake of Geneva entertained a great many of the Worker Mental and the Contained of Western Europe, was J. C. J. S. de Samondi. Who made an Law of western Europe, was J. C. J. S. de Samondi. Histories des républiques tablemand to Italian history with his Histories des républiques tablemand to Italian history with his Histories des républiques tablemand to Italian history with his Curpon and Cisaq.) Buropean in outlook, especially in his book L'homme dis midt et Phompe dis

To a later development belong the humorous tales and sketches of Rodolphe Toepfier, depicting a more homely world (Labibliothèque de mon onde, 1823), while the poems of Juste Oliver testify to a pronounced partiotism (Polmes sussess, 1830). The criticism of Alexandre Vinet, based on an essentially personal interpretation of Christianity, found an echo both in Switzerland and in France. Toward the end of the 19th century a powerful interpretation of Christianity, found and the Stance.

ternational influence was exercised by the posthumous publication of the fragments of H F Amel's Journal intime (1833), that caused Tolstoy to write a moving preface for 1st Russian translation. In his historical withings Philippe Monnier, in a manier reminiscent of Jakob Burckhardt, deals with Italy in the 15th and 13th centures (Le Quattrockin, 1901; Funsa aut 8 sidelo, 1907). C F Ramux wrote strongly imagnative novels about life amongst unerowers and Alonie herdsmen (Oscuws combibles, 1904).

Gonzague de Reynold, with a consistency hardly known before him, demonstrated the inward connection between German and French-speaking Switzerland in the 18th century and depicted the whole of his country in his Cités et pays surses

Italian Swiss Literature .- Only about 4% of the total population of Switzerland use Italian as their native language home is in the Ticino country and in some of the southern Grisons valleys It is thus unlikely that the literature of such a small group could exist without a strong and permanent relation to Italian literature proper Since the 18th century there have been a few nationally distinct features in what is now often referred to as the Swiss Italianità The themes of these minor writings devoted to poetry and fiction, natural science and history, economics and politics are fairly characteristic. As an exponent of the Age of Reason. Father Francesco Soave of Lugano translated John Locke and Salomon Gessner into Italian and, following the example of the latter. wrote his own Novelle Morah (1782), which since then have appeared in hundreds of editions and have also made the story of William Tell popular in Italy. A representative figure in the first half of the 19th century is Stefano Franscini, who in theory and practice helped to bring about the new unity of the Ticino country and to connect it with the spirit of the Swiss confederation. His main work. La Svizzera Italiana (1837-38), bears as a motto a quotation from Albrecht von Haller; "Alpibus quidem ad Italiam spectantibus ego plurimum boni spero" (The Alps looking toward Italy are my greatest hope). His Nuova statistica della Svizzera (1847) proved to be a particularly effective description of Switzerland in that neriod

So far, undensably the most outstanding poet and novelist of the Trino country has been Francesco Chiesa A convounced regionalist he combines a profound love of his country with an admiration for the great Lombard poets and thus creates the high treary standards necessary for the Italian-speaking part of Switzerland. His vast influence on his contemporaries has essentially contributed towards keeping the Italianità of his region intact (Calilope, 1907, I valid d'oro, 1911, Tempo di marzo, 1925) One of his disciples equally bent on exploring and interpreting his home country was Giuseppe Zoppi (Leggende ticenesi, 1928, and Presento d'un Trimo, 1933).

Raeto-Romance Literature,-The Raeto-Romance language was formerly spoken far beyond the boundaries of Switzerland, todav it is only used in a few Grisons valleys A treatise, published by the Grisons historian and philologist Joseph von Planta in the Philosophical Transactions of the Royal Society of 1776, made the existence of the language known to a wider public. Only recently, however, was it officially recognized. On Feb. 20, 1938, following a plebiscite of the whole country, Raeto-Romance, though represented by only 1% of the total population, was declared one of the four national languages of the Swiss confederation. Raeto-Romance literature was in its origins predominantly ecclesiastical and began in the middle ages. The Reformation gave it new impulses. There is a rich variety of popular songs, especially of the political kind. Owing to its geographical distribution Racto-Romance literature is essentially regional in character. Nevertheless the anthologist Caspar Decurtins and the poet Peider Lansel achieved decidedly more than mere local fame in the 20th century

Swiss Dialect Literature.—The fortunes of Swiss shiest hierature vary according to the language situation in each respective section of the country. In the Ticino country dalect literature is being produced with much devotion, but so far seems to have been of little consequence. In the French-speaking part of the country the local dialects are on the wane and, consequently, so are dialect writings. The maportant instances of this sort of literature belong to past centuries such as the different Genevee ballade. tional fame was achieved by the various Rang des vaches, melodies sung or played on the horn by herdsmen and in one case taken down by Rousseau in his Dictionnaire de musique (1768)

At present dialect literature flourishes mainly in the Germanspeaking part of the country, chiefly because there the population. regardless of social rank and education, consistently sticks to the use of the dialect for everyday purposes The existence of numerous local idioms might even produce an ever increasing variety of dialect writings This, however, would be at cross purposes with the accepted determination of the writers and their reading public to remain on common ground with German literature as a whole, which explains why some of the best poets express themselves both in high German and in their dialect. Thus Adolf Frey published a volume of poems in the dialect of the Aargau (Duss und underm Rafe, 1891 and 1921) and Meinrad Lienert one in the dialect of Schwyz ('s Henvili, 1908) There are vigorous novels in the Bernese dialect by Rudolf von Tavel, who began in 1007 with Ja gall, so gest's, and by Simon Gfeller, who depicted life among the peasants of the Emmenthal beginning with Heimisback (1011)

Patrimonium Helveticum .-- Without detriment to their connections with European civilization many Swiss consider the existence of a sixfold national literature with deep satisfaction. They are perfectly aware of the perplexing problems it inevitably involves and even look upon them as an asset Between the extremes of absolute diversity and absolute unity there is room for all aspects and expressions of thought and imagination. This is what the Swiss spirit of freedom fundamentally wills A representative cultural centre-such as Florence once was for Italy and Paris still is for France-is inconceivable for Switzerland Each group and even each individual expresses itself according to its character and region. Such a state of affairs may have its greatness, but it certainly also has its drawbacks and its dangers, which can only be overcome on the level of a vigorous national consciousness So far this consciousness has proved adequate for the solution of the problems involved. A deteriorating structural change could only occur if the minorities were estranged from the confederate whole or if the majority forces were tempted to exploit their position regardless of tradition. Although there is at present a trend for a slight shift in the numerical relationship of the different languages one cannot seriously speak of a peril to the wellestablished balance of the different cultures. On the contrary the fact that the underlying ideals are very much alive may produce further highlights of national integration A development of over 1.000 years is at the basis of the literary life of Switzerland and will continue to shape what might be called an ever-growing patrimonum Helveticum (F. E., H Sn.)

Contemporary Writers .- Swiss contemporary authors have found themselves inescapably confronted with two world wars, totalitarian revolutions, the triumphs of technical civilization and a growing disintegration of the great traditional values.

A considerable minority stick to the old values still current in the village and the small town, praising the good gifts of the earth (Hemrich Federer, 1866-1928; and Alfred Huggenberger), Others furnish antidotes to the conventional order of things and are alert to the stimuli of international modern thought After 1914 Albert Steffen, Jakob Schaffner (1875-1944), Robert Faesi and others opened broader and deeper vistas of the individual and of nations Marxist views are expressed by Hans Mühlestein and Jakob Buhrer On the other hand the complicated, highly strung modern individual preoccupies novelists like Monique Saint-Hélier and Kurt Guggenheim. A wave of irrationalism has set free new forces in Swiss poetry. In some writers, a refined sense of form (Siegfried Lang) and the bold use of intuitive imagery (Albin Zollinger, 1895-1941, Werner Zemp, Silja Walter) are reminders of the nearness of C. G. Jung, the Swiss explorer of the unconscious. Religious thought in this epoch has been greatly influenced by the theology of Karl Barth and Emil Brunner. A promising, provocative playwright is Friedrich Dürrenmatt,

With a few exceptions (e.g., the Zürich dramatist Max Frisch and the young Swiss Italian Felice Filippini) existentialism has had

commemorating the victory of the Escalade in 1602 Interna- little chance with Swiss writers so far, but many of the best believe that the truth lies in a sort of holism, an interpenetration both of the forces of the native soil and the world at large, eg, the novelists Gustav Keckeis and Cecile Ines Loos and the poet Urs Martin Strub, whereas the novelist Meinrad Inglin and the playwright Caesar von Arx (1895-1949) stress the native element A similar sense of many-sided relationships is an essential feature of the histone and literary essays of Gonzague de Reynold, Carl J. Burckhardt. Fritz Ernst and Max Rychner, representatives of a truly (A Bx) European Switzerland

SWITHUN (or SWITHIN), ST. (d. 862), bishop of Winchester and patron saint of Winchester cathedral from the 10th to the 16th century. He is scarcely mentioned in any document of his own time. His death is entered in the Anglo-Saxon Chronicle under the year 861; and his signature is appended to several charters in Kemble's Codex diplomaticus. Of these charters three belong to 833, 838, 860-862. In the first the saint signs as "Swithunus presbyter regis Egberti," in the second as "Swithunus diaconus," and in the third as "Swithunus episcopus," Hence if the second charter be genuine the first must be spurious, and is so marked in Kemble More than 100 years later, when Dunstan and Ethelwold of Winchester were inaugurating their church reform. St Swithun was adopted as patron of the restored church at Winchester, formerly dedicated to St. Peter and St. Paul. His body was transferred from its almost forgotten grave to Ethelwold's new basilica on July 15, 971, and according to contemporary writers, miracles accompanied the translation.

The revival of St. Swithun's fame gave rise to a mass of legendary literature. The so-called Vitae Swithuni of Lantfred and Wulstan, written about AD 1000, hardly contain any germ of biographical fact; and the earliest detailed authority is a biography ascribed to Gotzelin (# 1058-78) From this writer, who has perhaps preserved some fragments of genuine tradition, it is learned that St. Swithun was appointed bishop of Winchester under Aethelwulf. At his request Aethelwulf gave the tenth of his royal lands to the church. He died on July 2, 862, saying that he was not to be buried within the church but outside in "a vile and unworthy place,"

William of Malmesbury adds that, as Bishop Alhstan of Sherborne was Aethelwulf's minister for temporal, so St. Swithun was for spiritual matters. The same chronicler uses a remarkable phrase in recording the bishop's prayer that his burial might be "ubi et pedibus praetereuntium et stillicidis ex alto rorantibus the well-known weather myth contained in the doggrel lines-

St Swithin's day if thou dost rain For forty days it will remain, St Swithin's day if thou be fair For forty days 'twill rain na mair-

had already, in the 12th century, crystallized around the name of St Swithun, but it is doubtful if the passage lends itself by any straining to this interpretation

SWITZERLAND (Ger Schweiz; Fr Suisse, It Svizzera; Lat Helvetia) is a confederation or Esdgenossenschaft of 22 cantons (3 of which have half-cantons) with a republican and federal constitution It is situated in central Europe and bounded north by Germany, east by Austria and the principality of Liechtenstein (included since 1924 in the Swiss customs and monetary union), southeast and south by Italy, and southwest, west and northwest by France.

#### PHYSICAL GEOGRAPHY

Switzerland extends between 45° 49' and 47° 48' 30" N lat, and from 5° 58' to 10° 30' E long It forms an oval-shaped mass of which the greatest length (west-southwest to east-northeast) 18 226 mi, and the greatest breadth (north to south) 18 137 mi It has little or no physical unity, consisting as it does of numerous small districts, differing widely in language, religion, ethnology and customs, bound together in a political alliance, made originally for common defense

The nation consists of three great river valleys (Rhône, Rhine and Aar), lying to the north of the main chain of the Alps and including within their Swiss basins all the region between the Alps and the Jura In addition, the wedge-shaped canton of Ticino runs south from the St Gotthard massif and drains to the Po, while in the extreme east a tongue of the Grisons canton drains northeast via the Engadine, into the Danube The Rhône and Rhine valleys are shut off from that of the Aar by the great northern ridge of the Bernese Oberland and Todi Alps The Aar valley is wide and undulating, but the upper Rhine and Rhône have cut deep trenches in the structural depression which separates the great parallel chains. The main chain of the Alps provides the loftiest wholly-Swiss summit (15,200 ft.) in the crowning Dufourspitze of Monte Rosa, though the Dom (14,942 ft ) in the Mischabel range, immediately north of Monte Rosa, is the highest entirely Swiss mountain mass. The highest summit in the northern parallel ridge is the Finsteraarhorn (14,026 ft ) in the Bernese Oberland, while the lowest level within the confederation is on the Lago Maggiore (646 ft.)

The geological build of the Alps has been proved to be exceedingly complex; the contorted, folded, and even overfolded recent rocks have been fractured, exposing old crystalline cores to denudation; the Jura are much less complicated in their folding and in their exposures. Much of the central hummocky plain is covered with undisturbed very recent rocks of Oligocene and Miocene age, many of which are marine deposits formed at a period when an arm of the Mediterranean spread up the present Rhône course along the outer border of the Alps as far east as Austria. These deposits are concealed in many parts of the plain by the most recent glacial and alluvial accumulations.

The present confederation drains into the North sea, Mediterranean sea (direct), Adriatic sea and Black sea which, respectively, receive the Rhine, Rhône, Ticino-Po and Inn-Danube. The Swiss portions of their basins are approximately, in the order named: 11,160; 2,760; 1,360; and 660 sq.mi,

Many of its rivers, with their Alpine origin, tend to seasonal

esset obnoxius," This expression has been taken as indicating that overflows which have necessitated artificial embankment. The most important contiol scheme was that of Conrad Escher of Zurich (lates Conrad von der Linth) who in 1807-27 turned the turbulent Linth into Walensee, from which it emerges as a canal-1zed stream An earlier (1714) successful work was the diversion of the troublesome Kander into the Lake of Thun, where it is now placedly building an extensive fertile delta

The lakes of Switzerland are very numerous, the largest, Geneva (southwest) and Constance (northeast) are on the frontiers and are not wholly Swiss Neuchâtel (83 sq mi ) is the largest wholly Swiss lake. About 16 sq mi at the north end of Lago Maggiore (82 sq m1) belongs to Switzerland, next in order of size are Lucerne, Zurich, about half of the Swiss-Italian Lake of Lugano (19 sq mi.), Thun, Brienz, Morat, the Wallen and Sempach (55 sq m1), no others exceed 4 sq mi Eleven of these lakes are in the Aar basin, two (Maggiore and Lugano) are in the Po basin, and Geneva is the great Rhône filter. The lakes of the Swiss portion of the Inn basin are small; the largest are Sils (1 5 sq mi ), and the still smaller, slightly lower and adjacent Silvaplana Many small mountain lakes are of interest, such as the dreary Daubensee (7,264 ft alt) near to the Gemmi pass, the extremely beautiful Oeschinensee (5,223 ft alt) mirroring the snowy Blumlis Alp, and the remarkable, though sometimes empty Marielensee (7,766 ft alt) on which float miniature icebergs from the Great Aletsch glacier

Of the countless waterfalls in Switzerland those of the Rhine (near Schaffhausen), 100 ft high, inclusive of rapids, and 340 ft. wide, are the grandest, but the most beautiful are of less volume and greater height, such as those of the Lauterbrunnen valley and particularly the Staubbach, a mere veil of water hanging in front of a precipice 980 ft high

Switzerland contains many more glaciers than the combined total for adjacent lands, the number is estimated at more than 1.000, but no exact computations are possible on account of numerous detached ice masses which may or may not rank as glaciers Practically all of them are now in retreat, though they will long continue to feed all the important rivers and streams of Switzerland They probably occupy 700 sq mi, very unequally distributed; 11 of the cantons possess no glaciers The greatest area is found in the Valais (more than half of the total area), followed by the Grisons and Berne (about one-sixth each), then by Uri, Glarus and Ticino (the last about 13 sq mi), the remaining cantons-Unterwalden, Vaud, St. Gallen, Schwyz and Appenzell have, in aggregate, a glacier area little superior to that of Ticino alone. The longest glacier in the main Alpine chain is the Gorner (9.25 mi ), but it is exceeded by the Great Aletsch (16 5 mi ) and by the Fiescher and the Unteraar (10 mi. each) which run down from the high eastern mountains of the Bernese Oberland

Climate.-In an area such as Switzerland which extends through less than two degrees of latitude, climate will be influenced more particularly by differences of altitude, aspect and gradient, these show wide and surprisingly sudden variations, e.g., Monte Rosa (15,217 ft. high) is only 30 mi. distant in a "straight" line from Lago Maggiore, with waters in the same latitude, but only 646 ft. in altitude Great heights are characterized by (1) low barometer readings; Monte Rosa summit records about half sealevel pressure; hence the possibility of "mountain sickness", (2) usually more brilliant sunshine and dry air, particularly in winter, producing sunburning and ice-dazzle, which in some subjects amounts to snow blindness, (3) much lower temperatures, among the Alps the average fall in temperature is about 1.2° F on the south side and about 0.0° F, on the north side for each 330 ft of ascent. The height of the Alpine crest and its main direction also profoundly influence the winds. In addition to local winds of certain higher levels which show a daily change of direction, downhill in the morning and uphill in the evening, there are other characteristic winds which are much less localized in their effects, as the southerly föhn, warm, dry and oppressive, which affects considerable areas in east Switzerland, particularly during spring and autumn; and the northerly bise, a cold wind experienced especially in Geneva. Switzerland's many climates are important, not only in Europe's playground generally, but also in the "nests of

sanatoria." Hence, climate and weather statistics have been carefully compiled for many stations

January is the coldest month, the following averages in degrees F being recorded. Basle (909 ft alt ) 31 8, Altdorf (1,480 ft alt ) 32 4, Davos (5,121 ft alt) 18 7, St Gotthard (6,877 ft alt) 18 1, Santis (8,202 ft alt) 16 2, while an unusually low average is from Bevers (5,610 ft alt) with 14 2. Precipitation (either rain or melted snow) shows wide variations, eg, Basle has 32 5 in total annual precipitation, Altdorf, 49 o in , Davos, 35 7 in and Santis, 95 7 in At several stations much of this falls as snow On Santis the precipitation is as snow from November to April inclusive, and only July and August have more rain than snow Snow accumulates to a depth of 20 to 25 ft at Bevers and upward of 45 ft on Santis July is the hottest month, the average July records in degrees F being Basle 66 4, Altdorf 64 4, Davos 53 8, St Gotthard 46 2, Santis 41 o, Bevers 53 2 The range of 39 00 at Bevers tends to be extreme, Santis, though cold, is much more equable, 24 8°. The snow line, showing considerable local variations, is about 9,000 ft, high on the western Alps, and about 10,500 ft in the drier eastern mountains

Vegetation.—Though Swiss vegetation is mainly central

European in character, in some of the warm sheltered valleys Mediterranean types are found The true alpine flora (plants growing above the tree limit) is akin to that of the Pyrenees rather than to either of the other elements (see ALPS). Mediterranean species, found locally in the wide valley between the Jura and the Alps, in the Rhône valley in Valais, and on the southern slopes of the mountains running down to the Italian lakes, include vines. walnut trees, camelias, magnolias and palms. The lowlands and foothills are largely cultivated, and wherever possible land is farmed in the mountains. The natural climax vegetation of the mountain region, up to about 4,000 ft on the northern slones and 5,000 ft, or more on the southern, consists of deciduous trees such as oak, beech, ash and sycamore, but mixed forests of timber trees such as spruce, silver fir, larch and birch have been planted to a great extent in their place. The subalpine region covers the next 1,000 ft or so where the pure conferous forest (spruce, silver fir, larch and Scotch pine) are found These merge into the scrub of the alpine region which contains dwarf pines and willows, juniper, bilberry, creeping azalea, mezereon, white dryas, rhododendrons, etc. This is also the region of the alpine pastures Above about 6,500 ft. (where the summer lasts only five or six weeks) the flora is typically alpine, and cushion plants, mosses and lichens flourish among the bare rocks, screes and glaciers Finally, between 8,000 ft and 9,500 ft. comes the region of perpetual snow

The alpine meadows are transformed into brilliant gardens in May June and July Among the first to blossom are crocuses, anemones, Gentiana verna, Princula farinosa and pheasant's eye nacrosus, while on the higher sloopes the celelwess is in bloom. In June come St. Bruno's lity, orchids, campanulas, larkspurs and many others, followed by the martagon lity, oxeye dasay, etc. The alpine roses, Rhododendron ferrugnessim and R hiratistim (only found on limestone), clothe the sides of the Alps and Junt together with Saponaria oxymandss, Helanthensum alpistire, Gentiana muchis, the alpine lily and many more, As soon as the meadows have been cut for hay the autumn crocus (Colchicum autusnale) appears

Fauna.—In Switzenland the animals are protected and there is only a very short ahooting season. Many of them, for example the chamois that lives high up in the mountains and the marmot that is found near the snow line, are abline animals. Among the inhabitants of the forests are squirreds and foxes and woodpeckers, jusy, tits and many other birds. Hares and faled mice are common in the meadows. In the lakes and rivers there are trout and other fish, and salmon are found in the Aart, the Rhane and Lake Zürich. Among regitlist the viper is common Insects are numerous; butterflies and moths abound in the meadows when the flowers are in bloom and ants are pleintful in the woods.

#### HISTORY

For indications of the prehistory and ancient history of what is now Switzerland see Alamanni, Burgundy, Celt, Geneva, Helleviti, La Tener, Raria, Savoy, House or; Vinglicki, etc The following pages treat of the history of the Swiss confederation from its origin to the present day

The Swiss confederation forms a nation the patriotism of whose members is universally acknowledged, but Swiss history is very intricate and very local. A firm hold on a few guiding principles is therefore most desirable, and of these there are three which must always be borne in mind (1) The first is the connection of Swiss history with that of the empire. Swiss history is largely the history of the drawing together of bits of each of the imperial kingdoms (Germany, Italy and Burgundy) for common defense against the Habsburgs, and when this dynasty had secured to itself the permanent possession of the empire, the Swiss league little by little won its independence of the empire, practically in 1499, formally in 1648. (2) The second is the German origin and nature of the confederation Around a German nucleus (the three Forest districts or, as they are now called, cantons) there gradually gathered other German districts, and it was not until 1803 and 1815 that its French- and Italian-speaking cantons were raised to political equality with the German confederates (3) The third is that Swiss history is a study in federalism. Based on the defensive alliances of 1201 and 1315 between the three Forest cantons, the confederation was enlarged by the admission of other districts and towns, all leagued with the original three members, but not necessarily with each other. Hence great difficulties are encountered in looking after common interests; the diet was merely an assembly of ambassadors with powers very strictly limited by their instructions, and there was no central executive authority The whole constitutional history of the confederation is summed up in its transition to a federal state, which, while a single state in its foreign relations, in home matters maintains the more or less absolute independence of its members

The League of 195.—On Aug. 1, 1357, the men of the valley of Urt, the free community of the valley of Schwy, and the association of the men of the lower valley or Nidwalden—Obwalden or the upper valley is not mentioned in the text, though its name was afterward added to the attached seal of Nidwalden—formed the Everlasting league for the purpose of self-defense against all who should attack or trouble them, a league which was expressly stated to be a confirmation of a former one. This league was the foundation of the Swis confederation.

The legal and political conditions of each district were very different (1) In 853 Louis the German granted all his lands in the pagellus Uromae to the convent of SS. Felix and Regula in Zurich (the present Fraumunster) and exempted them from all jurisdiction save that of the king (Reschsfreshest), so that though locally within the Zurichgau they were not subject to its count, the king's deputy. The abbey thus became possessed of the greater part of the valley of the Reuss between the present Devil's Bridge and the Lake of Lucerne, for the upper valley (Urseren) belonged at that time to the abbey of Disentis in the Rhine valley and did not become permanently allied with Un until 1410. The privileged position of the abbey tenants gradually led the other men of the valley to "commend" themselves to the abbey. The important post of protector (advocabus or vogt) of the abbey was given to one family after another by the emperor, in 1218 the office was granted to the Habsburgs, but in 1231 the German king Henry VII bought it back in order to control the St. Gotthard pass, the valley thenceforward depending immediately on the king (2) In Schwyz (first mentioned in 972) it is necessary to distinguish between the districts west and east of Steinen. In the former the land was in, the hands of many nobles, among whom were the Habsburgs; in the latter there was, at the foot of the Mythen, a self-governing community of free men, both, however, were politically subject to the king's delegates, the counts of the Zünchgau, who after 1173 were the ever-advancing Habsburgs, But in 1240 the free community of Schwyz obtained from the emperor Frederick II a charter which removed them from the jurisdiction of the counts, placing them in immediate dependence

on the king, like the abbey men of Ur. In a few years, however, the Habbungs contrived to dispense with this charter in praetice. (3) In Unterwalden things were very different. The upper valley (Obwalden or Sarnen), like the lower (Nidwalden or Starse), tormed part of the Zurichgau, while in both the soil was owned by many lay and ecclesiastical lords, among them being the Habsungs and the Alsatian abbey or Murbach Hence in this district there were privileged tenants, but no free community and no entert of unity, this explains why Obwalden and Nidwalden won their way upward so nuch more slowly than their neighbours in Urn and Schwy

The Habsburgs had risen steadily from the position of an unimportant family in the Aargau to that of powerful landed proprietors in Swabia and Alsace and had attained political importance as counts of the Zurichgau and Aargau. In one or both qualities the cadet or Laufenburg line, to which the family estates in the Forest cantons around the Lake of Lucerne had fallen on the division of the inheritance in 1232, seems to have exercised its legal rights in a harsh manner In 1340 the free men of Schwyz obtained protection from the emperor. It was natural that when, after the excommunication and deposition of Frederick II by Innocent IV in 1245, the head of the cadet line of Habsburg sided with the pope, some of the men of the Forest cantons should rally around the emperor. Schwyz joined Sarnen and Lucerne (though Un and Obwalden supported the pope); and in 1247 the men of Schwyz, Sarnen and Lucerne were threatened by the pope with excommunication if they persisted in upholding the emperor and defying their hereditary lords the counts of Habsburg The rapid decline of Frederick's cause soon enabled the Habsburgs to regain their authority in these districts. These incidents are the only foundation in fact of the legendary stories of Habsburg oppression told of and by a later age. After this temporary check the power of the Habsburgs continued to increase rapidly. In 1273 the head of the cadet line sold all his lands and rights in the Forest cantons to the head of the elder or Alsatian line, Rudolph, who a few months later was elected German king. He recognized the privileges of Uri but not those of Schwyz; and as he united in his person the characters of German king, count of the Zurichgau and landowner in the Forest cantons, the union of offices might be expected to result in a confusion of rights. On April 16, 1201, Rudolph bought from the abbey of Murbach in Alsace (of which he was advocate) all its rights over the town of Lucerne and the abbey estates in Unterwalden. It thus seemed probable that the other Forest cantons would be shut off from their natural means of communication with the outer world by way of the lake. Rudolph's death, on July 15 of the same year, cleared the way, and a fortnight later (Aug 1) the Everlasting league was made between the men of Uri, Schwyz and Nidwalden for the purpose of self-defense against a common foe.

Morgarten and the League of 1315,-In the struggle for the empire, which extended over the years following the conclusion of the league of 1291, the confederates supported without exception the anti-Habsburg candidate. On Oct. 16, 1201. Ura and Schwyz alhed themselves with Zurich and joined the general rising in Swabia against Albert, the new head of the house of Habsburg. It soon failed, but hopes revived when in 1292 Adolph of Nassau was chosen German king. In 1297 he confirmed to the free men of Schwyz their charter of 1240 and, strangely enough, confirmed the same charter to Uri, instead of their own of 1231. It is in his reign that the first recorded meeting of the Landesgemende (or legislative assembly) of Schwyz (1294) occurred. But in 1298 Albert of Habsburg himself was elected German king, His rule was strict and severe, though not oppressive. He did not indeed confirm the charters of Uri or of Schwyz, but he did not attack the ancient rights of the former, and in the latter he exercised his rights as a landowner and did not abuse his political rights as king or as count. In Unterwalden the two valleys were joined together (1304) under a common administrator (the local deputy of the count)—a great step forward to permanent union. The stories of Albert's tyranny in the Forest cantons are not heard of until two centuries later. His successor, Henry of Luxemburg, confirmed, on June 3, 1300, to Uri and Schwyz their charters of 1393 and, for some unknown reason, confirmed to Unterwalden all the liberties granted by his predecessor, though as a matter of fact none had been granted. This charter and the nommanton of one royal bailift to administer the three distructs had the effect of plaung them all in an identical political position, and that the most privileged yet given to any of them—the freedom of the free community of Schwy 20 Jipure 13, 1311, Henry granted the request of Leopold I of Habsburg, who had accompanied him on his expedition to Rome, that Baron Eberhart of Burglen and Count Frederick of Toggenburg should inquire into, the precise rights of the Habsburgs in Alsace and in the Foest cantons with a view to restoring them. But no steps were taken to draw conclusions from this investigation.

On Henry's death in 1313 the men of Schwyz seized the opportunity for making a wanton attack on the great abbey of Einsiedeln, with which they had a long-standing quarrel as to rights of pasture The abbot caused them to be excommunicated, and Leopold's brother Frederick of Habsburg (chosen king, as Frederick III, by a minority of the electors), who was the hereditary advocate of the abbey, placed them under the ban of the empire His rival. Louis of Bayaria, to whom they appealed, removed the ban, whereupon Frederick issued a decree by which he restored to his family all their rights and possessions in the three valleys and Urseren and charged Leopold with the execution of this order The confederates hastily made arrangements with Glarus, Urseren, Arth and Interlaken to protect themselves from attack on every side. Leopold collected a brilliant army at the Austrian town of Zug in order to attack Schwyz, while a body of troops was to take Unterwalden in the rear by way of the Brunig pass. On Nov 15, 1315, Leopold moved forward along the shore of the Lake of Aegers, intending to assail the town of Schwyz by climbing the slopes of Morgarten above the southeastern end of the lake There they were awaited by the valiant band of the confederates, who utterly defeated them. Leopold fled in haste to Winterthur, and the attack by the Brunig was driven back by the men of Unterwalden On Dec q, 1315, representatives of the victorious highlanders met at Brunnen, on the Lake of Lucerne and renewed the Everlasting league of 1291. In their main lines the two documents are very similar, the later being chiefly an expansion of the earlier. That of 1315 is in German (in contrast with that of 1201. which is in Latin) and has one or two striking clauses largely indebted to a decree issued by Zurich on July 24, 1201. None of the three districts or their dependents was to recognize a new lord without the consent and counsel of the rest. Strict obedience in all lawful matters was to be rendered to the rightful lord in each case, unless he attacked or wronged any of the confederates, in which case they were to be free from all obligations No negotiations, so long as the "Lander" had no lord, were to be entered on with outside powers, save by common agreement of all. Louis solemnly recognized and confirmed the new league in 1316, and in 1318 a truce was concluded between the confederates and the Habsburgs. The lands and rights annexed belonging to the Habsburgs in the Forest cantons were fully recognized as they existed in the days of Henry of Luxemburg, and freedom of commerce was granted. But there was not one word about the political rights of the Habsburgs as counts of the Zurichgau and Aargau

The League of Eight Members—The name Switzerland (Swaez; derroyd from Schwyz, which had always been the leader in the struggle) applied to the three Forest cantons as early as 1320 and extended to the confederation as a whole in 1325. But it was not until after Sempach (1386) that it came into popular use, and it did not form the official name of the confederation until 1803. This is in itself a proof of the great renown which the league won by its victory at Morgarten Another is that as years passed other members were admitted to the provileges of the original alliance of the three Forest cantons. First to join the league (1332) was the neighbouring town of Lucerne, which had grown up around the monastery of St. Leodegar, Ludger or Leger (a cell of the great house of Murbach in Alsace) and had been sold to the Habsburgs in 129. It is accession brought a new element unto the pastoral association of the Forest cantons, which surrounded the entire Lake of Lucerne. Next came the ancient

town of Zurich in 1351, when it got the help of the Forest cantons and of Lucerne against the threat of an Austrian attack The league was then advanced from the hilly country to the plains, though the terms of the treaty with Zurich did not bind it so closely to the confederates as in the other cases and hence rendered it possible for Zurich now and again to incline toward Austria in a fashion which did great hurt to its allies. In June 1352 the league was enlarged by the admission of Glarus and Zug Glarus belonged to the monastery of Sackingen on the Rhine and the Habsburgs as advocates of the abbey claimed many rights over the valley, which, however, refused to admit them and joyfully received the confederates who came to its aid. However Glarus was placed on a lower footing than the other members of the league, being bound to obey their orders Three weeks later the town and district of Zug, attacked by the league and abandoned by their Habsburg masters, joined the confederation diate occasion of the union of these two districts had been a war begun by the Austrian duke Albert II against Zurich, and the peace of Sept 1352 restored Glarus and Zug to the Habsburgs. who also regained their rights over Lucerne Zug was won for good by a bold stroke of the men of Schwyz in 1364, but it was not until the day of Nafels (1388) that Glarus recovered its lost freedom These temporary losses were, however, far outweighed by the entrance into the league in 1353 of the famous town of Berne Founded in 1191 by Berchtold V of Zahringen, Berne had become a free imperial city in 1218 on the extinction of the Zahringen dynasty and made a treaty with the Forest cantons as early as 1323 In 1352 it had been forced to take part in the war against Zurich, but soon after the conclusion of peace entered the league as the ally of the three Forest cantons, being thus only indirectly joined to Lucerne and Zurich. The special importance of the accession of Berne was that the league began to spread to the west and so came into contact for the first time with the French-speaking land of Savoy The league thus by the end of the 14th century numbered eight members, the fruits of Morgarten, and no further members were admitted until 1481, after the Burgundian war. But while each of the five new members was allied with the original nucleus-the three Forest cantonsthese five were not directly allied to one another

Sempach and the Aargau.-Soon afterward, the quarrels with Austria broke out afresh Lucerne fretted much under the Austrian rule, received many Austrian subjects among its citizens and refused to pay custom duties to the Austrian bailiff at Rothenburg, on the ground that it had the right of free traffic. An attack on the customhouse at Rothenburg and the gift of the privileges of burghership to the discontented inhabitants of the little town of Sempach a short way off, so irritated Leopold III (who then held all the possessions of his house outside Austria) that he collected an army, with the intention of crushing his rebellious town. Lucerne meanwhile had summoned the other members of the league to its aid, and approximately 1,600 men of Uri, Schwyz, Unterwalden and Lucerne opposed the 6,000 which made up the Austrian army The decisive fight took place on July 9, 1386, near Sempach. Leopold, with a large number of his followers, was slain and the Habsburg power within the borders of the confederation finally broken. Glarus at once rose in arms, but it was not until the expiration of the truce made after Sempach that Leopold's brother, Albert III of Austria, brought an army against Glarus and was defeated at Näfels (not far from Glarus) on April 9, 1388, by a handful of Glarus and Schwyz men.

In 1380 a peace of seven years was made, the confederates being secured in all their conquests; and on July 16, 1394, the peace was prolonged for 20 years (and again in 1412 for 50 years), various stipulations being made by which the long struggle of the league against the Hinbsburgs was finally crowned with success. By the peace of 1394 Glains was freed on payment of \$200 annully; Zug too was released from Habsburg rule. Schwys was gwen the advocatia of the great abbey of Einstedelin; Lucenne got the Entlebuch (finally in 1405), Sempach and Rothenburg; Berne and its ally Solothuru were confirmed in their conquests. Above all, the confederation as a whole was relieved from the overlordship of the Habsburgs, to whom, however, all their rights and

dues as landed proprietors were expressly reserved, Berne, Zurch and Solothum guaranteeing the maintenance of these rights and dues with power in case of need to call on the other confederates to support them by arms. Though the house of Habsburg entertained hopes of secovering its former rights, so that technically the treates of 1389, 1394 and 1412 were but truces, it was finally to renounce forever all its feudal rights and privileges within the confederation by the Everhsting compact of 1424

The victory at Sempach enabled the league to extend both its influence and its territory. Both the league and its individual members were able to take the offensive. In the right century each member increased and rounded off its territory, though it usually withheld political rights from the men of the newly acquired lands. It was in the same century that Appenzell, St. Gallen and the Upper Valais first became associated with the league, though they did not become full members for a long time—Appenzell in 1731, St. Gallen in 1859, the Valais in 1854 Owner all, the 15th century saw the first attempt of the confederation to secure a footing south of the Alos.

In 1412 the treaty of 1394 between the league and the Habsburgs had been renewed for 50 years. When in 1415 the German king and future emperor Sigismund placed Duke Frederick IV of Austria under the ban of the empire, the league hesitated, because of their treaty of 1412, until Sigismund declared that this treaty did not release them from their obligations to the empire Sigismund's name, therefore, and by his special command, the different members of the league overran the extensive Habsburg possessions in the Aargau The chief share fell to Berne, but certain districts (known as the Frese Amter and the county of Baden) were joined together and governed as bailiwicks held in common by all members of the league (save Uri, busied in the south, and Berne, which had already secured the lion's share of the spoil for itself) This is the first case in which the league as a whole took up the position of rulers over districts which, though guaranteed in the enjoyment of their old rights, were nevertheless politically unfree

First Italian Conquests .- As the natural policy of Berne was to seek to enlarge its borders at the expense of Austria and later of Savoy, so Uri, shut off by physical causes from extension in other directions, as steadily turned its eyes toward the south. In 1410 the valley of Urseren was finally joined to Uri, an acquisition which gave to Uri complete command over the St. Gotthard pass, long commercially important and henceforth useful for purposes of war and conquest. Already in 1403 Urr and Obwalden had occupied the long narrow upper Ticino valley on the south of the pass called the Val Leventina or Livinental; in 1410 the men of the same two lands, exasperated by the insults of the local lords, called on the other members of the league, and all jointly (except Berne) occupied the Val d'Ossola (Eschental) on the south side of the Simplon pass Having lost this to Savoy in 1414, they obtained in 1416-17 the alliance of the men of the Upper Valais, then fighting for freedom, and thus regained the valley (1416). In 1419 Uri and Obwalden bought from its lord the town and district of Bellinzona This rapid advance, however, did not meet with the approval of the duke of Mılan, Filippo Maria Visconti; the confederates were not at one with regard to these southern conquests: Filippo Maria intrigued with them; and finally in 1426, by a payment of a large sum of money and the grant of certain commercial privileges, the Val Leventina, the Val d'Ossola and Bellinzona were formally restored to him,

The First Civil War.—The original contrasts between the scale condution of the different members of the league became more marked when the period of conquest began Quarrels and illefeling arose on the subject of the Aargau and the Italian conquests and a few years latter ripened into a civil war, brought about by the dispute as to the succession to the lands of Frederick VII, count of Toggenburg, the last male representative of his house. Count Frederick's predecessors had greatly extended their domains, so that they took in not only the Toggenburg or upper valley of the Thur, but Uranch, Sargans, the Rhine valley between Feldkirch and Sargans, the Prättigau and the Davos valley. He himself, the last great feudal 10rd on the left bank of the Rhine, had

managed to secure his vast possessions by making treaties with several members of the league His death (April 30, 1436) was the signal for the outbreak of strife The Prattigau and Davos valley formed the League of the Ten Jurisdictions in Raetia, while Frederick's widow took sides with Zurich against Schwyz for different portions of the great inheritance which had been promised them After being twice defeated, Zurich was forced in 1440 to buy peace by certain cessions to Schwyz, the general feeling of the confederates being opposed to Zurich, so that several of them went so far as to send men and aims to Schwyz Zurich, however, was bitterly disappointed at these defeats and had recourse to the policy which it had adopted in 1356 and 1393-an alliance with Austria (concluded in 1442), which now held the imperial throne in the person of Frederick III (Frederick IV as German king) Though permissible according to the terms of Zurich's joining the league in 1351, this act caused the greatest irritation in the confederation, and civil war broke out. In 1443 the Zurich troops were completely defeated at St Jakob on the Sihl, close under the walls of the city Next year the city itself was long besieged Frederick, unable to get help elsewhere, procured from Charles VII of France the dispatch of a body of Armagnac free lances (the Ecorcheurs), who came, 30,000 strong, under the dauphin Louis, plundering and harrying the land At the very gates of the free imperial city of Basle the desperate resistance of a small body of confederates (1,200 to 1,500), until cut to pieces, checked the advance of the freebooters, who then returned whence they had come Several small engagements ensued, Zurich dechning to make peace because the confederates required, as the result of a solemn arbitration, the abandonment of the Austrian alliance At length peace was concluded in 1450, the confederates restoring almost all the lands they had won from Zurich

(W A B C; H. Nz.) Waldshut and the Burgundian War.-Various communities such as the abbey and the city of St Gallen (1451), Appenzell (1452), Schaffhausen (1454), Rottweil (1463) and Mulhouse (1466) now became allies or associates of the eight cantons, while a successful war secured Thurgau as a common lordship, administered by all the states, except Berne, in agreement (1461) In 1467 and 1468 Berne used various pretexts to secure control of the Aargau, and war followed in 1468, partly in order to maintain the continued independence of Mulhouse against Sigismund of Tirol, the emperor Frederick III's cousin, who had succeeded to the Habsburg lands on the Rhine and in Alsace on his father's death in 1439 (in the years immediately following Frederick had been acting as his guardian) The war was hurriedly ended in Aug 1468 by the treaty of Waldshut, by which Sigismund was obliged to pay an indemnity of 10,000 gulden within a year, failing which he was to forfeit Waldshut and his possessions in the Black forest. Sigismund had no ready cash and his efforts to secure a loan led to an even greater was.

Louis XI of France refused to advance any money; but by the treaty of Sain-form (May 14,6) Charles the Bidd, duke of Burgundy, was willing to offer 50,000 guiden in cash in return for a pledge of the Austrian lands m Upper Alsace, Perrette, the Black forest and the Rhemsh towns of Waldehut, Sackingen, Rheinfelden and Laufenburg Skiffully interpreting some permissive clauses of the treaty favourably to his own expansionst ambitions, Charles proceeded to occupy the whole of Upper Alsace. He appointed Peter von Hagenbach as his agent with instructions to redeem mortgages, repair fortifications and improve administration in a way that would permanently unite Alsace with the Burgundian territories. This threatened the empire, and Fredrick III declared the treaty void; it also greatly perturbed Berne, whose prospects of espansion were greatly reduced. Further, Charles the Bold entered into an alliance with Savoy and with Milan and also threatened to occupy Mulbious, closely associated with Berne.

One result was the formation of the Lower union in 473 by Basle, Colmar, Mulhouse, Seisatt and Strasbourg; another, the Perpetual understanding of 1474 between Sigismund of Tirol and the Swiss, by which the former renounced any further territorial claims in Switzerland in return for promises of money to pay off its debts. Hagenbach was illegally arrested and executed in the

spring of 1474-a deliberate act of defiance of Chailes the Bold, who seemed to be fully occupied elsewhere The Lower union, supported by Berne, attacked Héricourt (Nov 1474) and Blamont (1475), Louis XI promising cash subsidies while the war continued Inspired by Niklaus von Diesbach, this western and southern movement continued all through 1475, much of the Vaud and part of Savoy, including Grandson, Orbe, Echallens, Jougne, Morat, Avenches, Estavayer and Yverdon being occupied by the end of the year, the inhabitants of the Valus acting in collaboration with Berne to prevent any interference from the side of Milan Enraged and even a little alarmed. Charles the Bold came south in person in 1476, occupying Grandson at the end of February and hanging its Beinese garrison Beine had gathered a considerable force from many states of the confederation and from the Lower union for the rehef of the castle too late to effect this, they oftered battle on March 2 at Grandson Charles' faulty generalship in the face of a disciplined force of pikemen, whom he mistakenly despised as ignorant peasants, led to the rout but not to the destruction of the Burgundian army The duke regrouped his forces at Lausanne and again advanced against Berne in June. His way was blocked by the castle of Morat, held by Adrian von Bubenberg and 2,000 Bernese The threat to this position was sufficient to bring 20,000 Swiss to its defense, and the battle of Morat (June 22, 1476) ended in a complete Swiss victory Charles was forced to fall back on Lorraine, whose ruler, René, had turned against him At Nancy (Jan 5, 1477) the duke was defeated and killed The Burgundian lands devolved upon his daughter Mary, Louis XI of France secured the duchy of Burgundy, Savoy regained, with French help, a good deal of the Vaud, and a Swiss incursion into Franche-Comté failed to consolidate itself into a permanent occupation.

Fribourg and Solothurn Admitted.-Such unity as the Swiss had so far enjoyed had been based almost entirely on successful defense against external enemies They had been, in fact, poor and apparently insignificant communities co-operating with difficulty for self-preservation Their military prowess, nurtured by necessity, had made them potentially great the latter part of the 15th century was the golden age of the mercenary soldies, and the Swiss had proved themselves the best available recruits There was much money to be made by military service and, for the first time, prospects of lucrative employment opened to young men of valour But the cessation of danger from outside and the lure of foreign gold were almost sufficient to turn friendly states into competitors. There was no constitution to hold them together, no common officers, seal, law courts, comage or flag, there was a growing divergence of interest between the cities and the mountaindwellers, as well as between east and west, there were numerous family feuds and endless local realousies, culminating in disputes about the distribution of the booty taken in the Burgundian war and about the administration of the territories held in common, particularly the Thurgau Fribourg and Solothurn were anxious to come within the circle of the confederation, but neither Zurich not Lucerne was very anxious for their support, while the country districts were anxious to maintain their predominance over the cities By 1481 these differences had become so exacerbated that all common purpose seemed at an end and civil war threatened It was averted by the intervention at Stans of the mysterious and self-effacing hermit Nicholas Lowenbrugger (Nicholas von der Flue or Bruder Klaus), who arranged the compromise which held the confederation together. By this Stanser Verkommus the full sovereignty of the component states was maintained and reasserted, but each agreed to abstain from attempts to foment internal discord or separatist activity among the subjects of any other state, the confederate oath of union was to be renewed every five years; loot captured in war was to be divided proportionately among the actual participants in the campaign, but lands occupied were to be shared equally by the states involved. The ancient guarantees of mutual aid and assistance in time of war were renewed, and Fribourg and Solothurn were admitted as full sovereign members of the confederation.

Zürich and the Swabian War.—Zurich had grown steadily in power and influence after its readmission to full confederate

status in 1446 Its textile manufactures had increased and with them the influence of the guilds, the effective authority within the city was shared by the ancient aristocracy, the Constajel Hans Waldmann (1436-80) was recruited to the one by apprenticeshin and to the other by marriage, he took part in a number of cam-paigns, including the battle of Morat, and was equally successful in war, business, diplomacy and politics Burgomaster in 1482. he became virtual dictator of the city, upholding the interests of the citizens against the peasants and turning the city itself into a community whose welfare, amusements, food and clothing were subjected to regulation and supervision In 1480, however, Waldmann had to face an armed peasants' revolt, which led to a constitutional revolution and to his execution The aristociacy of birth and of labour joined hands, and the possibility of Zurich's dictatorship extending to the confederation was averted. The struggle between the government and the peasants, however, was repeated with local variations in Schwyz, Unterwalden, Zug, Lucerne and St Gallen, although in no instance did the country people secure all their hopes

The temporary eclapse of Zunch was followed by the last attack from the north. The emperor Maximilian I, uniting in his own person Habsburg and Burgundian traditions, sought to extend alike the imperal prerogatives and the possessions of his house. In tags the imperal allet of Worms had put forth a revested constitution for the empire ensuring internal peace and common taxation and setting up an impernal chamber (Rechaksmine genchl) as a final court of appeal. The Swiss communities were technically imperial subjects and had teasin to fear renewed Habsburg aggression. They were therefore anxious to renew the understanding with France—Charles VIII was opposing Maximilian in Italy and was ready to hire Swiss mercenaries—and unwilling to join the South German Sewabana league for the maintenance of peace

South of the ten states of which the confedention was now composed by the Grosons. In Raetu many small separate communities had united into an Upper league, a League of God's House and a League of the Ten Jurusdictions, and the two former were in alliance with the Swass confederation. In 499 a boundary dispute between Triol and the League of God's House had led to a Trioles incursion into the Engadine and the Munsterthal and thus to war with Maximilan, the Swass came to the help of their ally, the emperor took up the implied challenge and in 1499 there was fighting from Basle to Bornio Basties raged at Hard, Bruderholz, from Baste to Bornio Basties raged at Hard, Bruderholz, brown as the state of t

Basle, Schaffhausen and Appenzell Admitted.-Basle as a member of the Lower union had taken part in the Burgundian war with the Swiss and had learned the value of such co-operation, as an imperial city it evaded with difficulty an obligation to support Maximilian in the Swabian war, while the confederates obviously needed security in the northwest. The bishop of Basle was politically much less influential than he had formerly been, and on July 13, 1501, the state was admitted to the confederation It was a notable addition, for the city was well fortified, strong, relatively wealthy, a home of scholarship with an active university and with an industrious and busy population. Schaffhausen, although smaller, was in much the same position it had had much difficulty with local knightly landlords, it had sent men to help its Swiss neighbours since 1453 and been accepted by most as an ally; and it had firmly refused to join the Swabian league. It received the reward of full admission to the confederation on Aug 10, 1501, Pinally, on Dec 17, 1513, a little reluctantly, Appenzell, which had been an ally rather especially closely associated with the confederation, was admitted to full membership and partnership. It was the last addition to the whole body, now 13 independent states, until the French Revolution, and it was accepted only because it helped to redress the balance of the "country" as against the "city" states.

The Milanese Campaigns.—The northern frontiers of the Italian states especially Milan, were exceedingly ill-defined. The southern route through Uri over the St. Gotthard was of growing

importance for trade and much used by the mercenaries hired for service in the Italian wars The inhabitants of the Val Leventina renounced Milanese allegiance in 1475 and were upheld in 1478 by armed men from U11 and other Swiss states Bellinzona was besieged but not taken, and at Giornico a small Swiss force defeated a much larger Milanese one But Berne and the western states were not interested in this southward expansion and refused to support any further advances, and it was with some difficulty that in April 1503 Bellinzona and the Blemo valley were secured by Uri, Schwyz and Nidwalden from Louis XII (as duke of Milan) in return for help against Ludovico il Moro. There was, however, growing resentment felt at the expenditure of Swiss lives in fighting on behalf of strangers, and opinion was markedly divided about the continued value of the French alliance, especially when France controlled Milan The greatest man in the Valais was Matthaus Schiner, bishop of Sion and a cardinal, who had turned against the French In 1510 Schiner arranged for Swiss support of the Holy league formed by the masterful pope Julius II for the expulsion of the foreigner from Italy After the death of Gaston de Foix at Ravenna in 1512 Swiss, papal and Venetian forces in co-operation were able to secure the removal of the French from the plains of Genoa regained a transitory independence, Maximilian Sforza, son of Ludovico il Moro, returned as duke of Milan and acquiesced in the occupation of Locarno, Lugano, Mendrisio and the Val d'Ossola by the confederates, while the Grisons secured the Valtellina, Bormio and Chiavenna. At Novara (1513) a fresh French army under Louis de La Trémoille was almost annihilated in a hard-fought battle, after which the Swiss penetrated into the duchy of Burgundy as far as Dijon but jeturned home when promused a substantial sum of money Francis I renewed the French invasion of northern Italy in 1515. The division of interests between the eastern cantons (who were reluctant to leave the St Gotthard route uncovered) and Berne (traditionally well-disposed to France), together with a growing dislike of mercenary service and an equally strong distrust of Cardinal Schiner, led to a division of forces Berne, Fribourg, Solothurn and the Valais were bought off at Gallarate, and a truncated Swiss army, with Milanese and papal support, was defeated on Sept 14, 1515, at Marignan (q v ) with heavy losses Francis I willingly agreed to easy terms in 1516 retaining the duchy of Milan but acknowledging all that the confederates and the Grisons had gained in the Bellinzona area except Domodossola and paying a considerable sum as well

The Reformation.-Five dioceses-Basle, Lausanne, Sion, Chur and Constance-provided the spiritual framework for the ministrations of the church to the Swiss people Neither the institutions nor the men were suited to the changing needs of the 16th century. The bishops were sometimes nonresident, sometimes incompetent, often, as absentee landlords, disliked The parish priests were frequently ignorant and sometimes lazy or immoral While there were no territorial princes, as in Germany, to benefit by a redistribution of church property, the considerable monastic lands were coveted by certain cities, and if there was little active opposition to the indulgence system which so enraged Martin Luther, there was little popular support for it either. Humanism could hardly impinge upon the lives and thoughts of peasant mountain dwellers, but contacts with Italy were easy and Basle became the home of Erasmus and Joannes Froben's printing press. All these things affected the career of Huldreich Zwingh (o.v.) (1484-1531) who became the most influential figure in the Swiss Reformation A musical, intelligent boy of good peasant stock from the Toggenburg district he had taught classics at the University of Basle and had been parish priest at Glarus (1506) and at Einstedeln (1516) and people's priest (Leutpitest) in the Zurich minster in 1518. He had been to Rome and with Swiss armies in the field, had studied widely in the Fathers and read the Bible in the original Hebrew and Greek. Experience had convinced him that mercenary service was harmful to his countrymen, and his Bible study and reading of the works of Erasmus had made him critical of the pope and opposed to indulgences.

In the all-important city of Zurich the pulpit, properly used, could be most influential, and on Jan. 2, 1519, Zwingh started a course of sermons on St. Matthew's Gospel such as had not been

Lutheran although it was, in fact, the independent outcome of his own thought and studies. In the same year there was plague in Zurich which caused a revivalist movement. Next, in 1520, Zwingli was denouncing the compulsory payment of tithe to the canons The city council then permitted the public preaching of the gospel, and in 1522 Zwingli formally challenged ecclesiastical authority by eating meat (sausage) during Lent He also denounced clerical celibacy and married Anna Reinhard, setting out his convictions and theological standpoint in 67 conclusions, which were publicly debated in Zurich in 1523 Appealing to the Bible, he convinced his hearers; the Great minster was reformed, monks and nuns began to leave the cloister, the clergy to marry and the communion to be administered in both kinds, the income from church property being diverted to education or poor relief Images were discountenanced, preaching encouraged, relics hidden or destroyed, monasteries dissolved and finally, in April 1525, the mass was superseded by a simple commemorative service. Zurich had thus by steady stages accepted the Reformation, and Zwingli was lett almost as head of the state as well as religious leader He set out his religious teaching in writing, issued a vernacular translation of the Bible, rejected the teaching of the Anabaptists (who were proscribed) and secured a permanent majority of supporters in the city council

The Catholic states were by then seriously alarmed and made every effort to isolate the new teaching in Zurich and to prevent its extension even to the common lordships over which Zurich shared jurisdiction. It soon became apparent that religious and economic interests were likely to coincide, the strongly Catholic cantons were, generally, the rural mountainous areas, U11, Schwyz, Zug, Unterwalden, Lucerne, Solothurn and Fribourg, while the city-dominated communities, Basie, Beine and Schaffhausen in particular, were lost to the old faith. The coherence of the confederation had been difficult to maintain in 1480, it proved almost impossible in 1529. In February of that year the Catholic communities, encouraged by pope and emperor, formed a separatist group known as the Chustian union; Zurich then tried to force the pace by an armed campaign in June, but the western states, particularly Berne, were not interested, and the antagonists were singularly loath to kill one another. The first armistice at Kappel (June 24) was followed by an agreement to dissolve the Christian union, to allow treedom of worship in the common lordships and to decline further foreign pensions. But neither side kept the spirit of the agreement. Then, in Oct 1529, the efforts of Philip of Hesse to unite the Protestants by bringing Luther and Zwingli together at Mathure conspicuously failed By 1531, when an Italian adventurer attacked the Grisons, the Forest cantons could refuse to come to the help of a non-Catholic state and could complain that the evangelical faith was being forced on the Thurgau, Choosing time and place with great skill, the five Catholic cantons declared war on Zurich at Lucerne on Oct. 4, 1531, and sent a force north to Kappel, where they met a hurriedly raised detachment of volunteers from Zurich led by Jorg Goldli and with Zwingh in person among them, The battle of Kappel (Oct. 11, 1531) resulted in a Catholic victory and in Zwingh's death.

Zurich thus lost the effective leadership of the confederation, which devolved, not very satisfactorily, upon Berne; the Catholics regained an appreciable amount of ground, so that when the Jesuits came they were in a strong position. For almost three centuries after 1531 religion so divided the Swiss people that co-operation was hardly possible. The rare diets of the whole confederation, necessary only for the administration of commonly owned territories, were brief and formal; the Protestant cities entered into cordial relations with England, Scotland, northern Germany and Scandinavia; the Catholic states were the willing agents of France, Spain and Austria on the rare occasions when these powers were found acting together. The wonder is that the confederation survived at all.

Geneva was not to be admitted as anything other than an allied state until 1815. Important strategically, it had entered into a pact of co-citizenship with Berne and Fribourg in 1526 in order to throw off the rule of its bishop and to prevent its absorption

heard in the minster before his teaching was inevitably called unto the expanding and ambitious duchy of Savoy The Protestant faith was brought into the Vaud from France and preached by Guillaume Farel and Pierre Viret under the protection of Berne, which had already taken various parts of the Vaud into a kind of protective custody The Reformers were successful in 1535, after the usual public disputation, in inducing the independent city council of Geneva to forbid the public celebration of the mass Threatened by their former bishop and by Savoy, the Genevans appealed to Berne, and a Bernese force under Hans Franz Nageli overran the Vaud, occupied Lausanne and brought temporary se-curity to Geneva At this juncture John Calvin, who in 1536 had published at Basle his definitive Christianae Religious Institutio came to Geneva and, not without some setbacks, soon made that city the centre of an active and independent religious teaching Calvinist doctrine was explicit and logical, the duties of the Christian household were clearly prescribed, attendance at church, particularly at seimons, was enforced, sumptuary laws were enacted by the city, an excellent system of schools established and ministers of religion were chosen with the greatest care for their character and capacity By the agreement of Zurich (Consensus Tigurinus), made with Heinrich Bullinger in 1549, Calvinism became the creed of the whole of Protestant Switzerland The Catholic cantons would not agree to the inclusion of Geneva in the confederation so that the city had to rely upon the alliance with Berne, upon the desire of the communities of the Valais that Savoyard aggression should be restrained, and upon the obvious interest of France in a friendly neutral at such a strategically important point Savoy was to make a last attempt to capture Geneva by surprise in 1602; this failed, and the city was never again in serious danger until it was annexed to France in 1798

The Counter-Reformation and the Valtellina,-Carlo Borromeo (a v ) became archbishop of Milan in 1565, and much of southern Switzerland lay within his province He was determined to stamp out the new faith wherever possible even if this meant straining the law and peace-agreements, he set a personal example of piety and of activity, visiting Einsiedeln and encouraging active Catholic conversion wherever possible. From the Swiss college at Milan, which he founded, and from the Jesuit houses missionaries came north, but the Protestants expelled from Locarno found a place of refuge in Zurich, and the Inquisition found little support even in the Catholic cantons However, the nomination of a permanent papal nuncio was welcomed, and Lucerne and Fribourg gladly received Jesuit colleges The historian Giles Tschudi, by a well-managed war, the so-called Tschudikrieg (1559-64), and through French and papal mediation, got the decrees of the Council of Trent enforced in Glarus, with the ultimate elimination of the Zwinglians, and Appenzell between 1579 and 1507 was subjected to an intensive process of reconversion which was so successful that the canton split into the two halves, Ausser Rhoden and Inner Rhoden (it thus remained politically impotent until 1848, and the division is still operative) Lucerne not only became the centre of Catholic Switzerland but it was also represented in France, during the Wars of Religion, by Ludwig Pfyffer (d, 1594) and it was the chief component of the Golden league which supported Philip II of Spain. Melchior Lussy (d 1606) of Nidwalden not only advanced this cause by his skilful diplomacy, making himself very wealthy in the process, but he also secured the confidence of the pope and averted the threatened entire dissolution of the confederation.

The loosely united communities (Giev league, League of the Ten Jurisdictions, League of God's House) known as the Grisons, two-thirds Reformed, one-third Catholic, controlled the important eastern passes, which were of interest alike to Milan and to Venice. Milan was under Spanish control and jealous of its ancient commercial and territorial rival Venice, which in 1603 had secured the friendship of the Grisons partly through the powerful Planta family. The Valte'lina (q.v.) was governed by the Grisons and inhabited by Catholics; its roads formed the most convenient link between Milan and Austria, Habsburg allies whose co-operation was unwelcome to France. A revolt in the Valtellina in 1620 led to Spanish support for the inhabitants against their northern masters and to successful Austrian intervention. The treaty of Monzon (1626) called in the pope as a third party and led to further disputes, formented by the local patriot, pastor, politician and pervert Georg Jenatsch (q v ) and ended by a return to the status quo in 1639, with the Valtellina restored to Grisons sovereignty but

with the Catholic rights markedly reinforced The Thirty Years' War .-- All Switzerland was interested in the Bohemian war of 1618, which grew to a conflict that involved every great power on the continent, but the religious division in the confederation effectually prevented any corporate action This was advantageous, for a Habsburg victory might have meant a renewal of Habsburg claims or an enforcement of the Edict of Restitution (whereby the Catholics recovered lost ecclesiastical lands), while a decisive Swedish triumph must have altered the balance of power in the confederation decisively. Many Swiss soldiers were hired by either side, and much material was sold to the combatants at a profit, while the necessities of frontier defense caused all the 13 states to come to a rare agreement in the Defensionale of Wil (1647) The frontiers would be defended against any aggressor and a mixed council of war of Protestant and Catholics would direct a force recruited from all parts of the confederation and its subjects and allies. The Defensionale was to be revised in 1668 and certain details were challenged later. but the acceptance of the principle of defense of neutrality was significant. The negotiation of the peace of Westphalia (1648) owed much to the indefatigable labours of Johann Rudolf Wettstein, burgomaster of Basle, and it was appropriate that this European instrument should take notice of the explicit renunciation by

the emperor Ferdinand III of all imperial claims over Basle and

the former Habsburg territories in Switzerland, an act followed by

the abrogation of any claim by the Reichskammergericht to exer-

cise appellate jurisdiction there The Villmergen Wars and Louis XIV.—The soil of Switzerland, however carefully cultivated, could not support its growing population, and the temporary prosperity caused by the wars gave way to a depression in the latter part of the 17th century Exports were necessary, and for this an industry was required which should use as little heat as possible and make the maximum use of human ingenuity and activity. Home industries were popular, partly because conditions in the valleys restricted outdoor work, particularly in the winter. Hence wood carving, spinning, frame-work knitting and embroidery were popular; water power made textile manufacture (silk, cotton and linen) profitable, particularly around the lake of Zurich and in St. Gallen; and in western Switzerland the construction of clocks and watches and of musical instruments, at first luxury trades allied to the art of the goldsmith and the jeweller, centred in Geneva, spread to Neuchâtel, Olten, La Chaux-de-Fonds and Le Locle. Basle was a commercial city, where stockings and silk ribbon and the preparation of tobacco and snuff occupied many; Berne remained primarily the capital of a great agricultural state, where the real or imaginary virtues of the peasant received an exaggerated recognition which was later to become a kind of intellectual cult (popularized by Hans Caspar Hirzel in his Wirthschaft emes philosophischen Bauers, 1761). Mercenary service, particularly with the French army, was a popular form of employment, and returning soldiers brought

news of foreign markets and fashions that was often valuable, The government of a number of states, Berne, Lucerne, Fribourg and Solothurn in particular, was in the hands of a patrician aristocracy, exclusive and splendid. Difficult economic conditions after the Thirty Years' War led to a rising in 1653 of the peasants of the Entlebuch against Lucerne. With the help of neighbouring governments it was suppressed, but it was followed by similar trouble in the Bernese Oberland and in the rural territories of Basle. The peasants seemed united, and the cities in alarm cooperated for the defense of their privileges, irrespective of religious differences. A battle at Herzogenbuchsee established their superiority, and harsh punishments were meted out (followed by some belated reforms). Zürich tried to make the confederation more of a reality, but the attempt broke on the rock of religious prejudice. The Catholic states reinstituted the Golden league in 1655, and the expulsion of some Protestant families from Arth led to a split between Schwyz and Zürich which developed into no common language, coinage, system of weights and measures,

civil war between the five inner states and Zurich allied with Berne At Villmergen (Jan 24, 1656) the Catholics under Christopher Pfyffer defeated their opponents and reasserted to the full the favourable position secured at Kappel and the complete individual sovereignty of the cantons.

In the age of Louis XIV the Swiss could hardly escape the allpervading influence of Versailles If the Protestant states were not very eager to help the persecutor of the Huguenots, and the Catholic states looked to Spain for help, both could be influenced by the appeal of Jean de La Barde, the French ambassador, to renew the Perpetual understanding with France In 1663 an embassy confirmed this renewal by a spectacular public oath in Notre Dame at Paris and for the next half-century French influence was paramount in such external relations as the confederation had Louis XIV's aggressive policy was in many respects at the expense of ancient Swiss interests. At the end of the 15th century Swiss influence had been almost paramount in the Franche-Comté and in Alsace, and these were exactly the areas against which Louis proceeded most successfully In 1667-68 the Habsburgs succeeded in retaining possession of the Franche-Comté, but the French threat to it alarmed the confederates Its final annexation to France in 1678 brought France to the Bernese fronties and caused fears for the future of the French-speaking Vaud, while the French occupation of Strasbourg meant that Mulhouse and Rottweil could not hope to remain permanently linked with the confederation, Basle, too, recognized how serious French pressure could be when a French battery at Huningen confronted its defenses The confederation remained discreetly neutral during the War of the Spanish Succession, but politically its independence was the safer because of the victories of the duke of Marlborough and Prince Eugene One other setback to France occurred in Neuchâtel on the extinction of the ruling French family of Orléans-Longueville in 1707, a struggle ensued between the French candidate François Louis de Bourbon, prince of Conti, and the Prussian king Frederick I, in which the latter won the principality for the Hohenzollerns.

The religious question in the common lordships, particularly the Thurgau and the Rheintal, was a delicate one, as the populations of both creeds were ruled by nominally co-operating states of similarly divergent faiths Questions of mixed marriages and the education of children were urgent ones and roused strong feelings, which were accentuated by the attempt of the prince-abbot of St Gallen to dictate to his mainly Protestant subjects in the Toggenburg district A road entirely under Catholic control was being constructed from Schwyz into imperial territory, and the abbot Leodegar Burgisser was determined that the Toggenburgers should contribute labour and materials to its construction. They demurred and appealed successfully for support to Berne and to Zurich, and in 1712 an armed conflict broke out. The abbot had the support of the emperor Charles VI, which made France willing to mediate; moreover, the French representative, Charles François de Vintimille, comte du Luc, was well-disposed to the Protestant cause. Berne and Zürich co-operated well, while Lucerne was unable to co-ordinate effectively the forces of the Forest cantons, The abbot fled, the Protestants won a victory at Bremgarten, besieged Baden and blockaded their enemies elsewhere. A final battle (July 25, 1712) at Villmergen settled the issue in their favour; and the peace of Aarau (Aug. 11, 1712) established real equality of treatment for both sides in the common lordships, increased decisively the influence of Berne and Zurich in the confederation and entirely superseded the second peace of Kappel,

The Bighteenth Century .- Every form of government existed side by side: a patrician aristocracy, proud, exclusive and competent, ruled in Berne, Fribourg, Lucerne and Solothurn; Zürich, Basle and Schaffhausen were governed by their craft guilds and trading corporations; in the oldest states, Zug, Uri, Unterwalden, Schwyz, Glarus and Appenzell, the primitive democracy of the Landesgemeinde assured the participation in the government of every adult male citizen; in Neuchâtel and St. Gallen autocratic princes were in power. Every state, individually or collectively. ruled subject territories; there was little sense of nationality and army or law courts There was a general arr of contentment, prosperity and industry and determination not to change. A vigorous and varied intellectual life was evidenced by the work of Johann Jakob Bodmer, Johann Kaspar Lavater, the Bernouilli family at Basle, Albrecht von Haller and Johann Heinrich Pestalozzi (qq v.), as well as the philosopher Isaac Iselin (1728-82) The country was increasingly visited by foreigners Edward Gibbon wrote much of the History of the Decline and Fall of the Roman Empire in Lausanne, Voltaire was to be found on the frontier at Ferney Jean Jacques Rousseau was proud to describe himself as a citizen of Geneva, and his thought was profoundly influenced by Swiss conditions The general complacency was disturbed by several manifestations of discontent John Daniel Davel attempted to free Lausanne and part of the Vaud from the domination of Berne in 1723; he was quite unsuccessful and was exe-cuted, but not forgotten There was trouble in Appenzell raised by Lorenz Zellweger in 1733 Geneva unwillingly acquiesced in a greater degree of democratic government in 1738 A serious conspiracy against Berne headed by Samuel Henzi was decisively dealt There were demonstrations against the authority of with in 1740 Uri in the Val Leventina in 1755 and armed opposition to the patricians of Fribourg, led by Nicolas Chenaux, in 1781, but neither these, nor somewhat similar explosions in Schwyz, Lucerne and Geneva, presented any real challenge to constituted authority All the time a consciousness that something more than mere defense and self-interest held the Swiss states together was growing, and this found public expression in the formation of the Swiss society (Helvetische Gesellschaft) in 1761.

The French Revolution and Napoleon .- The ideas of "enlightenment," rationalism and general improvement which became widespread in 18th-century Europe were eagerly absorbed in Switzerland The writings of Montesquieu, Voltaire, Denis Diderot, Jean Le Rond d'Alembert and the Encyclopédistes, as well as the almost home-bred solvent thought of Rousseau, powerfully influenced the intellectual circles, many talked of liberty and equality in societies in which there was little practical application of either Some of the more advanced thinkers had found life more congenial in France than at home in 1789, and in 1790 a "club of Swiss patriots" was founded in Paris by Jean Castellaz and supported by a number of Vaudois refugees, by Henri Monod, by Jean Jacques Cart and, most notably, by Frédéric César La Harpe who had been employed by Catherine the Great in Russia to teach her grandson Alexander In 1791 F C La Harpe was urging the French people to support the malcontents in the Vaud and the Valais while, as in Great Britain, the conservatives in Switzerland were in strong opposition to Jacobinism. Feeling was roused to violent heights by the massacre of the Swiss guards of Louis XVI in the Tuileries (Aug 6, 1792), but neither this event nor the invasion of the lands of the bishop of Basle by a French army nor even the formation of the First Coalition led to war In Paris Robespierre urged correctly that the interests of France called for a friendship with the Swiss people; and the war party in Switzerland, led by Niklaus von Steiger, was able to secure only an agreement that the allies might recruit Swiss mercenaries. There was, however, a good deal of anti-French activity in Switzerland, including the collection of war material for use against France and a spy service in the pay of William Pitt's representative, Sir William Wickham,

The successful invasion of Italy by Napoleon Bonaparte in 1796 and the peace of Campo Formio (1797) was soon followed by the annexation to the Cisalpine Republic of the three provinces ruled by the Grisons, the Valtellina, Chiavenna and Bormio, and the Swiss could do nothing but accept the accomplished fact. In Paris, La Harpe and Peter Ochs of Basle were urging a French invasion of Switzerland in the name of liberty, using the separatist movement in the Vaud as an excuse for intervention. There were inspired riots in the Liestal near Basle and elsewhere, culminating in the proclamation of a "Republique Lémanique" in Jan. 1798. The French Directory at once sent soldiers to the help of the insurgents: Berne resisted, but received no help from the diet of the confederation, which debated fruitlessly at Aarau. A French contingent was driven back at Neuenegg (March 5) but at the same

time the main Bernese force capitulated at Grauholz and the city of Berne was occupied. Great quantities of supplies and bullion were carried off to France by Bonaparte's agent Guillaume Brune, while Peter Ochs drafted a new constitution for a unitary Helvetian republic. The common lordships and the associated districts were abolished, the number of cantons was enlarged from 13 to 23, a bicameral legislature (great council and senate), chosen indirectly by manhood suffrage, was to be responsible for law-making, and a directory of five members was constituted the executive The rights of the individual citizen were written into the constitution, including freedom of worship, of meeting, of petition and of the press A national militia was embodied, and local government was controlled by centrally appointed prefects

The new constitution was not imposed without resistance. In Nidwalden a revolt was savagely put down by Gen Balthasar de Schauenbourg, but discontent continued to manifest itself in the east, especially when the country was marched over by opposing armies A compulsory alliance with France gave that country the right to use Swiss roads for military purposes, and the French guarantee of the Helvetian republic offered easy opportunities for intervention. The allies regarded the republic as a satellite of France, and in May 1799 Austrian and Russian forces under Suvorov met a French army under André Masséna near Zurich before making a classic retirement into the Vorarlberg. The campaign had devastated the countryside, the price of provisions rose alarmingly, and a bad harvest made the winter of 1800 one that was long to be remembered for misery and unemployment. The cost of the new centralized government was relatively high, although the burden was more equally distributed, direct taxation being introduced for the first time and feudal dues, corvées, tithes and ground rents abolished without compensation. Some money was spent on education, and an elaborate scheme of free or cheap public instruction (culminating in a national university as in France) was adumbrated, but little could be done in a short time, J H Pestalozzi, however, was given a free hand to proceed with his innovations, which attracted much notice, although his adventures in journalism, as editor of the Helvetisches Volksblatt, were less satisfactory. The first constitution barely outlived the Directory in France. Then, after violent struggles between the protagonists of greater centralization and those who stood for more cantonal authority, the Malmaison constitution was established in May 1801, and Aloys Reding was chosen as the first Landammann or head of the state of 15 cantons. He had to meet political and financial difficulties, culminating in a rebellion in the Vaud and a kind of counter-revolutionary movement in Aargau and Berne

Napoleon promptly intervened to dictate the Act of Mediation from Saint-Cloud (Sept 30, 1802, amplified on Feb 19, 1803). The cantons were again defined with boundaries substantially as they have remained ever since Berne lost most, Aargau and Vaud becoming separate entities at its expense; the Grisons became part of the confederation, with Ticino, St Gallen and Thurgau. There were now 19 cantons, the new ones, where representative democratic institutions were accepted, the old Landesgemesinde cantons, where popular open-air voting continued but was limited to men of 20 years or more; and the city cantons Zurich, Berne, Fribourg, Solothurn, Basle and Schaffhausen, where the old aristocracy regained some of its ancient influence under new forms. With Lucerne substituted for Schaffhausen, these latter became the directing cantons, having seniority in turn, the chief magistrate for the year having custody of the seal of the republic and presiding over the assembly. The sovereign rights of the cantons, the issue of money, control over customs, education, monasteries and the posts, were restored, but freedom before the law, of settlement and of occupation was guaranteed to all citizens.

Napoleon was at first a relatively popular protector until the war with England obliged him to demand the 16,000 men promised him by the military capitulation. British recruiting of mercenaries was stopped and Switzerland forced to participate in the continental system with very great harm to its own commerce and industry, particularly in cotton. The Swiss frontiers were violated by armed forces. Thousands of Swiss took part in the Russian campaign, distinguishing themselves in the crossing of the Beresina

during the retreat but losing most of the effectives. The Valuis which had remained aloof from the Swiss republic was united with France as the département of the Simplen in 1810, nominally to put an end to anarchy, Ticino was occupied by French-commanded Italian troops in order to stop smuggling, and Neuchâtel was banded over to Marshal P. A. Berthier as a kind of feudal fief When therefore it became appaient in 1813 that the Napoleonic empire was crumbling after the battle of Leinzig, the Landanianian for the year, Hans Reinhard, called a special assembly at Zurich which voted for a policy of armed neutrality Prince Metternich soon saw this to be on the whole to the advantage of France and encouraged certain discontented elements, who desired a restoration of pierevolutionary conditions, to apply for military help A force marched through northern Switzerland on its way into France at the beginning of 1814, while the Napoleonic Act of Mediation was formally denounced

The Restoration.—The congress of Vienna devoted comparatively little time to the Swiss question, but certain of its decisions were none the less of far-reaching importance Swiss affairs were left largely to the competent advice of Baron Heinrich vom Stein, Baron Wilhelm von Humboldt, Count Capo d'Istria and Stratford Canning, who made as few boundary alterations as possible The most serious loss was to Austria, which annexed from the Grisons the three districts of Chiavenna, Bormio and the Valtellina, On the other hand, partly as a result of the efforts of Charles Pictet de Rochemont, Geneva was at last united to the confederation with reasonable boundaries, as too was Valais Neuchâtel, part of the dominions of the king of Prussia, also came in, and the independent existence of the Vaud as a separate canton was accepted Berne received the city of Biel and the former prince-bishopric of Basle The northern part of Savoy, on the southern shore of the lake of Geneva, was declared neutral, as was, permanently, the whole Swiss state. This declaration and a guarantee of Swiss integrity was reinforced by the second peace of Paris (Nov 20, 1815) The return of Napoleon from Elba made no substantial difference. Swiss soldiers in the service of France did not join him. a Swiss contingent marched with the allies, who were allowed to cross Swiss territory, into Upper Burgundy There was a small modification of the frontier of the Vaud and the creation of a free zone in Gex and its neighbourhood under the treaty of Tunn (March 16, 1816). Mulhouse remained in French hands and the Swiss confederation now consisted of 22 contiguous cantons Its constitution, after a conservative patrician restoration in Berne and some rioting elsewhere, had been settled at the "Long diet" of Zurich in 1814. Its keynote was the full restoration of the sovereignty of the cantons, almost the only federal institution being the army, for the defense of the frontiers, and for the unkeep of which a special fund was voted. Each canton was equally represented in the diet. Lucerne, Zurich and Beine acting as chief city for two years in turn. The possessions of the monasteries were placed under federal protection, but the earlier general freedom of worship, as of settlement and occupation, were not retained. Each canton continued to collect its own customs, coin its own money and manage its own affairs by the customary machinery, The franchise was everywhere limited so as to favour the old ruling families and the property owners, and any alteration of the federal

status quo was made constitutionally impossible. Military service with foreign powers again became possible. Louis XVIII gladly enlisting a number of men. Reserving its neutrality, the confederation declared its adhesion to the Holy alhance in 1817, thereby pleasing the tsar. Refugees in some numbers (including the future Napoleon III) obtained asylum within its borders, so that Metternich complained that the country was a focus of revolutionary plots and in a state of anarchy. The diet even agreed to place limitations on the freedom of the press from the rigid tariff restrictions of its neighbours. France and Austria in particular, from the decline in European purchasing power after the Napoleonic wars, from successful British competition in world textile markets and from its own constitutional inability to have any common policy on imports. Apart from some

more substantial signs of a religious revival, the Swiss states showed little activity in the 1820s

News of the July revolution in Paris in 1830 caused a good deal of excitement among the politically minded young men of certain Swiss cities Clubs, societies, even athletic associations began to demand larger measures of cantonal democracy, more popular education and some protection of women and children against industrial exploitation. A number of mass demonstrations led to the introduction of more liberal legislation in 11 of the larger cantons in 1831, implying the acceptance of the principle of popular sovereignty and the expansion of the franchise. More schools and training colleges for teachers were opened and universities were founded at Zurich and Berne There were, however, exceptions and the surge forward was followed by a reaction In Schwyz the opposition of reformers and conservatives was so violent that only the intervention of federal troops saved the state from civil war or self-partition In Basle long-standing differences between the relatively wealthy city, with great external interests, and the predominantly agricultural countryside came to a head in 1831 adoption of a democratic constitution for the state would give political preponderance to the country people and this the citizens were determined to resist. After violent demonstrations in 1831 the canton was divided in 1833 into two halves. Basel-Stadt and Basel-Land, which have remained permanent. Frederick William III of Prussia in 1831 most reluctantly abandoned a small part of his absolute rights in his principality of Neuchâtel (eg, that of nominating the whole of the cantonal council), but there were clashes between the republicans and the monarchists, neither of which was long satisfied with the compromise agreed to by the monarch One result of these differences was the formation in 1832 of the Siebnerkonkordat (Zunch, Berne, Lucerne, Solothurn, St Gallen, Aargau and Thurgau) opposed by the conservatives united in the Sarnenbund (Basel-Stadt, Uri, Unterwalden, Schwyz and Neuchâtel) None of these internal changes affected the traditional willingness of the country to shelter political refugees Poles were welcomed in considerable numbers in the north, while the harbouring of Prince Louis Napoleon (particularly after his attempted coup at Strasbourg) and the notonous use of Swiss bases by Giuseppe Mazzini almost brought about war.

The Sonderbund War .- The 1830s were years of considerable literary activity and of much thought about the future of the confederation Strictly constitutional revision was difficult, if not impossible, but the changing needs of the times and the general modification of opinion toward more liberal forms of government clearly suggested change With a growth of national feeling went a growing conviction that there were certain minimum individual rights of the citizens that ought to be secured to all, and some were prepared to enforce this point of view, others were impressed by the expense and dislocation caused by each canton's having its own tariff and customs barriers. There were several local mamfestations of discontent but they remained localized and ineffective, The bond of union was found in religion How was the principle of religious freedom to be enforced? The Articles of Baden (1834), condemned by Pope Gregory XVI but upheld by the liberal cantons, called for a general diminution of ecclesiastical privileges and exclusive claims, the mass demonstration against the appointment of D. F. Strauss to a chair of theology at Zürich in 1839 indicated the depth of passion aroused. Matters came to a head in Aargau There in 1835 the monks of Muri had objected to taking an oath of loyalty, and in 1841 the Catholic minority demonstrated in arms against a liberal revision of the constitution, The government then dissolved the Aargau monasteries, which were held to have fomented the revolt. The federal pact of 1815. however, had expressly guaranteed the property of the monasteries against secularization, and the Aargau Catholics appealed to their friends in the south The chief Catholic canton was Lucerne, and there Joseph Leu had taken advantage of the situation to secure the recall of the Jesuits, invited by Eutych Kopp, to undertake the teaching of theology and the control of the clerical seminary. This action was lawfully done and lay within the proper province of the canton, but was highly provocative. A demonstration against it in slight manifestations of embryonic nationalism and some rather Lucerne itself was severely punished, and a general popular demand for the expulsion of the Tesuits from the confederation was ignored. The Radicals passed from argument to violence, Joseph Leu was found shot, and from most of the Protestant cantons bands of volunteers (Freischarler) marched on Lucerne under the command of Ulrich Ochsenbein, a Bernese staff officer. The expedition was mismanaged, and in a fight at Malters more than 100 men were killed and more than 1.800 made prisoner (April 1, 1845)

The battle was followed by the union of the Catholic cantons, Luceme, Uri, Schwyz, Unterwalden, Fribourg and Valais into a separatist confederation, the Sonderbund The primary purpose was to prevent any alteration of the weak federal act of 1815, even if this were the declared will of the majority of the people, and foreign alliances were welcomed to this end Through 1846 opposition grew Berne, Solothurn, Zurich, Vaud and finally Geneva (under Tames Fazy) elected radical governments, determined to declare the Sonderbund an unlawful pact. In May 1847 St. Gallen joined the liberal cantons, and 12 votes out of 22 were certain. The diet met in Beine in July 1847 under the presidency of Ochsenbein and by a majority declared the Sonderbund to be dissolved A commission was appointed to draft a new federal pact, and the expulsion of the Jesuits from Lucerne, Fribourg, Schwyz and Valais was ordered, together with their exclusion from the whole confederation. In the name of religion and of state rights the minority determined to resist by force. Their leader, Constantin Stegwart-Muller, purchased arms, collected an army under the command of Johann Ulrich von Salis-Soglio and looked for support from Louis Philippe and Metternich This, partly because Lord Palmerston openly sympathized with the opposite side, was slow in coming. The Sonderbund War was soon over While at Lucerne there were divided counsels and uncertainty of purpose, the Radical cantons entrusted their men and fortunes unreservedly to Guillaume Henri Dufour of Geneva, a somewhat conservative professional soldier, simple, upright and unselfish. Dufour had more men than his opponents, and these better trained and equipped, with better guns and superior economic advantages. All these he used to decisive effect Fribourg capitulated on Nov. 14, 1847, almost without fighting, and the ring closed relentlessly in on Lucerne. Zug surrendered on Nov 21, and two days later the decisive battles were fought at Meierskappel and Gislikon. Luceine was entered, officers, Jesuits and nuns fleeing by steamer to Fluelen and then over the St. Gotthard to exile. Valais was the last canton to submit, on Nov. 28. Somewhat more than 100 men on both sides had been killed. The costs of the war were charged to the losers, and Appenzell Inner Rhoden and Neuchâtel had to pay fines for their neutrality. A collective note from the powers, unsupported by Palmerston (who sent Stratford Canning with sympathetic instructions to Berne), could be and was ignored until the greater troubles of 1848 left Switzerland free to work out its own destiny

The New Federal State, From 1848 .- The revision commission had a new constitution ready for submission to the cantons in June 1848, and it was adopted with little change by 151 cantons (1,897,887 votes) against 61 (293,371 votes). The central authority of the confederation was strengthened, particularly in regard to defense, law and order and the promotion of the common welfare. There was to be a cabinet or executive (Bundesrat) of seven. a supreme federal court (Bundesgericht), a senate or council of states (Ständerat) consisting of two representatives from each canton and a national council (Nationalrat) representing the county as a whole. Foreign affairs became the concern of the federation only, although separate cantons might, with federal approval, make agreements not of a political nature with one another and with neighbouring countries. The posts, currency, weights and measures and customs duties became the province of the federation, which thus acquired an independent revenue, cantonal expenses being met by local levies, taxes on salt, an excise on wine and stamp duties. Universal military service in a federal force was accepted; very small cantonal armies were approved, and the cantons controlled infantry training but not the cavalry or artillery. Service with foreign armies, military capitulations and the acceptance of foreign pensions or decorations were prohibited. Freedom of the press, of worship, of association and of settlement and equality before the law were secured to all, but these were somewhat narrowly interpreted in some cantons-the Jews remained under special disabilities and the Jesuits were excluded Berne became the seat of the government, Lausanne of the high court and Zurich of the federal institute of technology. It had been the hope of many that a great federal university at Zurich would unite the higher education of the country, the ordinary teaching of children being left to the cantons; but the existing academies at Geneva, Lausanne and Neuchâtel and the universities of Berne and Basle were not prepared to accept this measure of academic unification, and in the end only technology was thus centralized Similarly it was only after considerable differences of opinion that the French franc and the metric system of weights and measures were fully adopted

Foreign Affairs .- Neuchâtel, part of the dominions of Frederick William IV of Piussia, had in 1848 adopted a republican form of constitution, which had been accepted as that of a federal canton This was partly the work of the industrial region of Le Locle and La Chaux-de-Fonds and was resisted by the older ruling families, who proclaimed their loyalty to their monarch. The last of several attempts at counterrevolution took place in Sept 1856, when the lovalists under Comte Frédéric de Pourtalès-Steiger gained possession of the castle of Neuchâtel and had to be ejected by force The king of Prussia threatened to intervene on behalf of his "subjects" and mobilized his men; the federal army was placed on a war footing and sent to the northern frontier. British good offices and diplomatic pressure on Prussia by Lord Palmerston were followed by the mediation of Napoleon III, and in 1857 the king gave way, renounced all sovereign rights and secured an am-

nesty for his supporters.

More serious was the question of refugees. Switzerland, like Great Britain, was a home for political exiles from many countries, and Giuseppe Gambaldi and Mazzini now found safety from the Austrian police there Mazzini continued to plot the violent overthrow of the lawful rulers of Lombardy and Venetia and attempted to gain recruits for his secret associations until he left the country. In 1850 some measures were taken to prevent Switzerland from becoming too obvious a base for revolutionary propaganda but the law on this subject was never very strictly enforced In the Ticino the sympathy of the population for Italian nationalism combined with provocative anticlerical actions led to Austrian reprisals in the form of the expulsion of Ticinese from Lombardy and of an economic boycott which caused much suffering. Perhaps only Austrian preoccupation elsewhere prevented matters from being pushed to extremities. During the war of 1859 federal troops prevented Swiss sympathizers from crossing the frontier to join the insurgents and secured the interpment of belligerents who fled north. The war was followed in 1860 by the cession of Nice and Savoy to France and the reopening of the question of the neutral zone of Chablais, Faucigny and the Genevois. A federal councillor, Jacob Stampfli, threatened to readjust matters by a Swiss occupation of this area, a threat impossible to carry into effect as the easy repulse of a Genevan force that attacked Thonon in March 1860 clearly showed. In the end the neutral zone was enlarged a little, arrangements made about the collection of customs and the issue shelved until 1919 (when full French sovereignty over the area was to be asserted and accepted). The war had further been responsible, indirectly, for the establishment of the International Red Cross organization, a widely read pamphlet by Henri Dunant having drawn attention to the unnecessary sufferings of the wounded at the battle of Solferino (1859) In 1864, after much local activity, the Convention of Geneva regulated the care of wounded in war and arranged for the neutralization of the medical and ambulance services, distinguished by the federal cross in reverse colour

Economic Development.-The Swiss people did not at first welcome the advent of the railway; it was believed to be aesthetically and technically unsuited to mountainous country and it threatened the prosperity of the roadside hotels. The interests of Basie and Zurich conflicted and cantonal state-rights were a serious obstacle. It was therefore not until 1847 that an experimental line was opened between Baden and Zurich. After a report from Robcit Stephenson the federal council accepted the necessity for planned railway construction, and a conflict between Alfred Escher on the side of private enterprise and Jacob Stampfli on that of state ownership and control resulted in the victory of the former There was soon a manua for railway speculation, and lines were built with little or no co-ordination, sometimes in conscious rivalry. In 1853 the North Eastern railway linked Zurich with the Rhine and the lake of Constance, and in the same year the route Morges-Lausanne-Yverdon was opened, by 1850 the Central railway joined Basic with Olten and thus to Lucerne on the cast and to Solothurn. Beine and Thun on the south Finance, politics, personalities, cantonal rivalries and strategic considerations soon caused difficulties The construction of a railway through the St Gotthard tunnel was not completed until 1882, after much negotiating with Baden and Wurttemberg and with the Italian government. Escher was chairman of the company responsible, the confederation refusing to accept any financial obligations The estimates proved maccurate, and Escher was forced to resign, some part of the excess cost being borne by public funds. There were difficulties about gauge, locomotives and differential rates, and in 1883 a suggestion of unification by public ownership was rejected by a small majority A similar suggestion was rejected by a referendum in 1801, but in 1808 nationalization of the main lines was accepted by a popular vote, and the principle was extended in 1903 and 1909

The existence of ample water power and an industrious population gave Swiss industry a good start, but the absence of coal made further developments difficult until the progress of hydroelectric schemes supplied an alternative source of heat and energy. Swiss textile manufactures, including cotton goods, largely held their own in a predominantly free-trade world but declined in face of growing protection and large-scale competition. Embrodiery of good quality, however, was to maintain a wide market until about 1020, as did the Basle silk-ribbon industry Dyeing led to a considerable development of the chemical industry; and the traditional localized watchmaking and clockmaking was supplemented by large-scale factory production, which met with considerable success and led to the making of a wide range of machines and locomotives The home production of grain decreased in the 1880s, when it became much cheaper to import foreign wheat; the farmers turned to stock breeding and dairy farming Cheese making, the export of milk products of all kinds and the chocolate industry became widespread. Better communications with the outside heightened the flow of the valued tourist traffic.

Constitutional Revision and Internal Politics, 1860-1914. -The German Kulturkampf had its repercussions in Switzerland. The issue of the Syllabus errorum by Pius IX in 1864 attracted a good deal of attention and helped to make the Radicals also to some degree anticlerical, and the definition of papal infallibility in 1870 and the emergence of the Old Catholics in Germany, with many sympathizers in Switzerland, created difficulties. The Catholics of the diocese of Basle, in particular, refused to follow their bishop, Eugène Lachat, in accepting papal infallibility and declared him deposed. In this they were upheld by the cantonal governments, particularly Berne, but a majority of the clergy stood by their bishop, refused to accept his removal and protested against the secularization of his property. Berne now required that parish priests should be chosen by their parishioners from among those who were approved by the government and had undergone a state examination. In Geneva the action of the pope in appointing Gaspard Mermillod to an apostolic vicariate there without any prior consultations led to Mermillod's being expelled from Switzerland (1873), to the recall of the papal nuncio and to the prohibition of the activities of religious associations in schools.

The feeling thus aroused helped forward the growing demand for a general revision of the constitution of 1848. The introduction of the "initiative" (i.e., the right of the people to propose legislation) into the canton of Zürich in 1869 was a victory of the leftiwing democrats over Escher and his followers. The freedom of the press was extended, the principle of payments to councillors was accepted, and the example of Zürich was largely copied by

Berne, Lucerne and Solothurn. In 1866 the Jews, who had been denied freedom of settlement on commercial grounds, were admitted to full civic lights In 1874, partly as a result of the Franco-German War, a revision of the conditions of military service was generally demanded The division between those demanding greater centralization and increased federal authority and those upholding the rights of the cantons was focused on the rivalry of Emil Welti of Aargau and Louis Ruchonnet of the Vaud Radicals were only partially successful, but a revised federal constitution was accepted by popular vote in 1874 Direct popular control over the government was further extended by the principle of the referendum, by which a national verdict on an issue could be sought if properly demanded by 30,000 votes or eight captons In 1801 it was agreed that a demand by 50,000 votes (the initiative) could bring similar machinery directly into operation The army was more directly centralized, discipline and military education. the provision of arms and the collection of exemption-payments were to be federal matters, the force being based on the cantons (which also promoted some of the officers). Freedom of trade and choice of occupation within any canton was secured to all, and each canton was obliged to make provision for full primary education. Teaching was to be secular, civil marriages were made compulsory and the foundation of new monasteries was forbidden Certain other anticlerical regulations were made. The authority and appellate jurisdiction of the federal court at Lausanne was upheld and extended, and federal laws dealing with factories, bank notes and the railways were made more comprehensive money needed to meet the additional expenditure was secured by the extension and raising of duties on imports.

The opening of the St. Gotthard route attracted some attention to the Ticino; an increasing number of immigrants heightened party rivalries, Radicals and Conservatives being almost precisely equally balanced Religious feeling made matters worse, the Conservatives were accused of manipulating the elections so that they would remain permanently in power, and rioting in 1800 ended in the formation of a provisional government. Armed federal intervention became necessary, a revised electoral law introduced proportional representation, and an increased electorate was followed by a Radical and peaceable administration. Growing industrialization and an increase in the size of the urban populations were accompanied by the spread of socialism. The Social Democratic party formed in 1870 avowedly existed to forward the claims of the manual workers and, under Otto Lang, began to demand social reforms and positive opposition to large-scale capitalist enterprise A notable piece of practical socialism was the slow nationalization of the railways. Some action was necessary to prevent important sections of the railways from passing under foreign control, and in 1801 the federal council negotiated the purchase of the Central railway; but the proposal was negated by a popular referendum. Seven years of discussion followed, accompanied by an occasional strike. Then in 1898 agreement was secured for the public purchase of certain main lines. The principle was extended in 1903 and 1909 and was to make much easier the later electrification of the federal lines.

Political refuges, their numbers increased by German antisocialist legislation, continued to be a source of difficulty. In 1889 a German police inspector, August Wohlgemuth, arrested as a ppy, was expelled from the country only after an acrid exchange of notes between the Swiss government, represented by Numa Droz, and Bismarck. Anarchists were more difficult to central or eliminate. In 1898 the Austrian empress Elizabeth was asassinated in Geneva; and in 1902, after the murder of King Humbert of Italy, the Italian government demanded that action should be taken against Guillo Silvistrelli for provocative newspaper articles. A temporary breaking-off of diplomatic relations between Switzerland and Italy followed, but normal inercourse was soon restored. The principle of permanent neutrality had become firmly accepted by the people when World War I began in Aug.

World War I.—Attention in 1914 in Berne was soon transferred from the Swiss national exhibition to the needs of defense. The wisdom and the value of the policy of neutrality, imposed

alike by public instruments, by national interest and by tradition, was never in doubt. The citizen-army was rapidly mobilized and sent to guard the frontiers There was a momentary controversy over the choice of a supreme commander, the parliamentary representatives voting for Theophil Sprecher von Bernegg, the federal council (supported by a decisive popular vote) choosing Ulrich Wille Fortunately a neutral Switzerland had certain advantages both for France and for Germany, and no attack upon its frontiers was ever seriously considered. Universal military service, the rigours of campaign conditions without an enemy to fight and the use of soldiers for public works were less resented than the economic conditions imposed on a country which could neither entirely feed itself nor supply all its own raw materials. The tourist traffic, which the 20th-century enthusiasm for mountaineering and allied pursuits had rendered especially active, came to an end, a run on the banks was with difficulty averted, and the large number of resident foreigners added certain difficulties. But it was soon apparent that Swiss services could be of value alike to both belligerent groups and a certain amount of trade became possible For certain purposes Cette became an open port for Switzerland Heavy taxation and a good deal of borrowing were necessary, there was a violent controversy when two officers, Col K Egh and Col. M von Wattenwyl, were discovered to have given military information to the Germans (Feb 1916), sympathy with the Allied war aims was most prominently expressed by the French-speaking Swiss The factory workers in the cities were discontented at the lapidly rising prices and at political and industrial conditions unfavourable to them, and the Social Democratic party became a vehicle for the teaching of Lenin, resident in Zurich until his transference to Russia by the Germans The constitution, however, made political action slow and ineffective, and in Nov. 1918 a general strike was called. The workers demanded a 48-hr week, oldage pensions, national health insurance, female suffrage, the election of a new national council by proportional representation, conscription of labour and a capital levy Prompt action by the administration, the hurried expulsion of the Soviet legation, the arrest of strike leaders and the use of some show of military force ended the general strike quickly, after which a number of the de-manded reforms were enacted. Concurrently with the general strike the serious influenza epidemic that affected so much of Europe wrought considerable havoc.

Swiss agencies, governmental and private, including the Red Cross, were much used by the belligerents, but the expression of Swiss opinion had little effect on the course of the war or on the peace negotiations in Paris The collapse and partition of the Habsburg empire decisively altered conditions on the Swiss eastern frontier, where the inhabitants of the Vorarlbeig wished to form themselves into a new canton of the confederation The decision about this rested with the Allies, who declined to detach the territory in question from the new Austrian state and ignored the principle of self-determination, so that the treaty of Saint-Germain-en-Laye left the frontier there unchanged Switzerland was affected in several ways by the treaty of Versaillesthe international control of shipping on the Rhine thereby became very much a concern of France; the agreement with Germany about the regulation of the St Gotthard line was revised; and the neutralized "free" zone of Gex and Upper Savoy became an undifferentiated part of the French republ

The League of Nations.—The Covenant of the League of Nations, an space of the flattering choice of Genova as the headquarters of the organization, was not regarded with satisfaction in Svitzerland. The guarantees for the maintenance of peace in Europe were less adequate than the Swiss project had suggested, and it was obviously difficult for a permanently neutral state to be associated with the enforcement of collective security and with active resistance to aggression. But Swiss idealizing welcomed the general implications of the League, and outstanding difficulties were solved when, by the Declaration of London (Feb. 13, 1920), the council of the League recognized the special position of Switzerland as permanently neutral and agreed that no military assistance, direct or indirect, could be required from it in the event of a breach of the covenant, although "economic sanctions" would

become applicable The issue was long debated; the federal council advised entry into the League, which was accepted by the Nationalrat by 115 votes to 50, by the Standerat by 30 to 6 The necessary referendum on May 16, 1920, revealed even greater caution 112 states were for, 101 against, and the final figures revealed a favourable majority of 90,000 in a total vote of 700,000 On the social, economic, intellectual, industrial and medical committees of the League of Nations Swiss help was prominent. The country readily accepted the Kellogg pact abolishing war as an instrument of policy, and it advocated the early admission of Germany into the League The passage of foreign armed forces across Switzerland, even on the most direct and manifest League missions, was strenuously and successfully resisted Relations with the USSR, embittered by the murder of the Soviet representative Vorovsky at Lausanne in 1923, remained unsatisfactory, and Switzerland opposed the admission of that country into the League in 1934 In 1935 trade relations with Italy were not broken off when Italian forces invaded Abyssinia, although an embargo was placed on the export of arms to both sides The Sino-Japanese War, the failure of the Disarmament conference, the war in Spain and the successful Anschluss between Germany and Austria caused a national reaction, and in May 1938 Switzerland publicly refused to participate in future sanctions

World War II and After .- Switzerland had foreseen the outbreak of a general conflict and was militarily prepared against World War II On Aug 30, 1939, Henri Guisan was elected general (commander in chief) by a large majority. The army was mobilized, the frontiers guarded and conscription of labour enacted The tourist traffic and with it the hotel industry, already affected by European conditions, suffered greatly while both imports and exports were exposed to severe and immediate limitations There were many expensive diplomatic and Red Cross activities, and with the fall of France in 1940 a large number of French and Polish troops crossed the frontier and were interned Belligerent aeroplanes flew high over Swiss territory and were seldom shot down, certain towns, notably Schaffhausen, were ac-cidentally bombed Defense measures were deliberately concentrated upon the mountainous interior, and these were not put to the test. War materials were supplied to both sides and conveyed by rail between Germany and Italy Home agriculture, corn-growing in particular, received all possible encouragement, and the country emerged from the war less impoverished than might have been expected. A careful censorship was exercised over the press, incitement was avoided, as dislike for German National Socialist activities increased and the Communist party was proscribed. Diplomatic relations with the U.S.S.R. were reopened in 1945, and every effort was made to co-operate with international organizations which were consistent with the maintenance of the increasingly difficult principle of permanent neutrahty A number of wartime restrictions were removed by popular vote in 1949 when a return to direct democracy was accepted. The growing financial and economic difficulties of Europe in the 1050s, in spite of Swiss currency stability, were reflected in a number of individual trade agreements and efforts to secure markets and supplies of scarce raw materials. Some action against Communists at home and increased defense expenditure reflected Swiss reluctant acceptance of the consequences of world tension and anxieties.

Characteristically the Swiss government accepted an important and limited responsibility for the Korean truce in 1953.

# POPULATION AND SOCIAL CONDITIONS

Switzerland has an area of 41,295 sq.km. or 15,944 sq.mi. of which 22.6% is "unproductive" (i.e., bare mountains, plateau

slopes, lakes and rivers), 24.8% is occupied by forests, 243% consists of alpine pastures and only 28 3% is agricultural land.

Well-organized census returns were made at ten-year intervals from 1850 on, except that censuses were taken in 1888 and not in 1890, and in 1941 and not in 1940 The total population by the census of Dec 1, 1950, was 4,714,992. This represented an increase of 449,289 or 10.5% over the figure for 1941 and was almost double that for 1850 (2,392,740) Three-quarters of the increase since 1941 was due to natural causes and the remainder to immigration. The gains were the industrial ones of

cantons registering the greatest Zurich, Zug, Basle and Geneva (See Table I ) There was a steady increase in density of population from 150 per square mile

mile) and Uri (69) The Jura cantons are much better populated Vaud (305) and Neuchâtel (415) The densest of all are the cantons of Geneva (1,861) and Zurich (1,163).

The non-Swiss element of the population increased from 3% in 1850 to 11 6% in 1900, but fell to 8.8% in 1930 its total increased from 71,570 in 1850 to 355,522 in 1930. By 1941 there were only 223,554 aliens in the country (5 2%), the most numerous being Italians (96,018), next in order came Germans (68,622), French (24,396) and Austrians (9,652). In 1950 there were 283,367 foreigners

From 1800 to 1940 about 683,000 Swiss emigrated, mainly beyond the seas The annual average of emigrants was 6,800 in the decade 1871-80, reached 11,500 in the years 1881-88, fell to 4,400 in the years 1889-1900, reached the peak of 11,800 in the years 1910-20 and was about 6,000 in the decade 1931-40 The number of Swiss-born residents in the United States rose steadily from 13,358 in 1850 to 124,848 in 1910; by 1940 the number was

Language -- By the federal constitution of 1874, German, French and Italian are recognized as national languages for the purposes of debates in the federal parliament and for the public notification of federal laws and decrees. The recognition on July 8, 1937, of Romansh (See Rhaeto-Romance Languages) as a fourth national language did not affect the constitution German predominates in 16 cantons, including even the Grisons (where, however, one-third of the people speak Romansh in the

form known as Ladin and about one-fifth Italian): French prevails in Vaud, Neuchâtel, Geneva, Fribourg and Valais; Ticino is Italian-speaking Detailed census returns as to language had revealed a small amount of shifting (See Table II.)

Religion .- The constitution of 1874, while recognizing no established Swiss church, guarantees full religious liberty and freedom of worship, as well as exemption from any compulsory church rates. It repeats the constitution of 1848 in forbidding the settlement of Jesuits and their affiliated societies in Switzerland; the interdiction can be extended to any other religious orders that may endanger the safety of the state or interfere with the peace of other creeds. Protestants outnumber the Catholics in

Education -- Under the constitution of 1848 each canton or half-canton is sovereign in education The constitution stipulates. however, that elementary education is compulsory and free: that all public schools must be under the direction of the state; and that freedom of religion and conscience must be guaranteed. The confederation financially supports public elementary schools and vocational training in all its branches. By regulating examinations for the professions, the confederation also influences the curriculum of the higher middle schools The only institution of higher education maintained by the confederation is the Federal Institute of Technology at Zurich (Eudgenössische Technische Hochschule). The ministry of the interior in Berne is in charge of education on behalf of the confederation; there is an educational department in every canton,

Children enter the primary school at the age of 6 or 7 and leave it at 14 or 15. Secondary and lower middle schools form a link between primary and higher or vocational schools. Pupils enter between the ages of 11 and 13, remaining for two to five years; they are grouped in language-history and mathematics-science branches. The technical or vocational schools serve pupils under-

going an apprenticeship between the ages of 15 and 19. The higher middle schools either take their pupils from the senior classes of a primary school or themselves provide the preparatory schooling, in the latter case the course lasts 121 years They prepare their pupils for the higher school certificate in three types of schools: classical (with compulsory Latin and Greek), modern language and science, there are boys', girls' and coeducational institutions

In addition to the Federal Institute of Technology at Zurich (founded 1855), there are seven cantonal universities, viz., Basle (1460), Lausanne (1537), Geneva (1559), Zurich (1833), Berne (1834), Neuchâtel (1838) and Fribourg (1889). The commercial college of St Gallen (1808) ranks also as an institution of higher education. At Lausanne, Geneva and Neuchâtel instruction is given only in French, at Basle, Zurich and St. Gallen only in German Fribourg and Neuchâtel have no medical faculties Swiss universities are lay (laigues), but all, except Fribourg, are in cantons of Protestant tradition At Basle, Geneva, Lausanne, Neuchâtel and Zurich the theological faculties are Protestant at Berne there are Protestant and Catholic faculties, at Fribourg only a Catholic one Of the 16.501 students in 1950-51 nearly a quarter were foreigners, at Lausanne one in three students is a foreigner, at Geneva one in two. (See Table V.) (K. Sm.)

## GOVERNMENT

The Cantons.-The political divisions are the communes (of which there are now about 3,000), districts (198), and cantons (22). Of the cantons, 19 are undivided In 1831 the rural districts of Basle revolted against the undemocratic rule of the urban trade guild; the latter were twice defeated in the field before they agreed (in 1833) to the subdivision of the canton into Basle-Stadt and Basle-Land Unterwalden, from before 1291, was divided into Obwalden and Nidwalden, representing two distinct physical divisions in different river valleys. In 1291, Nidwalden accepted alliance with Urı and Schwyz; Obwalden did not join until later The Reformation led to a division (1597) of Appenzell into the Inner Rhoden, mainly Roman Catholic and pastoral, and Ausser Rhoden, largely Protestant and industrial,

Each of the 22 cantons has its own legislature, executive and judiciary. The older cantons have in some instances (Unterwalden, Appenzell and Glarus) preserved their ancient democratic assemblies (Landesgemeinden), in which all male citizens of full age meet, usually annually during April or May, in the open air for the purpose of legislation and the selection of an annual administrative council. In the remaining cantons the legislature (Grosser Rat or grand conseil) is composed of representatives chosen by universal male suffrage and usually by proportional representation. These councils exercise all the functions of the Landesgemeinden. The executive also in most of the newer cantons is elected by a popular vote and not as hitherto by the cantonal legislature. All the cantons have the referendum and the popular initiative, the application of which varies in the different cantons,

The cantons are build up of two main types of communes, or Gemeinden. These are the real units. The burgher communes (communes bourgeoises or Bürgergemeinden) are now principally of historical interest, having for the most part been gradually absorbed by the second class of political communes. Initially burgher communes were groupings of the people to manage the 'lands subject to common user' (mainly summer pastures and canton or one from each half-canton; i.e. 44 in all. The mode

forests). Later, by purchase or otherwise, the burghers became possessors of manorial rights. But when the federal diet imposed the care of the poor on the several communes (1551) these naturally gided only their own burgher members nonburgher settlers, were excluded from any share in the enjoyment of the common lands, or in their management, though they paid local rates Increased communication facilities, together with a shifting industrial population, made such restrictions invidious and unfait, particularly after the introduction, under the Helvetic republic (1798-1801) of a federal citizenship, superior to cantonal citizenship. Later, the increase of communal public duties meant financial obligations exceeding the sums produced by the common lands To avoid some of these inconveniences, political communes (municipalités or Einwohnergemeinden) were set up. The duties of these communes were largely increased after the liberal movement of 1830, the care of the highways, the police, the schools, the administration of the poor law being successively handed over to them Swiss citizens belonging to cantons other than those in which they resided were, by the federal constitution of 1848, given rights of voting there in cantonal and federal matters, but not in those relating exclusively to the commune itself, but the federal constitution of 1874 gave to permanent Swiss settlers communal voting rights, subject to three months' residence

In most cantons a number of communes are grouped together to form a district (Amtsbezirke) under a prefect who represents the cantonal government Minor communes are controlled by a small council. In the larger communes an executive council is chosen by a general assembly of all male Swiss citizens over 20 vears of age, of good conduct and with three months' communal residence. A maire (Gemeindebrasident) is elected by the larger body to preside over the council which has the management of all local affairs, including the carrying out of cantonal and federal laws or decrees, save and except matters relating to the pastures and forests held in common

The Confederation .- On the cessation of the federal pact in 1848 a new constitution was accepted by general consent. This is fundamentally the constitution in operation today, but sundry revisions were made in 1874 and 1931, and the amended constitution is the one now in force. Any subsequent revision can be made by normal federal legislation with a compulsory referendum on the demand of 50,000 franchised citizens, or by popular instiative. Changes require a favourable majority in total votes and total number of cantons.

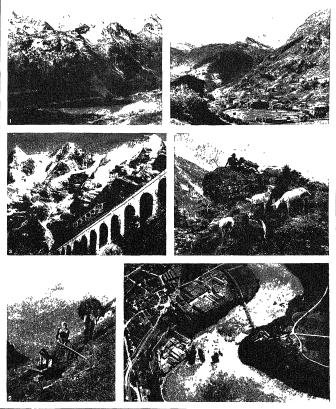

Federal sovereignty is exercised by the legislative federal assembly (Bundesversammlung) and by the executive federal council (Bundesrat), both meeting at Berne. The assembly consists of two chambers; the national council (Nationalrat) and the

council of the states (Standerat),

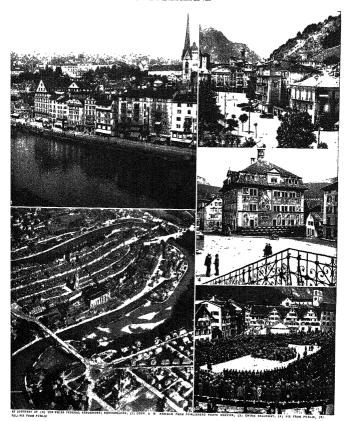

Every whole canton is represented in the national council, on the basis (from 1950) of one member for every 24,000 people in the canton, with an additional deputy for any remainder exceeding 12,000. On the census returns of 1050 there were thus 196 representatives varying from 33 for Berne and 32 for Zürich to 1 for Uri. The deputies receive attendance pay and travelling expenses from federal funds; neither allowance is lavish. (See Table VI.)

of their election, term of membership and rate of pay are entirely cantonal matters and vary accordingly. Their average financial allowance is less than that for a deputy to the national council

A general election of representatives to both chambers takes place every four years, voting is by proportional representation with universal male franchise for persons of 20 years of age or more, and any voter other than a clergyman, may be elected a deputy Laws passed by the federal assembly, though this represents both people and canton, can be vetoed as a result of a majority-supported referendum based on a popular initiative demand by 30,000 enfranchised citizens

The seven members of the federal council or government are elected for four years by the federal assembly and are responsible for the following departments foreign affairs, justice and police; interior, defense, finance and customs; public economy, and railways and post office. No canton may have more than one representative in the federal council, but according to custom it should always include a Bernese, a Zurichese and a Vaudois Usually four members are German-speaking, two French-speaking and one Italian-speaking. The president of the confederation (who is titular president of the federal council) and the vicepresident of the federal council (who is one of its seven members) are elected for one year only (Jan 1—Dec 31) by the federal assembly and cannot be immediately re-elected Federal councillors cannot hold a plurality of office, either federal or cantonal, and must not engage in any profession or trade The federal government (assembly and council) is being increasingly entrusted with matters formerly considered to be purely cantonal

Justice .- Each canton elects, controls and pays (often merely a nominal sum, even if the posts are not entirely honorary) its own magistracy for ordinary civil and criminal trials. There are cantonal variations in the penal code, e.g., capital punishment exists only in nine cantons and one half-canton

The federal supreme court (Bundesgericht) sits at Lausanne. There are 26-28 full members (plus 9 supplementary judges), elected by the federal assembly to hold office for six years with eligibility for re-election. The federal assembly also elects every two years the president and vice-president who, as such, cannot The original and final jurisdiction of the Bundesbe re-elected gericht extends to disputes between the confederation, the cantons, corporations, and private individuals, so far as these differences refer to federal matters and involve more than 4,000 Fr in financial suits It is a court of appeal against cantonal authorities in the application of federal laws and also against decisions of other federal departments. It is a court of trial for persons accused of treason, or other offenses against the confederation. The four courts of the Bundesgericht are: the court of accusation, the criminal court (with paid jurors elected by the people), the federal penal court and the court ot cassation (W. E. WH.; X.)

### DEFENSE

The Militia System .- Being composed of militia, the Swiss army contains no forces maintained permanently with the colours except a corps of 327 instructors a system which is unique in Europe. The total number of men physically fit and trained for military duty was

total number of men physicany in and trilines no minus? was year approximately reacted in 1953. In approximately reacted in 1953, approximately reacted in 1953, and the year in which their 20th birthday fails until the year of their aght birthday. Service may be rendered either personally or by the payment of a military tax. Volunteering before the legal age is permitted. The military is as payable up to the age of 48. Bollstennet takes place in the year of the 19th birthday. Personal service includes attendance in the year of the 1911 birtheay. reasonal service because for training, active service at home or abroad in defense of the country, and maintenance of public order and security. Men passed fit for auxiliary service pay a tax in lieu of military training for the years in auxiliary service pay a tax in lieu of military training for the years in which it would otherwise be performed. After physical training for boys, provided by the cantons under the supervision of the federal gov-

boys, provided by the cantons under the supervasion of the federal government, the training is carried out under the military department. The army consists of a first line (Atsizing or élite!) for ages from to 31 inclusive, Londoueler for ages from 33 to 40 inclusive, and Landoueler for ages from 35 to 40 inclusive, and Landoueler from 51 to 118 days according to the arm of their course varying from 51 to 118 days according to the arm of their course varying the state of the state

As the militia keep their rifles in their own houses, the whole army

can be mobilized in 48 hr In 1939 about 500,000 were mobilized, but after the collapse of France in 1940 the number under arms was reduced

10 55,000 O'rdet of Battle.—The country is divided into nine divisional distinct. There are use four independent monattan bigades and three areas of the country of the

105-mm guns and 105-mm and 150-mm howitzers. There is a small aut force, which by 1931 had 179 left lighter auteraft in the first line.

In 1950 Switzerland started an extraordinary rearmament program, the total cost of which amounted to about 1,400,000,000 Fin 1950 the total military expenditure amounted to 480,000,000 Fi, four times The military estimates for 1952 amounted to as much as in 1938

Higher Command.—In peacetime the Swiss aimy has no general, colonel being the highest rank. One of the seven federal councillors is head of the military department, the central authority in peacetime for national defense If troops are mobilized on a large scale the is need of the means of the month of the means of the mea Gen Henri Guisan was appointed There is a general staff under the military department and a national defense committee, with the head of the military department as chairman and the chief of the general staff and with four aimy colps commanders and the officer commanding infantry as members The committee ceases to function when a commander in chief is appointed

### ECONOMIC CONDITIONS

According to the census of 1941, the economically active popula-According to the census of 1941, the economically active popula-tion was employed as follows 4, 50% in the nanulacturing industry, handscrifts, building, mining and quarying, 20 8% in agriculture and ministration and the professions, 4,7% in the hold industry, 38% in tansport and communications, and the rest in domestic and other services. As these proportions clearly show, Switzelland is preponder-antly an industrial country, depending for its existence and prosperity on the export of machinety, apparatus and instruments. This is all the more supprising as the country has practically no useful mineral resources except salt and is entirely landlocked, without direct access to overseas markets. Apparently condemned by nature to a meagre

pastoral economy, the Swiss by hard work, inventiveness and persever

pastoral economy, the Swiss by hard work, inventiveness and peasever-ance have succeeded in developing other industries but their hold is always precurous. (See Table VII) Switzenland, the high average altitude, the excessive rannial and the prevailing system of small holdings all combine to prevent the country from being preponderantly agricultural From the middle of the roth century the rural population has declined: in 1888 the proportion of the economically active population engaged in agriculture was 37% as compared with so 8% in 1941. At the same time the country has be-come necessingly dependent on imports for its food supply, especially come increasingly dependent on imports for its food supply, especially for its bread grain. By 1850 the grain production was sufficient to food the grain production was sufficient to the proportion of the grain production was reduced to one-third. Softwarend its many state of the proportion was reduced to one-third. Softwarend its many proportion was reduced to one-third. Softwarend its many proportion was reduced to one-third. as complicated machinery, durable consumers' goods such as watches or boots and shoes, and luxury products such as fine salks, embroideries, perfumes and other articles of interest mainly to the feminine world As industrial technique progresses and as fashions vary, all production involving the use of intricate machinery and destined to satisfy luxury tastes is inevitably subject to extreme fluctuations. Thus, while the first of these two factors has favoured the development of the chemical, mechanical, aluminum and artificial silk industries, the second has crippled the silk and silk ribbon industries and in combination with the construction, export and establishment abroad of very high-grade embroidery machinery, all but killed what, at the beginning of the century, was the second branch of Swiss manufactures

Foreign Trade,-The importance of foreign trade for Switzerland is reflected in the annual value per head of the population of imports and exports together. In 1938 that figure, in Swiss francs, was 464; of 564 for Belgium, 523 for the Netherlands and, on the other hand, 430 for Great Britain. Imports, consisting of such necessities as raw

SWOLD, BATTLE OF: see OLAF I TRYGGVESSON SWORD, a general term for a hand weapon of metal, characterized by a longish blade, and thus distinct from all missile weapons on the one hand, and on the other hand from staff weaponsthe pike, bill, halberd, and the like-in which the metal head or blade occupies only a fraction of the effective length The handle of a sword provides a grip for the hand that wields it, or sometimes for two hands; it may add protection, and in most patterns does so to a greater or less extent.

Early Forms .-- Of the actual origin of swords we have no direct evidence. Neither does the English word nor any of the equivalent words in other languages, Aryan or otherwise, throw any light on the matter. Daggers shaped from reindeer antiers occur among the earliest relics of man, and there are flint daggers of the Neolithic period, which may be supposed to have been the model for the first hand weapons made of copper Bronze took the place of copper about 2000 B C., and the transition from bronze to iron in Europe is assigned to the period 1000 to 700 B.C Whatever the further discoveries of archaeologists, we know that swords are found from the earliest times of which we have any record among all people who have acquired any skill in metal-work There are two very ancient types, which we may call the straightedged and the leaf-shaped. Assyrian monuments represent a straight and narrow sword, better fitted for thrusting than cutting Bronze swords of this form have been found in many parts of Europe, at Mycenae, side by side with leaf-shaped specimens, and more lately in Crete. We have also from Mycenae some very curious and elaborately wrought blades, so broad and short that they must be called ornamental daggers rather than swords. The leafshaped blade is common everywhere among the remains of men in the "Bronze Period" of civilization, and this was the shape used by the Greeks in historical times, and is the shape familiar to us in Greek works of art. It is impossible, however, to say whether the Homeric heroes were conceived by the poet as wearing the leafshaped sword, as we see it, for example, on the Mausoleum sculptures, or a narrow straight-edged blade of the Minoan and Mycenaean pattern. In any case, the sword holds a quite inferior position with Greek warmors of all times. Strange as it is to a modern swordsman, representations m Minoan art seem to show that not only the bronze daggers but the long swords were used with an overhand stabbing action like a modern Asiatic dagger. The handles are too short for any but a rigid grip without finger-play. Before about 1500 B.C. the rapier type was the prevailing one, but there is no evidence of historical connection between the Assyrian and the Minoan rapiers It is thought that the leaf-shaped blade came to the Mediterranean countries from the north So far as we know from works of art, it was mostly used with a downright cutting blow, regardless of the consequent exposure of the swords-

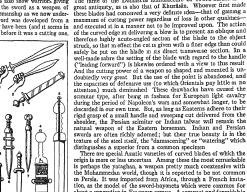

man's body, this, however, matters little when defence is left to a shield or armour, or both. Attic vases also show warriors giving point, though less often The use of the sword as a weapon of combined offence and defence—swordsmanship as we now understand it—is quite modern. If the sword was developed from a spearhead or dagger, it would naturally have been (and it seems in fact to have been) a thrusting weapon before it was a cutting one.

But when we come to historical times we find that uncivilized people use only the edge, and that the effective use of the point is a mark of advanced skill and superior civilization The Romans paid special attention to it, and Tacitus tells us how Agricola's legionaries made short work of the clumsy and pointless arms of the Britons when battle was fairly joined. Asiatics to this day treat the sword merely as a cutting weapon, and most Asiatic swords cannot be handled in any other

Historical Types,-The normal types of swords which we meet with in historical times, and from which all forms now in use among civilized nations are derived, may be broadly classified as straight-edged or curved. In the straight-edged type, in itself a very ancient one, either thrusting or cutting qualities may predominate, and the blade may be double-edged or singleedged. The double-edged form was prevalent in Europe down to the 17th century The single-edged blade, or back-sword as it was called in England, is well exemplified among the Scottish weapons commonly but improperly known as claymores (the real claymore, i.e. great sword, claid-Ligands mdg, is an earlier mediac Fie 1—GREE AND INDARA SWOWLES and I form), and is now all but e. 2–3. Great, et the classical types classically employed for military weapons. But these, with few experiences of the company of the influenced by the curved Oriental sabre. Among early double-edged swords the Roman pat-

Cavairy (monument at Worms)
From Trajan's column. 10. &
Sword handles (Kiel and Mainz) tern (gladius, the thrusting sword, contrasted with the barbarian ensis) stands out as a workmanlike and formidable weapon for close fight. In the middle ages the Roman tradition disappeared, and a new start was made from the clumsy barbarian arm which the Romans had despised. Gradually, the broad and all but pointless blade was lightened and tapered, and the thrust, although its real power was unknown, was more or less practised from the 12th century onwards. St. Louis anticipated Napoleon in calling on his men to use the point; and the heroes of dismounted combats in the Morte d'Arthur are described as "foining" at one another. In the first half of the 16th century a well-proportioned and well-mounted cut-and-thrust sword was in general use, and great artistic ingenuity was expended, for those who could afford it, on the mounting and adornment The growth and variations of the different parts of the hilt would alone be matter enough for an archaeological study. One peculiar form, that of the Scottish basket-hilt, derived from the Venetian pattern known as schiavone, has persisted without material change.

Quite different from the European models is the crescent-shaped Asiatic sabre, commonly called scimitar. We are not acquainted

origin is more or less uncertain. Among these the most remarkable is perhaps the yataghan, a weapon pretty much coextensive with the Mohammedan world, though it is reported to be not common in Persia. It was imported from Africa, through a French imitation, as the model of the sword-bayonets which were common for about a generation in European armies A compact and formidable hand weapon was thus turned into a clumsy and top-heavy pike. The double curve of the yataghan is substantially identical with that of the Gurkha knife (kukri), though the latter is so much

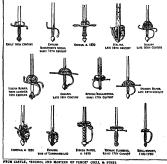

FIG. 2.-TYPICAL EUROPEAN SWORDS, 16TH AND 17TH CENTURIES

broader as to be more like a woodman's than a soldier's instrument. It is doubtful, however, whether there is any historical connection. Similar needs are often capable of giving rise to similar inventions without imitation or communication. There are yet other varieties which have acquired a strong individuality Such are the swords of Japan, which are the highly perfected working out of a general Indo-Chinese type; they are powerful weapons and often beautifully made, but a European swordsman would find them ill-balanced, and the Japanese style of sword-play, being

SWORD 694

two-handed, has little to teach us

Other sorts of weapons, again, are so peculiar in form or historical derivation, or both, as to refuse to be referred to any of the normal divisions The long straight gauntlet-hilted sword (patá) found both among the Mahiattas in the south of India and among the Sikhs and Rajputs in the north, is an elongated form of the broad-bladed dagger with a cross-bar handle (katår), as shown by a transitional form, much resembling in its shape and the size of blade the mediaeval English anlace and furnished with a guard for the back of the hand When once the combination of a long blade with the gauntlet hilt was arrived at, any straight blade might be so mounted; and many appear on examination to be of European workmanship-German, Spanish or Itahan There are various other Oriental arms, notably in the Malay group, as to which it is not easy to say whether they are properly swords or not. The Malay "parang latok" is a kind of elongated chopper sharpened by being bevelled off to an edge on one side, and thus capable of cutting only in one direction The anlace incidentally mentioned above seems to be merely an overgrown dagger; the name occurs only in English and Welsh; in which language first, or whence the name or thing came, is un-

Later European Developments.—In the course of the 16th century the straight two-edged sword of all work was lengthened, narrowed, and more finely pointed, till it became the Italian and Spanish rapier, a weapon still furnished with cutting edges, but used chiefly for thrusting We cannot say how far this transition was influenced by the estot or Panzerstecher, a late mediaeval thrusting weapon carried by horsemen rather as an auxiliary lance than as a sword The Roman preference for the point was rediscovered under new conditions, and fencing became an art Its progress was from pedantic complication to lucidity and simplicity

and the fashion of the weapon was simplified also Early in the 18th century, the use of the edge having been finally abandoned in rapier-play, the two-edged blade was supplanted by the bayonet-shaped French duelling sword, on which no improvement has since been made except in giving it a still simpler guard. The name of rapier was often but wrongly given to this by English writers. About the same time, or a little earlier, the primacy of the art passed from Italy to France. There is still a distinct Italian school, but the rest of the world learns from French masters It is unnecessary here to consider the history of fencing (q v).

Meanwhile a stouter and broader pattern, with sundry minor varieties, continued in use for military purposes, and gradually the single-edged form or broadsword prevailed. The wellknown name of Ferrara, peculiarly associated with Scottish blades, appears to have originally

belonged to a Venetian maker, or family of makers, towards the end of the 16th century. The Spanish blades made at Toledo had by that time acquired a renown which still continues. Somewhat later Oriental examples, imported probably by way of Hungary, induced the curvature found in most recent military sabres, which, however, is such as not to interfere with the effective use of the point. An eccentric specialized variety of the sabre is the narrow and flexible "Schläger" with which German students used to fight their duels, under highly conventional rules almost identical with those of the old English "back-swording" practised within living

memory, in which, however, the swords were represented by

Modern Swords .- The present military swords are descended from the straight "back-sword" and the Eastern scimitar or talwar The difference between the curved "sabre" and straight "sword" has been preserved in some languages (eg, in German, Degen stands for the straight, and Sabel for the curved, sword), though in English the single word

4 --- TYPES OF GERMAN AND BRITISH SWORDS

BRITISM SWUNDS, 18 and 18 sword (men) pattern, 1889, 351, long. 2 British cavality sword (officers) 35½ in long 3. British infantry sword (officers), 32½ in. long. 4 British general officer's sword, 32½ in long

"sword" covers both varieties The shape of the sword has varied considerably at different times; this is due to the fact that it is practically impossible to decide by trial whether a straight or a curved sword is the better under all circumstances The trooper can use his sword in three different ways-to cut, to guard and to point, and his success depends upon the training of his horse, his skill in horsemanship, and, above all, upon the dexterity and methods of his adversary. The result is that changes have often been made in cavalry armament under the erroneous impression that the arm used has been the main cause of

success The Ottoman cavalry up to the end of the 18th century was regarded as one of the best in Europe The curved European cavalry sabre so long in use may undoubtedly be traced to this cause, the superiority of the Turks being put down to their curved scimitars, though horsemanship and dash were really the dominating factors.

The shape of the sword to be chosen depends obviously on the purpose for which it is mainly intended. In this much-debated matter the facts appear to be as follows A determined thrust, especially when delivered by a horseman at full speed, is difficult to parry if it gets home, it will probably kill the recipient outright or disable him for the rest of the campaign. That this is the case is borne out by the very large proportion of killed as compared with wounded in the British cavalry when engaged with that of the French in the Peninsular War, the French making much use of the point, and their heavy cavalry being armed with a long straight sword On the other hand, to deliver a bold thrust, while disregarding the uplifted sword of the adversary, and leaving one's own body and head open to an impending blow, demands complete confidence that the thrust will get home before the blow can descend Such confidence can only be the fruit of long training, especially as it is the natural tendency of all men to cut when excited, therefore, in view of the excitement of the mêlée, it is considered by many unwise to adopt a sword with which a powerful cut cannot be delivered as well as an effective thrust, The swords adopted by most nations in recent times have represented a compromise. They have blades which are nearly straight, but of sufficient weight towards their points to enable an efficient cut to be delivered with them. France, however, in 1898 decided on a long straight sword designed wholly for thrusting practically identical with that which was in use about a century ago. The following year Great Britain introduced a slightly curved weapon, but in 1908 a new sword was adopted which has a long straight blade and is intended to be used chiefly for thrust-

SWORDFISH (Xiphias gladius), a large fish, widely dis-tributed in warm seas, dark purplish in colour, and with the snout prolonged to form a long, flat "sword" As in the mackerels, to which it is related, the caudal peduncle is slender and the caudal fin is widely forked. It reaches a weight of about 1,000 lb. It swims swiftly at the surface and feeds on other fishes, especially mackerel, and is said to dash into a school, killing a num-ber with slashes of its sword. The flesh is red and oily and is valued as food, fisheries exist in the Mediterranean and off the Atlantic coast of America, the usual method being harpooning The record swordfish taken with rod and reel was 13 ft. 9 in, long and weighed 860 lb

Related to the swordfish are the spearfishes (Tetrapturus), marlins (Makaira) and sailfishes (Istiophorus) in these the rostrum is not flattened, but is spear-like, rounded in transverse section. Each genus has two or three species, all large fishes of warm seas. Istrophorus americanus of the Atlantic is a beautiful fish, silvery and blue-backed, with the very large sail-like dorsal fin deep blue, with numerous round black spots. The members of this group are said to attack whales, and whereas this is doubtful, it is certain that they frequently strike ships, possibly mistaking them for whales. The sword or spear may be driven into a wooden ship with such force that the fish, in order to get free, has to break it off short. In the Natural History museum in London is a piece of timber, less than a foot square, containing the broken ends of three spears.

They were declared legitimate in 1397 and took the name of Beaufort from one of their father's SYAGRIUS (d 487), the last of the independent Roman

administrators of Gaul, was the son of Aegidius, who had seized Gaul while Ricimer was master of Italy Defeated in 486 by Syagrius fled, leaving his land at the mercy of the Franks He sought refuge with Alaric II, king of the Visigoths, at Toulouse, but Alanc imprisoned him instead of granting him refuge, and delivered him up to Clovis. He was executed in 487, secretly

and by the sword, according to Gregory of Tours

SYBARIS, a city of Magna Graecia, on the Gulf of Tarentum, between the rivers Crathis (Crati) and Sybaris (Coscile), which now meet 3 m from the sea, but in ancient times had independent mouths, was the oldest Greek colony in this region. It was an Achaean colony founded by Isus of Helice (about 720 BC), but had among its settlers many Troezenians, who were ultimately expelled Placed in a very feitile, though now most unhealthy, region, and following a liberal policy in the admission of citizens from all quarters, the city became great and opulent, with a vast subject territory and daughter colonies even on the Tyrrhenian sea (Posidonia, Laus, Scidrus) For magnificence and luxury the Sybarites were proverbial throughout Greece, and in the 6th century no Hellenic city could compare with its wealth and splendour. At length contests between the democrats and oligarchs in which many of the latter were expelled and took refuge at Crotona, led to a war with that city, and the Crotoniats, with very inferior forces, were victorious. They razed Sybaris to the ground and turned the waters of the Crathis over its ruins (510 B.C.) Explorations have so far failed to lead to a precise knowledge of the site. The only discoveries have been (1) that of an extensive necropolis, some 8 m to the west of the confluence of the two rivers, of the end of the first Iron age, known as that of Torre Mordillo, the contents of which are now preserved at Potenza, (2) that of a necropolis of about 400 BC-the period of the greatest prosperity of Thuris (q v )-consisting of tombs covered by tumuli, in some of which were found fine gold plates with mystic inscriptions in Greek characters.

SYBEL, HEINRICH VON (1817-1895), German historian, was born on Dec. 2, 1817, at Dusseldorf Sybel was educated at the gymnasium of his native town, and then at the University of Berlin, where he came under the influence of Savigny and of Ranke, whose most distinguished pupil he was to become In 1841 he settled at Bonn as Privatdozent in Instory. He was already known by his Geschichte des ersten Kreuzzuges (Dusseldorf, 1841; new ed, Leipzig, 1881; Eng. trans by Lady Duff-Gordon, 1861) This was followed by a study on the growth of German kingship (Die Entstehung des deutschen Königtums, Frankfurt, 1844, and again 1881), after which he was appointed professor. In the same year (1844) Sybel came forward as an opponent of the Ultramontane party In 1846 he was appointed professor at Marburg, while a seat in the Hessian Landtag gave him his first experience of political affairs. In 1848 he was present at Frankfurt, but did not sit in the National Assembly His opposition to the revolutionary party made him unpopular with the mob, who broke his windows, as his liberalism made him suspected at court. He sat in the Erfurt parliament of 1850, and was attached to the Gotha party, which hoped for the regeneration of SWOYERVILLE, an anthracite-mining borough of Luzerne Germany through the ascendancy of Prussia. During the years of county, Pennsylvania, U.S.A., 3 mi. N. of the public square of reaction that followed all political activity was impossible, but he Wilkes-Barre. Pop. (1950) 7,793.

was fully occupied with his great work, Geschichte der Revo-SWYNFORD, CATHERINE (c 1350–1403), wife of John Mutomate 1750–1500, for which he had made prolonged studies of Gaunt, duke of Lancaster, was a daughter of Sir Payne Roelt. in the archives at Paris and neswhere. The lacet ceitions of the eather volumes are much enlarged and altered, and a new edition was published at Stuttgart in 1882. The first three volumes have been translated into English by W. C. Perry (1867–69) In this work he for the first time showed the connection between the

internal and external history of France

In 1856 Sybal accepted the post of professor at Munch Here he founded the Historische Zeitschrift, the original and model of numerous technical Instorical publications. In 1861 he accepted a professorship at Bonn, which he held till 1875. He was at once elected a member of the Prussian Lover Bouse, and during the next three years was an active member, opposing the policy of Bismarck, not only on financial but also on the Polish and Danish aflars. In 1864 he did not stand for re-election. He had a seat in the Constituent Assembly of 1867, and while he joined the National Liberials he distinguished himself by his opposition to the introduction of universal suffrage, the effects of which he, as did many other Liberials, much distrusted. In 1874 he again accepted a seat in the Prussian parlament. In 1886 he settined

In 1875 he had been appointed by Bismarck director of the Prusian archives. Under his superintendence was begun the great series of publications, besides that of the correspondence of Frederick the Great, in the editing of which he himself took part. His last yeass were occupied on his great work, Die Begrandung des deutschen Ruches durch Withelm I (Munich, 7 vols., 1889–94). He died at Marbug Aug. 1, 1895.

SYCAMORE, the name applied to American species of the genus *Platonus* which also embraces the European and Asiatic planes (see Plane). The eastern sycamore (Platanus occidentalis), also known in certain localities as buttonwood or American plane, is probably the largest hardwood species in the eastern United States Best development is attamed on rich alluvial bottomlands, where it often reaches a height of 150 ft. and a diameter of 8 to 12 ft. It is occasionally found in pure groves, but is much more common as an occasional tree in association with other bottomland hardwood species such as river birch, red and silver maples, American elm, cottonwood and willows. Sycamore features large, simple, shallowly 3- to 7-palmately-lobed leaves, each with a long petiole swollen at the base and enclosing next year's bud. A pair of large foliaceous stipules at each node is another conspicuous feature. The flowers are monoecious and are borne in solitary heads which appear in advance of the leaves. The fruit is a multiple head of obovoid achenes, each furnished at the base with a fringe of brown silken hairs. Winter characters are also distinctive. The stout, brown, conspicuously zigzag twigs feature alternately disposed conical buds that are capped with a single scale and nearly surrounded by a leaf scar. Above each leaf scar is a prominent stipule scar which encircles the twig. The bark on small branches is creamy white; that on larger limbs and the main bole (except near the base of large trees) is characterized by the annual exfoliation of the brown outer layers to expose the lighter yellowish to white layers immediately below.

The Arizona sycamore, P. wright, is one of the most abundant hardwoods of southwestern Unted States. This tree features deeply 5- to 7-lobed leaves and the multiple heads of achenes are borne in racenoes clusters of from two to four. The California sycamore, P racemost, a medium-sized tree of the coast ranges and lower Siera Nevada mountains of California, features 3- to 5lobed leaves, and fruit in racemose clusters of two to seven. (E. S. Ha.)

SYCOPHANT, in ancient Greece the counterpart of the Roman delator (a.n.), a public informer (Cr. arcospérrer). According to ancient authorities, the word (derived by them from else, "fig." and doutse, "its above?" meant one who informed against another for exporting figs (which was forbidden by law). This derivation is doubtful and the question is still contested. Any Athenian citizen was at liberty to accuse another of a public offence. Allusions to the sycophants are frequent in Aristo-phanes and the Attic orators. The word is now generally used in the sense of a cringing flatterer of the great.

Sid La Whibley Companion to Greek Studies (1916).

THOMSON, ist Baron (1799-1841), British statesman, was

born September 13, 1799 After some years spent in his father's busness an Russa and m London he was returned to the House of Commons for Dover in 1826 In 1830 he jouned Lord Grey's ministry as vice-presedent of the board of trade and treasured of the navy He was elected MP for Manchester in 1835, a seat which he occupied for many years In 1839, he accepted the governor-generaliship of Canada, where it fell to his lot to establishing the Canadian constitution were recognized in 1840 by a K C B, and a perage. He took the title of Basine Sydenham of Sydenham in Kent and Toronto in Canada He died unmarried September 4, 1841, when his perages because extinct

His Memons were published by his brother, G. J. Poulett Scrope, in 1843

SYDENHAM, GEORGE SYDENHAM CLARKE, IST BARON (1848-1933), British soldier and administrator, a leading authority on fortification, was boin in Lincolnshire on July 4. 1848. Educated at Haileybury and Wimbledon, and afterwards at the Royal Military Academy, in 1868 he entered the Royal Engineers. Having served in various expeditions abroad, he returned to England in 1885, and was employed at the War Office until 1802 From 1804 to 1001 he was superintendent of the royal carriage factory at Woolwich. On his retirement from Woolwich he was made a member of the committee on War Office reorganization In 1901 he was appointed governor of Victoria (Australia), and on his retirement in 1904 he became secretary to the Committee of Impenal Defence. From 1907 to 1913 he was governor of Bombay. He had been created GCMG. in 1905, and in 1913 was raised to the peerage. In addition to his classic work on Fortification (1896; 2nd ed. 1907), his publications include The Navy and the Nation (1897) and Studies of an Imperialist (1028)

SYDENHAM, THOMAS (1624-1689), English physician, was born on Sept. 10, 1624, at Wynford Eagle, Dorset, the son of a country gentleman He received his MB from Oxford in 1648, and about the same time became a fellow of All Souls After further study and a period of service in the Puritan army. Sydenham continued his researches at Montpellier In 1663 he passed the examinations of the College of Physicians and was thereby able to practise in London In 1676 he became M.D. of Cambridge. He died in London on Dec. 29, 1689. Sydenham's fame among his contemporaries rested on his successful cooling treatment of smallpox, on his laudanum (the first form of a tincture of opium), and on his use of Peruvian bark in quartan agues. But his more important contributions to medicine soon became recognized, and he himself regarded as the English Hippocrates He revived the Hippocratic idea of Epidemic Constitutions, and made an elaborate study of the variations in epidemics of different diseases according to different seasons, years and ages Further, rejecting the traditional dogmas of medicine and insisting that observation should have precedence over theory, Sydenham diligently studied the natural histories of diseases and contended that most forms of ill-health could be ranked in certain definite species His title of the founder of modern clinical medicine is warranted by his clear accounts of the diseases of his day, especially of malaria, plague, smallpox, hysteria and gout. Sydenham is also credited with the first diagnosis of scarletina and with the modern definition of cholera. Acute diseases, such as fevers and inflammations, he regarded as a wholesome effort of the organism to resist injurious influences operating from without. but chronic diseases he held to be due to a deprayed state of the humours arising from errors of diet and methods of life.

Sydenham's chief works are: Methodus curandi Jebres (1668), which appeared in a 3rd edition under the better-known title of Observationes: nedicae (1676); two Epitoles responsories (1680), one 'on Epidemice' and one 'on the Lues veneres'. Dissertatio epitolarist (1682), an account of hysteria, and Tractains de podage et hydroge (1683), his famous description of gout. His last completed work was Processus integri (1629).

SYDENHAM, a large residential district in the south of London, England, partly within the metropolitan borough of Lewisham (q,v). The Crystal Palace (q,v) was in this district. SYDNEY, a city situated in the Sydney Basin (County Cum-

us, bo

# SYDNEY

Sperland) is the capital of New South Wales, Australia, and hes (lat 33° 52' S, 151° 12' E) mainly on the south shore of Port Jackson somewhat south of the central east of the State The oval-shaped area which extends from about Broken Bay (Hawkeshury River estuary) on the north to a little beyond Port Hacking on the south, and from the coast east of Sydney c. 40 miles mland (near Glenbrook) forms the lower part of a geological and tectonic basin which is disposed fairly symmetrically about the line Botany Bay-Penrith.

The Sydney Basın is enclosed on three sides by flattish highlands which are, moreover, deeply dissected and seamed with gorges by streams which now, for the most part, form part of the Hawkesbury system but which formerly had different (westward and north-westward) courses and were dislocated by the late (Tentrary?) uplift which raised the plateaux. On the seaward side, also, recent earth-movements have resulted in the drowning of river valleys and created spacious mlets-Port Hacking, Botany Bay, Port Jackson, Broken Bay—but here also the basin-edge structure is apparent in the upstanding cliffs which form an outer tampart along the coast and give rise, at the entrance of Port Jackson, to the famous Sydney Heads, great sandstone cliffs which admit between them a deep (80 ft. low-water) sea passage of a minimum breadth of 2 mile.

The Sydney Basin is one of the largest coastal lowlands of the State, but its lack of easy land communications makes the presence and growth of Sydney seem somewhat surprising. The reasons are partly physical but more historical the superiority of the deep and sheltered harbour, defensible yet easily accessible from the sea, gave it an advantage over the shallower and more open Botany Bay and the semi-silted Port Hacking, and when Governor Phillip, in 1788, removed the early settlement from Botany Bay, he chose the small deep-water cove at the head of which now stands Circular Ouav, but where was then a fresh-

running stream (Tank Stream) now obliterated.

Port Jackson, sheltered from the southerly gales, covers an area of 22 sq miles and has a highly embayed coastline-a succession of romantic low bluffs and coves, still often densely wooded, giving a total shore-line of nearly 190 miles. It opens a way into the heart of the lowlands and upon its southern and lower shores (elevation 100 ft.) the original settlement grew. For some time it was, from the point of view of its founders, not only "the State," but "all Australia," and from it emanated, and upon it centred, much of the energy and initiative which built up the growing colony. Hence its triumph over physical obstacles, for the roads and the railways have had to cross the highlands at one of their most difficult sections, and, outside the basin, and apart from a few special areas—e g., mining centres, and also the tourist resorts (Katoomba, etc.) attracted by elevation and scenery the barren and rugged highlands at a distance of 50 miles are still almost unoccupied. The city expanded rapidly (pop. 1861, 97,061; 1901; 487,932; 1921, 906,103) until in 1933 the total metropolitan area contained 1,235,267 inhabitants, or 47.5% of the population of New South Wales. The metropolitan area includes the city proper (Sydney in 1933 with 88,312; North Sydney 49,749) and a group of suburbs organized into a total of 48 additional municipalities. Altogether in 1933 it covers an area of 244 sq. miles and has a density of 5,062.98 per sq. mile. But this concentration of a large portion of the citizens of a vast State into what is virtually the Sydney Basin is characteristic. The remarkable growth of large industrial cities, which in so many countries has drained the countryside during the last half century, has characterized Australian growth from almost the beginning and without the typical agrarian preliminary stage.

However, as the city grows, industrial and commercial occupation advances and the residential areas are pushed farther out. Thus the higher and less accessible northern shores of the harbour have developed mainly as residential areas (e.g., Ryde, pop. 27,861). Industries are expanding along the southern shore—Redfern (18,834), Paddington (24,674), Balmain (28,472)—and westwards—Granville (19,718), Parramatta (18,076), Lidcombe (17,379)—so that residential areas are now developing far afield. Along the southeast coast is Randwick (78,957) and in the Bot- Heads and close to the busine

any Bay (q v) area are Berdey ( ? ... mned Hurstville (22,663) and Canterbury (70 mally erally healthful and invigorating, coul mally winds in winter (May to September in his. cover unpleasantly humid in summer The provident was ber-April (inclusive) are from the north 6r). from 70 1° F in summer to 56 2° F in with anv thev F and 35 9° F. Sydney is a city of sunthing Rainfall is distributed throughout the year isted and winter maximum (Feb-July) and et : 4 gical besides its splendid site, has had the advantage that r un conlocal quarries The old town had win-hit part of the and enclosed streets. In spite of much record to any wear tenalong the water-fronts-some of these 167 the an old-world flavour. The public building ren notably fine, the two Cathedrals (Anglican at 1) bus the University, Post Office, several of the king of the king. besides some of the public galleries, etc. 1 gard face The main streets also offer excellent special and and out and substantial architecture, while it; .. ... (Government House, etc.) have historical at the late of the unusually well endowed with parks, recreated to get . and mine Domain, Hyde Park which commands man a product water in addition the Sydney Cricket Ground, the Hours, Salvall and Society's Ground where is held annually the it is the total made cultural show in the State. There are 6,000 at 15 and the serves in the municipalities, and two national restricts by home Park, 16 miles south of Sydney (33,800 ac.) area : 1 + Hr hand and the Kuringgai Chase (35,300 ac.) 15 miles north to Berling Bay-both with magnificent scenery-less to come and Parramatta and Botany Bay, making a total (14574 6/ 146 hour se reserves besides 440,000 ac. commons within the (greater) states politan area.

The harbour of Sydney, with its coves, creeks and beggs, is a favourite pleasure resort, as are also such besther to Maria for surf-bathing, etc. Sydney has an excellent and as well water supply derived chiefly from the Nepean, Cataract and Company Rivers (347 sq.miles catchment), the reservoirs containing (1941) So,000 million gal. Trams (375 m. of track of which the miles are electric, the remainder steam) and electric and steam research serve the city and suburbs, and ferries ply in the hartway. The great steel-arch Sydney bridge, completed in 1931, spans the her bour from Dawes Point (south) to Milson Point (porth), has a total length of 3,770 ft. (main arch span, 1,652 ft.; cleares; t vessels passing underneath, 170 ft.), and carries a roads av vessels passing underreauti, 170 11.), and carries a roads sy wide, two fontways, and four lines of rulway. It is one largest steel-arch bridges in the world. The city is, is real its social, educational and artistic life a leading city of the ern hemisphero. There are 6,123 factories employing hands in the Sydney Basin area (Cumberland Counts) hands in the Sydney Brain and Committees 5,974 factories and 183,600 hands are in the marea. Clothing, metal, machinery (including railway and committees the committees of th mdustries are the most important, food and drinks coming next. (For industrial areas and suburbs: v. is also the chief commercial, banking, warehousing centre of the State. Upon it are centralized the from its own basin, but from a very large part of the meat, butter, fruit and many other primary pr way to the city, from inland or by coasting s sumption or for export, but most important ar istic is wool. Sydney is by far the largest wo Australia and its sales, which begin in Son months, are world-famous. Port Jackson

rivalled opportunities for harbou The Sydney Harbour Trus has pursued a vigorous policy and largely transformed the e of the water-front. The princi

developp stitufe elop

companies, etc. Woolloomooloo Bay (6.000 ft wharfage) is the principal overseas harbour, Circular Quay (3,600 ft ) is used both for fetry and overseas traffic, Glebe Island (4,800 ft) is the wheat-exporting hatbour with modern appliances including an elevator of 6,500,000 bu, capacity, and there are also wool, timber, and other special cargo whatves, warehouses, etc. All these are on the southern shores and do not include ferry wharves. private jetties, etc. The islands (9) in Port Jackson are either pleasure resorts or used for special (naval, fire-station, etc.) purposes. On Cockatoo Is and at Woolwich are large graving docks. Some 7,500-8,500 vessels (7,500,000-0,130,000 tons) have entered Sydney Harbour in recent years, of which c 2,400 (7,200,oco tons) are engaged in overseas, the remainder in inter-state (coasting), trade. In 1939 the cargoes shipped amounted to 212,oco tons interstate; and 1,000,000 tons overseas. The total discharged was 1,400,000 tons. The total overseas trade is valued at more than £100,000,000, constituting Sydney easily the first port in Australia and one of the foremost in the British empire

in Australia and one of the foremost in the british empire See Griffich Taylor, "The Warped Littoral Around Sydney" in Proc. Royal Soc. N.S.W., vol. lvn, 1923, and also in Commonwealth Year Book, No. 20, 1927, etc.; K. Ussher, The Cities of Australia (1928). Official Year Book of N.S.W. (1938-39).

SYDNEY, the chief city of Cape Breton county, Nova Scotia. on a good harbour, the eastern terminus of the Canadian National railway. Pop. (1951) 31,317. Formerly a quiet country town, it became between 1891 and 1901 the chief shipping port of the Dominion Coal company, which has ten collieries within a radius ot ten miles of the city, and the site of the large works of the Dominion Iron and Steel company.

On the opposite side of the harbour are the flourishing towns of North Sydney and of Sydney Mines. The town is the starting point for the line of steamers to the Bras d'Or lakes and a favourite summer resort. North Sydney is the terminus of the ferry line to Port aux Basques, Nfd. Sydney is a trunk line port of call of

several air lines to St. John's, Nfd.

SYED AHMAD KHAN, SIR (1817-1898): see SAYYID Ahmad Khan, Sir.

SYENITE, in petrology, the group name for a class of plutonic rocks composed essentially of an alkali-felspar and a ferromagnesian mineral A special group of alkali-syenites is characterized by the presence of a felspathoid mineral (nepheline, leucite, analcime or sodalite).

The name was first used by Pliny for the rock occurring at Syene (Assuan) on the Nile in Upper Egypt This rock, so ex-tensively worked in ancient times for monumental structures, is a hornblende-granite with abundant quartz, Werner subsequently adopted the name for the class of tocks defined above, of which the type example is the hornblende-syenite of the Plauen'scher Grund, near Dresden. As essential constituents there occur sodaorthoclase and green hornblende with subordinate amounts of oligoclase felspar The texture of syenites is like that of the granites, hypidiomorphic-granular. Mineralogically these rocks differ from granites only by the absence or scarcity of quartz. The alkali-felspars include orthoclase, perthite or albite, more rarely microcline, while the ferromagnesian mineral may be biotite, hornblende or pyroxene. In the alkali-syenites, the amphiboles or pyroxenes are frequently soda-bearing varieties. The more normal syenites are divisible into augite-, hornblende-, and biotite-syenites according to their prevalent dark-coloured mineral, but syenites are also divisible, as in the case of granites, into potash and soda syenites, according to the type of alkalifelspar. The accessory constituents include sphene, apatite, zircon, magnetite and pyrites. Quartz, except in the special group of alkali-syenites, is rarely absent, but never abundant. A special suite of accessory minerals, cancrinite, eudialyte eucolite, katapleite, melanite, corundum, etc., is found in this latter class. Syenites are by no means common, and are not of equal importance with granites and diorites from a geological standpoint.

Among the potash syenites, are classed the original hornblende-

syenite (Plauen), and the well known hornblende-syenite of Biella, Piedmont, of which analyses are given below.

The rocks known as nordmarkite, akerite, larvikite and pulas-

controls c 63,000 ft. of wharfage which is leased to shipping kite are classed among the soda syenites. Of these the first two are quartz-bearing and were originally described from the Oslo region (Norway) Nordmarkite is built up of pink microperthite and subordinate aegitine and arrvedsonite together with some quartz. Akerite is a quartz bearing augite-syenite with considerable plagnoclase. The larvikites are augite-syenites with large cryptopertintic (anorthoclase) felspars possessing a remarkable schiller structure They are coarse-grained rocks, origmally described from Larvik (Norway), and their great freshness and indescent appearance when polished make them favourite ornamental stone for facades and pillars. The subordinate constituents are titaniferous augite, olivine, and barkevikitic hornblende. The pulaskite svenites, first described from the Fourche mountains, Ark., consist of soda-orthoclase, alkalıhornblende together with some biotite. The occasional presence of nepheline indicates their close relation to the nepheline-syenites (an) Rocks transitional between syenites and diorites are known as monzonites (q v).

The following analyses show the chemical composition of a few of the principal types of syenite. They are characterized by a moderate amount of silica, relatively high alkalis and alumina. while lime and magnesia are more variable, but never in great

SYKES, SIR MARK, 6TH BARONET (1879-1919), English traveller and politician, was born on March 16, 1879, in London, the only son of Sir Tatton Sykes, 5th baronet. He was educated at Beaumont college, Windsor, at Monaco, at Brussels and at Jesus college, Cambridge He served with the Yorkshire Militia in the South African War (1902). On his return he travelled for some time in Syria, Mesopotamia and southern Kurdistan, and, after a short period (1904-05) as secretary to George Wyndham in Ireland, was appointed honorary attaché to the British embassy in Constantinople.

At the outbreak of World War I he raised a battalion of the Yorkshire Regiment, but did not accompany it to France He was sent by the Government on important special missions to Bulgaria, Serbia, Russia, Mesopotamia and Syria. His special knowledge and qualifications led, m 1915, to his participation in the Anglo-French conversations in London on the Syrian question He was an enthusiastic advocate of Arab independence The settlement arrived at is known as the "Sykes-Picot Agreement." Sykes then became attached to the Foreign Office and was on several occasions sent on missions to Egypt He was on friendly terms with the Arabs and designed the flag under which they marched to Damascus. In 1918, hoping to reconcile the aims of the French and the Arabs, he established himself at Aleppo, and his diplomacy in a difficult position rendered valuable service to the Government. His efforts, however, told on his health and he died in Paris of influenza on Feb. 16, 1919.

His publications include: Through Five Turkish Provinces (1900); Derail-Islam (1904), Five Mansions of the House of Olhman (1909); The Caliph's Last Heritage (1915).

See Shane Leile, Mark Sykes, his Life and Letters (1923); for the terms of the Sykes-Peot Agreement, see Temperley, History of the Peac Conference at Paris (vol. vi., 1924).

SYKES, SIR PERCY (MOLESWORTH) (1867-1945), British soldier, was born on Feb. 28, 1867, and educated at Rugby and Sandhurst. In 1888 he obtained a commission in the 16th Lancers, afterwards being transferred to the 2nd Dragoon Guards. In 1893 he began his travels in Baluchistan and Persia, in the

African Wai, he was a member of the Intelligence department. and also commanded with distinction the Montgomery Imperial Yeomanry After holding appointments as consul general for Khurasan (1905-13), and for Chinese Turkistan (1915) he was created KCIE in 1915 In 1916 he was appointed, with the rank of brigadier general and the title of inspector general, to organize a force of Persian troops to restore order in southern Persia This step was taken in consultation with the Persian government He landed at Bandar Abbas in March 1916 For an account of the campaign see Persia, Campaigns in Sykes held the post of GO C in southern Persia until the end of 1918 In 1919 he received the CB He retired in Sept 1920, and died in London on June 11, 1015

He published accounts of his travels in Ten Thousand Miles in Persia (1902), The Glory of the Shia World (1910), Through Deserts and Oases of Central Asia (with Ella Sykes, 1920) He also wrote a History of Persia (1915), a biography of Sir Mortimer Durant (1926), A History of Exploration (1934) and History of Afghanistan, 2 vols (1940).

SYLHET, a town and district of British India, in the Surma valley division of Assam The town is on the right bank of the river Surma, on rising ground, embowered in groves, and has a station on the Assam-Bengal railway With a population (1041) of 28.128. it is, next to Shillong, the largest town in Assam The chief institutions are the Murarichand college, Sanskrit college, Madrasa and leper asylum.

The DISTRICT OF SYLHET has an area of 5,478 sq miles It consists of the lower valley of the Surma or Barak river, and for the most part is a uniform level, broken only by scattered clusters of sandy hillocks called tilas, and intersected by a network of rivers and drainage channels. It is a broad and densely-cultivated plain The rainfall is heavy, reaching an annual average of 159 in , of which over 100 in fall between June and October,

In 1941 the population was 3,116,602. The normal cultivated area is 2,400,000 ac, giving an average of nearly an acre a head. but much of the district is low lying and subject to floods. Ten cultivation is a flourishing industry in the southern hills. The tea gardens had a population in 1921 of 169,000, with 90,000 ac. under tea and an output of 29,000,000 pounds Lime is extensively quarried; under the Mogul Government Sylhet lime was a monopoly of the nawabs of Bengal Other industries are boatbuilding and the manufacture of fine reed mats, buttons from fresh-water shells, ironwork inlaid with brass, and perfume the perfume is exported to Turkey, Arabia and China

SYLLABUS, literally something taken together, a collection (Late Lat syllabus), hence a compendium, table or abstract giving the heads, outline or scheme of a course of lectures, teaching, etc The word in the sense of a list or catalogue is used of a collection of eighty condemned propositions, addressed by order of Pius IX to all the Catholic episcopate, under the date of the 8th of December 1864 The official title is: "A collection (syllabus) containing the principal errors of our times as noted in the Allocutions, Encyclicals and other Apostolic Letters of our Holy Father Pope Plus IX." Discussion of disputed doctrines began in 1840 All aspects were thoroughly debated by clerical and lay theologians gathered in a commission in 1861 The result of it was the Syllabus, in eighty propositions, arranged under the distinct heads; the propositions are not accompanied by any theological censure, but simply by a reference to the Allocution, Encyclical or Letter from which each had been more or less textually extracted. This was addressed to the episcopate together with a letter from Cardinal Antonelli, and dated the 8th of December 1864, the same date as the Encyclical Quanta cura, from which, however, it remains quite distinct. Its publication aroused the most violent polemics; what was then called the Ultramontane party was loud in its praise; while the liberals treated it as a declaration of war made by the Church on modern society and civilization Napoleon III's government forbade its publication, and suspended the newspaper PUnivers for having published it Controversies were equally numerous as to the theological value of the Syllabus Most

course of which he founded the consulates for Kerman and Per- Catholics saw in it as many infallible definitions as condemned sian Baluchistan (1894) and in Serstan (1899) During the South propositions, others observed that the pope had neither personally signed nor promulgated the collection, but had intentionally separated it from the Encyclical by sending it merely under cover of a letter from his secretary of state, they said that it was hastily, and sometimes unfortunately drawn up (cf prop 61); they saw in it an act of the pontifical authority, but without any of the marks required in the case of dogmatic definitions, they concluded, therefore, that each proposition was to be appreciated separately, and in consequence that each was open to theological comment That such is the true view is proved by the fact that Rome never censured the theologians who, like Newman, took up this position (The condemned propositions are given in convenient form in Latin and English in Schaff, Creeds of Christen-dom, vol 11, "Greek and Latin Creeds," pp 213 sqq)

BIBLIOGRAPHY—The documents from which the propositions of the Syllabus were borrowed have been collected together in the Recuerl Syllabus were botrowed have been collected togethei in the Rezeast des allocations constronized, etc., eties dans Pencydque et le syllabus (Paius, 1865). SYLLOGISM, in logic, denotes a mediate argument, that is an argument in which an inference is drawn about the relation between two terms from two premises which state the ielation of each of the two terms to the same third term For instance. "The morning star is Venus, the evening star is Venus, therefore the evening star is the morning star" (or vice versa) It is usual to say that syllogism is not only mediate but also deductive reasoning, that is to say that it requires the application of a general premiss to relevant cases For example, "All planets move in elliptical orbits, Venus is a planet, therefore Venus moves in an elliptical orbit" This argument is mediate, like the previous example, but it is also deductive (or involves the application of a general premiss, or a premiss concerning a whole class of objects) whereas the previous example was not deductive Now, it is true that syllogisms are mostly deductive as well as mediate, but there is no sufficient reason for restricting the term to deductive cases only. Moreover, just as an argument may be mediate without being also deductive, so an inference may be deductive without being mediate. For instance, "All watches have a hair-spring, therefore my watch has one" It is also customary to restrict the term syllogism to arguments the propositions of which involve only relations of substance and attribute, as in the above examples But for this also there is no good reason. The arguments (z) "x=y; y=z, therefore x=z," and (z) "M is north of P; S is west of M; therefore S is north-west of P," are also syllogisms. west of M, therefore S is nontrivers of F, are also synogenies. For, after all, "syllogism" means "thinking together" or, as one might say, "putting two and two together." It is true, however, that syllogisms involving other relationships than those of identity or of substance and attribute require special care, much more than the others. See Logic.

SYLT, the largest German island in the North Sea, being about 38 sq m in area and nearly 23 m, long. It is, however, very narrow, being generally about half a mile in width, except in the middle, where it sends out a peninsula to the east 7 m. across. It lies from 7 to 12 m from the Schleswig coast. The chief places are Keitum, Tinnum, Morsum, Rantum and Westerland. The latter is a favourite pleasure resort. During the Danish War of 1864 the island was in the hands of the Danes but was occupied by the Piussians later in that year (See Frisian Islands )

SYLVANITE, a mineral consisting of gold and silver telluride, AuAgTe4, containing gold 24-2 and silver 13-3%; an important ore of gold. Crystals are monoclinic and often very rich in faces; they are frequently twinned, giving rise to branching forms resembling written characters; on this account the mineral was early known as "graphic gold" or "graphic tellurium" (Ger, Schrifterz). It was also known as "white gold," the colour being tin-white with a brilliant metallic lustre. The hardness 15 2, specific masmuch as the bacteria are able, in some way not yet clear, to gravity 8 2 It occurs with native gold in veins traversing porphyry at Offenbánya (= Baia de Aries) and Nagyág (= Săcărâmb) in Transylvania (from which country it takes its name); also at several places in Boulder county, Colorado, and at Kalgoorhe in Western Australia Sylvanite may be readily distinguished from calaverite, AuTe2, by its perfect cleavage in one direction (parallel to the plane of symmetry), but in this character it resembles the very rare orthorhombic mineral krennerite ([Au, Ag]Te2)

SYLVESTER, JOSHUA (1563-1618), English poet, the son of a Kentish clothier, was born in 1563. He was in 1591 in the service of the Merchant Adventurers' Company, and from 1606 had a small pension from Prince Henry He was stationed, in his business capacity, at Middelburg, in the Low Countries, where he died on Sept 28, 1618 He translated into English heroic couplets the scriptural epic of Guillaume du Bartas. His Essay of the Second Week was published in 1598; and in 1604 The Divine Weeks of the World's Birth Sylvester's popularity ceased with the Restoration, and Dryden called his verse "abominable fustian"

His works were reprinted by Dr A B. Grosart (1880) in the "Chertsey Worthies Library" See also C. Dunster's Considerations on Milton's early Reading (1800)

### SYLVIIDAE: see WARBLER.

SYLVITE, a mineral consisting of potassium chloride, KCl, first observed in 1823, as an encrustation on Vesuvian lava Wellformed crystals were subsequently found in the salt deposits of Stassfurt in Prussia and Kałusz in Poland. It crystallizes in the cubic system with the form of cubes and cubo-octahedra and possesses perfect cleavages parallel to the faces of the cube. Although the crystals are very similar in appearance to crystals of common salt, they are proved by etching experiments to possess a different degree of symmetry, namely plagihedial-cubic, there being no planes of symmetry but the full number of axes of symmetry Crystals are colourless (sometimes bright blue) and transparent; the hardness is 2, specific gravity 1-08 Like salt, it is highly diathermanous The name sylvite or sylvine is from the old pharma-(L J.S) ceutical name, sal digestivus sylvii, for this salt.

SYMBIOSIS, a mutually beneficial internal partnership between two organisms of different kinds, such as sea-anemone and unicellular algae. It differs from commensalism, where the partnership is external, as in the case of some hermit-crabs (e.g., Pagurus bernhardus) which have as constant companions certain sea-anemones (e g , Adamsia rondeletii) It also differs from endoparasitism, which is not beneficial to the host; though it is possible that some symbionts or symbions, e.g., the bacteria in the root-tubercles of Leguminosae, began as parasites, and that some parasites began as symbionts. The term mutualism is often used to cover both symbiosis and commensalism; and the term commensalism is sometimes used as equivalent to mutually beneficial symbiosis. This unnecessary confusion is increased when parasitism is called "antagonistic symbiosis"

The idea of symbiosis first became clear in regard to lichens, which were shown to be mutually beneficial combinations of an alga and a fungus This was demonstrated analytically by De Bary (1866) and others, while Rees and Stahl were subsequently successful in building up a lichen synthetically from the appropriate alga and fungus. Symbiosis between two different plants is also illustrated by the numerous cases of mycorhiza (q v), where a fungus has entered into intimate and profitable partnership with the roots of other plants, such as oaks, pines and orchids. Sometimes, as in the case of heather, the partner fungus spreads through the whole plant, from root to stem, from leaf to flower, and even into the seed. It is this partnership with a fungus that enables the heather to flourish on the soil of the moorland where few other plants can survive. This mycorhizarelation is now known to be very common, and it occurs in various forms. Thus the fungus may be ectotrophic, investing the roots externally, as in the beech; or it may be endotrophic, penetrating into the internal tissue, as in orchids. Also symbiotic is the occurrence of tubercle-forming bacteria (e.g., Bacillus radicicola) in the roots of leguminous plants, a linkage of great importance,

capture and fix the tree atmospheric nitrogen

A second form of symbiosis is between an animal and an included unicellular green alga, such as Zoochlorella The plant is sheltered, and it may be borne about by the animal, whose respiratory carbon dioxide it can utilize in its photosynthesis The animal profits by the oxygen given off by its minute partners, and it can also utilize the carbon-compounds which the algae build up. Some green animals-green because of the included algae-can flourish for a long time without any extraneous food, being sufficiently sustained by what their symbionts supply Most animals of a green colour are green because of these partnerplants, many of which are included in the genera Zoochlorella and Zooxanthella This was first made clear by Cienkowsky, Geddes and Brandt in regard to the "yellow cells" found inside radiolarians, whose symbiosis probably contributes to the great wealth of numbers and of species exhibited by these pelagic Protozoa While there seem to be some Protozoa, such as euglenids and Vorticella viridis, which have chlorophyll corpuscles of their own, most of the green or greenish Protozoa, eg. Stentor, owe the colour to their symbionts The same is true for freshwater sponges, Hydra viridis, some sea-anemones, most reef-corals, numerous Alcyonarians, some Turbellarians, and a few higher forms, eg, a polyzoon and a sea-slug Very interesting is the small turbellarian worm, Convoluta roscoffensis, which creeps from the sand and forms green patches on the flat beach at Roscoff, in Brittany, when the tide goes out Its life has become intimately wrapped up with a symbiotic alga, one of the Chlamydomonadineae As Keeble has well shown, there are four chapters in the history of Convoluta The very young worm feeds independently Then green symbionts appear and multiply, and the worm is nourished from within as well as from without Thirdly Convoluta ceases to take any solid food and depends entirely on the photosynthetic activity of the symbions. Finally, the animal digests its partners, and, having done so, dies

A third type of symbiosis, especially studied by Buchner, is seen in many insects where fungoid plants, eg, bacteria and yeasts, live in the lining cells of the food-canal and assist in some obscure way in the process of digestion. These intracellular symbionts are known in at least seven orders of insects, especially in types that feed on dry wood and the like. The fungoid infection usually takes place in the egg-cell. In some cases there is a special organ or "mycetome" for the multiplication of the symbionts. In a few luminescent marine animals, e g, some cuttlefish, (such as Sepiola elegans) there is considerable evidence that the light is produced by symbiotic bacteria

A similar type of symbiosis is illustrated by the wood-eating species of termites, which have remarkable infusorians in their food-canal. These are essential to the health of the termites which die when bereft of them. Their symbiotic function is to digest the wood, which no higher animal is able to do Thus there may be symbiosis between plant and plant, between plant and animal, or between animal and animal

SYMBOL, the term given to a visible object representing to the mind the semblance of something which is not shown but realized by association with it. One of the first symbols of the Saviour, the fish, was derived from an acrostic of the Greek word lxθbs, the component letters of which were the initials of the five words Ίησοθε Χριστός, Θεοθ Υίός, Σωτήρ, Jesus Christ, Son of God, Saviour. The ship, another early symbol, represented the Church, in which the faithful are carried over the sea of life Other symbols are those which were represented by animals, real or fabulous, and were derived from Scripture: thus the lamb typified Christ from St. John's Gospel (i 29 and 36), and the lion from the Book of Revelation, where (v 5) Christ is called the "Lion of the tribe of Juda" The peacock stood for immortality: the phoenix for the Resurrection; the dragon or the serpent for Satan; the stag for the soul thirsting for baptism.

sacred monogram Chi Rho, & supposed to have been the celestial sign seen by the emperor Constantine on the eye of the defeat of Maxentius, represents the two first letters of the Greek word Χριστός which Constantine figured on his labarum, or standard. and is tound on early Christian coins bearing also the favourite decoration of the Byzantine sarconhagi

SYMBOLISM: see PAINTING

SYMBOLISTS, THE, the name given to a large but loosely connected group of French poets (many of them of foreign extraction) writing in the 1880's The term decadent was often used as an alternative, especially of the extreme manifestations of the movement. In 1888 the critic Brunctière suggested that the history of French poetry from the 17th century could be plotted in three phases, the architectural, the pictorial and the musical Bearing this programme in mind and taking as examples from his own literature Dryden's Ode to Mistress Anne Killigrew, Keats's Ode on a Grecian Urn and Tennyson's Claribel, the English reader will best understand the scope and extension of the Symbolist movement. In its origin the movement was a revolt against Naturalism as being too concrete, and against Parnassianism as being too clear-cut, to satisfy young minds who had caught from E A Poe and Baudelaire, from Wagner, and to some extent from the Pre-Raphaelites, the "sense of the meffable" and were seeking a medium for its expression. Their object was not to declaim, not to depict, and least of all to transcribe, but to suggest to communicate in their lost subtlety the most intimate and evanescent tones of experience. Baudelaire himself, Banville, Gérard de Nerval and Villiers de l'Isle Adam had already been engaged in the same quest. The common stock of poetic symbolism has been accumulated to serve common uses a private symbolism, unless it is forced into currency by a great poet, is bound to be largely unintelligible and will often be suspected at least to be nonsense It is not surprising therefore that the French public was at first half inclined to regard the new poetry as a hoax, and on the other hand to take seriously a volume of parodies Les Déliquescences d'Adoré Floupette (1885) which first made it popularly familiar. But in the meantime Verlaine had entered the circle, he gave it a watchword "Pas de couleur, rien que la nuance," and in his book Trois Poètes Maudits introduced the young decadents to their true masters, Rumbaud, Corbière, Mallarmé The year 1885 may be taken as the centre of the movement, besides the three already mentioned, Rodenbach, Verhaeren and Jean Moréas had then already appeared Laforgue, H de Régnier and Vielé Griffin published their first volumes in 1885, and they were followed by Rémy de Gourmont in 1886. Maeterlinck in 1889, Claudel in 1890, Robert de Montesquieu in 1803 With Samain's first volume in this last year the movement may be said to rejoin the main stream. Its principal representative, in prose, had been J K Huysmans, as poets, Rimbaud, Verlaine and Mallarmé, still after 40 years dominant influences in French literature. It was Mallarmé who provided the symbolists with their aesthetic theory and the most accomplished models of metric style, and in the whole course of the movement his weekly conversations were probably the most effective influence at work-an influence not unfelt in England, where it coincided with the aesthetic movement and the Celtic renascence.

Constitute with the selected involvent and the centre fractione of Emilionary.—A. Symons, The Symbolist Royement in Literature Emilionary of the Symbolist Royement in Literature A. Barthelot, etc., 31 vols., 1837—1903); Catulle Mendes, Ropport set I movement polique français de 1876 4 1900 (1903); all with blographies; also R. de Gourmont, Livre des Masques (1896); E. Vigid-Locco, La police contemporation (1896).

SYME, JAMES (1799-1870), Scottish surgeon, was born in Edinburgh on Nov. 7, 1799. His chemical experiments at the university led to the discovery that a substance obtainable from coal tar would dissolve india-rubber, and could be used for waterproofing silk and other textile fabrics, an idea patented a few months afterwards by Charles Mackintosh, of Glasgow. From 1818 he held resident appointments in the infirmary and the fever hospital, and in 1823 took charge of the anatomy classes of Robert Liston. In 1824-25 he started the Brown Square school of medicine, and later a surgical hospital of his own, Minto House hospital, which he carried on from 1829 to 1833 with great success

as a surgical charity and one of the first schools of clinical instruction In 1833 he became professor of clinical surgery in the university, a post which he held until his acceptance of the chair of clinical surgery at University college, London, in 1847 Misunderstanding concerning the conditions of this appointment led him to return to his old position in Edinburgh, where he was recognized as the leading consulting surgeon of Scotland In 1849 he broached the subject of medical reform in a letter to the lord advocate and in 1854 and 1857 addressed open letters to Lord Palmerston In 1858 a Medical Act was passed which largely adopted his suggestions, and he became a member of the general medical council called into existence by the act. In April 1869 he

had a paralytic seizure and died near Edinburgh on June 26, 1870 Among Syme's labours may be mentioned his early papers on the nature of inflammation, his demonstrations of the function of the periosteum in the repair of bone, his introduction into Britain of excision of the elbow and of amputation at the ankle-joint, his treatment of ulcers by blistering, his study of diseases of the

rectum and his general improvements in plastic surgery

In 1831 he published On the Excision of Diseased Joints (the celebrated ankle-joint amputation is known by his name); in 1832 Principles of Surgery, Diseases of the Rectum in 1838; Stricture of the Urethra and Fistula in Perineo in 1840 and Exission of the Scapula in 1864, Contributions to the Pathology and Practice of Surgery in 1848 and Observations in Clinical Surgery in 1861 See R. Paterson, Memorials of the Life of James Syme (1874)

**SYMEON,** "the Great," Bulgarian tsar (? -927) succeeded his father Boris  $(q\ v\ )$  in 893, after the short intervening reign of his dissolute elder brother, Vladimir Educated in Constantinople, Symeon was probably destined by his father for the aichbishopric of Bulgaria, and at one time took monastic orders

His dominant ambition, himself to ascend the imperial throne of Byzantium-an aspiration afterwards shared by many Bulgarian tsars-led Symeon to embark on many wars with the empire (894, 896, 913, 917, 923) He never took Constantinople, although it was more than once at his mercy; but he took for himself the title of "Tsar of all the Bulgarians" (918) and raised the archbishop of Bulgaria to the rank of a patriarch. In the Balkans he extended the power of Bulgaria over south Macedonia, south Albania and Serbia, which became his vassal, but Bulgaria's shadowy domimon north of the Danube was probably lost during his reign Symeon was twice married, and left four sons, of whom the second, Peter, succeeded him

SYMEON METAPHRASTES, the most renowned of the Byzantine hagiographers The menology of Metaphrastes, who is thought to have lived in the second half of the roth century, is a collection of lives of saints for the twelve months of the year, consisting of about 150 distinct pieces, some of which are taken bodily from older collections, while others have been subjected to a new recension (μετάφρασιs). Among other works attributed (though with some uncertainty) to Symeon are a Chronicle, a canonical collection, some letters and poems, and other writings of less importance. The Greeks honour him as a saint on Nov. 28, and an office has been composed in his honour See A Ehrhard, Die Legendensammlung des Symeon Metaphrastes (Rome, 1897).

SYMMACHUS, QUINTUS AURELIUS (c. 345-410), was a brilliant representative of 4th-century paganism in Rome He was educated in Gaul, and in 373 was pro-consul of Africa (for his official career see CIL vi. 1699). His public dignities, which included that of pontifex maximus, his great wealth and high character, added to his reputation for cloquence, marked him out as the champion of the pagan senate against the Christian emperors. In 382 he was banished from Rome by Gratian for his protest against the removal of the statue and altar of Victory from the senate-house, and in 384, when he was prefect of the city, he addressed to Valentinian II a letter praying for the restoration of these symbols. After this Symmachus was involved in the rebellion of Maximus, but obtained his pardon from Theodosius, and appears to have continued in public life up to his death In 391 he was Consul ordinarius. His honesty. both in public and in private affairs, and his amiability made him very popular. As his letters do not extend beyond the year 402, he probably died soon after that date

Of his writings we possess (1) Panegyites, written in his youth, two on Valentinian I and one on the youthful Gratian, (2) mine books of Epistles, (3) parts of Complimentary Orations, five trem a palimposes (also containing the Panegyite'), of which part is at Milan painingsest (also containing the Paneryics), of which part is at Milan and part in the Vatiena, discovered by Mai, who published the Milan fiagments in 1815, the Roman in his Scriptorian veterain nova collectro, vol 1 (1825), and the whole in 1846; (4) the Relationes, which contain an interesting account of public life in Rome, composed for the emperor All cather editions are now superseded by that of O Seech in Monumenta Germaniae historica Auctores antiquissimi (1881), 11, 1, with introductions of his line, works and chronology

SYMMACHUS, pope from 498 to 514 had Anastasius II for his piedecessor and was himself followed by Hormisdas He was a native of Sardinia, apparently a convert from paganism, and was in deacon's orders at the time of his election. The choice was not unanimous, another candidate, Laurentius, having the support of a strong Byzantine party, and both competitors were consecrated by their friends, the one in the Lateran church and the other in that of St Mary, on Nov. 22, 498 A decision was obtained in favour of Symmachus from Theodolic, to whom the dispute had been referred; but peace was not established until 505 or 506, when the Gothic king ordered the Laurentian party to surrender the churches of which they had taken possession. An important incident in the protracted controversy was the decision of the "palmary synod" The remainder of the pontificate of Symnachus was uneventful, history speaks of various churches in Rome as having been built or beautified by him

SYMMETRIC FUNCTIONS. A symmetric function is a rational function of  $x_1, x_2, \dots, x_n$ , which is unchanged when any of the  $x_1, x_2, \ldots, x_n$  are interchanged If  $x_1, x_2, \ldots, x_n$ are roots of an equation  $x^n + a_1 x^{n-1} + \dots + a_n = 0$ , then the coefficients as represent certain symmetric functions of the 100ts, for example,  $r_1+x_2+$  .  $+x_n=-a_1$ ,  $(-1)^n$   $r_1$   $x_2$  .  $x_n=a_n$ . This type of function occurs in algebra (see EQUATIONS, THEORY OF), group (R. G SR) theory and statistics

SYMMETRY, due proportion of parts, in geometry the metrical correspondence of parts with reference to a median plane or line or point; and in algebra the correspondence of terms in a function in such a way that the function is unaltered when any two variables on which it depends are interchanged (See Func-TION ) The word is derived from the Greek συμμετρία, symmetria, due proportion, from σύν, syn, with, and μέτρον, metron, measure. In botany it implies agreement in number and distribution of parts among the organs of a flower; and in zoology it implies symmetrical disposition of parts around a line in the body or on opposite sides of a plane through the body. The term is also used with various derived meanings in architecture, aesthetics, crystallography, etc., and it appears even in certain ancient theories (as that of Herodotus, for instance) concerning the distribution of rivers, etc., on the earth

SYMONDS, JOHN ADDINGTON (1840-1893), British essayist and historian of the Italian Renaissance, was born at Bristol on Oct 5, 1840. He was educated at Harrow and at Balliol college, Oxford, and was elected a fellow of Magdalen college. He died in Rome on April 19, 1893.

Of acute sensibility, he developed early symptoms of pulmonary disease and, after many journeys in search of health, finally (1877) settled at Dayos Platz in the Swiss highlands, where most of his work was done, though with frequent journeys to Italy. Symonds found in literary work and in the society of his Swiss friends and neighbours relief from torturing metaphysical doubts, and his output was very large. His chief work, The Renaissance in Italy (7 vol., 1875-86), is rather a series of extended essays than a systematic history but has passages of both insight and eloquence. He also translated the Sonnets of Michelangelo and Campanella (1378), the Autobiography of Benvenuto Cellini (1887), and the Memours of Carlo Gozzi (1890). His Life of Michelangelo Buonarrotts (1892) is a work of great industry and research, but shows signs of failing powers.

Earlier he had published two series of Studies of the Greek Poets (1873-76), several volumes of travel sketches, and monographs on Shelley (1878), Sir Philip Sidney (1878) and Ben Jonson

(1886), and on the day of his death appeared his study of Walt Whitman, with whom he had corresponded and of whom he was Whitman, with whom he had contesponded and of whom he was one of the first European admirers. His verse is of less account Bitallogarativ—HR RF Brown, John Addington Symonds, a Biography, and at Clondon, 1921), Van Werk, Brooks, J. John Clondon, 1921), Van Werk, Brooks, J. John C. Law, and J. S. Clandon, 1921), Van Werk, Brooks, J. John C. Law, and J. 
SYMOND'S VAT, one of the most famous view points on the River Wye. England It stands on the River Wye o mi above Monmouth and 12 mi below Ross, on a deeply incised meander nearly 5 mi long and 600 vd across the neck. The penmsula forms Huntsham bill (Carboniferous limestone), in which there are catterns

The Yat or Gate is situated on the west side of the neck (height 500 ft ), and a road from the east drops to a ferry, which was of early importance The Yat is in Herefordshire, but the railway station opposite is in Gloucestershire. There are cottages and mns on both banks, New Weir is opposite the Yat and a little above it is Whitchurch, both small villages The river banks are densely wooded, except where they become sheer cliffs, as at the Coldwell rocks above the station

The views from the Yat embrace the Forest of Dean to the south and east and are backed by the mountains of the Welsh border in the west

SYMONS, ARTHUR (1865-1945), English poet and critic, was born in Wales of Cornish parents, on Feb 28, 1865. He was educated privately, spending much of his time in France and Italy He was a contributor to the Vellow Book and in 1806 became with Aubrey Beardsley editor of the Savoy Symons was an admirer of Stephane Mallarmé, Charles Baudelaire and Paul Verlaine, and he did much to spread the ideas of the French symbolists in England He was an acute critic and covered a wide field. His poetry belongs mainly to the fin de siècle in feeling. His works include verse-Silhouettes (1892), London Nights (1895), Amous Victima (1807), Images of Good and Evil (1000). The Fool of the World (1906), prose-The Symbolist Movement in Literature (1899), Studies in Prose and Verse (1904), Spiritual Adventures (1905), Studies in Seven Arts (1906), Studies in Elizabethan Drama (1920), Charles Baudelaire (1920), Confessions, an autobiography (1930). He also contributed a number of articles to the Encyclobædia Britannica

Bibliography -Collected Works of Arthur Symons (London, 1924,

SYMPATHETIC SYSTEM, in physiology By the "sympathetic system" is understood a set of neives and ganglia more or less sharply marked off from the cerebrospinal, both functionally and anatomically (For anatomy see Nervous System) Formerly it was thought more independent from the rest of the general nervous system than recent discoveries have found it actually to be The sympathetic system is now known to consist entirely of conducting paths which, like the nerve trunks of the cerebrospinal system, merely conduct nerve impulses either toward the great nervous centres of the spinal cord and brain, or, on the other hand, away from those great centres. In the cerebrospinal nerves, the preponderance of the conduction is toward the centres, in the sympathetic system the preponderance of conduction is away from the centres

More is known of the sympathetic system from its efferent aspect than its afferent, and we shall consider the former first. One great difference between the efferent paths of the sympathetic and those of the ordinary cerebrospinal system is that the former carry nervous impulses not only to muscular tissue but to secreting glands, whereas the latter convey them to muscle only, indeed only to muscle of the striated kind. Another difference is that the efferent path which the sympathetic affords from the great central nervous centres to its muscles and glands consists always of two nerve cells or neurones, whereas the effecent path afforded by the cerebrospinal motor nerves consists of one neurone only. The two neurones forming the sympathetic path are so arranged that one of them whose cell-body lies in the spinal cord has a long axon-process passing out from the cord in the motor spinal

ganglion, quite distant from the spinal cord and somewhere on the way to the distant organ which is to be innervated In this canglion the first sympathetic neurone ends, forming functional connection with ganglion cells there These ganglion cells extend each of them an axon-process which attains the organ (muscular cell or gland cell), which it is the office of the sympathetic path to reach and influence The axon-process of the first neive cell is a myelinated nerve-fibre extending from the spinal cord to the ganglion, it constitutes the pre-ganglionic fibre of the conduction chain The axon-process of the second nerve-cell, that is the neurone whose bell-body hes in the ganglion, is usually non-myelinate and constitutes the post-ganghonic fibre of the chain.

This construction, characteristic as it is of the sympathetic efferent path, has been found also in certain other efferent paths outside the sympathetic proper. And as these other efferent paths convey impulses to the same kind of organs and tissues as do those of the sympathetic itself, it has been proposed to embrace them and the sympathetic under one name, the autonomic system. This term includes all the efferent paths of the entire body excepting only those leading to the voluntary muscles

That the term "autonomic system" is not merely a convensence of nomenclature, but seally represents a physiological entity, seems indicated by the action of nicotine This drug acts selectively on the autonomic ganglia and not on the cerebrospinal. In the former it paralyses the nexus between pre-ganghonic and post-ganglionic fibre It is by taking advantage of this property that many of the recent researches which have done so much to elucidate the sympathetic have been executed.

The term "autonomic system" must not be taken to imply that this system is independent of the central nervous system. As mentioned above in regard to the sympathetic, that is not the case The autonomic system is closely connected with the central nervous system through the ordinary channel of the nerveroots, spinal and cranial. It may, in fact, be regarded as an appendage of certain of the cranial and spinal roots

The sympathetic is that part of the autonomic system which is connected with the spinal roots from the second thoracic to the second lumbar inclusive (man). Its ganglia are divided by anatomists into the vertebral, those which he as a double chain on the ventral face of the vertebral column, and those which lie scattered at various distances among the viscera, the pre-vertebral. Langley has shown that there is no essential difference between these except that the vertebral send some of their post-ganglionic fibres into the spinal nerves, whereas the latter send all their fibres to the viscera. The sympathetic sends its post-ganglionic

- I. To the muscular coats of the whole of the alimentary canal from the mouth to the rectum; to the glands opening into the canal from the salivary glands in front back to the intestinal glands; to the blood vessels of the whole of the canal from mouth to anus inclusive.
- 2 To the generative organs, external and internal, and to the muscular coats of the urinary bladder.
- 3. To the skin; (a) to its blood vessels; (b) to its cutaneous glands; (c) to unstriated muscle in the skin; e.g., the erectors of the hairs
  - 4. To the iris muscles and blood vessels of the eyeball.

The sympathetic nervous system is sometimes called the visceral. It will be seen from what has been said that this term is not well suited in some respects, because the sympathetic supplies many structures which are not visceral. Another objection is that a great deal of important nerve-supply to the viscera is furnished by parts of the autonomic system other than sympathetic. That the sympathetic does, however, of itself constitute a more or less homogeneous entity is indicated by a curious fact. The substance adrenalin has the property when introduced into the circulation of exciting all over the body just those actions which stimulation of the efferent fibres of the sympathetic causes, and no others. It is possible that when a nerve is stimulated some body at the nerve ending is set free, and this by combining with and thus the loss of heat from the body through that channel les-

root, and this extends to a group of nerve-cells, a sympathetic another chemical substance induces activity in the end organ (gland or muscle) It may be that when a sympathetic nerve is excited adrenalm is set free and combines with some substance which induces activity. (See Adrenatin, Supra-renal Ex-

TRACT.) The rest of the autonomic system consists of two portions, a cranial and a sacral, so called from their proceeding from cranial and sacral nerve-roots respectively The cranial portion is subdivided into a part belonging to the mid-brain and a part belonging to the hind-brain The ciliary ganglion belonging to the eyeball is the ganglion of the former part, and its post-ganglionic fibres innervate the iris and the ciliary muscles. The hind-brain portion gives pre-ganghonic fibres to the facial (intermedius), glossopharyngeal and vagus nerves, its post-ganglionic distributton is to the blood vessels of the mucous membrane of the mouth and throat, to the musculature of the digestive tube from the oesophagus to the colon, to the heart, and to the musculature of the windpipe and lungs.

The sacral part of the autonomic system issues from the spinal cord with the three foremost sacral nerves. Its ganglia are scattered in the neighbourhood of the pelvic organs, which they innervate. The distribution of its post-ganglionic fibres is to the arteries of the rectum, anus and external genitalia and to the musculature of the colon, rectum, anus, bladder and external genitalia

The past played by the sympathetic and the rest of the autonomic system in the economy of the body is best considered by

following broad divisions of organic functions.

Movements of the Digestive Tube.-It is those movements of alimentation not usually within range of our consciousness which the autonomic system regulates and controls Nor is its control over them apparently essential or very complete. For instance, the pendular and peristaltic movements of the intestine still go forward when all nerves reaching the viscus have been severed Extirpation of the abdominal sympathetic has not led to obvious disturbance of digestion or nutrition in the dog It is noteworthy that the sympathetic inhibits contraction of the musculature of the stomach and intestine, while the other, the vagus, portion of the autonomic system excites it

Action on the Circulation .- The arterial blood supply of most organs is under the control of vaso-constrictor nerves. All vaso-constrictor nerves are sympathetic Organs to which vasoconstrictor nerves are supplied either poorly or not at all are the lungs heart, lives and probably the skeletal muscles. In some parts the capillary vessels are supplied with sympathetic constrictor nerves. The blood vessels of certain parts of the body have, in addition to vaso-constrictor nerves, nerves which relax their muscular wall, vaso-dilatory nerves. The latter are never furnished by the sympathetic, they are in the mucous membranes and glands at the oral end of the body furnished by the cranial portion of the autonomic system. In regions at the aboral end of the body they are furnished by the sacral portion of the autonomic system. Elsewhere the vaso-dilatators when present are derived from the nerve-cells of the spinal ganglia (Bayliss).

The control of the calibre of the blood vessels by the autonomic system is of importance in several well-ascertained respects By constricting the blood vessels of the viscera the system is able to favour an increase of blood supply to the brain. A noteworthy instance of such an action occurs when the erect attitude is assumed after a recumbent posture. Were it not for vaso-constriction in the abdominal organs the blood would then, under the action of gravity, sink into the more dependent parts of the body and the brain would be relatively emptied of its supply, and fainting and unconsciousness result. Again, it is essential to the normal functioning of the organs of warm-blooded animals that their temperature, except in the surface layer of the skin, should be kept constant. Part of the regulative mechanism for this lies in nervous control of the quantity of blood flowing through the surface sheet of the skin That sheet is a cool zone through which a greater or smaller quantity of blood may, as required, he led and cooled. By the sympathetic vaso-constrictors the capacity of these vessels in the cool zone can be reduced. sened. In cold weather the vaso-constrictors brace up these skin vessels and lessen the loss of heat from the body's surface. In hot weather the tonus of these netwes is relaxed and the skin vessels dilate; a greater proportion of the blood then circulates through the compara-

tively cool skin zone

The heart itself is but a specialized part of the blood-vascular tubing. and its musculature, like that of the arteries, receives motor nerves from the sympathetic. These nerves to the heart from the sympathetic are known as the accelerators, since they mucken and augment the beating of the cardiac muscle The heart receives also nerves from the cramal part of the autonomic system, and the influence of these nerves is an-tagonistic to that of the sympathetic supply The cranial autonomic nerves to the heart pass via the vagus nerves and lessen the beating of the heart both as to rate and force. These inhibitory nerves of the heart are analogous to the dilatator nerves to the blood vessels, which, as mentioned above, come not from the sympathetic but from th cranial and sacral portions of the autonomic system The spleen which functions as a blood reservoir (Barcroft) for the general circulation, discharges its reserves by contraction of its capsule and septa; its scle is innervated by the sympathetic

muscie is inhervated by the sympathetic Skin Glands.—In close connection with the temperature regulat-ing function of the sympathetic stands its influence on the sweat-secreting glands of the skin Secretory nerves to the sweat glands are furnished apparently exclusively by the sympathetic

Pilomotor Nerves.—The skin in many places contains muscle of the unstriped kind Contaction of this cutaneous tissue causes knotting of the skin as in "goose-skin." and erection of the hairs as in the cat, or of the quills as in the hedgehog and porcupine The efferent the cat, or or the quities as in the needgenog and porcupine. The elicient nerve fibres to the unstripped muscles of the skin are furnished by the sympathetic (polomotor nerves, etc.) In this case the sympathetic contributes to emotional reactions and perhaps further to the regulation of temperature, as by fuffling the fur or feathers in animals exnosed to the cold

The Respiratory Tube .- The windpipe and the air passages of the lungs contain in their walls much unstriped muscular tissue, arranged so as to control the calibre of the lumen. The nerve supply to this muscular tissue is furnished by the cranial autonomic system via

the vagus nerves

Eyeball.—An important office of the sympathetic is the controlling of the brightness of the visual image by controlling the size of the pupil The sympathetic sends efferent fibres to the dilatator muscle of the pupil. In this case, as in others noted above, the cranial muscle of the pupil. In this case, as in others hoted above, the crahial part of the automotic system sends never so in altagonistic effect to the effects of the pupil and the property of the sends of the pupil. This same part of the crainal automotic system supplies also motor fibres to the ciliary muscle, thus effecting the accommodation of the lens for focusing clearly objects within the range of what is termed near-vision than the pupil of the pupil and the pupil of the pupil and the pupil of the pupil and the pupil of the pupil and the pupil of the pupi

Of the afferent fibres of the sympathetic little is known save that they are relatively to the efferent, few in number, and that they, like the afferents of the cerebrospinal system, are axons of nerve cells

seated in the spinal gangia (C. S.)
SYMPHONIC POEM (Symphonische Dichtung, Tondichtung, Poème symphonique, etc.) This term was first used by Franz von Liszt in his 12 Symphonische Dichtungen. It implies a large orchestral composition which, whatever its length and changes of tempo, is not broken up into separate movements and which, moreover, gratuitously illustrates a train of thought external to the music and to its conditions of performance The form of the symphonic poem is dictated by its written or unwritten program; and so it is not every piece of "program music" that can be called a symphonic poem. Beethoven's sonata Les Adieux and his Pastoral Symphony are, for instance, works in which the poetic idea does not interfere with the normal development of sonata style.

Great disturbances in musical art have always been accompanied by appeals to external ideas. New art forms are not born mature, and in their infancy their parent arts naturally invite other arts to stand godfather It is certain, first, that no theorizing can long prevent musical ideas from growing where and how they please; secondly, that musical ideas are just as likely to be inspired by literature and other arts as by any other kind of experience; and lastly, that, as musicians gain in mastery, their music outstrips their literary analysis; hence the frequent ability of great composers to set inferior words to music which is not only great, but evidently based upon those words; hence the disgust of great composers at unauthorized literary interpretations of their works; hence, on the other hand, the absence of any strain on the classical composer's conscience as to making his music gratuitously illustrative. Accordingly, the importance of the symphonic poem lies, not in its illustrative capacity, but in its tendency toward a new instrumental art of tomorrow.

The symphonic poem has been described elsewhere (see Music, section 9, and Paosam Music) as the application of the Wagnerian time scale to symphonic music. List is successful only where he is writing on a hardly more than lyric scale, as in Orpheus, or, at the utmost, on a scale less than that of the earliest and best of all symphonic properties. phonic poems, Schubert's Wanderer fantasia (op 15) Schubert had not the slightest idea that he was writing a symphonic poem; but in that piece he achieved everything that Liszt attempted, even to the metamorphosis of whole sections Liszt's efforts on a larger time scale do not even begin to solve the problem, they achieve no sense of movement at all, and the device of deriving all their themes from a single figure is totally irrelevant. Charles Saint-Saens and Césai Franck are incapable of such failure, and their symphonic poems flow very conindepable of such failure, and their symphonic poems flow vely com-venengly, though not on a very large seal. They also illustrate their subjects aniusingly enough. The first achievement of real Wagnesian symphonic at belongs to Richard Strauss The power of composition in his 4800 speach Zarathasira, Ein Heldenkben, the osterationally but deceptively patiety Dor Ojunosie and the Symphonic Domestica with care and the strain of the strain of the strain of the strain SYMPHONY, in music (?) The term outphorie was used

by the Greeks, first, to denote concord, in general, whether m successive or simultaneous sounds, secondly, in the special sense of concordant pairs of successive sounds (i.e., the "perfect") interval of modern music, the 4th, 5th and octave), and thirdly, as dealing with αντιφωνού, the concord of the octave, thus meaning the art of singing in octaves, or magadizing, as opposed to δμοφωνία, or singing and playing in unison. In Roman times the word appears in the general sense, which still survives in poetry, viz, as a harmonious concourse of voices and instruments. It also appears to mean a concert. In St. Luke xv. 25. it is distinguished from vocal and translated as signifying "music and dancing." Polybius and others seem to use it as the name of a musical instrument.

(2) In the 17th century the term is used, like "concerto," for certain vocal compositions accompanied by instruments, e.g. the Symbhoniae sacrae of Henrich Schutz. The modern use of the word symphony for the instrumental ritornello of a song is also found in Schutz's Kleine geistliche Concerte

(3) The principal modern meaning of the word is a sonata for orchestra (see Sonata Forms). The orchestral symphony originated in the operatic overture (qv), which in the middle of the 18th century began to assimilate the essentials of the sonata style. Mozart's overture to his early opera, La Finta Gurdiniera, marks the breaking point between three-movement symphony and operatic overture, since it contains the usual first movement and slow movement, and the curtain rises with what sounds like the beginning of its third movement.

Though the sonata style is dramatic, the stiffness of its early forms did not help C. W. Gluck toward his ideal of an overture that should

and not neight. We direct toward his ideal of an overture that should not not neight to the contrast of loosely kell passages of various textures in vague forms which he learned from San Martini. These as no less wident in the symphonies of Philipp Emmanuel Back niede the dis-wident in the symphonies of Philipp Emmanuel Back niede the dis-mity of the symphony, but the style was more essential than the form, and in Mozarit's and Haydra's matter works we find the sonata form and in Mozart's and Haydn's mature works we find the sonata form a firmly established in the overture as in the symphony, while the styles are quite distinct. Mozart's most chalorate overture, that of lates a symphonis, nor could the finale of his Jupiter symphony be taken for a prelude to an opera See also Muser, SONATA FORMES; INSTRUMENTATION, OTHERURE, SCHENDY, VALISTONE.

SYMPHOSIUS or SYMPOSTUS, the name given to the author

of a collection of 100 riddles of uncertain date, but probably composed in the 4th or 5th century A.D. They have been attributed to Lactantius and identified with his Symposium, but this view is not generally accepted. The style and versification of the riddles, each of which consists of three hexameter lines, are good. They were written to form part of the entertainment at the Saturnalia.

SYMPHYLA. A group of small myriapoda (q.v.), the largest less than a centimetre ( 39 in.) long They are fragile, almost white in colour, often quite active and may readily be mistaken for young centipedes; indeed, when the first symphylid was described by G. A. Scopoli in 1763, he referred it to the well-known centipede genus Scolopendra. Symphyla are known in many countries, about 70 species having been described; but proper search would doubtless greatly increase this number. They live in moist. loose soil, under stones or in damp decaying vegetation Though they occasionally deyour the bodies of small dead insects, they subsist mainly on plant food, in captivity they feed readily on fragments of potato or carrot, and one species (Scutigerella immaculata) has acquired an unenviable reputation in Europe and America as a pest in greenhouses and even in cultivated land, where it damages the roots of asparagus, beets, carrots, lettuce, spinach and many other crops Soil furnigants (carbon bisulphide or paradichlorobenzene) are recommended for control in greenhouses, lengthy flooding may be beneficial on cultivated land

The body of the symphylid (see fig 1) consists of a head and of a trunk of 14 segments, the segmentation being obscured, however, by the presence of two tergites on some of the segments The head bears a pair of long agile moniliform antennae, and at their bases the sense organs of Tomosvary, of unknown function. Eyes are absent The mouth appendages comprise (1) a pan of segmented mandibles, (2) a pair of maxillae, with minute spinclike palp, (3) a pair of second maxillae which, alone among myilapods, are united into a labium as in insects. The first 12 trunk segments bear each a pair The first 12 tunk segments oear each a pail and the first pair being diminutive and rosent indeed sometimes absent. The 13th segment rosent bears the backwardly directed cerd (spin-bears the backwardly directed cerd (spin-bears) and the segment rosent the backwardly directed cerd (spin-bears) and the segment rosent the segment rosent ro nerets), capable of secreting a thread when MANDALATA ADULT the animal is disturbed, the last segment carries a pair of long tactile setae At the bases of most of the legs are

the coxal sacs (presumably moisture-absorbing organs) and, in many forms, the coxal styles (see fig 2) The intestine is a simple straight tube, consisting of fore-, mid- and nid-gut, and from the latter arise two malpighian tubes. The heart ahove the intestine and traverses the length of the body. The hind-gut, and from the latter arise two malpighian tubes. The lies above the intestine and traverses the length of the body respiratory organs are tracheae, of which there is a single pair, with openings on the side of the head, they supply chiefly the brain and

anterior trunk segments. The genital ducts pass forward from the reproductive organs and have a single median opening on the floor of the fourth segment. The only FEMALE GENITAL.
OPENING is the presence of a pair of curved genital plates in the male (fig 2)
The females lay their eggs in

small clumps in the soil or in decaying vegetation, sometimes mounting guard beside them The young emerge with six (in some species seven) leg-bearing segments, the ad-ditional segments being added singly at the hinder end as the larva grows In Scutigerella immaculata

a longevity of as much as four years has been observed.
Three families of Symphyla are recognized (1) Scalependrillidae.
Coal styles weak or absent; 35 tenglios Example Scalependrillidae.
Coal styles weak or absent; 35 tenglios Example Scalependrillidae.
The styles of the Symphyla are styles of the Symphyla shoding to this family, (3) Geophielidae 22 tenglies, rare. Example, Geophielida.
To the scolesight the Symphyla are or much interest, for they are ovidthe Insects arose. Indeed, the name Symphyla was given them by J. H.
Rydur (1885) on Mondest their amendent position between myrispods
and hascit, their remarkable resemblance to such primitive insects as
the state of a longevity of as much as four years has been observed

LATA

Campodae being later stressed by many writers. The one obstacle to this interpretation—the fact that they are Prognosta and not Opisthogoneata (see Myrkarona)—has been removed by the working out of their embryology, for the reproductive ducts are found to arise from pleternal ingrowths in the growing larva and not from recommodates in the reforming the stress of t

(συναγωγή lit. "assembly") or their place of worship or, more gen-

SYNAPSE, the functional conjunction between two neurons, making conduction of nervous impulses continuous from one to the other. Synapses occur between the axone terminations of one neuron, and the cell body of an adjacent cell This type of synapse is called axosomatic. Synapses also occur between axone terminations of one neuron and the dendrites of the next, and are then termed axodendritic. Adjacent neurons may be connected by both types of synapse. The term synaptic nunction is used to describe this functional and anatomical relation. The term is also used in embryology to denote the pairing and union of the homologous chromosomes of the male and female pronuclei. This process is also named syndesis. (W M M .: X)

SYNCRETISM, the act or system of blending, combining or reconciling inharmonious elements The term is used technically in politics, as by Plutarch, of those who agree to forget dissensions and to unite in the face of common danger, as the Cretans were said to have done; in philosophy, of the efforts of Cardinal Bessarion and others in the 16th century to reconcile the philosophies of Plato and Aristotle; and in theology, of a plan to harmonize the hostile factions of the Church in the 17th century, advocated by Georg Calixtus, a Lutheran professor of theology at Helmstadt. Its most frequent use, however, is in connection with the religious development of antiquity, when it denotes the tendency, especially prominent from the 2nd to the 4th centuries of the Christian era, to simplify and unify the various pagan religions. During this period, as a result of the intimate knowledge of the world's religions made possible by the gathering of every known cult of importance into the religious system of the Roman Empire, belief in the identity of many deities which resembled each other, and indeed in the essential identity of all, received a special impulse. Not only were various forms of the same deity, such as, for example, Jupiter Capitolinus and Jupiter Latiaris, recognized as being really the same under different aspects, but even the gods of different nations were seen to be manifestations of a single great being Roman Jupiter, Greek Zeus, Persian Mithras and Phrygian Attis were one. The Great Mother, Isis, Ceres, Demeter, Ops, Rhea, Tellus, were the same great mother deity under different masks (see Great Mother of the Gods) Venus and Cupid, Aphrodite and Adonis, the Great Mother and Attis, Astarte and Baal, Demeter and Dionysus, Isis and Serapis, were essentially the same pair. Syncretism even went so far as to blend the deities of paganism and Christianity. Christ was compared with Attis and Mithras, Isis with the Virgin Mary, etc. Isis, perhaps more than any other deity, came to be regarded as the great maternal goddess of the universe whose essence was worshipped under many different names

Naturally, the influence of Greek philosophy was very pronounced in the growth of syncretism. Plutarch and Maximus of Tyre affirmed that the gods of the different nations were only different aspects of the same deity, a supreme intelligence and providence which ruled the world. The Neoplatonists, however, were the first school to formulate the underlying philosophy of syncretism: "There is only one real God, the divine, and the subordinate deities are nothing else than abstractions personified. or celestial bodies with spirits; the traditional gods are only demons, that is, beings intermediate between God and man. . . . All, like every other created being, are emanations from the absolute God" (Jean Réville, La Religion à Rome sous les Sévères). Care must be taken, however, not to place too much emphasis represented was not new in the 2nd century A.D. The identification of Latin with Etruscan gods in the earliest days of Rome, and then of Greek with Italian, and finally of Oriental with the Graeco-Roman, were all alike syncretistic movements, though not all conscious and reasoned The ideal of the common people, who were unreflecting, as well as of philosophers who reflected, was "to grasp the religious verity, one and constant, under the multiplex forms with which legend and tradition had enveloped it" (Réville). The advent of Greek philosophy only hastened the movement by conscious and systematic effort.

Syncretism, being a movement toward monotheism, was the converse of the tendency, so prominent in the early history of Rome, to increase the number of deties by worshipping the same god under special aspecta excording to special activities. In the hands of the Neophtonists it was instrumental in retarding somewhat the fall of paganism for the time, but in the end contributed to the success of Christantly by familiarizing men with the belief in one supreme delity.

See Jean Réville, op. ef. especially pages 134-129, 135-134, 284-105, For other catangles of syncretism, of that of Suddhisu Zonostramism in the state religion of the Indo-Scythian kingdom of Kanshka tee Persain History: Amerik, to the Fall of the Sassend Dynasty: The Parthies Empfre); see articles on almost all the religions of the East, of MUTRAS: ZOROMSTER.

SYNDERESIS, a term in scholastic policosophy applied to the inhorn moral consciousness which distinguishes between good and will. The word is really syntherais? (Gr. owerfgorer, from owerspect) to look after, that cears of), but syntheresis is the commoner form. Diageness Lacitius in his account of the Stoics uses the phrase proper heart of to describe the instinct for self-preservation, the inward harmony of Chrysoppus, the recognition of which is owelfgorer. The term syntheresis, however, is not found till Jerome, who in dealing with Rock 1, 4–75, says the fourth of the "living creatures" of the vision is what the Greeks call overlayers, i.e., statistical constantiate the "spars of conscience," Here apparently syndersis and conscience (orweldpuss) are equivalent. By the school intern, however, the terms were differentiated, conscience here

ing the practical envisaging of good and evil actions; synderesis being so to speak, the tendency toward good in thought and action. The exact relation between the two was, however, a matter of convoersy, Argunsa and Duns Scotus holding that both are practical teason, while Bonaventina narrows synderesis to the volutional tendency to good actions.

tendency to good actions
SYNDICALISM is the name given to a form of revolutionary
doctrine first worked out, largely under anarchist influence, by
extain leaders of the French trade-union movement toward the
end of the 19th century. The word syndicalisme means simply
trade unionism; and what is known in English as syndicalisms
called in France syndicalisme révolutionnaire. The movement
flourished in Finance chiefly between 1900 and 1914 and had a
considerable influence on other countries, especially Italy, Spain
and Latin America.

It has also certain close resemblances to the movement of industrial unionism, which developed over the same period first in the United States and then spread to other English-speaking countries; and, in its theoretical aspect, it influenced socialist thought, especially in Great Britain, where guild socialism (q v)can be regarded as an attempt at reconciling syndicalist and socialist ideas After 1914 it lost much of its hold in France, where it was restated in a form closely resembling guild socialism by the French Confédération Générale du Travail, which advanced a plan for nationalisation industrialisée; that is, for a partnership between producers, consumers and state in the control of industry Both in France and elsewhere many of the leading syndicalists went over to communism; but the movement was never entirely submerged, and it tended to reappear in recent years in hostility to Communist party discipline and centralized control.

The anarchist wing remained powerful in Spain and maintained strong hostility to Communist dictatorship; and the lefttrade-union agitations which were often called Trotskyite—especially by Communists—were in fact largely syndicalist in their ideas, if not in name

Syndicalsts have often claimed that theirs is the most "proletanan" of all radical social theories and owes least to "middleclass theorists". This is true of its origination but hardly of its later development at the hands of Georges Sorel and Hubert Lagardelle.

It was Sorel who introduced into syndicalism the notion of social myths by which the workers could be irrationally stirred to revolutionary action. The general strike, advocacy of which the syndicalists had taken over from the anarchists, became in Sorel's hands a myth of this kind.

The syndicalist starts from the assumptions common to most schools of socialist thought He affirms the inherent injustice of the wage system and the fundamental immorality of capitalist society, which is based, in his belief, on the exploitation of labour. He accepts and pushes to its logical conclusion the Marxian dogma of the class war; he therefore affirms that solidarity of interests does not, and cannot, exist as between capitalists and wage earners. From these premises he draws the usual socialist conclusion; namely, that individual ownership of the instruments of production must be abolished and communal ownership and control substituted for it. But at this point syndicalism and socialism part company. Whereas the socialist dicalism and socialism part company. Whereas the socialist demands ownership by the state and its dependent organs such as the municipalities, the syndicalist demand, until recently, was for direct workers' ownership and control, acting through the organizations of their own creation-the trade unions and federations of unions.

State organization and control of industry are, in the syndicalist view, incompatible with true working-class enancepation. The state is, and must be, an instrument of class domination; it is indeed "the executive committee of the capitalist class." It exists to defend the interests of that class and is consequently as much the enemy of labour as capital itself. To extend its powers would be to twine the bonds of wage slavery ever more firmly about the workers' limbs.

The state is, moreover, hopelessly wedded to an uncreative

Its control, even if it were benevolent (which the syndicalist denies it could be), would necessarily be despotic and mefficient, the spirit of routine would combine with inexperience to crush out the possibility of economic progress Here, as will he seen, the syndicalist endorses the ordinary individualistic criticism of state socialism. Workers' control, exercised through the syndicats, would combine freedom with efficiency

The form of social organization in which this ideal could be realized was, until recently, conceived somewhat as follows the unit of organization would be the local syndicat This would be brought into touch with other local groups by means of the Bourse du Travail, the present function of which is to act at once as an employment agency and a general centre for trade-union activities When all the producers were thus linked together by the bourse, the administration of the latter would be able to estimate the economic capacities and necessities of the region, could co-ordinate production and, being in touch through other bourses with the industrial system as a whole, could arrange for the necessary transfer of materials and commodities, inward and outward A species of economic federation would thus replace the structure of capitalist industry, with which would necessarily disappear the political and administrative machinery of the state Two features of this utopia need to be emphasized, consumers as such were excluded from any share in industrial control, and a localized system of industry was envisaged

This latter feature was a direct reflection of French economic circumstances, both industry and trade unionism were much more local in range than in other and more highly developed countries But the movement toward large-scale organization which has so profoundly affected every aspect of modern economic life has produced a corresponding modification in syndicalist ideals

Syndicalist theory starts, as has been said, from the idea of a class war which must be waged relentlessly till a complete social transformation has been accomplished

The essential weapon in this struggle is the power of the organized workers As the cause of the conflict is economic it must necessarily be fought out in the economic sphere. Syndicalist congresses have persistently repudiated political action and pinned their faith to a general strike as the grand instrument of social revolution This reliance upon industrial or direct methods of action flows necessarily from the fundamental notions of syndicalism as to the nature of the state, and also from strictly practical considerations.

Outside the mine or factory, working men hold divergent religious or political opinions which make effective mass action difficult, if not impossible. Inside, the nature of their employment gives them a sense of solidarity which overrides other differences and bands them together in the syndicat for common defense, to persuade them to pass from the defensive to the offensive is the syndicalist's task, and in the accomplishment of this, political labels and controversies would be a hindrance. The strike, therefore, is the characteristic syndicalist weapon. However limited in its scope and object, it is an educative experience, successful, it inspires the workers with a sense of power; unsuccessful, it impresses upon them the servility of their lot and the necessity for better organization and wider aims. Thus, every strike is a preparation for the revolutionary day, when the workers, or a fighting minority of them (for syndicalism repudiates as bourgeois the dogma of the sacredness of majority rule), shall seize the instruments of production by an expropriatory general strike. In the meantime, they are working out from day to day, in the ordinary course of their employment, the ethics and the jurisprudence of the new social order.

The strike, of course, is not the only weapon in the syndicalist armoury. Various other means of waging the class war, known collectively as sabotage, have been both preached and practised. These range from bad work to the grève perlée (extending from ca'canny or go-slow to destruction of goods) and the chasse aux renards (literally, fox hunt); s.e, assaults on "black-legs" or jaunes. Sabotage has a much wider meaning in Franch than in

bureauciacy, incapable of mitiative and ignorant of industrial English, it covers, for example, doing better work than is demanded as well as worse, in order to put up the employer's costs It also covers what is known as the work-to-rule strike. It is fair to say that many syndicalist leaders criticize some of these methods as destructive of the worker's moral and technical com-

Syndicalism reflects French working-class experience and conditions of life, nevertheless, the history of Great Britain shows interesting foreshadowings of it. The idea of industrial self government by the producers attracted for a time the mind of Robert Owen, and the Grand National Consolidated Trades Union of 1833-34 was an attempt to realize it in practice The Operative Builders' union had developed the same notion in the previous year The plan of a general strike-originated by William Benbow some years earlier-for a time, under the strange title of the "Sacred Month," formed part of Chartist propaganda is no evidence, however, that these projects had any echo on the European continent.

The syndicalist idea, as understood in France, may be said to have developed out of the strong anarchist and antiparhamentary traditions of the French working class, and to have been much influenced by the teachings of P J. Proudhon and, on another side, by Auguste Blanqui A French delegate to the Congress of the International Working Men's Association held at Basle in 1869, for instance, prophesied that "the grouping of different trades in the city will form the commune of the future" when "government will be replaced by federated councils of syndicats and by a committee of their respective delegates regulating the relations of labour-this taking the place of politics" These tendencies manifested themselves with increasing strength during the 1800s in the two main labour organizations of the period-the General Confederation of Labour (or CGT under its French initials) and the Federation of Bourses du Travail The secretary of this latter organization, Fernand Pelloutier, did more perhaps than any other individual to work out the characteristic doctrines of syndicalism and to spread them among his fellow workers When these two bodies joined forces in 1902, trade unionism in general and syndicalism in particular received an immense accession of strength, and the doctrine subsequently remained-in spite of the efforts of political socialists to capture the syndicats for their own purposes-the characteristic expression of French revolutionary idealism

Syndicalist doctrine has had considerable influence outside France In the United States the analogous movement known as the Industrial Workers of the World resembled it in advocating direct action and in repudiating parliamentary action but differed from it in favouring strong trade-union centralization as a means of combatting the highly organized power of U S. capitalism

In Spain, the National Confederation of Workers (CNT: 26., Confederación Nacional del Trabajo) has been consistently syndicalist and indeed developed independently out of Spanish

In Italy, though syndicalism never wholly dominated the trade unions, its influence was considerable both before and immediately after World War I and was by no means extinct by the middle of the 20th century.

The influence of these ideas on the trade-union movement in Great Britain and Ireland was for a time pronounced, though they took a different direction, modified by the traditional parliamentarism of the British working class In Great Britain the real cause of the permeation of certain unions by syndicalist ideas between 1906 and 1914 was the absorption of trade-union leaders in administration or in politics which caused them to lose touch with the rank and file Especially was this the case with regard to the miners, the railwaymen and the engineers.

Daniel De Leon was a leader of the Socialist Labour party in the United States from 1880 onward, and his writings influenced British socialist thought, particularly in the Clyde and in South Wales. Though not an opponent of political action, as most syndicalists were, he advocated organization by industry and the general strike.

In England, between 1900 and 1910, there was a growing dis-

satisfaction among the rank and file with political action Despite the fact that the influence of the Labour party in the house of commons secured, to a greater degree than ever before, to the trade unions freedom of industrial and political action by the Trades Disputes Act of 1906 and the Trade Union Act of 1913, real wages were falling, and it was felt by many among the lank and file that a speeding-up was necessary, and state collectivism as a way out toward industrial democracy was discredited James Connolly, the Irish labour leader who was executed after the Easter rising in Ireland in 1916, started on the Clyde, in 1905, an organization similar to that of Daniel De Leon In his pamphlet Socialism Made Easy, he enunciated the syndicalist principles "that they who rule industrially will rule politically," and that "the function of industrial unionism is to build up an industrial republic inside the shell of the political state, in order that when the industrial republic is fully organized it may crack the shell of the political state and step into its place in the scheme of the universe" Tom Mann, while in France and Australia, to which had been imported ideas of the Industrial Workers of the World from the U.S., was powerfully influenced by the same theories; while on the Rand, in South Africa, a small but influential group of leaders was working out the structure, forms and policy of a movement similar in character. In 1910 Tom Mann preached the new faith in all the big British industrial centres and rapidly won many followers. Then followed the railway strike of 1911 and the great coal strike of 1912 The National Union of Railwaymen and the Miners' Federation of Great Britain became organized as two of the most powerful industrial unions in consequence of the new thought. Their leaders disagreed with the syndicalist view of the state, but they recognized the driving power of the theories that asserted that "political power is a reflex of industrial power '

The transport workers soon had a looser federation, and after the strikes of 1911 and 1912 and the Irish transport workers' strike' of 1913, the Triple Alliance (of railwaymen, transport workers and miners) was formed in 1915.

This alliance collapsed in 1021, when an endeavour was made to use it in support of the miners, who were-resisting wage reductions and longer hours during the postwar slump. The other unions withdrew their support when the miners refused to place the power to settle the strike in their hands. A somewhat similar fate brefell the miners in 1926, when the trade unions, after calling a general strike in their support, withdrew on the same grounds.

The general strike was doubtless to some extent influenced by syndicalist ideas; but its leaders, so far from accepting syndicalism, shoutly denied that it had any unconstitutional object and did their utmost to prevent it from developing into an attempt to overthrow the government or to assume power by illegal means.

SYNDICATE. PRESS. Press syndicates are organizations

SYNDICATE, PRESS, Press syndicates are organizations which sell the rights to literary and art materials to newspapers; they sell and distribute to considerable numbers of papers (and

even, in some cases, to periodicals). The term in common modern usage is not applied to the general wire news services such as Reuters and the Associated Piess, though it includes services such as the Newspaper Enterprise association which handle news but emphasize features and pictures. Syndicates distribute news, informative articles, descriptive, and entertaining essays and items of many kinds, editorials, signed columns on public affairs, fiction, verse, children's stories, himour, puzzles, comic pictures and strips, cartoris, news and feature photographs, and special material columns of the production of the pro

There were a few examples of syndication in the 18th century, such as the "Journal of Occurrences," distributed from Boston, Mass, in 1768 A few sporadic examples (political and fashion letters) occurred in the first half of the 19th century, but there was no important development of syndication before A N Kellogg of Chicago, Ill, began in 1875 to sell stereotyped plates carrying literary and pictorial matter to weekly papers Kellogg was followed in this technique by Maj. O J Smith in England (1882) and by directors of political parties and factions in Germany But the first modern syndicate was that of Irving Bacheller of Brooklyn, N.Y., who began handling fiction, household departments, and news and gossip letters in 1883 S McClure founded his famous syndicate ten months after Bacheller's Before the end of the century, syndication of features and pictures had become a considerable business in the United States, Britain and the dominions, and western Europe

Leading syndicates in the United States are King Features, owned by the Hearst interests; United Features, affiliated with the United Press; AP Newsfeatures, General Features, Bell Syndicate; and Chiego Tribune-NY News Syndicate Promue English syndicates are Central Press, Exchange Telegraph Co. and Inconported Press of Great Britain. (F L. MT)

and incolporated Press of Great Britain.

SYNEDRIUM, a Rabbien or legal body in Jerusalem, the Sanhedrim the form Sanhedrim is based on false etymology, suggesting a Hebrew mase, plural ending -in added to a non-existent noun Sanhéder The Oxford English Dictionary (cited in H. W. Fowler's Mod Eng. Glasge, 1936, p. 512) makes the following erroneous statement. "the incorrect foim Sanhedrim ... has always been in England (from the 17th ecnt) though form in popular use." As no Hebrew noun ending in M occurs, the only correct equivalent to TYPS must be Sanhedrim The existence of a court at Jerusalem is midcated in II Chron xix, S. An aristocratic Council of Elders and priests is mentioned both before and during the Maccabaean age (e.g., Josephus, Ant., xu, 3, 3). Probably the High Priest pressed from early times

The accounts in the Mishnah do not entirely agree with those of Josephus and with New Testament references but the amount of divergence is a matter of dispute. There are two lines of thought among modern scholars, some supporting the Mishnah, others maintaining that its information is an "academic reconstruction," hence unhistorical. That the Jewish court early lost its power is generally admitted (cf. John xviii, 31). Forty years before the fall of the Temple it could no longer inflict capital punishment (Jer. Sanh, 18a) and the right of deciding financial cases had been abrogated during the reign of Alexander Jannaeus (cf., T. B. Sanh. 41a). Nevertheless legal tradition was well preserved and the evidence of authorities such as Tose b. Halafta cannot easily be brushed aside. Büchler (cit. snfr) reconciles the conflicting evidence by assuming that there were two bodies, one, that of Josephus and the Gospels, possessing civil authority and one, that of the Mishnah, with purely religious functions, e.g., the fixing of the calendar or the purity of priests. The former sat in the town or on the west edge of the Temple hill; the latter, called "the great Sanhedrin," sat in the Xystus or Lishkath hag-Gazsth (chamber of hewn stone) and was composed of 71 members, mostly Pharisees, over whom the Nasi' and Ab Beth Din (rabbis) presided The lesser Sanhedrin of 23 members, mostly Sadducees and priests, was under the leadership of the High Priest,

Bint 1002APITY — "Sanbedila," Jewish Encyclopedia, "Crimes and Punshments" and "Sanbedila," Hastings Encyclopedia of Religion of Edition of Edi rucie on trial of Jesus in Journal of Theol Stud, xxi, pp 51-76 Det 1919) which is criticized by I Abrahams, Studies II, xv (1924) SYNESIUS (c 370 or earlier-c, 414), bishop of Ptolemais

in the Libyan Pentapolis, was born at Cyrene of wealthy parents

who claimed descent from Spartan kings

His extant works, written in Greek, are: (1) a speech before Arcadius, De regno; (2) Dio, sive de suo spsius instituto; (3) Encomsum calvitti, a comic defense of baldness. (4) De providentia; (5) De insomnus (on dreams), (6) 157 Epistolae; (7) 12 Hymni; and several homilies and occasional speeches

SYNGE, JOHN MILLINGTON (1871-1909), Irish dramatıst, was born at Rathfarnham near Dublin April 16, 1871. Educated at Trinity college, Dublin, he travelled for some years on the continent, spending much of his time in Paris He returned in 1898 to the Aran Isles There he wrote a number of sketches dealing with the life of the islanders, which were later collected in The Aran Islands (1907) In these and other sketches of the same period he had not quite shaken off the obsession of stylism, and still had a wish "to do for the west of Ireland what Pierre Loti had done for the Bretons" Gradually, however, Ireland took hold of him, and turning to the dramatization of incidents in the life he now knew intimately, he began to elaborate, partly from his notebooks and partly from the writings of Lady Gregory and Douglas Hyde, that richly imaginative Anglo-Irish dialect which he used with such complete success When, in 1904, he became a director of the newly opened Abbey theatre, Dublin, he had already produced two one-act plays, The Shadow of the Glen (1903) and Riders to the Sea (1904), published in one volume (1905) The Well of the Saints, a beautiful three-act play produced in 1905, was regarded by some as an affront to Irish morals, and when The Playboy of the Western World appeared in Jan. 1907, it was interrupted every night for a week by an organized disturbance. When the real merits of the play became known, it contributed largely to the fame of the Abbey theatre Time has shown how deeply Synge penetrated into the soul of the Irish peasant. The richness of the dialogue and the suggestion which it conveys of a permanent human enigma combine to make it a masterpiece. Synge's latest volumes were a collection of his poetical works entitled Poems and Translations (1909), and another play, Desidre of the Sorrows (1910) which he all but completed before his death. Synge's greatest work is probably The Playboy, though some critics give pride of place to Derrdre. Synge died in Dublin March 24, 1909.

SYNOPTIC CHARTS, a term used peculiarly in meteorology for maps of any large or small portion of the globe, on which are plotted weather observations taken at various points over the area represented and at approximately the same time. In addition the data on the map are usually analyzed by means of conventional symbols, isolines and shadings (see Weather FORECASTING). The expression weather map or weather chart is essentially synonymous to synoptic chart. The adjective synoptic implies a brief or condensed means of presenting a combined or general view of something, but in meteorological parlance the word came to have the connotation of synchronous because of the fact that according to most schools of meteorology only synchronous weather observations lend themselves to rational analysis of maps that are to be used for the purpose of preparing forecasts The notable exception is in the USSR where the official weather maps are not based on entirely synchronous observations but on observations made at the same local sun time

Synoptic charts are constituted in various forms according to their purpose and the kind of data plotted on them The basic chart for the use of forecasters is that which shows the synchronous observations at sea level or surface stations over a more or less extended area generally a large part of a continent at least and often a whole hemisphere For each weather station whose observations are taken at internationally standardized synoptic hours-one to four times a day-and received by radio or telegraph at the forecast offices, there are plotted in a model grouping around the circle representing the station on the map the values of or symbolic indications of a number of weather elements For all stations at least the baiometric pressure (usually reduced to sea level), the air temperature, the present weather, the wind direction and speed or force, and the sky cover will be reported. In some countries many stations also give visibility, dew point or relative humidity, forms, amounts and movements of clouds at different levels, net amount of pressure change during the last three hours, the characteristics or the tendency in the pressure during the last three hours and the amount of precipitation after the last observation. In case of ship reports the water temperature, state of sea, position and motion of ship are also reported

An innumerable variety of charts could be constructed from such reports but in practice only a few are made in addition to the standard charts containing the plotting and analysis of the complete surface reports, eg, charts to show the change in pressure and the change in temperature since the previous chart or in the last 12 hr. or 24 hr. are often made. The analysis of the basic surface chart consists usually of isobars (q v.), fronts (q v), and air mass (q v.) designations, and shadings or symbols to show

where precipitation and fog are present.

Such maps are two-dimensional To obtain a three-dimensional synchronous view of the atmosphere, it is customary, in regions where upper-air soundings are regularly made, to construct synoptic charts for several levels in the free atmosphere. Plotted on them, at the appropriate points where soundings are reported, are the values of the elements given by the soundings at that level, usually only pressure, temperature, humidity and wind The levels selected for upper-air charts may be surfaces of constant height, constant pressure or constant entropy. Constant-height surfaces of 5,000 ft, 10,000 ft and 20,000 ft mean sea level have been much used, but during the 1930s and the World War II years, after some experimentation with isentropic charts (q v ), nearly all weather services gradually came to prefer constant-pressure charts; by 1945 they became practically internationally standard

The World Meteorological organization recommended that data for the following surfaces be evaluated from the soundings and broadcast: 1,000, 850, 700, 500, 300 and 200 millibars, and that analysis of the 700- and 500-millibar surfaces be made as a minimum After World War II transmittal of sea-level and upper-air synoptic charts by means of facsimile (both telegraphic and radio)

was developed, in the United States particularly.

With the advent of jet aircraft, analysis of much higher levels in the atmosphere was required. In this connection some forecasters draw lines of equal wind speed (isotachs, isokinetics) on the constant-pressure charts for 500-, 300-, 200-millibar and even higher surfaces; and charts showing the topography of the tropopause are prepared.

For tropical regions isobaric and constant-pressure charts have not proved very helpful for forecasting, and experiments indicated that streamline charts would be more successful, though the technique is difficult and weather reporting stations were still too sparse over most of the tropics in the 1950s.

In addition to the various types of charts already mentioned, which might be called the basic ones, it is customary in the larger forecast centres to prepare many auxiliary charts such as those showing the changes in height of a pressure surface with time, and those for the thickness and temperature of the layers between a lower and a higher constant-puesure surface. Some of the systems of analysis and forecasting under trail in the 1958 movied the preparation of many charts of an intermediate character represting the step-by-step computation of derived rather than observed factors, e, g, in vorticity analysis and in some methods of numerical needs on

Finally, there are the prognostic charts which represent the forecast patterns of pressure, height of pressure surfaces, or other elements (temperature, wind, etc.), for some future time,

Thus the total number of charts constructed in a large forecast central may amount to hundreds per day, and consume the services of a large staff working in shifts around the clock

In connection with forecasting for longer periods of time than one or two days, it is desnable or necessary to construct mean synoptic charts which show averages of the elements over five days, a week, a month or more.

Over much of the northern hemisphere synoptic observations collected munetately by ware and audo permit maps to be made one, two, three or four times a day as desired, in some countries maps can even be made for every hour. The maps can be plotted and analyzed within two to six hours after the observations are made. Upper-air data are available only once or twice a day, however. Large areas of the oceans, and particularly of the polar regions and southern hemisphere, have few observing stations or ships and hence cannot be synoptically charted in the detail required by weather forecautes Methods of extrapolation of southings or map patterns to heights above those reached by many times.

Synoptic charts are published daily by the leading national weather services. A remarkable service of Historical Weather Maps for the northern hemisphere, one a day from Jan. 1, 1899, to June 30, 1393, compiled and analyzed by a uniform technique were published by the US government (weather bureau) during World War II and were resumed in 1946. The earliest weather charts were made well before 1835 by collecting synchronous weather reports by mail. The first telegraphic collection of synoptic reports and mapping thereof for forecasting was accomplished by Urbain J. L. LeVerner following the Crimean War. From about 1870 the leading nations have published charts each day along with the official forecasts: Simplified seal-level weather charts are published daily in many newspapers, posted in public places, and discussed on televisore programs.

For the principles of analysis and use of synoptic charts in forecasting see Air Mass; Fronts, Isallobars; Isentropic Charts; Isobar; Weather Forecasting

SYMOPTIC GOSPELS AND SYMOPTIC PROBLEM. The first three Gospels, Mathiew, Mark, Luke, are known as the Symoptic Gospels because in matter, language and order they lare much a common, and can, therefore, be viewed together or symoptically. The Symoptic problem is the problem of the relations between these Gospels, whether of influence, interdependence, or common origin, arising from their common features. (See Brus: New Testament: Modern Criticism; Gosper.; and the articles on the several Gospels.)

SYNTHETIC FIRES. The commercial production of synthetic textile fibres has been a development daing from about 1890. The first in the field was rayon, but many other types of synthetic fibres were later developed. All of these man-made fibres are produced either in the form of filament yarn (continuous parallel strands, similar to silk) or as staple fibre (short, uniform-length fibres to be spun into yarn in the same manner as cotton or wool.)

## HISTORY

The first person to visualize the possibility of making an artificial fibre by a process similar to the silk worm's spinning was Robert Hooke, an English scientist, who included a discussion of the subject in his book Micrographia, published in 1664. Again in 1734 the French scientist, René A. F. de Réaumur, predicted

the manufacture of an artificial textile from gums or resins, sinciliar to vamishes then being manufactured, which had the necessary qualities of resistance to heat and solvents. No concrete developments along these lines occurred, however, until the middle of the 19th century. In 1842 an English silk weaver, Louis Schwibe, exhibited a machine for making artificial filaments. This machine used nozeles with fine holes through which the liquid was forced to form filaments, which is the principle of the spinnerest though which rayon is spin today. Schwabe spun his filaments of glass, but he was not satisfied with the product and appealed to British scientists to discover a better material from which to manufacture filaments. A third development preparing the way for rayon was the discovery of introcellulose by C. F. Schonbem, a Swiss chemist, in 1846

The first known patent for the manufacture of rayon was issued to Geogea Audemans in 1855. He prepared three from the inner bark of mulberry and other trees, which he nitrated and dissolved in a mixture of ether and alcohol and combined with a ubber solution to form his spinning mixture. The filaments were spin by dipping the point of a needle into the solution and drawing out a filament which was connected with a winding machine. Two years later a patent was issued to E J Hughes for an elastic substance made of starch, gelatin, resin, tannins, fats, etc., which could be spin into silkight filaments.

A further advance was made by Str Joseph W Swan, who, searching for a better carbon filament for electric light bulbs, patented in 1883 a process for making a falament by squeezing a nitrocellulose solution into a coagulating medium and denitrating the filament. The fact that introcellulose could be denitated by the use of reducing agents such as ammonium sulphide was known as early as 1863. In 1885 Swan exhibited a few articles made from these filaments, but he did not follow up the textile possibilities of his invention.

Nitrocellulose Process.—The development of rayon as a struite really began with the work of Count Hisiar de Chardonaet, who is frequently called the "father of the rayon industry." Chardonnet began experiments on the making of an artificial textile in 1878, and in 1884 produced his first fibre from a nitrocellulose solution of pulp derived from mulberry leaves, coagulating the filaments in heated air. At the Paris Exposition in 1889, be exhibited articles made from these artificial fibres and secured to financial backing to build a factory at Besançon, Fr, where the financial backing to build a factory at Besançon, Fr, where the first commercial production of rayon began in 1891. Chardonnet's process was modified somewhat by Lehner, who used a solution of alcohol instead of warm air to coagulate the filaments.

Cuprammonium Process.—A second process for the production of artificial fibres from cellulose, the cuprammonium process, was patented in 1800 by a French chemist, Louis Henri Despeis-The discovery that cellulose could be dissolved in a cuprammonium solution and then precipitated with sulphuric acid is usually credited to M E Schweitzer (1857), although there is some evidence that John Meicer had already performed this operation. And in 1882 Edward Weston had patented a process for making filaments from a cuprammonium solution of cellulose, but, like Swan's discoveries in the mtrocellulose field, these filaments were developed in connection with the manufacture of electric light bulbs and were not exploited for textules. Despeissis himself did not put his patent into commercial production. Several German chemists (H. Pauly, M. Fremery, E. Bronnert and Urban) developed modifications and improvements on this process and put it into commercial production about 1898. This process of rayon production was comparatively expensive and was falling into disuse when Elsaesser further developed the method of stretch spinning (which had been patented by Edmund Thiele) and put the new process into production in 1919. Stretch spinning permitted the manufacture of very fine filaments and revived the use of the cuprammonium process.

Viscose Process.—A third process for the production of rayon grew out of the researches on cellulose derivatives by C. F. Cross and E. J. Bevan. These men discovered and patented in 1892 a viscous solution resulting from the dissolution of cellulose xanthate in dilute caustic sola. The manufacture of a textile fibre from

this solution was undertaken by C. H. Stearn and C. Topham while they were engaged in the spinning of lamp filaments of this material, but the technical problems of finding a proper solution and a satisfactory method for spinning the varn required years of research In 1808 Topham discovered the aging process in pieparing the spinning solution, and in 1902 he invented his spinning box, a revolving cylinder in which the very tender filaments were coiled by centrifugal force as they were drawn from the spinning bath In the same year (1902) Max Mueller discovered that it was possible to convert the cellulose vanihate into regenerated cellulose at the same time that the spinning solution was being coagulated into filaments, instead of by a separate operation This discovery, permitting the spinning of a yarn strong enough to be wound directly on a spool, greatly stimulated the development of the viscose process The commercial production of rayon yain by the viscose process was started in 1905, the use of this process rapidly increasing and surpassing the other methods of making rayon

In 1910, Samuel Salvage, a young English yarn merchant who had been in business in the United States, persuaded the English textile firm of Samuel Courtaulds & Company that the time was ripe for full-scale production of rayon in the United States The American Viscose company was formed, a tract of land was bought at Marcus Hook, Pa, and a new plant was built and in production by 1911 That year marked the founding of the American rayon industry with a total production of 362,544 lb of

Acetate Process .-- The fourth method for making rayon, the cellulose acetate process, was much later than the others in entering the field of commercial production. Cellulose acetate was produced by Laurent Naudin and Paul Schutzenberger in 1865 Cross and Bevan experimented with it and patented a process for its production in 1894. Bronnert, in Germany, experimentally made a textile thread from it in 1899. The important discovery that cellulose acetate modified by partial saponification (treatment with caustic) was soluble in acetone, instead of the chloroform necessary to dissolve ordinary cellulose acetate, was made by G W Miles in 1003.

In the United States, Arthur D. Little of Boston, Mass., had kept abreast of developments in the English experiments and, in partnership with William H Walker and Harry S Mork, was using the new cellulose acetate compound for electrical wire insulation In 1902 these three were granted a patent for spinning textile varn This first patent on a man-made fibre in the United States led to the first successful manufacture of acetate rayon.

But the full development of this process on a commercial scale was the work of Henri and Camille Drevfus, who made use of the acctone-soluble compound discovered by Miles. During World War I, the Drevfus brothers built a large factory at Spondon, Eng., for the production of cellulose acetate to be used as noninflammable dope for covering aeroplane wings A similar plant was started by them in the United States. When the end of the war destroyed the demand for the cellulose acetate dope, Drevfus turned to the production of rayon as the most promising use for the large plant he had built, and after several years of research a commercially successful spinning process was evolved. By the 1950s total world output of rayon plus acetate had risen to approximately 3,500,000,000 lb. annually, of which about a third was produced in the United States. (S. B. H.: X.) Synthetic fibres are classified in four groups, cellulosic fibres,

true synthetic fibres, protein fibres and inorganic fibres.

### CELLULOSIC FIBRES

Rayons and acetates fall under the classification of cellulosic fibres. The group includes regenerated cellulosic fibres, viscose rayon, cuprammonium rayon and saponified-acetate rayon Acetate, second in commercial importance to viscose, is a cellulose derivative fibre.

Surpassing in poundage all other synthetic fibres, rayon was the first successful man-made fibre, although it was many years after its discovery that the term artificial silk was abandoned and the generic term rayon adopted.

In each of the processes of manufacture of cellulosic textile fibres different solvents and chemical reactions are used in transforming the cellulose to liquid form. The mechanical method of extruding the chemically prepaied solution is fundamentally the same. The operation of extrusion is called spinning, not because of the textile spindle but in reference to the silkworm which discharges its glutinous liquid from external orifices called spinnerets located below its mouth, the threads combining into a single strand and immediately hardening on exposure to air.

The cellulosic solution prepared for synthetic textiles is conveyed from storage tanks through distributing pipes and filters to the spinning frame, consisting of rows of jet holders carrying spinning nozzles at their extremities. These nozzles consist of metal caps made of a hard, noncorrosive and light-weight precious metal or alloy, such as platinum and iridium or platinum and gold They are perforated with circular, concentrically arranged openings of almost microscopic size, about o i mm in diameter. These are called spinnerets, and the size of the aperture governs the size of the filament extruded.

Three systems of spinning viscose rayon came into use-the centrifugal, bobbin and continuous processes; the latter became more important commercially. The product may be continuous filament or cut staple Regular viscose rayon is of low tenacity. and it is this type which is used so extensively in fabrics. High tenacity rayon virtually displaced use of cotton in the cords

A summary of differences in manufacture and uses of cellulosic fibres is as follows.

Viscose Rayon .- Wood pulp or cotton linters are treated with caustic soda and carbon disulphide. The aged cellulose xanthate is dissolved in caustic soda and forced through spinnerets. Desulphurizing, washing and bleaching of the varn follows Stretching the filaments while in a plastic state produces high-tenacity

Typical uses include yarn for crepe, voile and low twists for many woven and knitted fabrics (the only continuous filament synthetic yarn being creped commercially), also hosiery and tire cord The staple is used alone and in blends for dress goods and sports wear, rugs, blankets, upholstery and house furnishings

Cuprammonium Rayon .- Purified cotton linters are dissolved in ammoniacal copper-hydroxide solution and extruded through a spinneret, drawn out in a water bath, and acidified. Uses include knitted and woven material for wearing apparel such as dresses, gloves and hosiery, upholstery and decorative fabrics.

Saponified-Acetate Rayon.-This fibre is manufactured like acetate (below) except that it starts as a cellulose-acetate fibre and after deacetylation under tension becomes regenerated cellulose It is sold only as a monofilament vain under the commercial name of Fortisan and is used for lightweight fabrics for coating, reinforcing, industrial belting and for some military purposes

Acetate.-Cotton linters or wood pulp are acetylated with acetate anhydride to form cellulose acetate which, dissolved in acetone, is extruded into warm air to form filaments. Highelongation acetate is produced by a modification of the piocess Typical uses include diess goods, linings, hosicry, underwear and

fused fabrics Staple (often blended) is used for men's and women's wear, blankets, upholstery, carpets and for fusing,

## TRUE SYNTHETIC FIBRES

True synthetic fibres are made of coal, water, air, petroleum and limestone. The results are the fibres formed by long chain molecules, the polyamides, the polyacrylics and the polyesters. Nylon was the first true synthetic fibre and remained the only important one from a commercial standpoint.

Nylon.-Nylon (a generic term) made revolutionary developments in the textile world. After its introduction to the industry in 1939, it virtually replaced silk in that fibre's most important commercial application-ladies' full-fashioned hosiery It also proved to be an adaptable and versatile yarn for other purposes.

Nylon was due to a laboratory accident. In 1927 the E. I du Pont de Nemours and Company set up a program of fundamental research as an important activity of the chemical department. One of the earlier studies undertaken was that of polymerization-

how and why certain small molecules unite to form giant molecules, such as those found in tubber, cotton and silk. After the work had been under way about two years one of the chemists. in attempting to remove a sample of the molten polymer from the vessel in which it had been prepared, found that it could be drawn out in the form of a long fibre, and that even after the fibre was cold it could be drawn farther to several times its original length Such a phenomenon had never been observed with a compound of that type The strand made was strong, elastic, lustrous and silklike After much more research a variety of polymer was developed which when drawn through a spinneret improvised from a hypodermic needle was actually the first nylon fibre First called "66," it was introduced to the public in 1938 as bristles in toothbrushes In 1030 hosiery knitted of nylon varn was produced in a pilot plant and made available for limited sale, and in May 1040, nylon hosiery was offered to the public on a national scale. Acceptance of pylon full-fashioned hosiery was immediate. and demand steadily increased, keeping ahead of production facolition

Nylon can be made in a number of different ways, such as the reaction between a diamine (for example, hexamethylene diamine) and a dicarboytic acid like adipic acid. In the manufacture of yarn the polyamide is melted, extruded through a spinneret and stretched.

Its great strength, ability to absorb energy dynamically or staticly, made nylon useful for a variety of modartial and military purposes. In addition to hossery it is manufactured into thread, rope, the cord, sail cloth, parachute shrouds and body armour in continuous filament it is popular in satins, taffetas and lingeric fairliers such as triot of (fairbic fairly with fine hornoutal and vertical lines). It can be crimped and blended with other fibres and spun on worsted or cotton systems.

Orlon and Aerilan are puncipally acrylic and are formed from a polymer of acrylonitrile. A solution of the polymer is extruded, the solvent is removed, and the resultant yarn stretched. Orlon is a continuous filament yarn, Aerilan a cut staple yarn. The latter's industrial uses are most important where high temperatures or acid conditions, or both, are found. It is good for awnings, sail cloth, rope, automobile tops, electrical insulation, lammates some chittines, sontwaver and sutures.

Dynel, partly acrilac, is made by a somewhat different process. A copolymer of vnyl chloride and acrylonitrie is dissolved in actone, filtered, and then spun dry by means of extrusion, then cut into desired lengths. Dynel's continuous filament counterpart is Vinyon N (see below)

The principal use of dynel is in pile fabrics, blankets, socks, industrial clothing and filter fabrics. It is used in blends with cotton, rayon or wool for apparel use in items usually considered in the wool category.

Dacron (known as Terylene in England) was the only commercially available polysets fibre in the 1950s. This fibre had been widely advertised for its nonwinkle qualities, its ability to hold a cresse, and the fact that garments made of it may be hold a cresse, and the fact that garments made of it may be affinity for wool and the rather unstable market for that natural fibre turned great attention to Dacron's possibilities. It was in full-scale production by the 1950s.

In the manufacture of Dacron yarn ethylene, glycol and terephthalic acid react to produce the polyester which is melted, extended through a spinneret, and stretched.

Saran, a monofilament yarn, is identified as vinylidene chloride. Petroleum and salt are treated to produce ethylene and chlorine. They are combined to form vinylidene chloride which is copolymerized with vinyl chloride. The resulting resin is melted and extruded to form filaments which are then orientated

Typical uses include screening, cords for racquets and the like, uphobstery, cutrans, filter cloth and shoe and handbag fabrics. Vinyl Resins.—Vinyon—A coplymer of vnyl chloride and vinyl accutte is dispersed in acetone, filtered, decreated, and then do-y-pun by means of oxtrusion After standing, the filaments are wet twisted and stretched. Both continuous filament and staple filter according by the continuous filament and staple filter according by more continuous filament and staple filter according to more continuous filament and staple filter according is unvolved.

Typical uses include filter fabrics, nets and seines, clothing and fabrics for protection against acids and alkalis, and fusible shape-retaining fabrics. Staple is used as a bonding agent in combination with other fibres.

Vinyon N—A copolymer of vinyl chloride and acrylontrile is dissolved in acetone, filtered, and then dry spun by means of extrusion Most types are stretched and twisted, following which they are dimensionally stabilized by additional processes

The unstretched staple (HH) is used in the manufacture of pile fabres, rugs, paper, felts, rope and bonded web, it is also used as a bonding agent. The stabilized, continuous fiament is used in dress goods, house frunishings, hoselw, foundation garments, limngs, multital fabrics (filter), thead, pant-brush bristles, fish lines; rope and multary fabrics.

### PROTEIN FIBRES

One large group of synthetic fibres is made from a natural proterion base (compared with the cellulose base of iayon). Commercial production of fibres in this group has been primarily of the type made from milk casen. Italy led in the development and production of casein-base textiles but they were later also manufactured commercially in Germany, Great Britain, Belgium, Holland and the U.S.

These casem-base fibres have a chemical composition almost identical with wool, with the exception of a lower subplur content. The fibres may be very fine and soft, or a harsh texture similar to coarser wools may be produced by modifications in the manufacturing process. The dyeng reactions of casein-base fibres are the same as those of wool, which is a great advantage in blending these two fibres. Casem-base fibres are usually manufactured in staple fibre form, rather than in continuous filaments, and are used principally in combination with wool. The lack of resiliency in casein fibre and its low wet strength make blending with natural fibres desirable.

It is possible to use many protein materials including peanuts (used to produce ardil), soybeans, sen (a corn protein from which Vicara is made), fish, waste animal skin, leather and muscle tissue to produce synthetic fibres. Other types of synthetic fibres outweigh protein fibres in commercial importance.

### INORGANIC FIBRES

Glass is the principal inorganic fibre Its flameproof qualities made it desirable for fabric purposes such as drapenes and pholstery and for certain purposes in military use. Because of its resistance to acids and solvents it is useful as a filter cloth It is employed also for plastic reinforcement and electrical insulation.

The method of manufacture is as follows special-composition glass marbles are melted in an electric furnace and the molten glass passes through the many munute holes in the base to form continuous fibres. The fibres are attenuated to the desired size; stanle fibres are attenuated and formed by steam jet.

### MILL PRODUCTION

Most synthetic fibres are spun into yams and woven into fabries on the cotton system, using the same, or partly the same machanery. Some synthetic fabrics, however, found greatest consumer acceptance in the hosjery field and knit-fabrics field where high-speed triton imachines can turn out large production. The textile machinery industy invested great amounts of capital in research and development of better processing for the science shrew and the blends of synthetics, cottons, woollens and worsteds. Dyeing and finishing of the synthetic fibres presented special problems to the chemist, as well as to the manufacturer of dyeing and finishing equipment.

The trend to multiblire production brought with it an almost complete reorganization of mill operation. Mills which successfully converted their cotton, woollen or worsted operations to the use of staple synthetics found that considerably more was involved in the conversion than a mere change-over in purchase of raw materials. Synthetics are run on the cotton system, the worsted system and the woollen system. Each has its own con-

version problems Cotton remained the most important fibre (in pounds consumed) but by the 1950s consumption of synthetic fibres equalled 25% of the total US market-still the largest consumer of cotton in the world Much of this increase in synthetic consumption had been due to blends and mixes in varies

Synthetics on the Cotton System.-When synthetics are spun on the cotton system, one of the major steps necessary is a thorough cleaning of the mill Even in the cleanest cotton mill, cotton lint may accumulate on roof beams, window sills and other likely places If the "fly" should by chance become mixed with the synthetic staple it would show up in dyeing and finishing operations because cotton and synthetics do not take the same dyes.

Oil which may have been on machines used for cotton must be removed as completely as possible from all exposed machinery parts Cotton has less affinity for oil than do synthetic fibres, but once oil is dropped on the synthetic varn or fabric it is difficult to remove

The hazard of mixing fibres and the costly results if they are mixed prior to the actual blending process, means that mills must carefully segregate raw material, ie, cotton fibre from synthetic staple This starts in the warehouse if lot blending is done. It is desirable to have separate opening and blending lines for cotton and for the synthetics, otherwise, plant cleaning is essential

The common method of keeping fibres separately identified after leaving the mechanical picker is to have laps of synthetic fibres tinted In a cotton system mill, pink, blue, green or other brightly tinted laps lay side by side with the traditional white of the cotton laps. The costs of tinting the synthetic fibre laps for identification purposes is small compared to the possible costs of accidentally mixing fibres Other problems, such as humidification for different fibres, necessitate adjustments and machine changes

Waste involves a special handling problem. A salable commodity which may mean the difference between profit and loss in a textile plant, waste must be kept as carefully segregated as staple fibre in process This involves cleanliness, care, sorting bins, and a good inventory system in the waste department

Synthetics on the Worsted System .- Most synthetics can be Synthetics on the Worsted System,—Most synthetics can be spun on standard worsted in-dervawing and spinning machinery. The spun on standard worsted in-dervawing and spinning machinery. The count of worsted yarn. Synthetics, usually static, need a small addition of antistatic oil to create better processing conditions. Research showed that in worsted blending synthetics perform best when a minimum of being the standard process. The spinning worst which we have been supported by the spinning worst which is the spinning worst

Synthetics on the Woollen System .- Each synthetic fibre needs special research and treatment when blended with woollens or worsted. One factor is the use of emulsion (usually of olive oil and water). In most cases of blending the synthetic yarn will absorb enough emulsion from the wool When 100% synthetics are being run on the woollen system less emulsion should be used than for wool. on the woolan system nest emittain solute for taket that for wool cardis is begun so that it may agage tensie strength by checking proper drafting (the process of attenuating the threads) on the mule (a type of summing machine). An advantage is guned when spinning 100% of summing machine) and survantage is guned when spinning 100% (unit used in measuring weight or size of silk, rayon and certain other yurns) as relative proportion such as 80% bulk docker: 0%; 5%; 5% in other staple and denier ranges. This gives an advantage similar to interlocking of wool fibres

Machine Developments,-Many mills today must be able to process not a single fibre but ten or more, either separately or in a wide range of blends

The American system of spinning was developed to enable spinners to take full advantage of various fibres available from one inch to seven inches in staple length. The system became sufficiently versatile to handle any required tange of material, and equally satisfactory for natural or synthetic fibres.

natura or synthetic three. The present are comparatively simple. Assuming The mechanics of the six commercial too of staple length up to seven inches (this might be either a too% worsted or a blend of any combination), the operations that follow would be first, pin drafting or its equivalent; second, superdraft rowing; and finally, long-draft synthing. Organizing is the reduction in bulk and weight of stock as it spanning. Officially a the reduction in outs and weight or stock as it passes through the machines involved in yarn manufacture. Pin drafting is a draft operation performed on the stock [fibre] as it passes through, but it is also a series of pins arranged in a rake or comblike fashion over which the stock passes, having the effect of straightening

out the fibres and parallelizing them Superdraft roving is generally understood as being a method of drafting using a 4-roll system and 2-apron pinneple developed by Whitin Machine Works Long drafting is a system of roving or spinning which permits the use of much higher diafts than the conventional system )

drafts than the conventional system)
The pin drafting would be carried out in either two or three stages, depending upon the quality and weight of sliver or thread desired. The roving would be a single-stage operation if number 40s or coarser yarns are to be spun finer yarns can be produced by inor coarser yarns are to be spun Finer yarns can be produced by introducing a scoul towing stage which would not have to be the super-draft type but the simpler three-full long-draft frame. The final process, long-dist spinning, completes the conversion of top to yarn Approximately half the number of machine operations are required compared with former methods of symning on the worsted system A rayon-stabilization process for kint goods to establish rayon in the fixed and circular kint field was developed.

tricot and circuiai kinti field was developed. The need for special lyusties for spinning fibre glass presented some difficult problems. Standard twisters were modified, and cicels, spindles and rolls were altered. Because of the abrasive quality of glass, and because tiny glass filaments were likely to work into and cut the bearings, machines had to be extremely sturdy, and a delicate control of twist had to be maintained at all times

twist had to be maintained at all times. Humshity control was early recognized as of critical importance in milk processing synthetics. One fibre may require a different opinium humshity than another. Systems were improved to obtain uniform humshity and steady evaporative cooling. Refinements were made in yarn conditioning equipments what in a modern mills not fee monsture is permitted within the conditioning room, and the most delicate natural and synthetic yarns are conditioned safely without specific processing the processing of the processing the proc

natural and synthetic yarns are conditioned safely without spotting.

Looms were improved to weave better synthetic fabries more

meet the need for a modified mechanical construction to weave synthetics and blended yarns with mixed filing was made available in

7.33 Experization was eliminated and production output was 25%

1033 Superstructure was eliminated and production output was 25% higher than average speeds on similar, less modern looms. In the processes of twisting and throwing (the piocess of twisting a number of threads into one flament), new inventions resulted from research into synthetic production. An all-purpose ring twister, which employed rings to twist the yarn, proved excellent for processing rayon, spun rayon, nylon, silk, wool, worsted, cotton and combination yarns (M G B A : X)

SYNTHETIC RUBBER: See RUBBER PRODUCTION AND MANUFACTURE.

SYPHAX, king of the Massaesyli, a tribe of western Numidians, played an important part in the later stages of the Second Punic War. In 213 a quarrel was in progress between him and Carthage; the Scipios leaped at this chance of establishing an ally in Africa, and sent a military mission to Syphax

SYRA or Syros (and Σύρος, perhaps Homeric Συρίη), a Greek island in the middle of the Cyclades (length about 10 mi , breadth 5, area 421 sq mi.). The prehistoric importance of the island is attested by early Aegean antiquities. In ancient times it was remarkably fertile, but the destruction of its forests has led to loss of alluvial soil, and left it a brown and barren rock, with scanty aromatic scrub, pastured by sheep and goats. In the 19th century Syra became the commercial centre of the archipelago, and is also the residence of the nomarch of the Cyclades and the seat of the central law courts. The population rose to about 33,700, but has declined. Hermoupolis had 21,156 inhabitants in 1928 but only 18,925 in 1940. Syra is also a province of the department of the Cyclades Axis troops occupied it in 1941.

Hermopolis (better Hermoupolis), the chief town, is built in a bay of the east coast. Old Syra, on a conical hill behind the port town, was built by the Capuchins, who in the middle ages chose Syra as the headquarters of a mission On the outbreak of the war of Greek independence about 40,000 refugees from Chios (Khios), after being scattered throughout Tenos, Spezia (Spetsai), Hydra (Ydra), etc., and rejected by Ceos (Kea), rallied at Syra under the protection of the French flag till the freedom of Greece was achieved. The harbour, with a breakwater 273 yd. long, has a depth of 25 ft. diminishing to 12 ft.

SYRACUSE, a city of Sicily (Gr. Συράκουσαι; Lat. Syracusae, Ital. Siracusa), the capital of a province of the same name, situated on the east coast of the island, 54 mi. by rail S. E. of Catania, and about 32 mi. direct. Pop. (1881), 21,739; (1921), 45,946 (town), 49,662 (commune); (1931) 23,631 (town), 50,096 (commune); (1936) 43,639 (town), 53,166 (commune); (1951) 70,300 (commune).

Syracuse was the chief Greek city of ancient Sicily, and one

of the earliest Greek settlements in the island. It was founded from Cornih, and Thucydides, who gives the date as the year after the foundation of Naxos (ie, 734 nc), mentions that the leader Archias expelled the Sicel inhabitants from Ortygia (See under Sicriv). Their presence there was definitely proved by the discovery of traces of hits and of a rock-cut tomb of the beginning of the second Sicel penod on Ortyga, while similar tombs may be seen both on the north and south edges of the terrace of Epippolae, and on the pennsula of Plemmyrium. (For this and other prehistoric sites in the neighbourhood of Syracuse see Sicrici, Archaeology)

Till the beginning of the 5th century 1s c our notices of Syracuse hatory are fragmentary, and we do not even know when the mole connecting the saland with the mainland was constructed in its external development Syracuse differed somewhat from other Sicilian cities Atthough it lagged in early times behind both Gels and Aragas (Argientum), it very soon began to aim at a combination of land and sea power In 65g it founded the sestlement of Arraga, 16g (a Samanna, on disp 3g Camarina, of which the first was unusually far inland. The three together secured for Syracuse a continuous dominion to the south-east coast. They were not strictly colonies but outposts, Camarina indeed was destroyed after a revolt agament the ruling city

Gelon and Hieron - Hippocrates, tyrant of Gela (402-485). threatened the independence of Syracuse as well as of other cities, and it was saved only by the joint intervention of Corinth and Corcyra and by the cession of the vacant territory of Camarina. In 485 the Gamoroi, or landowners (i e, the descendants of the original settlers, who formed an aristocratic body), who had been expelled by the Demos and the Sicel serfs and had taken refuge at Casmenae, craved help of Gelon, the successor of Hippocrates, who took possession of Syracuse, without opposition, and made it the seat of his power. He gave citizenship both to mercenaries and to settlers from Greece and added to the population the inhabitants of other cities conquered by him, so that Syracuse became a city of mixed population in which the new citizens had the advantage. He then extended the city by including within the fortifications the low ground (or at any rate the western portion of the low ground) between Upper Achradina and the island and making the agora there, at the same time (probably) he was able to shift the position of the crossing to the island by making a new isthmus in the position of the present one, the old mole being broken through so as to afford an outlct from the Little Harbour on the east. The island thus became the inner city, the stronghold of the ruler. Gelon's general rule was mild, and he won fame as the champion of Hellas by his great victory over the Carthaginians at Himera He is said to have been greeted as king, but he does not seem to have taken the title in any formal way.

Gelon's brother and successor, Hieron (478-467), kept up the power of the city and won himself a name by his encouragement of poets, especially Aeschylus and Simonides, and philosophers, while his Pythian and Olympian victories made him the special subject of the songs of Pindar and Bacchylides. But in his internal government he was suspicious, greedy and cruel After family disputes the power passed to his brother Thrasybulus, who was driven out next year by a general rising. Syracuse thus became a democratic commonwealth. Renewed freedom was celebrated by a colossal statue of Zeus Eleutherius and by a yearly feast in his honour. But when the mercenaries and other new settlers were shut out from office new struggles arose. The mercenaries, as in the last rising, held Ortygia and Achradina The people now walled in the suburb of Tyche to the west of Achradina. The mercenaries were at last got rid of in 461. Although we hear of attempts to seize the tyranny and of an institution called petalism, like the Athenian ostracism, designed to guard against such dangers, popular government was not seriously threatened for more than 50 years. The part of Syracuse in general Sicilian affairs has been traced in the article Sicilia (q.v.). We hear of a naval expedition to the Etruscan coast and Corsica about 453 B C. and of the great military and naval preparations of Syracuse in 439.

The Athenian Siege.-The Athenian siege (415-413) is of the deepest importance for the topography of Syracuse (The chief authorities for the siege are Thucydides [bks, vi, and vii ], Diodorus [bk xiii] and Plutarch, Nicias) Through the whole siege there was a treasonable party within the city, which kept up a correspondence with the besiegers When the Athenian fleet under Nicias, Alcibiades and Lamachus was at Rhegium in Italy, Athens had the prize within her grasp, and she lost it wholly through the persistent dilatoriness and blundering of Nicias It was at his advice that the summer and autumn of AIS were frittered away and the siege not begun till the spring of 414 By that time the Syracusans had built a wall from north to south across Epipolae, taking in Tyche and Temenites, so as to screen them from attack on the side of Epipolae on the northwest They did not, however, occupy Euryelus, at the western extremity of the high ground of Epipolae, and this omission allowed the Athenians to obtain possession of the whole plateau and to begin the investment of the city. The Syracusans then carried a counterwork up the slope of Epipolae, which, if completed, would cut in two the Athenian lines and frustrate the blockade At this point Nicias showed considerable military skill The Syracusans' work was destroyed by a prompt and well-executed attack; and a second counterwork carried across marshy ground some distance to the south of Epipolae and near to the Great Harbour was also demolished after a sharp action, in which Lamachus fell, an irretrievable loss However, the blockade on the land side was now almost complete, and the Athenian fleet had at the same time entered the Great Harbour. The citizens began to think of surrender, and Nicias was so confident that he neglected to push his advantages. He left a gap to the north of the circular fort which formed the centre of the Athenian lines, the point where Epipolae slopes down to the sea, and he omitted to occupy Euryelus. He made a final and irretrievable blunder in letting the Spartan Gylippus first land in Sicily and then march at the head of a small army, across the island, and enter Syracuse by way of Epipolae, past Euryelus Just before his arrival a few ships from Corinth had made their way into the harbour with the news that a great fleet was already on its way to the relief of the city The tables were now completely turned The military skill of Gylippus enabled the Syracusan militia to meet the Athenian troops on equal terms, to wrest from them their fortified position on Plemmyrium, which Nicias had occupied as a naval station shortly after Gylippus's arrival, and thus to drive them to keep their ships on the low beach between their double walls, to take Labdalum, an Athenian fort on the northern edge of Epipolae, and make a third counterwork right along Epipolae in a westerly direction, to the north of the circular fort. The Athenians were thus reduced to such a plight that, as Nicias said in his despatch towards the close of 414, they were themselves berieged rather than besieging. The naval preparations of the Syracusans, under the advice of Hermocrates, had led them, too, to confidence in their powers of giving battle to the Athenian fleet In the first sea-fight, which took place simultaneously with the capture of Plemmyrium, they had been unsuccessful; but in the spring of 413 they actually won a victory over the Athenians in their own element.

On the very next day, however, a second Athenian fleet arrived under Demosthenes and Eurymedon, with 73 ships of war and a large force of heavy infantry and light troops. Demosthenes decided at once to make a grand attack on Epipolae, with a view to recovering the Athenian blockading lines and driving the Syracusans back within the city walls. The assault was made by night by way of Euryelus under the uncertain light of the moon, and this circumstance turned what was very nearly a successful surprise into a ruinous defeat. The aimy was now thoroughly out of heart and Demosthenes was for at once breaking up the camp, embarking the troops, and sailing back to Athens But Nicias could not bring himself to face the Athenian people at home, nor could he be prevailed on to retire promptly to some position on the coast, such as Catania or Thapsus. He dallied till the end of August, many weeks after the defeat, when the coming of Syracusan reinforcements decided him to depart; but

on Aug 27 was an eclipse of the moon, on the stiength of which he insisted on a delay of almost another month The Syracusans

Dionysius' Successors.—Under his son, the you now blocked the mouth of the Great Harbour, and the Athenian fleet, after a frantic effort to break out and a desperate conflict, was utterly defeated and half destroyed. The broken and demoralized army, its ranks thinned by fever and sickness, at last began its hopeless retreat, attempting to reach Catania by a circuitous route, but, harassed by the numerous Syracusan cavelry and darters, after a few days of dreadful suffering it was forced to lay down its arms The Syracusans sullied the glory of their triumph by putting Nicias and Demosthenes to death

Dionysius I .-- Her great deliverance and victory naturally stirred up the energies of Syracuse at home and abroad Syracusan and Schnuntine ships under Hermocrates now play a distinguished part in the warfare between Sparta and Athens on the coast of Asia Under the influence of Diocles the constitution became a still more confirmed democracy, some at least of the magistracies being filled by lot. Diocles appears also as the author of a code of laws of great strictness. Under these influences Hermocrates was banished in 409 In 407 he was slain in an attempt to enter the city, and with him was wounded Dioaysius, son of another Hermocrates and an adherent of the aristocratic party, but soon afterwards a demagogue, though supported by some men of rank, among them the historian Philistus By accusing the generals engaged at Acragas in the war against Carthage, by obtaining the restoration of exiles, by high-handed proceedings at Gela, he secured his own election as sole general with special powers. He next procured from a military assembly at Leontini a vote of a bodyguard, he hired mercenaries and in 406-405 came back to Syracuse as tyrant of the city Dionysius kept his power till his death 38 years later (367). But it was well-nigh overthrown before he had fully grasped it. After his defeat before Gela (see Sicily) his enemies in the army reached Syracuse before him, plundered his house, and horribly maltreated his wife. He came and took his vengeance, slaving and driving out his enemies, who established themselves at Aetna In 397 Syracuse had to stand a siege from the Carthaginians under Himilco, who took up his quarters at the Olympieum, but his troops in the marshes below suffered from pestilence, and a masterly combined attack by land and sea by Dionysius ended in his utter defeat Dionysius, however, allowed him to depart without further pressing his advantage. This revolution and the peace with the Carthaginians confirmed Dionysius in the possession of Syracuse, and left it the one great Hellenic city of Sicily, which, however enslaved at home, was at least independent of the barbarian Dionysius was able, like Gelon, though with less success and less honour, to take up the rôle of the champion of Hellas

During the long tyranny of Dionyslus the city grew greatly in size, population and grandeur Syracuse absorbed the population of Gela, Camatina and Acragas, and received large accessions from some of the Greek cities of southern Italy, from Hipponium on its west and Caulonia on its east coast, both of which Dionysus captured in 389 B.C. There had also been an influx of free citizens from Rhegium. Dionysus largely extended the fortifications of Syracuse. The island (Ortygia) had been provided with its own defences, converted, in fact, into a separate stronghold. Dionysius, to make himself perfectly safe, drove out a number of the old inhabitants and turned the place into a barracks, he himself living in the citadel. Profiting by the experience gained during the Athenian siege, he included in his new lines the whole plateau of Epipolae, with a strong fortress at Euryelus, its apex on the west; the length of the outer lines (excluding the fortifications of the island) is about 12m. Syracuse was now the most splendid and the best fortified of all Greek cities. Its naval power, too, was vastly increased; the docks were en-larged, and 200 new warships were built. The fleet of Dionysius was the most powerful in the Mediterranean It was doubtless fear and hatred of Carthage, from which city the Greeks of Sicily had suffered so much, that urged the Syracusans to acquiesce in the enormous expenditure which they must have incurred under the rule of Dionysius. Much, too, was done for the beauty of the city as well as for its strength and defence. Several new temples

Dionysius' Successors .- Under his son, the younger Dionys ius-an easy, good-natured, unpractical man-a reaction set in amongst the restless citizens of Syracuse His uncle, Dion, was for a time the trusted political adviser of his nephew Dionysius II Dion's idea seems to have been to make Dionysius something like a constitutional sovereign, and with this view he brought him into contact with Plato But Dionysius had Philistus and others about him, who were opposed to any kind of liberal reform, and the result was the banishment of Dion from Syracuse as a dangerous innovator Ten years afterwards, in 357, the exile entered Achradina a victor A siege and blockade followed, till Dion made himself finally master of the mainland city Ortygia, provisions failing, was also soon surrendered. Dion's rule lasted only three years, for he perished in 354 by the hand of an assassin

Of what took place in Syracuse during the next ten years we know but little The younger Dionysius came back and from his island fortress again oppressed the citizens Sicily, too, was again menaced by Carthage Syracuse, in its extremity, asked help from the mother-city, Corunth, and Timoleon (qv) delivered Syracuse from the younger Dionysius and from Hicetas, who held the rest of Syracuse, and won a decisive triumph over Carthage and the safe possession of Sicily west of the river Halycus, the largest portion of the island From 343 to 337 he was supreme at Syracuse, with the hearty good will of the citizens Syracuse, with an influx of a multitude of new colonists from Greece and from towns of Sicily and Italy, once more became a prosperous city Timoleon, having accomplished his work, accepted the position of a private citizen After his death (337) a splendid monument, with porticoes and gymnasia surrounding it, known as the Timoleonteum, was raised to his honour

In the interval of 20 years between the death of Timoleon and the rise of Agathocles  $(q \ v)$  to power another revolution at Syracuse transferred the government to an oligarchy of 600 leading citizens It was shortly after this revolution, in 317, that Agathocles, with a body of mercenaries from Campania and a host of exiles from the Greek cities, backed up by the Carthagiman Hamiltar, became tyrant of the city, and the senate and the heads of the oligarchical party were massacred wholesale, while a unanimous vote of the people gave him absolute control over the fortunes of Syracuse His wars in Sicily and Africa left him time to do something for the relief of the poorer citizens at the expense of the rich, as well as to erect new fortifications and public buildings, and under his strong government Syracuse seems to have been at least quiet and orderly. After his death in 289 comes another period of revolution and despotism; and but for the brief intervention of Pyrrhus in 278 Syracuse, and indeed all Sicily, would have fallen a prey to the Carthaginians

A better time began under Hieron II, who had fought under Pyrrhus and who rose from the rank of general of the Syracusan army to be tyrant-king, as he came to be soon styled-about 270. During his reign of more than 50 years Syracuse enjoyed tranquillity and seems to have grown greatly in wealth and population. Hieron's rule was kindly and enlightened, combining good order with a fair share of liberty and selfgovernment. His financial legislation was careful and considerate; his laws as to the customs and the corn tithes were accepted and maintained under the Roman government, and one of the many bad acts of Verres was to set them aside. It was a time, too, for great public works-works for defence at the entrance of the Lesser Harbour between the island and Achradina, and temples and gymnasia. Hieron through his long reign was the stanch friend and ally of Rome in her struggles with Carthage.

Capture by the Romans.-Hieronymus, the grandson of Hieron, thought fit to ally himself with Carthage, but he soon fell in a conspiracy. There was a fierce popular outbreak and more bloodshed; the conspirators were put to death and Hieron's family was murdered; whilst the Carthaginian faction, under the pretence of delivering the city from its tyrants, got the upper hand and drew the citizens into open defiance of Rome, Claudius Marcellus was then in command of the Roman acmy in Sicily, and he threatened the Syracusans with attack unless they would get rid of Epicydes and Hippocrates, the heads of the in origin it was in Sicily that it reached its highest www.opment anti-Roman faction Marcellus struck his first blow at Leontini, which was quickly stormed, and its sack roused the feeling of the Syracusans against any negotiations with the Roman general, and, putting themselves under Epicydes and Hippocrates, they closed their gates on him Marcellus, after an unsuccessful attempt to negotiate, began the siege in regular form (214 B C.) by both land and sea, establishing a camp on Polichne, where stood the old temple of Olympian Zeus; but he made his chief assault on the northern side and on the defences of Tyche. The city was defended by a numerous soldiery and by the ingenious contrivances of Archimedes, whose engines dealt havoc among the Roman ships and frustrated the attack on the fortifications on the northern slopes of Epipolae Marcellus had recourse to a blockade, and at last, in 212, information was given him that the Syracusans were celebrating a great festival to Artemis. Making use of this opportunity, he forced the Hexapylon entrance by night and established himself in Tyche and on the heights of Epipolae The strong fortress of Euryelus held out for a time, but, being now isolated, it soon had to surrender The "outer" and the "inner" city of Thucydides still held out, whilst a Carthaginian fleet was moored off Achradina and Carthaginian troops were encamped on the spot. But a pestilence broke out in the autumn of 212, which swept them clean away and thinned the Roman ranks. The ships sailed away to Carthage; on their way back to Syracuse with supplies they could not get beyond Cape Pachynus owing to adverse winds, and they were confronted by a Roman fleet. All hope for the city being now at an end, the Syracusans threw themselves on the mercy of Marcellus; but Achradma and the island still held out for a brief space under the Syracusan mercenaries, till one of their officers, a Spaniard, betrayed the latter position to the enemy, and at the same time Achradina was carried and taken. Marcellus gave the city up to plunder, and the art treasures in which it was so rich-many of the choicest of them, no doubt-were conveyed to Rome Archimedes perished in the confusion of the sack while he pursued his studies.

Syracuse was now simply one of the provincial cities of Rome's empire. It retained much of its Greek character and many of its finest public buildings. Its importance and historic associations naturally marked it out as the residence of the Roman practor or governor of Sicily. Cicero often speaks of it as a particularly splendid and beautiful city, as still in his own day the seat of art and culture Caligula restored its decayed walls and some of its famous temples It was plundered by Frankish pirates about AD. 286. In the 4th century it is named by the poet Ausonius, chiefly, perhaps, on the strength of its historic memories; and there was a purple factory here under an imperial procurator. In 665 Heraclius Constans fixed his capital here, but owing to his oppressive government was assassinated in 668. Syracuse has been a place of comparatively little importance since the year 878, when it was destroyed by the Saracens.

Archaeology.-The mediaeval and modern town of Syracuse (with the exception of a new quarter which has sprung up since the construction of the railway between the station and the island) is confined to the island. This contains the remains of two Doric temples. The older, belonging probably to the beginning of the 6th century B.C., appears, from an inscription on the uppermost step, to have been dedicated to Apollo It was a peripteral hexastyle of 42 columns; the portion excavated shows that its total width is 741ft., the width of the cella 381ft, the lower diameter of the columns 61ft. The other temple, into which the cathedral was built in AD. 640, is to be dated 474-460 BC. It was a peripteral hexastyle of 36 columns, with a total length of 180ft, and a total breadth of 72ft.; the columns have a lower diameter of 52ft., and the intercolumniation is 134ft. It is almost certainly the temple of Athena. The site was previously occupied by buildings of the 7th and 6th centuries B.C., including an archaic temple and a great sacrificial altar; which were destroyed to make room for it. Their terra-cotta decorations were, however, carefully buried under the pavement of the space which surrounded it; and they are of the highest importance in the history of design, showing that even if the method was Corinthian

Near the west coast of the island is the famous fountain of Arethusa According to the legend, the nymph Arethusa was changed into the fountain by Artemis to deliver her from the pursuit of the river-god Alpheus (q.v); and the spring, which was fresh until an earthquake broke the barrier and let in the salt water, was supposed to be actually connected with the river. There are interesting remains of mediaeval architecture in the closely built town with its narrow streets, the beautiful 14thcentury windows of the Palazzo Montalto may be especially noticed, and also the 13th-century Castello Maniace at the southern extremity of the island The town also contains the large and well arranged archaeological museum which is the creation of Prof. Orsi, and is of the highest importance for both pre-Hellenic and Hellenic archaeology The discoveries of recent years in the south-eastern portion of Sicily, including especially the objects found in Sicel and Greek cemeteries, may be studied there. The isthmus connecting the island with the mainland, which was defended by strong fortifications erected by Charles V and Philip II. (now demolished), does not occupy the site of the mole erected in the 6th or 7th century B C, running due north from the north point of the island. On the landward side of the new isthmus was the agora, in which remains of a colonnade of the Roman period have been found. To the west are the remams of an extensive building of the Roman period, probably a palaestia with a small Odeum attached. To the west-north-west is an extensive necropolis, mostly of the 7th and 6th centuries BC (For the cemeteries see The Year's Work in Classical Studies, p. 123 [1924-25]) This necropolis was included within the defensive wall of Dionysius, a portion of which, no less than 181ft. thick, was found 1unning diagonally across the new cemetery, and later an outwork in front of it was discovered. East of this point it probably followed the edge of the low terrace above the marsh (the ancient Lysimeleia), while in the other direction it ran north-north-west. making straight for the western edge of the gorge known as the Portella del Fusco, which was thus included within the fortifications, as it would otherwise have afforded a means of access to the enemy Here the wall gained the top of the cliffs which mark the southern edge of the plateau of Epipolae, which from this point onwards it followed as far as Euryelus. The south wall of Epipolae, considerable remains of which exist, shows traces of different periods in its construction, and was probably often restored It is built of rectangular blocks of limestone generally quarried on the spot. Euryelus, the point where the terrace of Epipolae narrows down to a ridge about 60yds, wide, which is its only link with the hills to the west, had thrice proved during the Athenian siege to be the key to Syracuse. It now bears the ruins of a mighty fortress, finer than that which defends the entrance to the acropolis of Selinus-the most imposing, indeed, that has come down to us from the Greek period-which there is no doubt is the work of Dionysius. The total length of the works is about 440yds. In front of the castle proper are three ditches, the innermost of which can be reached from the interior of the castle by a complicated system of underground passages The front of the castle is formed by five massive towers; behind it are two walled courtyards, to the north of the easternmost of which is the well-guarded main entrance to the plateau of Epipolae (narrower minor entrances are to be seen on both the north and the south sides) communicating by a long underground passage with the inner ditch in front of the castle proper. On the north side of Epipolae the cliffs are somewhat more abrupt; here the wall, of a similar construction to that on the south, is also traceable, but here it is apparently all of one period. It is, indeed, recorded by Diodorus that Dionysius built the north wall from Euryelus to the Hexapylon in 20 days for a length of 22m., employing 60,000 peasants and 6,000 yoke of oxen for the transport of the blocks.

The most important buildings of which we have any remains are to be found in the lower part of Achradina and in Neapolis. a quarter of which we hear first in the time of Dionysius, and which at first was confined to the lower ground below Temenites: but in Roman times included it and the theatre also, though it

did not extend beyond the theatre to the uppermost part of the plateau In lower Achiadina remains of Roman private houses have been found, and it is in this district that the early Christians constructed their catacombs (St Paul tarried at Syracuse three days on his way to Rome [Acts xxviii 12] ) Those which are entered from near the 12th-century church of S Giovanni, situated near an ancient temple, are extensive and important, and include the ancient crypt of S Marcianus, and the type is different from that of the Roman catacombs, the galleries being far larger (partly owing to the hardness of the himestone in which they are excavated), and having circular chambers at the points of junction In Neapolis, on the other hand, public buildings pre-dominate The temple of Apollo Temenites has entirely disappeared, but the theatre, entirely hewn in the rock, is still to be seen. It is the largest in Sicily, being 1385yds in diameter, and having 59 rows of seats, the 11 lower tiers were originally covered with marble Each of the nine cunes or divisions bore a name, the inscriptions of five of them, still preserved on the rock, are in honour of Zeus, Heracles, King Hieron II, his wife Philistis, and his daughter-in-law Nereis It was restored after 238, after her marriage to Gelon Of the stage nothing but cuttings in the rock and foundations are visible (See G E Rizzo, Il Teatro Greco di Siracusa [1923] foi a most careful study) The situation is well chosen, commanding a splendid view over the Great Harbour, and it is often used for classical performances Not far off to the southeast is the amphitheatre. probably erected by Augustus when he founded a colony at Syracuse, it is partly cut in the rock and partly built. It is inferior in size only to the Colosseum and the amphitheatres of Capua and Verona, measuring about 153 by 130 yd over all the arena is 76 by 43 yd To the west of the amphitheatre is the foundation of the great altar erected by Hieron II, 217 yd long by 24 wide, and about 6 yd in height. To the northwest of the theatre a winding road ascends through the rock, with comparatively late tomb chambers on each side of it. In this district are seen hundreds of small niches cut in the rock, as a rule about 2 ft square and a few inches deep, which served for containing inscriptions or reliefs, sometimes of a sepulchral character, but sometimes relating to the cult of a divinity. Both the districts just described also contain huge quarries, the famous Lautumiae (from Gr. λâas, stone, and τεμεῖν, to cut; hence λα-ομία, quarry) of Syracuse, over 100 ft deep and of great extent (though through the collapse of the pillars supporting the undermined rock they have become still larger than they were in ancient times)

We have already seen that immediately outside Lower Neapolis on the south the marshes of Lysimeleia begin, which proved fatal to more than one besieging force They are traversed by the Anapus, with its tributary the Cyane, the latter famous for the papyrus planted by the Arabs, which here alone in Europe grows wild in the stream. To the south of the Anapus is the hill of Polichne, on which stood the Olympieum, attributed on stylistic grounds to 581 B.C. Its monolithic columns, of which two are still standing, are about 21 ft. in height and 6 ft, in lower diameter: its length is estimated at 197 ft , its breadth at 662 ft This and the temple of Apollo are the earliest known examples of peripteral temples in stone. The hill was frequently occupied in attacks on Syracuse by the besieging force. The hill of Dascon is a trifle to the southeast. From this point southward the shore of the Great Harbour begins to rise, until the rocky promontory of Plemmyrium is reached

As an important sesport, Syraciase was bombed by the Allies a number of times during World War II. With the rest of Sicily it was occupied by Angle-American forces in the summer of 1943. See A. Hölm and F. S. and C. Cavallari, Topograpia archeologica di Siracusa (Palermo, 1883), or the more handy German translation by B. Lugus, Topographie von Syracus (Strassuburg, 1897); P. Ord, in Atti del congration of sciences storicke, v. 151 (1994), in Monument Mauceri, Siracus (Palermo, 1940); J. Falhert and V. Schultze, "Die altchristlichen Grabstatten Stalliese," Jarbuach das h. d. arch, Instagnangsheit vii zi zigg. (1997), fort the archeology of Syracus; and alsg E. A. Freemap, History of Siddy, (1947–94), Sozian.

SYRACUSE, a city of New York, U SA, the county seat of Onondaga county, mudway between Albany and Buffalo, at the south end of Lake Onondaga, on federal highway 11 and the state barge canal I It has a municipal airport and is served by the Lackawanna, the New York Central, the West Shore and by motor-truck lines Pop (1950) 220,067, in 1940 it was 205,097 by federal census.

Syracuse has a beautiful location on high ground, in an amphatine of hills around the south end of Lake Onondaga (5 mt long), surrounded by a nch agricultural region, within a short drive of the Finger lake region and less than 100 mt from the Adinondacks and the Thousand Islands. Two creeks wind through the city to the lake. Wide boulevards have been constructed over the abandoned beds of the Erre canal (which crossed it from east to west) and the Oswego canal (which came from the northwest and ioned the Erre in the heart of the city).

There are seven large parks and many small parks and playgrounds, large modern hotels and beautiful residential streets,

many of them arched with interlacing elms.

Salma street is the main business thoroughfare Around St Mary's circle are grouped the county courthouse, the public hibrary, the Cathedral of the Immaculate Conception, and the unique and beautiful building of the First Baptist church which houses a hotel, built around and above the church.

Syracuse university occupies 100 ac in the southeastern part of the city, and on the western border are the state fair grounds (with extensive exhibition halls and a coliseum seating 7,500)

where the annual state fair was first held in 1890
Six miles south is the Onondaga Indian reservation

The city operates under a mayor-and-council form of government The water supply, brought from Skaneateles lake (20 ml. SW) by a gravity system, is ample for a much larger population Hydroelectnic current is available from Niagara falls and the Salmon river.

The Syracuse region, when first visited by Europeans, was the home of the Onendaga Nation and the capital of the Five (later Six) Nations of the Iroquois. It was visited by Champlain in 1615, by Radisson (while a captive of the Mohawks) in 1651, and in 1654 by Simon le Moyne, a Jesut missionary, who found that the spring of which the Indians would not drink (because they believed a demon lived in it and gave the water an evil smell) was a fountain of salt brine. A mission was founded in 1651 by Chaumonot and Dablon near the present village of Liverpool (5 mi. N.W of Syracuse) and the next year the mission and a military post were formally established with pomp and ceremony Both were abandoned because of the hostility of the Mohawks in 1658, but the mission was resumed in 1668 and continued through the century.

The Onondaga village (south of the lake) was visited by many important representatives of the Fiench and the English between 1570 and 1766 in their ravally for the friendship of the Five Nations; and the raid from Ft. Schuyler (April 21, 1779) which determined the Chondagas to side with the British in the Revolution, took place within the present limits of Syracuse. The first white settler on the site of the city was Ephraim Webster, who established a trading post near the mouth of Onondaga creek in 1786.

In 1788 Asa Danforth came from Mayfield (New York) with his wife and son. He built a sawmill and a gristmill, organized the militia, and is called "the father of Onondaga; county" In 1788 the state undertook, by treaty with the Onondagas, to manage the salt springs, and in 1795 it acquired title to them and rosqum. of surrounding land, in return for \$1,000 in cash and promise of an annual rental of \$700 and 150 bushels of salt. In 1797 the state begain leasing the salt lands, on a royalty basis. Three villages soon sprang up around the southern end of the late. Webster's Landing and Salma in 1797 and Geddes (founded Late. Webster's Landing and Salma in 1797 and Geddes (founded scale) in 1603 ("see the state of the salt lands, and Geddes (founded scale) in 1603 ("see the salt lands, so soon of thown by several names in succession until 1840, when 500 one of flown by several names in succession until 1840, when 500 one of flown by several names in Strick.

Syracuse was incorporated as a village in 1825, became the county seat in 1827, and in 1847 Syracuse and Salina were consolidated and chartered as a city. The population in 1850 was 22,271. From time to time various annexations of contiguous territory were made, including the village of Geddes in 1884.

The salt industry was the foundation of the city's development Until about 18,70 it was the dominating industry and Syracuse was the principal source of supply for the United States Not only was this andustry the base of most of the eatly individual fortunes in Syracuse, but pressure from the men interested in salt-making increased the demand for the Eric canal, the first section of which, passing through Syracuse from Rome to the Seneca river, was opened in 1820. In the 1850s Syracuse made many bicycles, and by 1900 at was one of the centres for the manufacture of type-writers. Later, the industries of the city became highly diversified, including steel, electrical products, hardware, roller bearings, automobile parts, in cans, agricultural implements, chinaware, soda sh, home appliances, foundry and machine shop products, radio and television sets, furniture, shoss, food products and numerous

other items SYR-DARYA (Gr and Lat Javartes, Alab Shash or Sihun), (1) a river of Asiatic Russia, flowing into the Sea of Aral, and having a length of 1,500 m. and a dramage area of about 320,000 sq miles Its headstream is the Naryn, rising in the Tianshan south of Lake Issyk-kul, on the south slope (12,000 ft.) of the Terskei Ala-tau. After union with the Barskaun, it flows W.S.W. at 11,000 to 10,000 ft, above the sea, in a barren longitudinal valley between the Terskei Ala-tau and the foothills of the Kokshal-tau. As the Naryn it flows through a wild gorge in the south-west continuation of the Terskei Ala-tau, falling 4,000 feet. Fort Narynsk, 20 m. below the confluence of the Great and the Little Naryn, is only 6,800 ft above the sea. Here the river enters a broad valley-formerly the bottom of an alpine lake-and flows past the ruins of Fort Kurtka, for 90 m. westward, as a stream some 50 yd wide and from 3 to 11 ft deep, used by the Kirghiz for irrigating their cornfields. The At-bash a large mountain stream, joins the Naryn at the head of this valley and the Alabuga or Arpa at its lower end, both from the left. Before reaching the lowlands the Naryn cuts its way through three ridges which separate the valley of Kurtka from that of Ferghana, and does so by a series of wild gorges and open valleys (170 m), representing the bottoms of old lakes; the valleys of the Toguztorau, 2,000 ft. lower than Kurtka, and the Ketmen-tube are both cultivated by the Kirghiz. Sweeping north, the river enters Ferghana-also the bottom of an immense lake-where, after receiving the Kara-darya (Black River) near Namangan, it assumes the name of Syr-darya The Kara-darya is a large stream rising on the northern spurs of the Alai mountains. As it deflects the Naryn towards the west, the natives look upon it as the chief branch of the Syr-darya, but its volume is less. At the confluence the Syr is 1,440 ft, above sea-level

On issuing from this gorge the Syr citers the Ard depression, and flows for 85 cm. in a north-westerly and northerly direction before reaching the Sea of Aral. On this section it is navigated by steamers Between the Fight rapids and Ballyd-rutagal (where it bends north) the river flows along the base of the subsidiary ranges which flash the Chotkal montains on the north-west, and receives from the longitudinal valleys of these alpine tracts a series of tributaries (the Angren, the Chrichig, the Keles).

Some 50 m. below Chinas (770 ft. above sea-level) the Syr bends northwards, but resumes its north-westerly course 150 m. farther down, following with remarkable persistency the edge of the beas. Its low banks, overgrown with reeds and rendered unliabilitable in summer by clouds of mosquitoes, are inundated for 20 m. on both sides when the snows begin to melt. These inundations prevent the moving sands of the Kyryl-kum desert from approaching the Syr; blow Perovsk (Kyryl-Cota, or akrom approaching the Syr; blow Perovsk (Kyryl-Cota, or akmudry sellow waters, at the rate of 3 to 5 m, an hour, in a channel 300 to 600 yd wide and 3 to 5; athorns deep; at Perovsk its vertical section is \$200 soft; and 312,500 cut. of water are discharged per sectiond. The Ary and the Bugun are the only

tributaries worthy of notice along this part of its course; the other streams which descend from the Kara-tau fail to reach the river. The Kirghiz rear numerous heads of cattle and sheep in the valley of the Arys, while lower down, as far as Julek, the Iginchis carry on agriculture. All this applies of course only to the right bank, on the left the moisture is absorbed by the hot winds which cross the Kyzyl-kum sands towards the river The dryness of the atmosphere has a marked effect upon the Syr when it gets below Julek, the Kara-kum sands being then on its right Ten miles below Perovsk the river traverses a marshy depression (the bottom of a lake not yet fully dried up), where it divides into two branches-the Jaman-darya and the Kara-uzyak The latter spreads out into marshes and ponds, from which it again issues to join the former at Karamakchi, after a course of 80 miles The main arm, owing to its shallowness and sinuosity, is very difficult to navigate, and the difficulty is increased by the rapidity of the current and the want of fuel Between Kazalinsk and the Sea of Aral (158 ft ) navigation becomes somewhat easier, except for the last 10 m., where the river divides into three shallow branches before entering the "Blue sea" All three have at their mouths sandy bars with only 3 ft of water.

Two former right-hand tributaries of the Syr-the Chu and the Sary-su-now disappear in the sands some 60 m before reaching it. The Chu, which is 600 m in length, rises in the Tian-shan south-west of Lake Issyk-kul, and as the Kashkar flows towards Lake Issyk-kul, but a few miles before reaching that lake turns suddenly to the north-west, enters under the name of Chu the narrow gorge of Buam, and, piercing the snow-clad Kunghei Alatau, emerges on its northern slope, having descended from 5,500 ft. to less than 2,000 in a distance of not more than 50 miles In this part of its course it receives from the right the Kebin, whose high valley equals in size that of the upper Rhone It then flows north-westwards through the valley of Pishpek, and, avoiding the Muyun-kum sands, describes a wide curve to the north before finally taking a western direction. Numberless streams flow towards it from the snow-clad Alexander mountains, but they are for the most part lost in the sands before reaching it The Talas, 170 m. long, formerly an affluent of the Chu, which rises in the highest parts of that range, pierces the Cha-archa mountains, and, flowing past Aulie-ata on the south border of the Muyun-kum. enters the salt lake of Kara-kul 60 m from the Chu The Chu terminates in the Saumal-kul group of lakes, 60 m from the Syr. Another elongated group of lakes-the Uzun-kul-near the above, receives the Sary-su, which has a length of nearly 570 m and flows rapidly in a narrow channel along the western edge of the northern Famine Steppe (Bekpak-dala).

The delta of the Syr begins at Perovsk, whence it sends a branch to the south-west, the Jany-darya (New River), which formerly reached the south-eastern corner of the Sea of Aral, very near to the mouth of the Amu-darya. The Kirghiz affirm that a canal dug for irrigation by the Kara-kalpaks gave origin to this river. It had, however, but a temporary existence A dam erected by the people of Khokand at Ak-mechet (Perovsk) caused its disappearance, and the Russians found nothing but a dry bed in 1820 When the dam was removed the Jany-darya again reappeared, but it failed to reach the Sea of Aral; in 1853 it terminated in Lake Kuchka-denghiz, after a course of 250 m; all traces of its bed were then lost in the sand. Five centuries ago, in the time of Timur, the Mongol prince of Samarkand, the Jany-darya brought the waters of the Syr to the Daukara lakes, close by the present mouth of the Amu. The series of old river-beds in the Kyzyl-kum, which are still seen above Perovsk, indicate that the Syr had a constant tendency to seek a channel to the southwest, and that its present delta is but a vestige of what it was once. At a still more remote period this delta probably comprised all the space between the Kara-tau and the Nura-tau in Samarkand; and the series of elongated lakes at the base of the Nuratau-the Tuz-kaneh and Bogdan-ata lakes-represent an old branch of the delta of the Syr which probably joined the Zarafshan before reaching the Amu The cause of this immense change is simply the rapid desiccation of all northern and central Asia. The extension of the Caspian sea as far as the Sary-kamysh lakes

during the post-Pliocene period and the extension of the Sca of Aral at least roo mi to the east of its present position are both proved by the existence of post-Phocene marine deposits

(2) A former province of Asiatic Russia, now included in the Kazakstan ASSR and Uzbek ASSR (ag v)

SVRIA, a country of western Asia, covering an area of 66,065, sq mi, bordered on the north by Turkey, on the east and on the southeast by Iraq, on the south by Jordan and Israel and on the west by the Mediterranean sea and by Lebanon. The modern state was created after World War I from portions of the Turkish vilayets of Aleppo, Damascus, Zou and Jazrah and, with Lebanon, came under French mandate in 1939 the snajk of Alexandretta was ceded to Turkey and then named the Hatay. Though the mandate over Syran was federated to be at an end by the Free French in 1941 the country did not effectively gain independence until 1046 (see History, below).

The population was 2,930,107 by the census of 1038 and was estimated at 5,043,310 in 1047 and at 3,517,000 in 1951. It is divided among numerous religious communities roughly as follows: Molems, 8.7%, mainly Sunni Arabs, Christians, 14%, comprising Roman and Uniate Catholics, members of the Orthodox Bastern Church. Iacobites and Gresorian Armenians, Druses, 4%: 1ews:

and some Vezidis.

Damascus, the capital had 3,3,100 inhabitants in 1950, Aleppo 362,500, Home 244,100, Hama 146,600. The country is divided into nine provinces (muhafisat). Damascus, Aleppo, Homs, Hama, Lutakus, Euphrates, Jazurah (Jeare), Haura and Jabal Druse (Jelel Druze). The chief port is Latakia (100,500 in-

habitants), the ancient Laodicea Physiography.-The whole area of the states of Syria and Lebanon (q.v) may be regarded as a single geographical unit extending from the eastern shore of the Mediterranean to the Syrian desert (which is crossed diagonally from northwest to southeast by the Euphrates) and the Jazirah east of that river. It is bounded on the north by the footbills of the Taurus ranges and terminates south of the Anti-Lebanon and Mount Hermon with the volcanic region of the Hauran and the Jabal Druse The coastal strip is a narrow, discontinuous plain measuring about 200 mi. in a direct line from Kara Duran on the northern frontier to Ras an-Nakurah (Ras en Nagura) in the south There are many varieties of shore line, from the cliffs and headlands north of Latakia and the rugged coast between Tripoli and Beijut, to the sandy shore near Tyre. Behind, from north to south, lie the Ansariyah and Lebanon ranges divided by the valley of the southern Nahr al-Kabir (the ancient Elcutherus) The Ansarıyah averages 18 to 20 mi. in width and is of fairly uniform, rounded outline intersected by deep valleys. The highest peak, Nebi Yunis (5,194 ft.), is toward the northern end of the lange. The Lebanon rises steeply from the Bika (Bekaa) plain to a tableland more than 8,000 ft, high from which rise several peaks, the highest being Kurnat as-Sauda (Qurnet es Sauda) (10,131 ft ) The main pass, which carries the Beirut-Damascus road, is the Dahr al-Baidar (5,057 ft.). South of this pass the main ridge is narrower and falls away southeast to the plain of Mery Ayun, south to the Litani gorge and southwest to the coast near Sidon. The upper slopes of the Lebanon are bleak, stony and desolate; the middle slopes, below 5,500 ft., are the most densely populated region and cultivation extends up to 5,200 ft. East of the coast ranges is a long depression. At the northern end are the Orontes valley and the Ghab marshes which extend for 38 mi. from north to south with a maximum width of about 9 mi. South of the Ghah the Orontes follows a tortuous course to Lake Homs, south of which is the Bika valley. The northern end of this valley, through which the Orontes flows is, for the most part, poor soil strewn with basalt houlders mixed with limestone and flint. South of the Baalbek ridge, the watershed between the Orontes and the Litani, the soil is rich and well-cultivated. The Litani river falls very gradually through it from northeast to southwest until it reaches the barrier of Jabal Gharbi, a low ridge between the Lebanon and Mount Hermon. The Bika valley is dominated on

the east by the Anti-Lebanon range which runs from northeast to The main ridge southwest nearly parallel with the Lebanon (8,300 ft ) rises steeply about 17 mi south of Homs and extends for 65 mi to the Zebdani depression through which pass the railway and road between Beirut and Damascus Mount Hermon (9,232 ft ) rises south of this gap Northeast of Damascus are the three Kalamun 11dges, the easternmost of which stretches for more than 130 mi to Palmyra Northwest of Palmyra hes a semiarid steppe sloping eastward to the Euphrates The Syrian desert, the Hamad, to the east of the Anti-Lebanon, comes up in places almost to the foot of the range Where water is available (as in the Ghuta around Damascus which owes its fertility to the Barada [the Abana of the Old Testament]), or rainfall is abundant (as in the Hauran farther south), cultivation pushes out toward the desert East of the Hauran lies the Jabal Druse (5.900 ft ), much of which is fertile though large areas of the district are lava-covered. To the northeast of the Euphrates is the Jazirah, roughly triangular in its Syrian portion, with a projection in the northeast (the "Duck's Bill") to the Tigris between Jazirat-ibn-Omar (in Turkish Cizre) and Faish Khabur. Except in the neighbourhood of the Euphrates and its tributaries, the Balikh and the Khabur, which cross the Jazirah from north to south, it is a district of stony hills and low ridges.

Climate.-Syria has a climate varying from the Mediterranean type in the west through the steppe type to the continental or extreme type, with a wide range of temperature and absolute aridity for six months, in the inland region, which is open to the Arabian desert on the south The two gaps in the mountain ranges screening the interior from the sea cause an extension of the maritime influence inland to the region south of Homs and to the Hauran and Jabal Druse south of Damascus The rainy season is from November to March, though abundant rainfall may occur in April or May. The average of rainfall varies from 20-40 in in the coastal belt (rising to 50 in or more in the mountains), through 10-20 in between Aleppo and Damascus, to 5-10 in in the crescent from Damascus to the northern frontier and to Dair az-Zor (Deir) and to as little as o s in, in the desert from Palmyra to the southeast. Snow falls on the mountains and may lie even on Mount Hermon until late in the summer. Normally Syria has a hot summer and a mild winter Temperatures increase from west to east and also. though to a lesser extent, from north to south. Summer temperatures, taking an average over a number of years, vary from mean monthly maxima and minima (August) of 106° F. and 68° F at Aleppo to 110° and 65° at Palmyra, with absolute maxima at Aleppo (115° F), Damascus (113°), Palmyra (120°) and Dair az-Zor (115°) Mean monthly maxima and minima for January, which is usually the coldest month, are: Aleppo 58° F. and 22° F., Damascus 62° F and 28° F, Palmyra 62° F, and 25° F.

(K. C. B.) Vegetation.—The coastal strip of Syria is intensely cultivated and planted with groves of mulberries, olives, etc., and there is httle space for natural flora Rocky patches bear brushwood with Calycotome villosa, buckthoin, tamarisk, etc : in swampy places reed-grasses grow; and among the crops brilliant flowers of the Mediterranean element such as Anemone coronaria, Ranunculus asiatious, Papaver syriacum, etc., spring up wherever possible. There is high forest of Aleppo pine in the north of the Ansariyah range with sessile and Syrian oaks (Quei cus syriaca); in the centre are stunted oak woods; in the south mulberry, valonia oak (O. aegilops), etc. The shrub constituent includes rock roses, tamarisk, terebinth, oleander, etc. On the Lebanon mountains there are forests of oaks, Aleppo pine, cypress, juniper, cedar and fir. Near Beirut there has been considerable re-afforestation with stone pine, and large areas of the lower slopes, up to 5,000 ft., are planted with olive, fig and mulberry (for silkworms). Wild plants in this zone include valerian and danewort, and above, where wheat and barley are cultivated (up to 6,000 ft.) is the montane region of sea holly and rhododendrons. The alpine zone supports peculiar plants such as Acantholimon libanoticum, a spmy milk vetch which grows in clumps, and sainfoin The Bika plain is almost treeless while composites, labiates and milk vetches are characteristic. On the foothills of the steppes terebinth predominates; on the plains 716

oak. The Hamad supports only halophytes and xerophytes except along the Euphrates and other water courses where poplars, tamarisk and a few others flourish.

Fauna .- In the upper regions of the Lebanon bear is still occasionally found-the largest remaining wild animal in Syria Antelope and gazelle are common in the Hamad. Other mammals include deer, polecat, wild cat, ichneumon, porcupine, hedgehog, squirrel, marten, ermine, otter, dormouse, rats, hares and the hyrax, Many migrating buds call at Syria on their way north and south Flamingoes, pelicans, cormorants, ducks, herons, snipe, etc., frequent the fresh waters and marshes; bustards and ostriches the desert; kingfishers, cuckoos, woodpeckers, etc , the valley , eagles, huzzards, kites and falcons the mountains. Horned and other vipers occur in the desert, and lizards and chameleons are common. Of innumerable insects, the mosquito is the most harmful but locusts and grasshoppers also do damage. In the lakes and rivers mullet, eels and bass are among the fish.

#### HISTORY

Fint implements of palaeolithic types have been found in caves in Syria and in Palestine, associated with bones of the rhinoceros and of the hippopotamus and, in the district of Mount Carmel, with skeletal remains of a manlike creature (these dating to the Mousterian period). The remains and industries of man, who already made use of fire, continue through the late Palacolithic into the Mesolithic age, which is well represented in the so-called Natufian culture found chiefly near Jerusalem. This was the work of men who appear to have been smaller than their predecessors and might be racially similar to the Hamites and Semites At first purely hunters, they began, before the end of the Mesolithic penod, to cultivate the wheat and bailey which, in their wild state, were indigenous to the country; and thus they made the decisive step from a nomadic to a sedentary life in which the arts of civilization could be born Rough pottery is found in a very early age (perhaps c. 4000 BC.) at Jericho, and not long afterward there was centred in northern Syria and in northern Mesopotamia a prehistoric manufacture of the finely made and beautifully painted ware named after Tell Halaf, the place of its first discovery. At about the same time began the use of copper for tools and ornaments. Oxen, sheep, goats and pigs were domesticated, and even irrigation was practised Population was mixed, the heavier Armenoids being mingled with a slighter race, which may already have spoken a Semitic language.

### EARLY HISTORY

History begins with the invention of writing, which took place in southern Babylonia perhaps c. 3500 B.C., the script being an original picture-character which developed later into cuneiform. An early Sumerian ruler of the city of Erech, named Lugal-zaggisi, recorded his triumphal progress from the lower sea to the upper (sc. the Mediterranean), and this may be taken as the first mention of the land of Syria, though not of the name, in history. Immediately after this mention, Syria appeared as the provenance of a great migration of Semitic invaders into Babylonia by way of the Euphrates, the first of several such movements which may all have begun from northern Arabia, but are never traceable farther back than Syria. These first intruders have been given the name of Accadians, from their leader, Sargon of Agade or Akkad, with whom is connected a legend that he was born obscurely on the upper Euphrates, launched on the river in a reed basket and adopted in Babylonia, where he found favour with a king, supplanted him and became the greatest conqueror and the most famous name in Babylonian history. From his new city of Agade he marched back up the Euphrates to the "cedar mountain" (the Amanus) and far beyond, if the various sources may be trusted. It is probable that he and his equally famous grandson Naram-Sin (c. 2300 BC.) ruled effectively over the whole of Syria, to which they doubtless introduced the Sumerian writing that they had learned and adapted to their Semitic language in Babylonia. But their successors were feebler men, and the dynasty of Agade was soon overthrown at its centre and superseded by the dynasty of Ur. Nothing certain is

١

wormwood; and in the Jabal Druse maquis with forests of kermes known about the authority (if any) that the kings of Ur exercised in Syria, so far away from their capital The end of their dynasty, however, was brought about chiefly by the pressure of a new Semitic migration from Syria, this time of the Amorites (se, the westerners), as they were called in Babylonia Their invasion began before 2000 BC and by the 18th century BC. they had covered both Syria and Mesopotamia with a multitude of small principalities and cities, mostly governed by rulers bearing some name characteristic of the Semitic dialect that the Amorites spoke The period of Amorite ascendancy is vividly mirrored in the Mari letters, a great archive of royal correspondence found at the site of Mari, near the modern frontier with Iraq. They treat of the wars and general affairs of a multitude of states extending from northern Palestine to the upper Tigris Among the principal figures in them are the celebrated lawgiver Hammurabi of Babylon (himself an Amorite) and a king of Aleppo, reckoned the most powerful of all, but of whom little is yet known Part of his kingdom was the city of Alalakh, on the Orontes near what was later Antioch This has yielded to excavation records both of the Amorite period and of a later age

At about the same time (later in the 18th century B.C.) there began from Syria a movement of people in the opposite direction This resulted in the Hyksos invasion of Egypt, which was subject to this foreign domination for about 150 years. The mixed multitude of the Hyksos certainly included Khurrians (Hurrians, Horites), who, not being Arvans themselves, were under the rule and influence of Aryans and learned from them the use of light chariots and horses in warfare, which they introduced both into Egypt and into Syria and Mesopotamia These Khurrians established the kingdom of Mitanni, with its centre east of the Euphrates, and this was for long the dominant power in Syna, reaching its height in the 15th century B C. But other nations were growing at the same time, and in the 14th century Syria was the arena in which at least four great competitors contended. The Khurrians were first in possession, and these maintained friendly relations with Egypt, which, after expelling the Hyksos, had established a vast sphere of influence (it was scarcely an "empire") in Palestine and Syria, under the kings of the 18th Dynasty. Third of the powers disputing Syria in the 14th century were the Hittites, who finally, under their greatest warrior Shuppilulumash (c 1350 B.C.) not only defeated the kingdom of Mitanni but established a firm dominion of their own in northern Syria with its principal centres at Aleppo and Carchemish. Fourth was the rising kingdom of Assyria which became a serious contender in the reign of Ashuruballit I. Indeed a fifth actor also appeared on the scene, the king of Babylon, but he was too distant and impotent to affect the issue This was the period of the Amarna letters which vividly illustrate the decline of Egyptian influence in Syria, especially under Amenhotep IV (Ikhnaton), the distress or duplicity of local governors and the rivalry of the aforesaid powers, contending with Egypt and with one another in a strife that was not to leave any of them with a final victory. Egyptians and Hittites continued their struggle into the 13th century, but even the famous battle of Kadesh, which Rameses II so boastfully claimed to have won (c. 1285 B.C.) led to no more than a treaty maintaining the equal balance. Assyria had already swept away the remains of Mitanni but soon fell into decline, and the Hittites were not long afterward driven from their centre in Asia Minor into a chain of minor states on the northwestern fringes of Syria by the migration of "peoples of the sea," west-ern invaders from the sles of the Aegean and from Europe. These immigrants then marched down the coast of the Levant and threatened Egypt, but were repulsed by Rameses III c. 1190 BC

While all the neighbouring states had failed to establish a lasting ascendancy in Syria, the actual possession was assumed gradually by a people without sufficient cohesion to appear as a power at all. Various documents of the 14th century mention the Akhlamu, who were forerunners of another vast movement of Semitic tribes called generically Aramaeans. By the end of the 13th century these had covered with their small and loose principalities the whole of central and northern Syria and a great part of Mesopotamia. The Assyrians, however, were able to guard their homeland from this penetration: henceforth much of the warfare of Assyrian kings

was to be a mixture of aggression and defense aimed at the A1amaean states of Syria and at the borderland "Hittite" principalities At about the same time as the Aramaean invasion there was proceeding the exodus of Israelite tribes from Egypt, and as these, toward the end of the 11th century established a kingdom centred upon Jerusalem, so did the Aramaeans set up their principal kingdom at Damascus, and the wars between kings of Judah or of Israel and kings of Aram make up much of Old-Testament history But the most formidable enemies of the Aramaeans and often of the Hebrews as their allies, were the great military kings of the Assyrians After a premature Assyrian incursion under Tiglathpileser I early in the 11th century BC, the real contest was reserved for the 9th and the 8th, during which the Assyrian empire was established over the west, though destined to be short-lived At the battle of Karkar in 853 B C Shalmaneser III of Assyria was opposed by Ben-Hadad of Damascus, Ahab of Israel and by 12 vassal monarchs. In 732 Damascus, the Syrian capital, was at length captured by Tiglath-pileser III But campaigns against the Aramaeans and Anatolians of northern Syria (called "Hatti-land") had to be undertaken by the Assyrians until almost the end of the Assyrian empire Culturally, the most important achievement of the Aramaeans was the bringing of the alphabet into general use for public and private business. It had been invented along the Syrian coast before the middle of the 2nd millennium B C. This was perhaps the greatest single contribution ever made to human civilization

Before the close of the 8th century BC began a massive southward movement of people, partly of Aryan stock, from the north and west Pressure of these upon the Assyrian dominions and homeland became ever more severe, and they deeply affected Syria also; and in the 7th century came the invasion of the Cimmerians, followed by the Scythians. To these and to the Medes, another Arvan people, Assyria finally succumbed with the fall of Nineveh in 612 BC A remnant supported itself in Harran for a year, but that city was evacuated before the advance of the Medes, now reinforced by Nebuchadrezzar, king of Babylon. Nebuchadrezzar finally defeated the attempted rescue of Assyria by Necho, king of Egypt, and annihilated his army at Carchemish in 605 BC. In 586 BC he captured Jerusalem and carried its people into exile Thereafter Syria was, for half a century, under the rule of Nebuchadrezzar's successors on the throne of Babylon. But another and greater Aryan power, the Persians, then came to the Under the leadership of Cyrus they subverted the rule of the Medes and assumed their empire, extending their conquests into Asia Minoi, where Cyrus defeated and captured Croesus of Lydia. No longer able to brook a rival, he thus came to a final collision with Babylon, which he occupied in 539 B C. He returned all the gods of Babylonia to their own places, and among the measures of restoration commanded by him and continued by his successors was a project of sending back the exiled Jewish community to Jerusalem and encouraging them to rebuild the temple. In Darius I's great organization of the Persian dominions more than 20 satrapies were constituted; Syna, with Palestine and Cyprus, was the fifth, bearing the name of "Across the River" (26., the Euphrates), and its tribute was fixed at 350 talents of silver. Damascus and the Phoenician cities were still the chief centres of Syna under the Persians, and in Sidon was the core of the Phoenician revolt against Artaxerxes III, which ended with the destruction of that city in 351 B.C But by this time the end of the Persian domination was at hand, and the Macedonians under Alexander the Great were about to bring the whole near east under Greek rule and influence. Alexander invaded Asia Minor in 334 B C., and his first decisive victory over the Persians was won on the fringe of Syria at Issus in 333; it was followed by the capture and enslavement of Tyre and Gaza With the battle of Gaugamela and the destruction of Persepolis the downfall of Persia was completed. See further Amorites; Hittites; Phoenicia; Damascus; Sidon; TYRE; and works cited in the bibliographies to these articles.

## (C. J. G.) HELLENISTIC AND ROMAN SYRIA

After Alexander's death in 323 BC his marshals contended for

gained the northern part and Ptolemy I Lagus gained the southern (Coele Syria) This partition between the Seleucids and Ptolemies was maintained for 100 yr despite intermittent Syrian wars during the 3rd century (see Seleucid Dynasty) Their administrative methods varied In the south the Ptolemies respected the existing autonomous cities, imposed a bureaucratic system on the rest of the country and established no colonies, while the Seleucids divided their part into four satraples which embraced the cities, and founded many cities and military colonies (including Antioch, Seleucia Pieria, Apamea and Laodicea [qq v]), drawing on settlers of European blood Republics replaced kings in the Phoenician coastal cities of Tyre (274 BC), Sidon, Byblus and Aradus. Further political and cultural changes followed - Antiochus III the Great defeated Ptolemy at Panium (200 B C or perhaps as late as 198) and thus secured control of southern Syria, where he introduced the satrapal system. His subsequent defeat by the Romans at Magnesia (Dec or Jan, 190-189), however, diminished both his territory in Asia Minoi and his prestige, thereby fundamentally weakening the Seleucid empire, which ceased to be a Mediterianean power Antiochus Epiphanes (175-163) stimulated the spread of Greek culture in Syria, with which went Greek political ideas, by a policy of urbanization increased city organization and municipal autonomy involved greater decentralization of his kingdom, his attempted hellenization of the Jews is wellknown Under the later Seleucid kings, with rival claimants to the throne and constant civil war, Syria disintegrated In the north the Seleucids controlled little more than the areas of Antioch and Damascus (Coele Syria) Commagene asserted its free-dom, many of the cities claimed independence and numerous petty chiefs established little principalities Southern Syria was partitioned by three tribal dynasties, the Ituraeans, the Jews and the Nabataeans The country was seized later by Tigranes of Armenia (83) until his defeat by Pompey who ended years of anarchy by making Syria a Roman province (64-63)

Pompey in the main accepted the status quo, but he reestablished a number of cities and reduced the kingdom of Judaea, 10 cities of the interior formed a league, the Decapolis Roman province of Syria therefore included the native kingdoms of Commagene, Ituraea, Judaea and Nabataea A Parthian invasion was thrown back in 39 BC, while Antony's extensive territorial gifts to Cleopatra (Ituraea, Damascus, Coele Syria, etc.) involved only temporary adjustments Under the principate Syria, which stretched northeast to the upper Euphrates and, until A D 73, included eastern Cilicia, became one of the most important provinces Its governor, a consular legate, generally commanded four legions until A D. 70. Administrative changes followed, Rome gradually annexed the client kingdoms Ituraea was incorporated (s.e., its territories were assigned to neighbouring cities) partly in 34 BC, partly c AD 93 Judaea became a separate province in AD 6, governed by procurators (apart from Herod I Agrippa's shortlived control; A.D. 37-44), until the destruction of Jerusalem in 70 Then the governor was a praetonan legate in command of a legion, next, under Hadrian he was a consular with two legions, and the province was named Syria Palaestina Commagene was annexed temporarily from AD. 17 to 38 and permanently by Vespasian in 72. The caravan city of Palmyra came under Roman control, possibly during Tiberius' reign. Finally, Nabataea was made the province of Arabia in 105, governed by a practorian legate with one legion. Syria itself was later divided by Septimius Severus into two provinces-Syria Coele in the north with two legions, and Syria Phoenice with one. By the beginning of the 5th century it was subdivided into at least five provinces. The frontiers of Syria were guarded by a fortified limes system, which was thoroughly reorganized by Diocletian and his successors (particularly against cavalry attacks) and endured until the Arab conquest, much knowledge of this system of "defense in depth" has been obtained with the aid of air-photography

Syria's economic prosperity depended on its natural products (e g, wine, olives, vegetables, fruits and nuts), on its industries (e.g., purple-dyeing, glassmaking at Sidon, linen and wool weaving and metalwork) and on its control and organization of trade passcontrol of the country, until after Ipsus (301) Seleucus I Nicator ang by caravan from the east to the Mediterranean through such

centres as Palmyra, Damascus Bostra and Petra Further, Synan merchants spread westward throughout the Latin provinces of the Roman empire The population of the country must have been larger than that of today. Some cities were founded under the empire, but these were not numerous and Syria remained essentially tural The urban upper and middle classes might be hellenized, but the lower classes still spoke Aramaic and other Semitic dialects in town as well as country Roman influences were naturally weaker than Greek though the army at first beloed the spread of romanization, while Latin, not Greek, was the language of instruction in the famous law school at Berytus until c AD 400 The splendour of Syrian culture is seen in the magnificence of the cities (Antioch, ranking among the greatest cities of the empire, was the residence of the governor and later of the comes Orientis), and in the luxury, gaiety and versatility of the Syrians splendour is also evident in their schools of rhetoric, law and medicine, in their art (the pre-eminence of Italian or Syrian elements in Syrian art is debated), in their literature and philosophy and in the variety of their religions, both pagan and Christian

During the three centuries Syria was administered from Constantinople, its cultural and economic life remained active, as names like Libanius, Ammianus Marcellinus, Procopius and John Majalas bear witness Government became more bureauciatic but it was efficient. From the middle of the 5th century, by which time paganism had died out and monasticism was spreading, religious controversy took a political turn with the growth of the Monophysites, in whom anti-imperial, nationalist and secessionist sentiment found a rallying point. The reperculsions of this heresy seriously weakened Syria and the Eastern Roman empire. Nor were external dangers lacking In the 4th century, during the campaigns of Constantius and Julian against Persia, Syria had again become a base of operations and at times endured Persian invasion, and the Huns had appeared before the end of that century The Persian menace died down during the 5th century, but it blazed up again in the 6th, when Arabs also added to the danger. The Persian Chosroes I captured Antioch itself (540); and though he was outwitted by Belisarius and though Justinian's Persian wars ended in a "50 years' peace" (562), yet ten years later the Persians were back again. The invasion of Chosroes II, which began in 666. was later rolled back by the victories of Heraclius, but the peace of 628 brought no tranquillity to Syria The Arabs advanced, Damascus and Antioch fell, and Herachus was forced to evacuate Syria Islam was master of the land which seven centuries earlier Pompey had formally added to the Roman empire

### MEDIAEVAL SYRIA

In 633 the Mohammedan Arabs invaded Syria from the south. After their decisive victory on the Yamnuk river in 636 they occupied the whole country piecemeal and made it a base for further conquests north and west. When civil war broke out in 656, the Arabs of Syria stood firm behind their governor, Mu'awiya, of the Meccan house of the Omayyads, who, after warding off at Siffin an attack by the Iraqi Arabs, extended his authority over the neighbouring provinces and was recognized as caliph in 661 (see CALIPHATE).

During the Omayyad caliphate (661-750) Damascus was the capital of an Arab empire which, despite internal outbreaks, extended by 715 from Spain and Morocco to Turkistan and Sind and held the mastery of the Mediterranean With the wealth drawn from the dependent provinces the caliphs 'Abd ul-Malik and Walid I endowed Jerusalem and Damascus with magnificent religious monuments, the Dome of the Rock and the Omayyad

mosque The first senous setback was the failure of the third and final Arab assault on Constantinople in 719 During the following decades unrest and weakness in the outer provinces involved the wide dispersion of Syrian troops on expeditions and garrison duty this, combined with factional feuds among the Arabs, undermined the military power of the Omayyads, who were finally overthrown by the Khurasaman army of the new Abbasid caliphate in Iraq

Under the Abbasids Syria reverted to the status of a dependent province It had little share in the economic and cultural development of the Abbasid empire and was increasingly abandoned to its sedentary Arab population and to the nomads on the desert frontiers As the empire disintegrated, Syria was anneved, in whole or in part, by the Egyptian dynasties (Tulunids, Ikhshidis, Fatimites), except for the brief principality of the Arab Hamdanids of Aleppo founded by Saif ud-Daula (044-067), whose early successes against the Byzantine empire were followed by the Greek recovery of Antioch (969)

During the 11th century the fragmentation of Syria was momentarry arrested by its unification under the Seliuk Tutush (1078-95) and attachment to the empire of his brother, the sultan Malikshah (see Seljuks) On his death the Seljuk kingdom fell to pieces, and Antioch, Jerusalem, the coastal regions and Kerak (Trans-Jordan) were occupied by the crusaders against feeble local opposition between 1098 and 1124 (see CRUSADES) hammedan counterattack began with the annexation of Aleppo by the Turkish atabegs of Mosul (1125), with the recovery of Edessa (1144), and with the union of inner Syria under Nureddin (1146-74), who also annexed Egypt in 1169 After Nureddin's death his principality was rebuilt and enlarged by his Kurdish viceroy in Egypt, Saladin (q v) (1174-93), who recovered all of Palestine and most of the inland crusader strongholds after his victory at Hattin (1187) but lost the Palestinian coast again as a result of the third crusade Concurrent developments of the 12th century were the rise to power of the sect of the Assassins (q v) and the rapid proselytism conducted by the Druses (q v)

The crusades, paradoxically, did much to rehabilitate inner Syria, both by the economic development resulting from the establishment of Itahan trading centres on the coast and by the impetus given to its cultural life by Nureddin and Saladin Although it was again split up after Saladin's death between the members of his family, the Ayyubites, who established separate principalities in Aleppo, Hama, Homs, Damascus, Baalbek and Trans-Jordan and disturbed by intermittent hostilities between their princes or against the crusaders, Syrıa as a whole regained during the Ayyubite period (1193-1260) a level of prosperity such as it had not enjoyed since the 3rd and 4th centuries. A severe blow was dealt by the first Mongol invasion and sack of Aleppo in 1260, but the Mongols were thrown back by the Mameluke sultans of Egypt, who re-organized the Ayyubite principalities as Mameluke governorships and completed the expulsion of the crusaders by 1291. After the defeat of a fourth Mongol invasion in 1304 Syria remained relatively peaceful and prosperous as a centre of culture, learning and industry under Mameluke rule until the invasion of Timur (q.v.) in 1400. From this fresh blow its economy never really recovered, and it continued to decay slowly under the later Mamelukes until its annexation in 1516 by the Ottoman sultan Selim I, who divided it into three Turkish pashaliks Its incorporation in the vast Ottoman empire brought some revival of economic prosperity to Aleppo and Damascus through trade and the pilgrimage to Mecca but did little to arrest the decline of agriculture and general security under the increasing pressure of the nomad tribesmen. (H A. R. G.)

## THE 19TH AND 20TH CENTURIES

For nearly three hundred years, then, the history of Syria was that of a province of the Ottoman empire (see Turkey); its internecine troubles of the 17th and 18th centuries are outlined in the article DRUSES. It was the French invasion of Palestine in Feb 1799 that brought the country once more under the full light of international concern Napoleon Bonaparte sought to secure Syria as a bulwark in defense of his newly conquered Egypt and

also as a base from which to threaten both Constantinople and the British power in India The campaign (see French Revorti-TIONARY WARS), though abortive, was one that Napoleonic piopaganda could represent as glorious the memory of it made a lasting and fatal impression on the mind of the French public

The revolt of Mohammed Alı, pasha of Egypt, and the conquest of Syria for him by Ibrahim Pasha (q v.) in 1832 had repercussions which are discussed at length in the article Eastern Oues-French sentiment saw Mohammed Ah as the continuator of the Napoleonic tradition in the Levant and was deeply incensed at the convention of London (1840), when the other interested European powers agreed to Turkey's recovering the lost territories. The Syrians themselves, however, though they had welcomed the advent of the Egyptian armies, had been in sporadic rebellion since 1834 and rose in revolt against Ibrahim as soon as the joint Turkish, British and Austrian fleet appeared off Beirut (See M Sinasi, Studien zur Geschichte der syrischen Politik Mehmed Alis [Gottingen, 1036] )

The 1840s and '50s were marked by recurring dissension between the Druses and the Uniate community of the Maronites, the latter being sustained by the informal but enthusiastic protection of France-whose interest in these particular Turkish subjects might indeed be traced back at least to Louis XIV's time (see CAPITULATIONS) The massacres of 1860 led to positive French intervention and to the constitution of Lebanon as an autonomous province in 1864 Further trouble for the Turkish authorities arose with Joseph Karam's insurrections in Lebanon (1866-67) and again when a costly and indecisive campaign had to be undertaken against the Druses (1895-96).

The Turkish revolution of 1908 gave impetus to the nationalist movement in the Arabic-speaking provinces of the empire, especially in Syria The political demands of the Arabs, whose representatives met in June 1913 in Paris, involved a decentralization of the Turkish empire with administrative and cultural autonomy for the Arab provinces The Syrian nationalists co-operated with similar movements in Mesopotamia and Egypt During World War I the nationalist leaders entered into close contact with Faisal (see Faisal ibn Husain). The Turkish administration persecuted them several of them were executed and were regarded by their followers as martyrs of the movement of national liberation.

The French Mandate, - Fassal had meanwhile formed an Arab army, which fought together with the British under Lord Allenby While the British conquered Palestine, the Arabs moved through Trans-Jordan northward and by the end of 1918 had reached Damascus, where, according to the promises given to the Arabs during the war, an independent Arab government was set up under Faisal But France, already holding Beirut and the coastal zone, desired a mandate over the whole of Syria, in spite of the fact that on Nov. 7, 1918, the British and French governments had jointly declared their intention of establishing in Syria and Mesopotamia "national governments drawing their authority from national congress, however, elected Faisal king of Syria on March 11, 1920, and adopted on July 3 a democratic constitution for the whole of Syria, including Palestine and Trans-Jordan; and in the summer of roro a United States commission found that the population rejected the idea of a French mandate. Nevertheless the French mandate was decided upon at San Remo on April 25, 1020, and the French high commissioner Gen. Henri Gouraud sent an ultimatum to Faisal demanding recognition of it in July. The Syrians rejected the demand, but their army under Yusuf al-Azmi was defeated at Khan Maisalun, the French entered Damascus, and Faisal left the country. The terms of the mandate were approved by the League of Nations on July 24, 1022.

To strengthen their position against the predominantly Moslem. nationalists, the French established on Sept. 1, 1920, an independent state of the Lebanon. Its nucleus was the formerly autonomous mountain district with its predominantly Christian population; but the French incorporated into it coastal and inland districts with a predominantly Moslem population who protested violently against separation from the rest of Syria. Syria itself was further divided into four "states": the state of Damascus,

2Ĭ--ĈC

the state of Aleppo, the state of the Jabal Druse and the state of the Alawis with the capital at Latakia The Sanjak of Alexandretta was made autonomous Damascus and Aleppo, however, had soon to be united again in a state of Syria. Beirut was chosen as the seat of the French high commissioner, and most high commissioners were accused of favouring the Christian minority at the expense of the Moslems Paper constitutions were given to the different states, representative councils were set up, some of them even elected presidents and ministers, but real power remained in French hands Discontent found expression in violent

demonstitations
The struggle for independence assumed a new form with the success
of a local revolt in the Jabail Druse under the leadership of Sultan
Pasha al-Attan which broke out in July 1925 On Aug 2 the
Druses approached Danascus itself, where the nationalists quickly
the Druses approached Danascus itself, where the nationalists quickly
the property of the pr

make greater concession

In 1928 the French high commissioner Hemi Ponsot abolished mar-tial law, reintroduced certain civil liberties, asked Sheikh Taj ud-Din that hav, reintroduced certain over inferties, asked Sneish risk up-al-Hasant to form a cabinet and, on March 10, announced electrons for overwhelming victory to the nationalists, and on June 9 the assembly was opened in Damascus Hashim al-Atas, who had been Syran prime minuter under Fassal in 1920, was elected president of the assembly and by August the draft of the constitution was ready. As a result of and by August the draft of the constitution was ready. As a result of conflict with the high commissioner, the assembly was finally disabled for the dustion of the mandate, was preclaimed on May 14, 1390. If provided for a legislature elected for four years and for the election of provided for a legislature elected property and the cute of the provided for a legislature elected property and the cute over 20 years of 1800 pind at work; there was only a property and the over 20 years of 1800 pind at work; there was only was responsible to the chamber, compulsory primary education for both sexes was provided. The Syrian lepublic adopted the Arab national flag. France promised to negotiate a treaty with Syria that would terminate the mandate and proclaim Syna's sovereignty In the next six years the constitutional life of Syria went through several periods of storm and stress, caused by disagreements with the high commissioner, which led to a temporary suspension of parliamentary life The former states of Latakia and of the contraction of the state of Latakia and of the contraction of the state of Latakia and of the state of roclaim Syria's sovereignty In the next six years the constitutional the Jabal Druse continued their autonomous existence under French administration

A first treaty draft submitted by France was rejected by the Syrians A finst treaty draft submitted by France was rejected by the Syrams in Nov 1938, whereupon the Syram parliament was suspended But in 1936 the growing tension in the Mediterranean and the example set in 1936 the growing tension in the Mediterranean and the example set attitude. In January the Syriams had a general stitute for independence Finally a calegation under Hashma si-Atas was invited to Pars, where Sach, a text was signed providing for a perpetual framedship besolves of the state of the state of the state of the sach set of the state of t

tories of Latakan and the Jabal Drüse; and either nation was to enjoy most-favoured-nation treatment from the other. This treaty failfuled imany Syman demands, except for that of union with the contract of of the Arabs in Palestine: many Syrians went to help the Palestunians in the uprising which started in 1936, until the British government in Palestine built a strong wall of barbed wire all along the frontier.

Under the shadow of the impending war and faced with strong op-

Under the shadow or, one impending war and tacca with strong op-position in partiament the French government announced on Det. 14, 1938, that they did not intend for the present to ask parliament to ratify the Syrian treaty. After several months of manouviring the Syrian government and president resigned, and on 10 yr 10, 1939, the new French high commissioner, Gabriel Puaux, suspended the constitution of 1930 and set up a directorate under his own control. Public

opinion in Syria was highly agitated, and serious disorders threatened

With the outbreak of World War II Gen Maxime Weygand, who as high commissioner had gained an intimate knowledge of Syria, became commander in chief not only of the French forces in Syria but also of the Albed troops in the near east and in the eastern Mediterranean the Allied toops in the near cast and in the eastern Mediterranean. In May 1940, however, he was called to assume command of the French army in Europe and Itel Cen. Eugène Mittelhauser as commander in April Mittelhauser and Fraux Getern Syram. Mittelhauser and Fraux Getern Syram Mittelhauser and Fraux Getern Syram Commander in Mittelhauser and Central Cent Syna into a basis of operations against the British. The Arab leaders first believed that Great Britain had been decisively defeated and that its empire would be inherited in the middle east by the Italians and They sounded the intentions of the German armistice the Germans commission, but the successful resistance of the British and the defeat of the Italians in Africa deterred them from committing themselves prematurely Abd un-Rahman Shahbandar had been assassinated, yet prematusely Abd us-Rahman Shahbandar had been assassmater, yet the idea of a unified Auban with Syma as its nucleus gained in atrength common state of the common state of the common state of the common state of the common state of the common state of the common state of the common state of the common state of the Chappe's death in an neroplane excident in December of that year, Gen Henii Deniz took his place The unsettled condizions, the szardiy and hoarding of food and the

The unsettled conditions, the scarcity and hoarding of food and the fast-rusang prices for all commodities hought the Arab unrest into the open in a wave of widespread and often violent strikes which paralysed communications. On March 70, 174, the Syrian national pair yield communications on March 70, 174, the Syrian national pair independence of the country. The tevolt grew so violent that, after French troops had been used several times to quell tools, the French were forced again to try to meet the native demands halfway. In April 154, they appointed Khalid Al-zam head of the Syrian government and Allied Nakkash prime minister of the Lebanon In May the Verlay government allowed Genma narcarlt to land and

between the British and a revolutionary pro-German government) and also supplied arms and ammunition to Iraq. At the end of the month asso supplied arms and ammunition to 1740. At the end of the month of the British foreign secretary, Anthony Eden, annunced Green Britains. British imperial forces and Free French troops started military operations for the iberation of the Eventh I took them about a month to overcome the teststance of the French troops under Vichy command Damasseu was occupied on June 21, and hostitutes ceased on The food situation remained difficult until the 1942 harvest,

mand Damaguis was occupied on June 21, and hostilities cased on but absequently Syria became once more an exposit of grain, at highly inflated prices. The British built railway lines from Bernat to Trapoli and Haift and so established a direct link between Egypt on British to Trapoli and Haift and so established a direct link between Egypt on British to the state of linguabed most of the departments of state to the Syrian and Lehanese governments; but they retained the locally securitied tempes sphenics, whom the two governments coveted to form the nucleus of their satisfact arms at Reb. 1949 Winson Charchill met at LeQuwalt in Carlo and times at Reb. 1949 Winson Charchill met at LeQuwalt in treaty comparable with the Anglo-Inqu treaty of 1940. But in May the French haple commissioner's return with his government's proposale concluded with the dissubstantant of two small contingents of French ments, not ramofroments, the Syrau and Lebanese governments fell that they would be negotiating under dures; and in any case the French proposals (losed on the abovitor treaty of 1949) were no longer compatible with their insistence on total independence. Discreters in Compatible with their insistence on total independence. the principal Syrian towns culminated in the French bombardment or Damascus by aircraft and heavy guns on May 19-30, causing about 500 Syrian deaths. The British government ordered their commander in chief in the middle east to intervene, the French troops were compelled to return to barracks, and French influence in the country came to an

Independence.-Meanwhile in March the Syrian and Lebanese overnments were invited to the United Nations conference at San Francisco, signifying their recognition as sovereign states. They appealed to the Security council to order the immediate withdrawal of French and British troops from their territories in Feb. 1946, and the

evacuation of Syria was completed by April 15 The National Bloc government was confirmed in power by elections in 1947, but discontent at its inefficient and allegedly corrupt administration was aggravated by the poot performance of the Syrian army in the Palestinian wai of 1948, which gave use to further political scandals. In Dec 1948 student demonstrations forced the replacement of the National Bloc government by a nonparty administration led by Khalid al-Acam On March 30, 1949, this was overthrown and President al-Quwali de-posed by a bloodless coun d'état led by the chef of staff, Husin az-Zaum. posed by a bloodless coup d'état led by the chief of stait, Husin az-caim, a Kiud who for a few weeks seemed as if he might prove the long-hoped-foi "saviour with a swoid". As the political leaders were reluctant to commit themselves by seving under him, however, he sought support from the still-hated French and from Egypt and, rapidly quarreling with all the neighbouring Atab governments, degenerated into an arbitrary despot On Aug 14 he was arrested and summarily shot by another military junts under CO Sami Hinnawi A general election m November returned a government of the Popular party, opposed to the National bloc and favouring a closer union with Iraq, but this project was forestalled by a third military coup on Dec 19, which removed Sami Hinnawn from power Meanwhile, Sylia had latified agreements for the construction of two oil pipelines from the Pessan gulf to the Mediterianean, which would eventually bring Syria 10yal-ties in dollars and so alleviate its acute shortage of foreign currences. but new difficulties arose after Syna's denuncation of the customs-agreement with Lebanon in Maich 1950 Internal disorders were pro-longed by the assassination of the commander in chief of the air force, longed by the assassination of the commander in their of the art torce, Mohammed Nasser, in July 1950. A new constitution was adopted on Sept 6, 1950 this strengthened the legislature by stipulating that the president should sign legislation within three days or else refer it to a state council constitutionally established. Hashim al-Atasi became president

Hostilities between Syma and Israel broke out in March 1951 be-Hostilites between Syna and Israel broke out in Masici 1951 incases of a fospute about the demilitarized frontier zone and went on until the Security council of the United Nations intervened in May A new criss a rose when Great Britain, France, Turkey and the United States submitted their scheme for the defense of the middle east to the countries of the Arab league in October Hassan Hakim, who had States submitted their scheme for the defense of the middle east to the countries of the Atab league in Octobe. Hassan Hakum, who had become prime minister in August, wanted to accept the plan and resigned in November because of cabinet opposition to it. After three weeks of crisis, Maruf ad-Dawalibi formed a cabinet, but was overweeks of crass, Maruí ad-Dawaibh formed a cabinet, but was over-thrown nine house later by a coup d'état. (Nov 29) engeneerd by the thief of the general staff, Adb sah-Shubakly President Hashım al-Kası resugned on Dec 1, and the lipher mitatury council under ash-rial march 1952 a new trade agreement was reached with Lebanon In March 1952 a new trade agreement was reached with Lebanon An important piogram of land cform, muvolum the distribution of some 4,000,000 ac among groups of agricultural co-operatives, was announced. (X., G. E. K.)

### GOVERNMENT AND ECONOMY

GOVERNMENT AND ECONOMY

Constitution.—In the earler yeas of the French mandate the state of Syna excluded the districts of the Alawas (Latakas) and the state of Syna excluded the districts of the Latay to 1496, they were to provide the state of the state of 1496, they were to the state of 1496, they were to the state of 1496, and the state of 1496, and the state of 1496, and the state of 1496, and a result of which an appeal was made to the Security council, the state of 1496, and the state of 1496, and a result of which an appeal was made to the Security council, the 1496, and 1

solutions, and in the estimation of the constituent assembly in 1969 whomes one deputy for every 3,0000 electron; the electracts being limited to men of 18 years of age and women of the same age holding, at least, an elementary school extrincts. Of the 11d deputs elected 1, swere Christians. The president nommates the pume minister, usually from the members of the contract of the 11d deputs elected 1, swere Christians. The president nommates the pume minister, usually from the numbers of the colinet. The party system is not highly developed, political groups tend to form round prominent individuals rather than follow as ten policy, and there are many "independents" —

Education.—There has been a steady increase in the provision of the colinet of the provision of the colinet of the provision of the colinet of the provision of the colinet of the colin primary and 2,954 secondary grade pupils. By 1948 there were 1,376 primary schools with 188,200 pupils and 93 secondary schools with

primary sensons with 188,000 pupus and 50 securiary sensons was also pupils. As 800 pupils and 800 pupils in leneases in gifts deducation took place after 1909 gitta attending schools numbered 5,500 at primary and about 100 at secondary schools numbered 5,500 at primary and special secondary schools numbered 5,500 at primary and 3,600 at secondary in 1948, when there were also 400 pirls at the university. The Syran University of Damacus, founded in 1923 (1,028 students in 1935-40; a 100 in 1936), has schools of medicine and law and later established schools of artis, some can en engineering. There are two

agricultural colleges, a teachers' training college at Damascus, and a college of engineering at Aleppo The Arab academy at Damascus, financed by the government, is a recognized cente for the study of A1-ab history and literature

Agriculture, Industry and Commerce,- Agriculture is the main industry and supports more than 55% of the population. The proportion of cultivable land is low (about 33%) and less than half of this is actually under cultivation, partly because of the system of of this is actually under cultivation, parity operaties of the system of Indi-denute The principal crops are wheat (c. 56,000 tons), barley (350,000 tons) and other cereals, vegetables and futt include olives, paritots, grapes, tigs and apples. Rice is grown in the Jazula and Aleppo districts (22,000 tons in 1948). Industrial plants are colotin, hem, liax sugart beek, liquicine, tobacco, seame and sugar cane. Only nemp, nax, sugan been inquorize, tobacco, sessing and sugar cane. Only about 15% of the land under cultivation is irrigated, on the remainder extensive dry faming is practised. Stock raising is characterized to a large extent by seasonal migrations. flocks and herds follow the pasture from region to region or move from the hills to the warmer plains in tiom region to region of move non the mins to the warmer plants in winter. The animal population in 1947 was sheep 3,176,000, goats 1,185,000, cattle 354,000, hotses 141,000, donkevs 330,000, mules 47,000, chickens 937,000. The development of industry has been assisted by the admission of industrial machinery duty-free. Modern variety of foodstuffs The government has instituted standards to be applied to certain industries

A concession to prospect for oil in all Syria north of Damascus is held A concesson to prospect for oil in all Syra north of Damacus is held by the Syinan Fertoleum company, one of the Iraq Petroleum company groups. The Iraq Petroleum company's notifier pipeline from Another pupeline crossing Syras is that of the TranchAnian company, a subsidiary of Aramoo, whose line from the Persain guilt terminates at Sanda (Lebanon). SYRIAC LANGUAGE. Syriac is the name given to the language used by Christian writers in the region east of Antioch, including the Christian subjects of the Peisian empire. It seems to have been originally the local Aramaic dialect of Edessa (q v ). which became a centre of Christianity as early as the last third of the 2nd century Edessa was till 216 the seat of a native monarchy, consequently the new religion took a vernacular form there whereas inside the Roman empire no languages except the imperial Greek and Latin were used by Christians for literature or public worship until the 4th century But the Bible and the forms of Christian liturgy having been translated into the Edessene dialect and publicly used, this dialect was accepted all over the east by native Christians as a classical literary language

Since the 5th century AD owing to theological differences Syriac-using Christians have been divided into Nestorians or East Syrians and Jacobites (Monophysites) or West Syrians, and these groups are now linguistically distinguished by certain differences of pronunciation, chiefly in the vowels The East Syrians in most cases have kept the more primitive pronunciation; eg, the old Semitic ā with them remained ā, but with the Jacobites passed into  $\delta$ . The name Jesus is by the East Syrians pronounced Isho, by the Jacobites Yeshu. The language of the Maronites, a religious body now in communion with Rome and chiefly living in the Lebanon region, is in all respects the same as that of the Jacobites or West Syrians Classical Syriac is now nowhere a spoken language A variety of the Western Syriac survived till about 1880 in some villages near Damascus, and the Nestonans of the Tigris valley speak a modern dialect akin to the old East Syriac though differing considerably from it

Writing .- Syriac has the same 22 letters as Hebrew. Their forms are ultimately derived from the Old Hebrew and Phoenician alphabets. The oldest mss., of the 4th and 5th centuries are written in a very beautiful current hand known as Estrangela, the lapidary form of which is still preserved in some old inscriptions at Edessa. This gave place to other scripts from about the 9th century, the Jacobite form being less graceful and further removed from the Estrangela than the Nestorian. Speaking generally, this writing only indicates the consonants, the vowel # (short or long without distinction), long s and final a. The other vowels, so long as Syriac remained a living language, were not indicated at all, or only partially indicated by a dot above or below the whole word. But about the time when Syriac began to be supplanted by Arabic, two systems of vowel-signs were invented, one by West Syrians, who borrowed the forms of Greek vowels, and the other more elaborate by East Syrians, who used combinations of dots. These signs are written above and below the consonantal letters. Neither system completely distinguishes long from short vowels; the Nestorian system is more satisfac-

tory, though more cumbrous Consonantal Permutations.—Syriac is a dialect of Aramaic (see Semitic Languages), and uses the same alphabet as Hebrew. as remarked above. As in Hebrew the six letters b g d k p t are aspirated ( $\beta \gamma \delta \chi \phi \theta$ ) when immediately preceded by any vowel sound. Thus "he wrote" is in Arabic kataba, in Hebrew kaθaβ in Syriac  $k\theta a\beta$ . We may note that the unwritten light vowel after k (light as e in "belong") aspirates the following consonant, but the second member of a diphthong is reckoned as a consonant.

so that we get bayta ("house"), not bayta

The peculiar dentals and sibilants of early Semitic, preserved
almost in their original diversity in classical Arabic came to be
pronounced differently in Hebrew and Syriac So we get

Arab thdidthā Heb. shlāshā Syr thoda ("three")

" dhahab " zākāg " dahpā ("godd")

" "ar¢ " "ere; " "arā ("earth")

" puhr " shōhrash. " lahrā ("midday")

In the Arabic s and sh sounds Syriac generally agrees with Hebrew against Arabic, but the details are too complicated to be

given here

Parts of Speech. (1) Pronouns—As in Hebrew the personal pronouns entis in two forms the longer is used as a nominative and is a separate word, the shorter is attached to verbs as an accusative and (in a slightly different from to nomes as a pessessive. These suffixes give use to less change in the vowels of the words to which they are attached than in Hebrew. The relative pronoun is d (i.e., d followed by the shortest kind of

vowel), which is prefixed to words

(a) Nourss—There are two numbers, sing and pl, and two genders, mass and fem Syriac, like all Aramaic dialects, has no definite article, but the noun has three "states"—absolute, construct, emphatic, e.g., risk, 'head," on headi'? irêk (mdkh), "the-head of (the-king)", rēskā, "the-head" But in Syriac the emphatic state (rēskā) has almost superseded the simple "absolute," which is hardly used except for adjectival or participial predicates and in certain stock phrases. The construct, which, as in Hebrew, must be immediately followed by a gentive, is less used than in Hebrew, except as the form on which to hang the possessive suffices In its place the relative participle d is used, in place of rēsk malkā ("the-head of the-king") we find rēskā dmalkā, i.e., "the-head which-the-king (has)," or rēškhē dwalkā, i.e., "this head which (\*d.)-the king." Here the d s s practicully equivalent to our "of" This genitive (with prefixed d), does not require the governing noun to precede it immediately, as must be the case with the construct: in this and many respects Syrac has gained greater fleability in synatus thum Hebreus.

The fem sing ending is -ā (absolute), -ab (construct), -la of (emph.): thus the fem sing abs is always identical in form with the mase sing, emph. The plural endings are: mase. abs -an, const. -ab, emph. -ā; fem. abs. -an, const. -ab emph. -abla.

(3) Verba—The most notable pecubarity of Syriac as

(3) Verbs.—The most notable pecularity of Syriac as compared with other Aramaci dallects, and indeed other Semilic languages generally, is that the prefix to the imperfect is n, not y, e.g., "how all vinite" is nextyle, not veytigh: this is hely to have been originally a mere local peculiarity of the speech of Edessa The Syriac verb has lost the original passive forms still surviving in Arabic, and in their place uses reflexive forms, with prefixed e<sup>0</sup>- and a change in the last towed. The simple active holig makes its passive e<sup>0</sup>bblog; the intensive hatte? makes e<sup>0</sup>bhattep; and the causative oxyle? makes utill passive makes in the b g d b p letters caused by the presence or absence of a preceding vowel.)

In Syriac the verbs have become real tenses, partly with the help of the autiliary (h)ws. a truncated form of hew ("was"). Thus we get Pres. k8669, "in writes," "he is writing"; Impt. k8669 ad, "he was writing"; Fut. nex/t6, "he will write"; Subj. dws/t6, "that he may write", Aor. or Petr. 1869, "he wrote; "he has written", Plupt. 1862 ws., "he had written"—sometimes also used for simple Aorist

slao used for simple Aorist. (4) Particles and Syntax—Syriac uses a great many conjunctions, many of them adapted from Greek. Thus we have give from γio, dos from θi for at least used like Greek δi), even man, from μio. The order of words which is permissible is also very free, more so than in, any other Semticle language, a fact which gives to Syriac great flexibility and also renders word-for-wood translation into it easier.

In some Syriac translations from the Greek, notably the later

Jacobte translations of the Bible and other Greek theological works, Greek idom is very slavishly followed This, however, is to be regarded rather as learned pedantry than as linguistic evolution. In other works,  $\varepsilon_g$ , the Syrac version of Fseudo-Callisthenes Lafe of Alexander, which was translated not from the original Greek but from a Pahlavi text, the influence of the Persian idom is quite perceptible in the syntax.

Christian Patertinian Syriae is the name given to a literative written not in "dasacal Syrae." but in the vernacular dialect of Palestine. It is exclusively theological (Bible Homiles, Cyris' Garchesses, etc.) and appears to date from the 5th or 6th centuries when certain emperors, notably Justiman, made belate efforts to evangelize the non-Greek-speaking populations of Palestine. The documents are written in a peculiar script. The language is very similar to the Jewish Targums and to some Aramaic parts of the Talmud unfortunately the linguistic value of this literature is greatly diminisable by the fact that it wholly consists of translations from the Greek and follows the Greek vidions with panful literaliess.

SYRIAC LITERATURE. The use of Syriac by Christians as a literary medium had its original centre in Edessa (Syr Ürhäi, modern Urfa), where, in all probability, the chief Syriac versions of the Bible were made. The use of the same dialect appears in the earliest Christian literature connected with such Mesopotamian cities as Nisībis, Amid, Mardin, Taghrīth and Seleucia-Ctesiphon, as well as west of the Euphrates at such centres as Mabbogh (Hierapolis) and Aleppo, northwards at Malatiah and Maiperkat and in the districts of Lake Van and Lake Urma, and to the east and south-east of the Tigris in many places which from the 5th century onwards were centres of Nestorian Christianity within the Sassanian empire. In Palestine and western Syria, the home of pre-Chustian Aramaic dialects, the vernacular Semitic speech had under Roman dominion been replaced by Greek for official and literary purposes Apparently this state of things lasted till after the Mohammedan conquest, for Barhebraeus tells us that it was the caliph Walid I. (AD 705-715) who, out of hatred to Christianity, replaced Greek by Arabic as the language of official documents at Damascus.

Syriac literature continued in life from the 3rd to the 14th century AD, but after the Arab conquest it became an increasingly artificial product, for Arabic gradually killed its vernacular use.

Religious Literature.-In the literature as it survives many different branches of writing are represented-homilies in prose and verse, hymns, exposition and commentary, liturgy, apocryphal legends, historical romance, hagiography and martyrology, monastic history and biography, general history, dogmatics, philosophy and science, ecclesiastial law, etc. But the whole is dominated by the theological and ecclesiastical interest. When we put aside one or two exceptionally fine pieces, like the hymn of the soul in the apocryphal Acts of Thomas, the highest degree of excellence in style is perhaps attained in straightforward historical narrativesuch as the account of the Perso-Roman War at the beginning of the 6th century by the author who passes under the name of Joshua the Stylite, or by romancers like him who wrote the romance of Julian; by biographers like some of those who have written lives of saints, martyrs and eminent divines; and by some early writers of homilies such as Philoxenus (in prose) and Isaac of Antioch (in verse).

For the general history of culture the work of Syrfac writers as translators is, perhaps, as important as any of their original contributions to literature. Beginning with the earliest versions of the Bible, which seem to date from the and century AD, the series comprises a great mass of tanslations from Greek originals—theological, philosophical, legendary, historical and scientific. In a fair number of cases the Syrfac version has preserved to us the substance of a lost original text. Often, moreover, the Syriac translation became in turn the parent of a later Arabic version. This was notably the case with some of the Artistotelian writings,

on the touch of Greek thought to the Arabs, by whom it was in turn transmitted to mediaeval Europe. The early Syriac translations are in many cases so literal as to do violence to the idiom of their own language, but this makes them all the more valuable when we have to depend on them for reconstructing the original texts. The later translators use greater freedom. It was not from Greek only that translations were made into Syriac Of translations from Pahlavi we have such examples as the version of oseudo-Callisthenes' History of Alexander, made in the 7th century from a Pahlavi version of the Greek original-that of Kalilah and Diminah executed in the 6th century by the periodeutes Bodh-and that of Sindbad, which dates from the 8th century, and in the late period of Syriac literature, books were translated from Arabic into Syriac as well as vice versa

The Cradle of Syriac Literature.-All our historical sources support the view taken above that Edessa, the capital of the kingdom which the Greeks and Romans called Osrhoene, was the earliest seat of Christianity in Mesopotamia and the cradle of Syriac literature But as to the date and circumstances of its evangelization we have little reliable information. The well-known legend of the correspondence of Abgar Ukkāmā, king of Edessa, with Christ and the mission of Adda to Edessa immediately after the Ascension was accepted as true by the historian Eusebius (d 340) on the faith of a Syriac document preserved in the official archives of the city An amplified form of the same story is furnished by the Doctrine of Addas, an original Syriac work which survives complete in a St Petersburg (Leningiad) ms of the 6th century, and is also represented by fragments in other mss of the 5th and 6th centuries. This work was probably written at Edessa about the end of the 4th century. But whether in its longer or its shorter form, the whole narrative must be pronounced unhistorical In all probability the first king of Osrhoene to adopt Christianity was Abgar IX, son of Ma'nū, who reigned from AD 170 to 214 or 216, and the legend has confounded him with an earlier Abgar, also son of Ma'nu, who reigned first from B C 4 to AD 7 and again from AD 13 to 50 (See Lipsius, Die edessenische Abear-Saga, 1880 ) A contemporary of Abgar IX at Edessa was the famous Bardaisan, himself a convert from heathenism, who was of noble birth and a habitué of the Edessene court. It was no doubt partly under his influence-also possibly in part through impressions received by Abgar during his visit to Rome about AD 202-that the king's conversion took place But Christianity must have reached Edessa some 30 to 50 years earlier Our oldest native historical document in Syriac-the account of a severe flood which visited Edessa in Nov AD 201-mentions "the temple of the church of the Christians" as overthrown by the flood The form of this notice shows, as von Gutschmid and others have remarked, that Christianity was not yet the religion of the State; but it must for some time have had a home in Edessa. By a skilful piecing together of the data furnished by the oldest Syriac versions of the Bible-such as the derivation of the Old Testament version from the Jews, and the almost exclusive use of Tatian's Diatessaron as the gospel of the Syriac Church down to the be-ginning of the 5th century—F C Burkitt has shown it to be probable that the preaching of Christianity at Edessa reaches back to the middle of the 2nd century or even to about the year 135 (Early Eastern Christianity, Lecture II ).

The Syriac versions of the Bible are treated elsewhere (see BIBLE) and may here be dismissed with a brief summary of facts and opinions The received Syriac Bible or Vulgate (called the Peshitta or "simple" version from the 9th century onwards) contains all the canonical books of the Old Testament. In the New Testament, 2 Peter, 2 and 3 John, Jude and the Apocalypse were originally left out, but Syriac versions were made at a later time. The Peshitta version of the Old Testament must have been originally made mainly by Jews, of whom we know there were colonies in Mesopotamia in the 2nd century. The translation was executed entirely from the Hebrew, but underwent later revision which brought it more into conformity with the LXX .- this to a greater degree in some books than in others. The Peshitta New Testament-according to the convincing theory which at present

so that in this field, as in some others, the Syriac writers handed holds the field-is not the oldest form of the Syriac version, at least as regards the Gospels From the beginning of the 31d to the beginning of the 5th century Tatian's Harmony or Diatessaron whether originally compiled in Syriac, or compiled in Greek and translated into Syriac-was the current form of gospel in the Syriac Church The text of the Gospels underlying it "represents the Greek text as read in Rome about AD 170" Slightly later was made the Old Syriac version of the separate Gospels, which survives in two mss -the Curetoman and the Sinaitic-in two differing forms but this never obtained much currency Its text "represents, where it differs from the Diatessaron, the Greek text as lead in Antioch about A D 200" Then at the beginning of the 5th century, by the efforts of the masterful Rabbūlā, who was bishop of Edessa from 411-412 to 435, a new version or recension of the Gospels was made and incorporated in the Peshitta or Vulgate, the use of the Diatessaron being henceforth proscubed Rabbūlā's text of the Gospels "represents the Greek text as read in Antioch about AD 400" The history of the Peshitta rendering of the Acts and Epistles is less clear

Apocryphal Books.-Of the large number of Apocryphal books existing in Syriac the majority have been translated from Greek, one or two (such as Bar Sira or Ecclesiasticus) from Hebrew, while some (like the Doctrine of Addai above referred to) are original Syriac documents Special mention may be made here of the tale of Ahikar-the wise and virtuous secretary of Sennacherib, king of Assyria-and of his wicked nephew Nadhan. This is the Syriac version of a narrative which has had an extraordinary vogue in the world's literature. It is now known to have existed in Aramaic as far back as the 5th century B C, appearing in Jewish papyri which were lately discovered by the German mission to Elephantine. It appears to be traceable in its Greek dress in writings of the philosopher Democratus and the dramatist Menander; it was certainly known to the author of Tobit and perhaps to the author of Daniel, some would trace its influence in the New Testament, in the parable of the wicked servant and elsewhere; it was known to Mohammed and is referred to in the Koran: it has been included among the tales in the Arabian Nights: and it survives in a good many versions ancient and modern The old Syriac version, which is to be found in a number of mss., was probably made from an early Aramaic version, if not from the original itself (which must surely have been Semitic) The Syriac has in turn become the parent of the Arabic, Armenian and Ethiopic-possibly also of the Greek and Slavonic-versions (See F Nau, Histoire et sagesse d'Akikar l'Assyrien, 1909.)

Another deeply interesting Syriac Apocryphon is the Acts of Judas Thomas (i.e., Judas the Twin), which is included in the collection of Apocryphal Acts of the Apostles The Acts of Thomas is now generally recognized to be an original Syriac work (or "novel," as Burkitt calls it), although a Greek version also exists It seems to have arisen in Gnostic circles, and its tendency is wholly in favour of asceticism and celibacy Among its peculiarities is the fact that Judas Thomas is regarded as the twin brother of Christ. The author has incorporated in it the finest poem to

be found in all Syriac literature, the famous Hymn of the Soul Lives of the Saints.—Lives of saints and martyrs form a large group among Syriac books. Among such documents connected with the early history of Edessa we have, besides the Doctrine of Addai, certain martyrdoms, those of Sharbēl and Barsamya assigned to the reign of Trajan, and those of Gurva and Shāmona and of the Deacon Habbībh under Diocletian and Lincinius. All these documents, like Addai, belong probably to the 2nd half of the 4th century, and are unreliable in detail for the historian though they may throw some light on the conditions of life at Edessa under Roman government. There are also accounts of martyrdoms at Samosāta (Assemani, Acta Mart. ii. 123-147), including that of St Azazail published by Macler (Paris, 1902). But the great bulk of the Syriac martyrdoms have their scene farther east, within the Persian dominions.

The life and writings of Bardaişan, "the last of the gnostics," and in some sense the father of Syriac literature and especially of Syriac poetry, have been treated in a separate article. The Book of the Laws of the Countries, which embodies his teaching was re-edited in 1907 by F. Nau (this also in the 2nd volume of logical position of Nestorius is to be obtained from the long lost Graffin's Patrologia). Mention may here be made of the valuable edition and translation by the late C. W Mitchell of S Ephrasm's prose refutations of Mani, Marcion and Bardaisan Transcribed from the palimpsest B M Add 14628 (1912-21)

An early Syriac document, probably of the 2nd or 3rd century, is the Letter of Mara son of Serapion, which was edited by Cureton in his Spicilegium Syriacum. It is almost the only exception to the rule that all surviving Syriac literature is Christian

By the beginning of the 4th century much progress had been made with the organization of the Christian church not only within the Roman district of Mesopotamia, but also to the east and south-east within the Sassanian enipire, round such centres as Seleucia-Ctesiphon on the Tigiis (near Baghdad), Karkā de-Beth Sělokh (modern Kerkuk) and Běth Lapat or Gunděshabhor (m the modern province of Luristan) The adoption of Christianity by Constantine as the official religion of the Roman empire had an unfortunate effect on the position of the Christians in Persia They were naturally suspected of sympathizing with the Roman enemies rather than with then own Persian rulers. Accordingly when Sapor Il (310-379) declared war on Rome about 337, there ensued almost immediately a somewhat violent persecution of the Persian Christians, which continued in varying degrees for about 40 years. One result of this and later persecutions of the same kind has been to enrich Syriac literature with a long series of Acts of Persian Martyrs, which, although in their existing form intermixed with much legendary matter, nevertheless throw valuable light on the history and geography of western Persia under Sassanian rule,

4th and 5th Centuries .- The two most important 4th-century writers-Aphraates and Ephraim-are dealt with in separate articles The importance of the former lies in the simple cast of his religious thought, his independence of theological formulas, his constant adherence to the letter of Scripture, his quaint exegesis, and the light he throws on the circumstances of his time, especially (1) the feeling between Jews and Christians, and (2) the position and sympathies of the Christian subjects of Sapor II. The position and character of Ephraim are very different He is the typical exponent in Syriac of unbending Catholic orthodoxy

Before leaving the 4th century we may mention two other writers who probably both lived on into the 5th-Balai and Cyrillona The former was the author of a good many poems, the longest-which is however by some attributed to Ephraim-is the work in 12 books on the history of Joseph, of which a complete edition was published by Bedjan in 1901 Other poems of his were edited by Overbeck in S. Ephraemi Syri, etc., opera selecta, pp. 251-336; and these have since been supplemented by Zetterstéen's edition of a large number of his religious poems or metrical prayers (Beitrage zur Kenntniss der religiösen Dichtung Balais, Leipzig, 1902). His favourite metre was the pentasyllabic. Cyrillona composed a poem on the invasion of the Huns in 395.

The 5th century was a time of storm and conflict in the churches of Mesopotamia and Persia, as in other parts of the Christian world. The teaching of Apollmarius that in Christ the Divine Word took the place of the human rational soul, thus seeming to do away with his possession of a true humanity, had led to a reaction by Paul of Samosāta, Diodore of Tarsus. Theodore of Mopsuestia, and Nestorius of Constantinople. Though with some points of difference, they agreed in emphasizing the permanence of the two separate natures in Christ, united but not mingled or confused, and laid stress on the reality of our Lord's human experience. One question on which great contention arose was as to the propriety of applying to the Divine nature attributes which belonged to the human nature-e.g., birth from a human mother-and vice versa. Hence the great dispute about the application to the Virgin Mary of the epithet θεοτόκος It seems to have been the objection of Nestorius to the use of this expression which mainly led to his condemnation and deposition at the Council of Ephesus (431) under the influence of Cyril, although as patriarch of Constantinople (428-431) he had distinguished himself by his zeal for Nicene orthodoxy. New light on the theo-

Book of Heraclides, a work of his own which has turned up in a Syrac version and was published by Bedjan in 1910

At Edessa the result of the conflict between the Nestorians and their opponents was long doubtful. When Rabbūla, the fierce anti-Nestonan and friend of Cyril, died in 435, he was succeeded in the bishopiic by Ibas, who as head of the famous "Persian school" in the city had done much to inculcate on his pupils the doctrines of Theodore of Monsuestia. But the feeling against the Nestorian party grew in strength, till on the death of Ibas in 457 the leading Nestorian teachers were driven out of Edessa. The Persian school continued to exist for another 32 years, but was finally closed and destroyed by order of the emperor Zeno in 489 The Nestorian teachers then started a great school at Nisibis (which had been under Persian rule since Joyian's humiliating treaty of 363) By the energetic efforts of Barsauma, bishop of that city, practically the whole church of Persia was won over to the Nestorian creed.

Great Churchmen .-- At the beginning of the 5th century one of the most able and influential men in the Syriac-speaking Church was Mārūthā, bishop of Maiperkat or Martyropolis Without entering on the details of his ecclesiastical activity, we may note that he was twice associated with embassies from the Roman emperor to Yazdegerd I (399-420), that along with lsaac, patriarch of Seleucia (390-410), he obtained from the Persian monarch a concordat which secured a period of religious toleration; and that he arranged for and presided at the Council of Scieucia in 410, which adopted the full Nicene creed and organized the hierarchy of the Persian Church As a writer he is chiefly known as the reputed author of a collection of martyrologies which cover the reigns of Sapor II, Yazdegerd I and Bahram V. By his history of the Council of Nicaea he made a great contribution to the education of the Persian Church in the development of Christian doctrine

The next bishop of Edessa, Ibas, who succeeded in 435 at the death of Rabbūlā, proved himself a follower of the Nestonan doctrine (See above ) As a teacher in the Persian school of Edessa he had translated, probably with the help of his pupils, certain works of "the Interpreter," ie, Theodore of Mopsuestia. Among these may have been the commentary on St. John of which the complete Syriac version was published by Chabot in 1897 He may possibly have translated a work of Aristotle. To the Nestorian movement in Persia he rendered useful service by his letter to Märi of Beth Hardasher, in which he maintained the tenets of Diodore and Theodore, while allowing that Nestorius had erred On the ground of his writings he was condemned and deposed by the "robber synod" of Ephesus (449), but was restored by the Council of Chalcedon (451), after he had anathematized Nestorius. His death in 457 was followed by a strong anti-Nestorian reaction at Edessa, which led to the expulsion of many of the leading teachers,

On Isaac of Antioch, "one of the stars of Syriac literature," see the special article. In spite of his over-diffuseness, he is one of the most readable of Syriac authors,

A Nestorian contemporary of Isaac, Dadhishos, who was catholicus of Seleucia from 421 to 456, composed commentaries on Daniel, Kings and Ecclesiasticus His chief importance in the history of the Persian Church lies in his having induced a synod of bishops to declare that church independent of the see of Antioch and of the "Western Fathers." (See J. Labourt, Le Christianisme dans l'empire perse, 1904, p 122 seq )

The most powerful missionary of Nestorianism during the and half of the 5th century was Barsauma of Nisibis, whom his opponents called "the swimmer among the reeds," i.e., the wild boar. Born probably between 415 and 420 he imbibed Nestorian doctrine from Ibas at the Persian school of Edessa, but was driven out in 457 on the death of his master, and went to be bishop of Nisībis. In a succession of missionary journeys he succeeded, partly by persuasion and partly (if his enemies are to be believed) by violence, in attaching to Nestorianism nearly all the Christian communities of Persia, with the exception of Taghrith, which was always strongly Monophysite. He had many quarrels with made peace with Acacius soon after the accession of the latter in 484. Among other severities towards the Monophysites, he persuaded the Persuan king Pērōz (457-484) to banish many of them into the Roman dominions. One of his great aims was to secure for the Nestorian clergy freedom to marry, and this was finally sanctioned by a council at Seleucia in 486 (Labourt, op cst. chap vi ), Barsāumā must have been bishop of Nisībis for nearly 40 years, but was dead by 496 His writings seem to have been chiefly liturgical, he gave the first set of statutes to the school of Nisibis, which was founded during his bishopric

His fellow-worker Narsai, whom the Jacobites called "the " but the Nestorians "the harp of the Holy Spirit," apparently accompanied Barsauma from Edessa to Nisibis, where according to Barhebraeus he lived for 50 years Barsauma appointed him head of the new school, where he taught rigidly Nestonan doctrine He was a copious writer, especially in verse Many of his poems have now been published (See Mingana, Narsai, homiliae et carmina, 2 vols Mosul, 1905) His theological position is clearly defined in a homily on the three doctors -Diodore, Theodore and Nestorius-published by the Abbé Martin in the Journal asiatique for July 1900

To about the same period belongs The book of Hierotheus by the "pantheist" Stephen bar Südh-arte, which has recently been edited and translated by F. C Marsh (1927)

Early Monophysites .- Among the early Monophysites were two of the best of Syriac writers-Iacob of Serugh and Philozenus of Mabbogh, who have been treated in special articles. The one

wrote mainly in verse, the other in prose. See also Ioshua the STYLITE

Another early Monophysite was Simeon of Beth Arsham, who by a series of journeys and disputations within the Persian empire did all he could to prevent the triumph of Nestorianism among the Persian Christians He had considerable success at the time, but the ground he had won was soon reconquered by his opponents, except at Taghrith and the surrounding district. It was after a successful disputation in presence of the Nestorian catholicus Bābhai (497-502/3) that Simeon was made bishop of Bēth Arsham, a town near Seleucia He made several journeys to Constantinople, where he enjoyed the favour of the empress Theodora It was there he died, probably about 532-533. His biography was written by John of Asia in the collection of lives of eastern saints which has been edited by Land (Anecd syr vol 11 ). His literary productions consist only of a liturgy and two exceedingly interesting letters. The one has for its subject Barsauma and the other Nestorian leaders in Persia, and gives a highly malicious account of their proceedings. The other, which has been often edited, is an account of a severe persecution which the Himyarite Christians of Najran in south-west Aiabia underwent in 523, at the hands of the king of Yemen. (See The book of the Himvarites, a Syriac work edited and translated by A. Moberg, Lund, 1924) As Simeon had repeatedly visited al-Hirah and was in touch with the Arab kingdom which centred there, his letter is a document of first-rate historical importance

Mention should be made of two other early Monophysite Justin I. (518-527) The one, John of Tellä, author of 538 canons, answers to questions by the priest Sergius, a creed and an exposition of the Trisagion. His life was written by his disciple Elias, and also by John of Asia. The other, John bar Aphtonya, was the founder of the famous monastery of Kenneshrë, opposite Jerābīs on the Euphrates, and wrote a com-mentary of the Song of Songs, a number of hymns and a biography of Severus, the Monophysite patriarch of Antioch (512-

The life of the great missionary bishop Jacob Burdě'ānā or Baradaeus, from whom the Monophysite Church took its name of Jacobite, belongs rather to ecclesiastical than to literary history (See H. G. Kleyn, Jacobus Baradaeus, de Stichter der Syrische monophysietische Kerk, Leyden 1882.)

his ecclesiastical superior the catholicus of Seleucia, but finally Sylla has produced. Of his life little is known, and that little not wholly creditable He wavered curiously in his ecclesiastical views, and ended by helping the persecutors of the Monophysite Church, to which he himself had belonged. He seems to have lived as a priest and physician at Ras'ain in Mesopotamia most of his life About 535 he travelled on various ecclesiastical missions, and finally made a journey to Rome and thence to Constantinople (in this latter accompanied by the pope Agapetus). The result was to bring about the deposition and banishment of the Monophysites from the latter city. Sergius died almost immediately atterwards, in 536 Among the works which he translated into Syriac and of which his versions survive are treatises of Aristotle, Porphyry and Galen, the Ars grammatica of Dionysius Thrax, the works of Dionysius the Areopagite, and possibly two or three treatises of Plutarch His own original works are less important, but include a "treatise on logic, addressed to Theodore (of Mery), which is unfortunately imperfect, a tract on negation and affirmation, a treatise, likewise addressed to Theodore, On the Causes of the Universe, according to the Views of Aristotle, showing how it is a Circle; a tract On Genus, Species and Individuality; and a third tract addressed to Theodore, On the Action and Influence of the Moon, explanatory and illustrative of Galen's Hepl κρισίμων ήμερων, bk in, with a short appendix 'On the Motion of the Sun'" (Wright) According to the historical compilation which passes under the name of Zacharias Rhetor, he also wrote a treatise on the faith. Some of his translations were revised at a later time by Honain ibn Ishāk (d 873).

Another translator from Greek was Paul, Monophysite bishop of Callinicus or ar-Rakkah, who, being expelled from his diocese in 510, retired to Edessa and there occupied himself in translating into Syriac the works of Severus, the Monophysite champion who was patriarch of Antioch from 512 to 519 This version appears to be quite distinct from that used by the compiler of the chronicle of Zacharias, and also from the version of "the 6th book of the select letters of Severus" which was made by Athanasius "presbyter of Nisibis" in 669, edited by E W Brooks (1902-04).

That important legal work, The Laws of the Emperors Constantine, Theodosius and Leo, which was composed in Greek about 475, and "which hes at the root of all subsequent Christian oriental legislation in ecclesiastical, judicial and private matters" (Wright), must have been repeatedly translated into Syriac. The oldest form is contained in a British Museum ms, which dates from the earlier part of the 6th century, and this was edited by Land (Anecd, syr i. 30-64). A later (probably Nestorian) recension is contained in a Paris ms., which was used along with the other by Bruns and Sachau in their exhaustive edition (Syrischromisches Rechtsbuch, Leipzig, 1880) In Notulae syriacae (privately printed 1887) Wright edited the surviving fragment of a 3rd recension which is preserved in a 13th-century ms at Cambridge. Finally Sachau has published three new reductions of the treatise from a ms found at Rome in 1894 (Syrische Rechts-

bucher, vol i, Lepzig, 1907).

Anonymous Works.—We may here take note of three important anonymous works, of which the first probably and the other two certainly belong to the 6th century.

The Më'arrath gazzë or Cave of Treasures, translated and edited by C. Bezold (Leipzig, 1883-88), is akin (as Duval remarks) to the Book of Jubilees. It is an imaginary history of the patriarchs and their descendants.

The tripartite narrative which is known as the Romance of Julian (the Apostate) has no claim to be regarded as an historical document. Its hero is Jovian, one of the feeblest of Roman emperors, and Julian is everywhere exhibited in flaming colours as the villam of the story.

A valuable historical source, though of small dimensions, is the Chronicle of Edessa, which gives a record of events from 132-131 BC. to AD. 540-at first exceedingly brief, but becoming somewhat fuller for the later years It appears to be thoroughly reliable wherever it can be tested It has been three times editedfirst by Assemani in the Bibliotheca orientalis (i. 388-417), sec-Translators from the Greek.—In Sergius of Rās'ain we ondly by L Hallier (Leipzig, 1892) with a translation, introduction one of the best Greek scholars and ablest translators whom tion and abundant notes, and thirdly by Guidi with a Latin version (in Chronica minora, Paris, 1903)

On John of Asia or Ephesus, the enginent Monophysite bishop and earliest Syriac church historian, see the separate article

An historical work of somewhat similar character to John's is the compilation in 12 books which is generally known by the name of Zacharias Rhetor, because the anonymous Syriac compiler has incorporated the Syriac version or epitome of a lost Greek history written by that author The Syriac work exists (not quite complete) in a British Museum ms of about the beginning of the 7th century this can be in part supplemented by an 8th-century ms at the Vatican From the latter Guidi published the interesting chapter (X 16) which contains the description of Rome The entire text of the London ms was published by Land in the third volume of his Anecdota syriaca, and there is now an English translation by Hamilton and Brooks (1899), and a German one by Ahrens and Kruger (Leipzig, 1800)

Of the other 6th-century Jacobite writers we need mention only Moses of Aggel (A c 550-570) who translated into Syriac some of the writings of Cyril, and Peter of Callinicus, Jacobite patriarch of Antioch 578-591, who wrote a huge controversial treatise in 4 books, each of 25 chapters, against Damian, patriarch of Alexan-

dria, as well as other less important works

The Nestonan writers of the 6th century were numerous, but as yet we know little of their works, beyond what 'Abhdīsho' tells us in his Catalogue. It will be sufficient to mention one or two Joseph Hūzāyā (i.e., of al-Ahwaz or Khūzistan), who came third in succession to Narsai as head of the school of Nisibis, was the first Syriac grammarian and invented various signs of interpunction Marūtha, who was Nestorian catholicus of Seleucia from about 540 to 552 (see Labourt, op. cst , pp 163-191), and a man of exceptional energy, made the only known attempt, which was, however, unsuccessful, to provide the Nestorians with a Bible version of their own. He was the author of many commentaries, homilies, epistles, canons and hymns Paul the Persian, a courtier of Khosrau Anosharwan, dedicated to the king a treatise on logic which has been published from a London ms by Land in the 4th volume of his Anecdota Bodh the periodeutes is credited with a philosophical work which has perished, but is best known as the author of the old Syriac version of the collection of Indian tales called Kalilah and Dimnah He made it doubtless from a Pahlavi version His translation, which was edited by Bickell with an introduction by Benfey, must be distinguished from the much later Syriac translation made from the secondary Arabic version and edited by Wright in 1884, of this there is an English translation by Keith Falconer (1884). Hannana of Hedhaiyabh, who nearly produced a disruption of the Nestonan Church by his attempt to bridge over the interval which separated the Nestorians from Catholic orthodoxy, was the author of commentaries

Decay in the 7th Century. "With the 7th century." as

Wright remarks, "begins the slow decay of the native literature of the Syrians, to which the frightful sufferings of the people during the great war with the Persians in its first quarter largely contributed." The same process of decay was greatly promoted by the Arab conquest of Persia, achieved through the victory of Kādisīya in 636-637. The gradual replacement of Syriac by Arabic as the vernacular language of Mesopotamia by degrees transformed the Syriac from a living to a dead language. Apart from a few leading writers-such as Jacob of Edessa, the anonymous historian whose work has passed under the name of Dionysius of Tell-Mahrë, Thomas of Marga, Dionysius bar Salībī, and Barhebraeus (qq.v) - there are few names of interest.

I. Theology.-Here we may first mention George, bishop of the Arabs (d. 724), who wrote commentaries on Scripture, and tracts and homilies on church sacraments, and finished the Hexaemeron of Jacob of Edessa. Bābhai the Elder, a leading Nestorian in the beginning of the 7th century and a prolific author, wrote many commentaries and theological discourses. Ishöyabh III., Nestorian catholicus from 647 to 657/8, wrote controversial tracts, religious discourses and liturgical works. Elias of Merv, who belongs to the 2nd half of the 7th century, compiled a Catena patrium on the Gospels and wrote many commentaries. Timothy , catholicus 779-823, wrote synodical epistles and other works

bearing on church law Moses bar Kepha (d 903), one of the most fertile of oth-century authors, wrote commentaries, theological treatises and many liturgical works. Other important contributors to this sphere of literature were Isho' bar Non (d. 827/8), John bar Zö'bî (beginning of the 13th century), Jacob bar Shakko (d 1241), and the great Nestorian scholar 'Abhdisho' (d 1318)

2 History -Besides the important writers treated in separate articles, we need mention only four Elias bar Shīnāyā, who in 1008 became Nestorian bishop of Nisibis, was the author of a valuable Chronscle, to which are prefixed numerous chronological tables, lists of popes, patriarchs, etc., and which covers by its narrative the period from AD 25 to 1018 Ot this work, which exists in only one imperfect copy, the later portion was edited by Baethgen m 1884, and the earlier by Lamy in 1888. Another important Chronicle is that of Michael I, who was Jacobite patriarch from 1166 to 1199. Its range extends from the Creation to the author's own day, and it was largely used by Baihebraeus in compiling his own Chronicle. Till recently it was known only in an abridged Armenian version which was translated into French by V Langlois (Venice, 1868), but the Syriac text was found in a ms belonging to the library of the church at Edessa, and has been published by J B Chabot A work rather legendary than historical is the Book of the Bee, by Solomon of al-Basrah, who lived early in the 13th century Lastly, acknowledgment must be made of the great value of the Catalogue of Nestorian writers, by 'Abhdisho' of Nisibis, the latest important writer in Syriac It was edited by Assemani in the 3rd part of his Bibliotheca orientalis, and has been translated into English by Badger.

3. Biography, Monastic History, etc.—Besides the important work by Thomas of Margā (q v) the following deserve special mention Sāhdōnā, who was a monk in the Nestorian monastery of Beth 'Abhe (the same to which Thomas of Marga belonged two centuries later) and afterwards a bishop early in the 7th century. wrote a biography of and a funeral sermon on his superior Mar Jacob who founded the monastery, and also a long treatise in two parts on the monastic life of which all that survives has been edited by P Bedjan (Paris, 1902). Whilst accompanying the catholicus Isho'vabh II. (628-644) on a mission to Heraclius, Sähdönä was converted, apparently to Catholicism (see H. Goussen, Martyrius-Sahdonas Leben und Werke, Leipzig, 1897), and thereby caused much scandal in the East. The chief events in his life are narrated by Ishō'děnah Another Nestorian who, a few years later, wrote ecclesiastical biographies and other theological works was Sabhrisho' Rustam, who lived at Mount Izla and other monasteries In the beginning of the 8th century David of Beth Rabban, also a Nestorian monk, wrote, besides a geographical work, "a monastic history, called *The Little Paradsse*, which is frequently cited by Thomas of Marga." A more important work is The Book of Chastity, by Ishō'dēnah, who according to 'Abh-dīshō' was bishop of Kasrā—but read Baṣrā—about the end of the 8th century. This work is a collection of lives of holy men who founded monasteries in the East, and is a valuable historical source. The work itself, or an abridgment of it, was discovered and published for the first time by J B Chabot (Rome, 1896) As the last under this head we may mention a late anonymous biography, that of the catholicus Yabhalāhā III. (1281-1317), which throws much light on the relations of the early Mongol kings with the heads of the church in their dominions Among other interesting features it contains information about the Nestorian Church of China in the 13th century.

4. Philosophy and Science - Special mention may be made of 'Ananisho' of Hedhaiyabh (middle of 7th century) well known as the author of a new recension of the Paradise of Palladius, and also the author of a volume on philosophical divisions and definitions; Romanus the physician (d. 896), who wrote a medical compilation, a commentary on the Book of Hierotheus, a collection of Pythagorean maxims and other works; Moses bar Kepha, the voluminous writer above referred to; the famous physician Honain ibn Ishāk (d. 873), who wrote chiefly in Arabic, but deserves mention here by his services to Syriac grammar and lexicography, and still more by his translations of Greek philosoph-

ical and scientific works into Syriac and from Syriac into Journal de la société finno-ouguenne, especially for 1903 Arabic, becoming in a sense the founder of a school of translators. and Jacob bar Shakko, whose work called the Diglogues treats of grammas, rhetoric, poetry, logic, philosophy and science

5 Grammar and Lexicography -Several of the authors in this department have already been mentioned. The more important. besides Jacob of Edessa and Barhebiaeus, are 'Anānīshō' of Hědhaiyabh, Honain ibn Ishāk, his pupil Bar 'Ali, Bar Sarōshwai (eaily 10th century), Bar Bahlūl (middle of 10th century), Elias of Tirhan (d 1049), Elias bar Shīnāyā (above), John bar Zō'bī (beginning of 13th century) and Jacob bar Shakko

Apart from the numerous editions of Syriac texts by Paul Bedjan, some of which have been cited above, nearly all the texts, recently edited are included in one or other of three comprehensive series now edited are included in one or other of three complemensive series now running—viz. (1) Patrologia syrace (Paus, 1894), (2) Corpus serie-torium christianorum orientalium—scriptores syrace (Paris, 1907). Patrologia orientaliu (Paris, 1907). See W Wright, History of Syrace torian Entimental Discourse Special States (Paris, 1907) See W Wright, History of Syr Literature (1805), R Duval, La Littérature syrique (3rd ed. 1907) A Baumstark, Geschichte der syrischen Literatur (1922). (N M'L)

SYRINGA, the common name applied to several cultivated ornamental shrubs of the genus Philadelphus, of the family Saxifragaceae (q v ). The name arose from the fact that the original generic name of these shrubs was Syiniga, which, however, propgerly belongs to the lilac (qv) The garden syringas, better known as mock-orange, are all species of *Philadelphius*. They possess conspicuous, usually strongly scented flowers and in a wild state are natives of the north temperate zone. There are about 40 species The common garden syringa (P. coronarius) is Eurasian, but is found in many horticultural varieties Noteworthy North American species are the scentless syringa (P. inodorus), the large-leaved syringa (P. grandiflorus) of the south-eastern U.S., and the western syringa (P. lewis), state flower of Idaho, found from Montana to British Columbia and Oregon.

SYRINGE, a hydraulic instrument, based on the principle of the pump, for the drawing up and ejecting of liquids. The ordinary form is that of a glass or metal tube ending in a pointed nozzle and fitted with an airtight piston-rod and handle. The nozzle is inserted in the liquid, which enters the cylinder by atmospheric pressure when the piston-rod is drawn up. On pushing back the piston the fluid is ejected in a jet through the nozzle. In sizes varying from the needle-pointed hypodermic syringe to the abdominal syringe, it is a common surgical implement used for the injection of fluids into the body or for the washing of wounds and cavities. A larger syringe of metal with a flat perforated nozzle is used as a garden implement for watering plants.

SYRINX, the Greek name for the pan-pipes. The pipes composing it were stopped at one end, so that the sound waves had to travel twice the length of the pipe, giving out a note nearly an octave lower than that produced by an open pipe of equal length. It consisted of a varying number of reeds, having their open ends in a horizontal line and their stopped ends, formed by the knots in the reed, gradually decreasing in length from left to right. Each pipe gave out one note, but by overblowing, i.e. increased pressure of breath and tension of lips, harmonics could be obtained The syrinx or pan-pipes owes its double name to ancient Greek tradition, ascribing its invention to Pan in connection with a wellknown legend of the Arcadian water-nymph Syrinx.

Syrinx is also a term used in medicine and anatomy, meaning (1) the Eustachian tube; (2) a fistula; and (3) a kind of secondary larvnx found in birds.

SYRYENIANS (also Sirianian, Syrjenian, Zyrenian, Zirianian, Zyrian and Zirian), a tribe of the Permian division of the eastern Finns. Their headquarters are at Ust-Ishma, at the junction of the Ishma and Pechora. Formerly they spread farther to the west. They are of moderate stature, blond and greyeyed, energetic and inclined to trade. They were converted to Christianity about 1350 and their language was reduced to writing. They call themselves Komi and are not sharply distinguished from the tribes known as Permian, the languages being mutually intelligible. The archaeological remains in the governments of Perm and Vyatka called Chudish by Russians are probably Syryenian. A grammar of the language was published by Castrén. and linguistic and other notices of the tribe are contained in the

SYZRAN, a town of the USSR, in the Kuibyshev region, in lat 53° 10' N, long 48° 33' E, near the right bank of the Volga Pop (1939) 77,679 It is on the Moscow-Kazan railway and has a branch going to Ryazan There are flour mills, leather factories and saw-mills Bricks and nails are manufactured and there is a biewery and a distillery. The town was originally a fort to protect settlers from Tatar and Circassian raids, but has developed, especially after the railway reached it, into a manufacturing centre, with river and rail trade in exported grain and imported timber and manufactured goods.

SYZYGY (si'zi-ji), in astronomy, either of the points at which the moon is most nearly in a line with the earth and sun The moon passes her syzygies, or is in a syzygy, at new and full

SZÉCHENYI, ISTVAN, COUNT (1791-1860), Hunganan statesman, the son of Ferencz Széchenyi and the countess Juhana Festetics, was boin at Vienna on Sept 21, 1791 Entering the army in his 17th year, he fought with distinction at the battle of Raab (June 14, 1809), and on July 16 brought about the submessage across the Danube to General J G Chasteler at the risk of his life Equally memorable was his famous ride, through the enemy's lines on the night of Oct 16/17, 1813, to convey to Blucher and Bernadotte orders for the impending battle of Leipzig In May 1815 he was transferred to Italy, and at the battle of Tolentino scattered Murat's bodyguard by a dashing cavalry charge. From Sept 1815 to 1821 he travelled widely, studying the institutions of the countries through which he passed A second-scientific-tour with his friend, Baron Miklos Wesselényi, In 1825, when he taught him much about trade and industry went to France to attend the coronation of Charles X, the canal du Midi attracted his attention and suggested to him the idea of regulating the rivers Danube and Theiss At the diet of 1825, when the motion for founding a Hungarian academy was made by Pál Nagy, who bitterly reproached the Magyar nobles for so long neglecting their mother-tongue. Széchenvi set the example by offering to contribute a whole year's income (60,000 florins) towards it The formation (June 1833) of the Danube Navigation Company, which eventually opened up the Danube from Buda to the Black Sea was the fruit of Széchenyi's imitative and personal study. Széchenyi was also the first to start steamboats on the Theiss, the Danube and the lake of Balaton

All this time Széchenyi had been following, with some anxiety the political course of Kossuth, whose extravagances he feared would plunge Hungary back into the chaos out of which he had helped to raise her The majority, indeed, sided with Kossuth, but neither this fact nor the gradual loss of his popularity restrained Széchenyi, both in the diet and at county meetings, from fulminating conscientiously against the extreme demands of Kossuth His views at this period are expounded in the pamphlet Politikai programm töredékek ("Fragments of a Political Programme"). He held the portfolio of ways and communications in the first responsible Magyar administration (March 23, 1848) under Bátthyány, but his increasing apprehension of a revolution, with its inevitable corollaries of civil war and a rupture with the dynasty, finally affected his mind, and on Sept 5 he was removed to an asylum Here he remained for many years, but recovered sufficiently to correspond with his friends and even to meditate writing fresh books; but the sudden death of his old friend Baron Samuel Jósika and the once more darkening political horizon led him, in a moment of despair, to take his own life (April 8, 1860). He richly deserved the epithet "the greatest of the Magyars" bestowed upon him by his political antagonist Kossuth.

See Antál Zichy, Biographical Sketch of Count Stephen Széchenyi (Hung.; 2 vols., 1896-97).

SZECHWAN, the largest province of China Proper, area formerly nearly 220,000 sq.mi., but after the institution of Sikang province on the western border reduced to 143,147 sq.mi. with a population of 46,403,006 (1939), very unevenly distributed. The heart of Szechwan is the plateau known as the Red basin, a region that continued as a gulf of the sea for some time, in later Palaeozoic period, after the north Mongolian region became land, and changed to a fresh-water lake during the Mesozoic, with deposition of the post-Rhaetic ied sandstones, later wrinkled and converted into land. The province is bordered on the west by the immense eastern Tibetan fault-zone, which gives a rapid rise from the Mm-ho (less than 1,500 ft above sea level) by broad terraces to great north-south mountain lines, the greater part of which is well over the 12,000 ft level Most of these western highlands were included in the province of Sikang. The density of population varies from 10 4 per sq mi. near Sikang to 2,392 in the 11ch rice regions near Chêngtu. There is much evidence of a long continuance of earth movement along this great fault line, and the river courses of the highland have adapted themselves to the changes involved, running southward between the ranges turning eastwards into southwest Szechwan and north Yunnan, eventually uniting in the portheastward course of the Yangtze Kiang. The mountain courses of the rivers are torrential; in the Red basin the rivers are generally navigable and afford the best means of communication On the northeast, the Red basin grades up to the Tapaling or Tapashan, beyond which, to the north, is the great west-east range of the Tsinlingshan

The Tapaling (Tapashan) end in a great fault against the Hunch basin, eastwards; and the latter is much lower than the Red basin The Yangtze Kiang makes its way from the one down to the other through the famous gorges of the northeast frontier of Szechwan to Ichangin Hupeh Von Richtofen thought that the sinking of the Red basin, as compared with the Tibetan highland, has continued until recent times, whereas that of the Hupeh basin, as compared with the Tapaling and the Red basin, ended earlier The result would be a tilt, lessening the slopes in the west of Szechwan, within the basin, but increasing them in the northeast: this furnishes at least a supplementary interpretation of the Yangtze Kiang (qv) gorges, which are so notable a feature of China's physical geography, and have played such a part in isolating Szechwan from Hupeh The Yangtze and its feeders within the basin in the west are less closely encased, so there are considerable alluvial plains, as around Chêngtu, the capital, where irrigation is highly developed. Beyond the Yangtæ Kiang, to the southeast, stands the limestone horst of the province of Kweichow, with its border towards the Red basin, often at an altitude of 4,500 ft, drained by streams which reach the deep channel of the Yangtze by narrow valleys The name Szechwan means four rivers, and the Yangtze Kiang is made up of the Min, To, Fu and Kialing, flowing north to south into the Red basin, where they meet the Kin-Sha or Upper Yangtze, which has also been formed of north to south streams and has then rounded the Liangshan and flowed north along its eastern side, really entering the basin at Sur-fu (Su-chow-fu) where the Min, from Chêngtu, joins it.

The climate of the Red basin may be studied from data for Chungkung, at the junction of the Kialing with the Yangue. The monthly average temperatures vary from 49° F in December and January to 80°-85° F. in Juyand August. The average minimum per month is not more than 3-x5° below the average, so, in the Red basin, snow and frost are not often lasting. The minfall is very low under the influence of the Central Asiatic anti-cyclene in December, January and February, but March has a minfall of 2 8 in., April a rainfall of 4 in, and so the amount increases up to a maximum of about 11 in, in each of the months of June and August. The early onset of rain before the summer monsoon has begun is probably epithaed by the beating of the monsoon from the consequent development of cyclonic, which thus midden the chinace of a region in the heart of a continue.

The winter is not too cold for growth of cereals (wheat, bairley, costs, millet) and the summer monsoon gives opportunities or almost tropical crops at low levels, and rice (especially on irrigated alluvium near Chéngiut), sugar, henpu, sesamum, pulses, mulbstry, oranges, maize and tobacco are thus grown. Wax trees are important around Kaitang-Ju. (See Sury-Ju. (See).

Until the last millennium B.c. Szechwan was entirely non-Chinese, and was under Indian culture influence, the results of

which pensist in the cultivation of sugal cane, the use of great water wheels for ringation, and the presence of the zebu and water buffalo. The Tsin dynasty incorporated Sectional within the emure, but its solation has often made it a basis for separatist movements. The population within the basin has become definitely Chinese, though almost forming a separate nationality within the Chinese group. The western highlands have a sparse Thetan population, while in the southwest are non-Chinese groups, Lolo, Sifan, Miautse, some probably of very long standing locally, others or relative late, it still pre-Chinese, entry

Millions of refugees from coastal provinces moved to Sechwan after the start of the Chinese-Jpanese war in 1937. They contibilated to a rapid modernization. With Chungking (population ε 1,000,000 in 1944) as wartime capital of China, Sechwan became China's political and economic centre. However, in spite of cities like Chingking, Chéngtin (ε 4,00,000), Wanhsien, Su-fu, Luchow, Shunking Fowchow and Huchow most of the population remained virus!

Coal, mainly bituminous and associated with iron, is mined by adits along the Yangitze valley, and supplies the river steamers plying the 348 mi. between Chungking and Ichang (Hipeh province). Oher coal and iron producing centres are the Min and Kalang valleys Copper is mined west of the Min river, where Ning-Yuan and Ya-Chow piefectures are the main producing districts Sall extraction by brine pumping is also a widely prevalent activity Gold, silver, lead and antimony are also mined, mainly west of the Min river.

The industrial development which started during the Chinese-Japanese war had led by 1943 to an investment of more than \$500,000,000 in industrial and mining enterprises. In many cases the location of new industries was kept secret. In the spring of 1940 the first iron and steel plant was completed. Along the To river alcohol distillenes were built to use the sugar cane, and blast furnaces and machine mudstries were established near the mines Some 300 new factories for textiles, drugs, dyeng, electrical equipment, machine repair shops, etc. were constructed Power was furnished by new plants with large possibilities for expansion.

Communications in Szechwan were handicapped by topography, and the easiest and most utilized roads were those of the tiver valleys. Chungking, which was until 1943 a treaty port (opened in 1890.), was a trading centre for silk, tea, rice and other goods of the Red basin and the area west of the Min river, which latter trade came through Chéngiu. The Great North road from Peiping via Sian to Chéngiu and the Little North road from Peiping via Sian to Chéngiu and the Little North road from Peiping via Sian to Chéngiu, and in 1943 the first motor road was completed from Chungking to Chéngiu, and in 1944, 3;00 miles of highway were open, linking Szechwan with all neighbouring provinces.

See F. von Richtofen, China, vol iii (Berlin, 1912); L. Richard, Geogr. de l'Empire de Chine (Shanghan, 1905).

SZEGED, capital of the county of Csongrád in Hungary and the second town in the country. It he just below the confluence of the Maros and the Tisa Pop (1939) 141,254 It is modern and well built, the old town having been almost destroyed by flooding of the Tisa in 1879. In early times it was important because it lay on the salt and timber route from Transpivana to the Adriatic. To-day it is essentially a market centre lying at the meeting point of four contrasted regions, viz:—the drift-sand Danube-Tisa sone, the loess-covered Backa, the garden region of the Koros-Maros interstream area and the cereal belt of the western Banat. It is the seat of a university.

SZÉKESFEHÉRVÁR, a town in Hungary, capital of the county of Feife; hes in a marshy valley connecting the loses-covered plains of the Danube with the Upper Hungarian Plant (Kis-Alfold). It trades in wine, fruit and horses and has tanneiss and shoe factories The town was the corneation and burnal place of the Hungarian kings from the roth to the roth century. The coronation church was built by St. Stephen, the first king of Hungary and in it were buried 1 s kings. At the end of the Turksh occupation, 7434–7686, the church, its tombs and archives

bishopric. Pop. (1930), 40,714

SZEKLERS (Magyar Székely), a people inhabiting the upper

valleys of the Mutes and the Olt in eastern Transylvania, They number to-day about 450,000, but are no longer distinguishable from the Magyars, with whom they are closely akin Their origin has been much debated According to their own tradition. reneated in Procopius (de bello Gothico, iv 18), they were descended from Attila's Huns, while others have seen in them Black Ugrians It is, however, now generally accepted that they are true Magyars, transplanted here probably by St Ladislaus to guard the frontier, their name meaning simply "frontier guards" For then history and bibliography, see Transylvania

SZÉLL, KOLOMAN (1845-1915), Hungarian statesman, was born on June 8, 1845. He studied at Budanest and Vienna and in 1867 became deputy for the district of St Gotthard Széll was one of Déak's intimates, whose ward, the daughter of the Hungarian poet Vorosmarty, he had married In 1875 he was finance minister in the Tisza cabinet, and began the task of restoring the shattered ciedit of Hungary In 1878 he concluded with Austria the first economic Ausglesch At that time the single Austrian bank was changed, in conformity with this arrangement into the dualistic Austro-Hungarian bank, and Széll consulidated the Hungarian sentes, and nearly succeeded in balancing the State finances. As he feared that this balance would again be upset by the occupation of Bosnia and Heizegovina, he resigned from the cabinet, incurring thereby the displeasure of the Crown At the beginning of the eighties Széll founded the Hungarian Mortgage Credit Bank, of which he was governor until the end of his life. He opened entirely new sources of credit for Hungarian agriculture. He declined repeated offers of the portfolio of finance. Széll became prime minister after the fall of Bánffy in February 1800. On the basis of the so-called Széll formula the new Ausgleich with Austria until the year 1907 was concluded after long negotiations. He was forced to resign on June 16, 1903 Széll was one of the Liberal seceders in 1904 Under the Coalition cabinet of Wekerle, he was chosen president of the Constitutional Party He tried continually, but in vain, to bridge the opposition between Tisza and Andrassy He died on Aug 16, 1915.

SZILAGYI, DESIDER (1840-1901), Hungarian statesman and jurist, was born at Nagy-Várad (Grosswardein) on April 7, 1840 He studied law at Budapest, Vienna, and in Germany As head of a section in the Hungarian ministry of justice he went to England to study the conditions of the administration of justice there, and took a conspicuous part in the codification work of the ministry of justice Deputy in 1871, professor of public

were destroyed. The town is a very old see of a Roman Catholic one of the leaders of the opposition, which, however, he left in 1886 In 1887 he was returned to parhament by Pozsony (Pressburg) as an independent member. He became minister of justice in 1880 From this time to 1894 he directed his efforts principally towards a radical reform of the whole administration of the courts His name is connected with the changes in ecclesiastical legislation made in 1804, notably with article XXXI of the law of civil mailiage, and articles XXXII and XXXIII on the religion of the children and on State registration Szilagyi was president of the house of deputies from 1895 to 1899 He died on July 3, 1901. See Szilagyi's Speeches (4 vols, in Hungarian, ed. Fayer).

SZINYEI-MERSE, PAUL DE (1845-1920), Hungarian painter, was born at Szinyeujfalu and studied art at the Munich Academy His pictures were characterised by gay and graceful colouring and a lyric view of nature In 1873 he finished the masterpiece of his life "May Festival" He gave successful exhibitions at Munich (1909), Berlin (1910) and Rome (1911) In 1905 he was appointed director of the Hungarian National Academy of Arts He died in 1020

See Béla Lázár, Paul von Szmyei-Merse (1911), Alexius Petrovics, Szmyei Pál (Aits Lexicon, 1926).

SZOMBATHELY, a town in western Hungary, that has lost, by the rearrangement of the frontier between Austria and Hungary in 1920, a large portion of the area it served as a market It occupies the site of the Roman capital of Pannonia, Sabaria Savaria and many remains of the Roman period have been excavated, some of these are preserved in the museum at Budapest, the remainder in the municipal museum. The town lies in the centre of a rich wine-producing downland and is an important agricultural centre with steam flour and saw mills and factories producing agricultural machinery and textiles in addition to foundies and a state railway workshop. It has been the see of a Roman Catholic bishop since 1777 and possesses a beautiful cathedral and several other ecclesiastical buildings Pop (1930) 35,758 About 5 m S hes the village of Jak which has an 11th century Dominican convent whose church is reputed to be one of the finest examples of Romanesque architecture in the country.

SZYMANOWSKI, KAROL (1883-1937), Polish musician, was born at Timoshovka, Russia, of Polish parents, and studied under Sigismund Noskowski at Warsaw. He became one of the leaders in the revival of Polish national music, but his early works owe much to the German tradition. He composed songs. orchestral works and chamber music, but a large proportion of his compositions were for the pianoforte. He also composed an opera "Hagith" written in 1912 and produced at Warsaw in 1922, which has won many admirers. In the works written law and politics at Budapest university in 1874, he was in 1877 after 1914 Szymanowski adopted new and ultra-modern methods

THIS letter corresponds to Semitic tau, the form of which on the Moabite stone was X. In all Greek alphabets, as well as in the Lydian and the Latin, the form was T. Etruscan had a form Y, from which probably were derived the Umbrian form X and the Faliscan † and Y.

Latin cursive gives a form that leans to the right Carolingian T is based upon uncial T. Generally speaking, in mediaeval miss the letter did not rise above the line and it is sometimes difficult to distinguish from a minuscule c In modern

THE DEVELOPMENT OF THE LETTER "Y" FROM THE PHOENICIAN THROUGH THE CLASSICAL, DOWN TO THE PRESENT FORM

handwriting and printing it is the custom to extend the vertical stroke above the horizontal.

The sound represented by the letter throughout its history has been the unvoiced dental stop. In English this has become more alveolar than dental, that is to say, it is pronounced by the tongue pressing upon the gems rather than the teeth. Modern unvoiced stops are probably also to be distunguished from the corresponding sounds in ancient Greek by the addition of a slight pull of breath following the sound, thus bringing the sound near to being an aspirate. Greek would perhaps have transliterated the English unvoiced stops by the letters  $\theta_t$ ,  $\Phi$  and  $\chi$  rather than  $\tau_t$ ,  $\pi$  and  $\kappa$ . This tendency towards aspiration is carried to much fatther lengths in the Irish dislates of English. (B. F. C. A.)

TAAFFE, EDUARD FRANZ JOSEPH VON, COUNT [11th Viscount Taaffe and baron of Ballymote, in the peerage of Ireland] (1833-1895), Austrian statesman, was born at Vienna, Feb. 24, 1833, second son of Count Ludwig Patrick Taaffe (1791-

1855), who was minister of justice in 1848 and president of the court of appeal As a child Tansfe was one of the chosen companions of the young archduke, afterwards emperor, Francis loopen In 1852 he entered the public service, in 1867 he was Statthalter of Upper Austria, and minister of the interior in Besut's administration. In June he became vice-president of the ministry, and at the end of the year he entered the first ministry of the newly organized Austrian portion of the monarchy For the next three years he took a very important part in the consultance of the control of the con

On the breakdown of the Liberal government in 1879 he was again called to office, becoming minister-president in July, and held office until July 1893, when he was defeated on a proposal for the extension of the franchise and resigned, dying at Ellerschau, Bohemia, on Nov 29, 1895 For the history of Tanfe's administration, see AUSTRIA, EXEPTER OF ESENTIALI'VA in Opportunist, he maintained office for many years by an unprecedented employment of the principle devide et impera Usually resting on the Slavs, and clericals, he was accused by the German Liberals or thing Austria; but he unted a deep devotion to the emperor with a singular grif for managing men and at least prolonged the life of an impossible system.

By the death of his elder brother Charles (1823–1873), a colonel in the Austrian army, Taaffe succeeded to the Austrian and Irish titles. He married in 1862 Countess Irma Tsaky, by whom he

left four daughters and one son, Henry

See Wurzbach, Biographisches Lexicon Oesterreichs Memoirs of the Family of Taaffe (Vienna, 1856), privately printed, and Taaffe's Political Correspondence issued after his death.

TAAL, a municipality (with administrative centre and 48 barrios or districts), of the province of Batangas, Luzon, Philippine Islands, on the Pansipit river, opposite Lemery, with which it is connected by a bridge. It is about 50 ml. south of Manila and near to Lake Taal Pop. [1948) 56,044

and near to Lake Taal. Pop. (1948) 25,044
On an island in the lake of Taal is a volcano which has erupted
many times, notably in Jan. 1911. The consequently fertile surrounding lands produce palay (the), maize (corn), sugar and
other crops. The manufacture of baskets, mats, hainess, shoes,
shippers, embroddery and bolos is extensive, while horse and catthe breeding and fishing are also carried on. Tagalog is the vernacular

Of the inhabitants aged 6 to 19 inclusive, 37.5% attended school in 1939, while 54.9% of the population 10 years old and over was literate. (C. S. L.)

TABACO, a municipality and port of entry of the province of Albay, Luzon, Philippine Islands, on Tabaco bay, a protected herbour about so mi N. of Albay (Legsaph), the provincial capital, with which it is connected by the railway. Population (1948) 32 2000.

The chief agricultural produce is abacá (Manila hemp). Cloth, baskets and mats are woven by the women. Tabaco is a port of entry in Albay province and has considerable trade. Bikol is the vernacular. Of the inhabitants aged 6 to 19, 30 1% attended school in 1939, while \$5.7% of the population 10 years old and over was literate. (C. S. L.)

TABARÎ [Abû Jafar Mahommed ibn Jarir ut-Tabarī] (838-923), Arabian historian and theologian, was born at Amol Tabarastan and studied at Rei (Rai), Baghdad, and in Syrna and Egypt. Cast upon his own resources after his father's death, he was appointed tutor to the son of the vizier 'Ubaidailân ibn Yahyā. He journeyed to Egypt, but soon returned to Baghdad, where he remained as a teached of tradition and law until his schools, and ended by establishing a school of his own, in which he incurred the wrath of the Hanbalites

he incurred the whath of the Ambountes.

Two of his works are very extensive The one is the Tärikh urRund usul-Middle (Thistory of the Prophets and Kings), generally

TABASCO, a state of southeast Mexico. Area 9.780 sq mi. Pop (1950) 351,106 The surface is generally low and flat. laigely covered with lagoons, watercourses and swamps. In the south and southeast there is an area belonging to the rough higher formation of Chiapas Dense forests cover the whole region, and there are valuable fine woods and dyewoods There are several large largons on the coast, two of which are called Santa Ana and Tupico bays. Two large rivers, the Grijalva and Usumacinta. traverse its territory. The Gijialva, also called Tabasco, the upper course of which is known as the Chiapas, is navigable for 93 miles. The Usumacinta forms the boundary between Guatemala and Chiadas until the frontier of Tabasco is reached, where its northwest course turns to the north and then northwest to a junction with Grualya-the two rivers having a common outlet. The Usumacinta. including its head streams, is about 500 mi. long, excluding them about 330 mi; for about 270 mi it is navigable and for about 180 mi it is navigable by large steamers. There are few good roads, and those rivers and the navigable channels of the Cuxcuchopa, Soledad, Cocohital, Tulas and Tortuguero are the principal practical thoroughfares in the state. The capital is Villahermosa (pop 1950, 33,588), on the Grijalva river The next most important town is Alvaro Obregón (Frontera) (pop. 1950, 8,449), a port 3 mi within the mouth of the Grialva.

TABERNACLE, the name given in the English Bible to the portable sanctuary, erected by Moses in the wilderness as the place of worship of the Hebrew tribes (Exod xxv sqq) It stood within a rectangular court, measuring 100 cubits by 50, say 150 feet by 75, which formed the centre of the camp in the wilderness Of the two equal squares into which the court may be divided, the more easterly was that in which the worshippers assembled. In the centre of this square stood the altar of burntoffering, a hollow chest of acacia wood overlaid with bronze In the western square stood the tabernacle itself. The essential part of the structure was that termed in the original the mishkan, ie, dwelling. It was formed of ten curtains, in two sets of five, of the finest linen with inwoven coloured figures of cherubim spread over a series of open frames of acacia wood overlaid with gold. each 10 cubits in height by 12 in breadth These frames, 48 in all, were so arranged as to form the southern, western and northern sides of a rectangular structure, 30 cubits in length and 10 in breadth and height, whose eastern end, forming the entrance, was closed by a special portière suspended from five pillars. The dwelling was divided into two parts by a second hanging, the "veil," 10 cubits from the western end. These two parts were termed respectively the holy place, and the most holy place or "holy of holies" Within the latter stood the ark of God, in which were deposited the two stone tables of the decalogue or "testimony" On the ark lay a solid slab of the finest gold, the propitiatory or mercy-seat, from which rose the figures of two golden cherubim, forming the innermost shrine of the wilderness sanctuary, the earthly throne of the God of heaven.

The furniture of the holy place consisted of the table of shewbread, the altar of incense—both, like the ark, of acacia wood overlaid with gold—and the golden "candlestick," or sevenbranched lamp-stand As a protection the delicate and artistic curtains of the dwelling were covered by two similar sets of goats'-hair curtains; these, in their turn, were protected by a double covering, the one of rams' skins dyed red, the other made of the skins of a Red Sea mammal, probably the dugong (Exod, xxvi. 14).

The aim of the "priestly" writers, to whom we owe this concep-

death. A Shāū'ite in law, he claimed the right to cuticize all tron of the tabernacle, was to provide a sanctuary and a ritual worthy of the higher conceptions of the Deity, which had grown up as the fruit of the discipline of the exile The thought of the almost unapproachable holiness of the Deity underlies not only the gradation of the parts of the tabernacle-court, holy place and holy of holies, each marked by an ascending degree of sanctity-but also the careful gradation of the materials employed in its construction. The whole is to be regarded as the expression of a religious ideal Building on the traditions of the simple Mosaic "tent of meeting," the priestly idealists followed the example of Ezekiel, and elaborated a sanctuary to serve as the model for the worship of the theocratic community of the future "Let them make me a sanctuary, that I may dwell among them" (Exod.

BIBLIOGRAPHY -See "Tabernacle" by Kennedy in Hastings' DB, BIBLIOGRAPHY—See "Tabernacte" by Kennedy in Hassings DB, with which may be compared the corresponding articles in the Ency. Bib by Benzinger, and in the Jewish Encycl. by Konig, also the commentaries on Exodus

In architecture, the term loosely expresses a niche for a statue, with a canopy (q v) over it, especially in the mediaeval styles When niches are arranged in vertical rows, with the canopy over one statue acting as the pedestal for the one above, the whole composition is often termed tabernacle work. The same term is also used for any richly decorated tabernacle or canopy-like forms, whether true tabernacles or not

TABERNACLES, FEAST OF. A famous Jewish festival which commences on 15 Tishri (five days after the Day of Atonement), and lasts seven days. Of these the first two (Tishri 15 and 16) are full festival days, the last five (Tishri 17-21) half-holidays. The "eighth day" Festival (Shemmi Aisereth), which like other festival days is doubled (Tishri 22 and 23, the second day in this case is called Simchath Torah), closes the celebration The whole nine days bear one descriptive designation, "season of our rejoicing" The festival is one of venerable antiquity. Its observance is commanded in the Mosaic Law (Lev. xxiii. 34), and its purpose is there explained as to commemorate the way in which the Israelites dwelt in booths (sukkoth) in the wilderness

Every Jew who owns a court or garden is required to erect a booth or something more or less equivalent, and to dwell in itor at least have meals in it-while the feast lasts. In order that the character of the original booth may as far as possible be retained, the modern counterpart is very lightly constructed. It "must not be covered with fixed boards and beams or with canvas. but with detached branches of trees, plants, flowers and leaves, in such a manner that the covering is not quite impenetrable to wind and rain or starlight" (Friedlander). The booths are required to be made during the days that intervene between the Day of Atonement and the Feast itself, they are adorned with garlands, flowers, and the like; often the text "Ye shall dwell in booths seven days" (Lev xxii 42), is displayed in a prominent place within the booth. On the eve of the Feast the members of the household attend Synagogue, and on returning assemble in their booth and partake of a meal. On this evening (the first of the Feast) the meal (as in the case of the weekly Sabbath on Friday evening) is preceded by Oiddush or the solemn sanctification, first over a cup of wine which is then handed round, all drinking of it, and then over two wheaten loaves, specially baked and placed on the table covered with a cloth; these the head of the family then proceeds to cut into pieces, which are distributed to and eaten by all present. A special blessing-which is repeated before every meal during the seven days-follows ("Blessed art Thou, O Loid . . . Who hast commanded us to dwell in a booth"). At the conclusion of the meal, and on leaving the booth the following prayer is said by the head of the household:

May it please Thee, O Lord my God, and God of my fathers, that in like manner as I have this time obeyed Thy command and have been sitting in the booth, so in the coming year I may be counted worthy to sit in the booth of Leviathan.

It should be observed that the Leviathan plays a prominent part in haggadic legend, especially in connection with the Messianic time. The monster is to be killed and the flesh is to furnish food for the righteous (at the Messianic banquet). From the hide tents will be made by God for the prous of the first rank

This last feature will explain the allusion in the text of the prayer On the occasion of the ceremony, the Synagogue is decorated with plants and fruits and certain ceremonies are caused out, viz. palm-branch processions culminating on the seventh day at the Musef or additional service. For further details see Oestelley and G. H. Box, Religion and Worship of the Synagogue (2nd ed. TOTT) (GHB)

TABLE (Lat tabida), in furniture, a flat, oblong slab supported upon legs or pillars. Of the many kinds of tables according to their uses, the following are outstanding as pieces of furniture and in artistic possibilities. (1) artist's table, (2) billiard table (qv), (3) breakfast table, (4) card table. (5) china table. (6)

console table, (7) dining table, (8) dressing table, (9) library table, (10) side table, (11) sofa table, (12) tea table, (13) wine table, (14) work table, (15) writing table The table was known. in a small and rudimentary form to the Egyptians, who used wood for its construction, the Assyrians certainly employed metal and possibly other materials in its manufacture Grecian tables were also often of metal, with three or four legs and of consid- of ART OF THE METROPOLITAN MUSEUM

erable variety of form, they were ENGLISH CHIPPENDALE small and low. By Roman times TABLE WITH TILT TOP, 1760-1770 the table had apparently become somewhat more common The favourite form was the tripod, but one and four legs were also used (See Pirte I, Bronze and Brass Ornamental Work ) Already the shape varied considerably, and in addition to wood, there were tables of marble, 19019, bronze and the pregious metals. The more costly examples were carved, inlaid or otherwise ornamented. cedar and the finely marked or grained woods generally were much sought after As in Greece the tables were low, they were intended for reclining, rather than sitting; their legs were those of wild beasts, or were formed of sphinxes, termini and other figures. Some of those which remain are of extreme grace and most delicate workmanship; to them the Empire style is enormously indebted In antiquity tables of any kind can only have been the appanage of the rich In the early middle ages, although there was variety of form-the circular, semi-circular, oval and oblong were all in use-tables appear, save in rare instances, to have been portable and supported upon trestles fixed or folding, which were cleared out of the way at the end of a meal. The custom of serving dinner at several small tables, which is often supposed to be a very modern refinement, was certainly followed in the French châteaux, and probably also in the English castles, as early as the 13th century. For persons of high degree, fixed tables were reserved. Even at a period when domestic furniture was of a very primitive character and few modern conveniences had been evolved, costly tables were by no means unknown-some dim traditions of Rome's refinements must necessarily have filtered through the centuries. Thus Charlemagne possessed three tables of silver and one of gold-no doubt they were of wood covered with plates of the precious metals Before the 16th century the number of tables properly so called was small; hence very few of earlier date than the middle of that century have come down to us In the chapter-house of Salisbury cathedral is a restored 13th century example which stands practically alone. In point of age it is most nearly approached by the famous pair of trestle tables in the great hall at Penshurst.

When the table became a fixed and permanent piece of furniture the word "board," which had long connoted it, fell into disuse save in an allusive sense, and its place was taken by such phrases as "joyned table" and "framed table"-that is, jointed or framed together by a joiner; sometimes people spoke of a "standing" or "dormant" table. They were most frequently oblong, some 2 ft. or a ft. 6 in. wide, and the guests sat with their backs to the wall, the other side of the table being left free for service. Sometimes

they were used as side-tables, or furnished with a cupboard beneath the board, they were supported on quadrangular legs or massive ends and feet, full of Gothic feeling, and were several inches higher than the dining-table of the 20th century Heavy stretchers or foot-rails were fixed close to the floor-for the avoidance, no doubt, of draughts. Oak was the usual material, but elm, cherry and other woods were sometimes used Soon the legs became bulbous, and were godrooned or otherwise ornamented, and the frame began to be carved The introduction. before the 16th century closed, of the "drawing table" marked the rapidity with which this piece of funiture was developed. This was the forerunner of the "extending dining table". Of the three leaves of which these tables were composed two were below the other; they diew out and were supported by brackets, while the slab proper dropped to the same level. Somewhat later legs became excessively bulbous; this ugly form gave place soon after the middle of the 17th century to baluster-shaped legs. Hitherto tables had, generally speaking, been large and massive-little in the nature of what is now called the "occasional table" seems to have been provided until some years after the Restoration About that time small tables of varying sizes and shapes, but still of substantial weight, began to be made, many of them were flaptables, which took up little room when they were not in use These, however, had been known at an earlier date. Charles II had not long been on the throne when the idea of the flap-table was amplified in a peculiarly graceful fashion. Two flaps were provided instead of one, the result being the rather large oval table of the "gate-leg" variety that has remained in use ever since. n which the open "gate" supports the flap (See Interior Decoration; English Furniture, Plate IX) Towards the end of the reign tables began to have the graceful twisted legs joined to the flat serpentine stretchers, which produced, almost for the first time in English furniture, a sense of lightness and garety. The walnut tables of the end of the Stuart period were often inlaid with marquetry of great excellence The number and variety of the tables in well-to-do households were now increasing rapidly, and the console-table was imported from the Continent contemporaneously with the common use of the mahogany side-table

As mahogany came into general use, about the beginning of the second quarter of the 18th century, an enormous number of cardtables were made with plain or cabriole legs and spade or claw and ball feet, often with hons' heads carved upon the knees, the top folded up to half its size when open The Chuppendale school introduced small tables with carved openwork "galleries" round the edges (to protect china and other small objects), and clustered legs: Gothic forms and Chinese frets were for a time fashionable Later in this century, so prohic in new forms of furniture, tables were frequently made of rosewood and satinwood, side-tables, often highly elaborate, adorned with swags and festoons and other classical motives, supported by termini or richly carved legs, were gilded and topped with marble slabs or inlaid wood. (See INTERIOR DECORATION; English Furniture, Plate XI) The Pembroke table, of oblong form, with two semi-circular or oblong leaves, with edgings of marquetry, was a characteristic feature of late 18th century English furniture, and still retains its popularity. During the Empire period the taper was replaced by the round leg, rosewood grew commoner, and brass mountings became the rule (For further illustrations see Interior Decoration: European; Early American; Modern; also, Modern Tendencies IN APPLIED ART.)

TABLE MOUNTAIN (Dutch Tafelberg), a name frequently given in South Africa to flat-topped hills and mountains, which are a characteristic feature of the scenery Occasionally such hills are called plat, ie, flat, bergen. Specifically Table Mountain is the mountain, which rises from the shores of Table bay, Cape Town lying at its seaward base and on its lower slopes. The mountain forms the northern end of a range of hills which terminates southward in the Cape of Good Hope. It is formed of gently inclined sandstones and quartzites of the Table Mountain Sandstone series, resting unconformably on granites, which are intruded into shales of the Malmesbury Series. The sandstones descend toward sea-level on the shores of False bay.

- 1. Table of Egyptins wood, XVII.—XVIII. Dynatly, Drah abv!
  2 Writing table of carred wood, English, lata Iciti century
  3. Gata-leg table, American woods, 1576-27000
  4 Sananh table, 1710 century
  5 Corred Haltan table of the 15th century
  11. Table in the order and table, 15th century
  12. Table in the modern most of glit bronze
  12. Table in the modern most of glit bronze

arrived from Cairo).

but are too high to be accessible as building stone for Cape Town. The northern face of the mountain, overlooking Table bay, extends like a great wall some two miles in length, and rises precipitously to a height of over 3,500 feet. The face is scored with ravines, a particularly deep cleft, known as The Gorge, affording the shortest means of access to the summit East and west of the mountain and a little in advance of it are lesser hills. the Devil's Pcak (3,300 ft ) being to the east and Lion's Head (2.100 ft ) to the west Lion's Head ends seaward in Signal hill (1.100 ft ). The western side of Table Mountain faces the Atlantic. and forms an escarpment, with a broken sky line, known as The Twelve Apostles: to the south Hout's Bay Nek connects it with the remainder of the range, on the east the mountain overlooks the Cape Flats. On this side its slopes are less steen, and at its foot are Rondebosch, Newlands, Wynberg, and other residential suburbs of Cape Town. The ascent of the mountain from Wynberg by Hout's Bay Nek is practicable for horses.

The south-east winds which sweep over Table Mountain frequently cause the phenomenon known as "The Table-cloth." The summit of the mountain is then covered by a whitish-grey cloud, which is being constantly forced down the northern face towards Cape Town, but never reaches the lower slopes. The clouds (not always caused by the south-easter) form suddenly, and the weather on the mountain is changeable. Rainfall on the summit is heavy, 72 14 in a year being a 13-year average. This compares with an average of 54 6 in at Bishop's Court, Newlands, at the foot of the mountain on the east, and with 24 3 in. at Cape Town (q.v.) at the northern foot of the mountain.

TABLES, MATHEMATICAL: See MATHEMATICAL

TABLE TENNIS, an extremely fast indoor athletic game, which, like lawn tennis, apparently descended from real or royal (indoor) tennis about 1880. It was known also under various trademarked names ("Gossima," "Ping-Pong," etc.) until 1926, when its name was adopted by the International Table Tennis federation of 20 national associations, which conducts world championship matches for individuals and men's and women's teams under modernized rules. The game is played by striking a pale, hollow celluloid ball (41-41 in circumference, 37-39 gr weight, or 37-49 gr. in USA) with a racket over a net (6 in high, 6 ft long) fixed across a dark, nonreflecting table top (9 by 5 ft, 30 in high) Modern tackets are of wood, faced on both sides with stippled rubber to control the ball and impart spin in chop and drive strokes, Server's racket hits the ball behind his end of table so it bounces over the net, first on his side of the table, then on his opponent's side; ball is then struck to and fro directly over net after bouncing (volleying is illegal) until a point is scored by failure to make a good return. Service alternates after every 5 points and winner is he who first scores 21 points; but at score 20-all service alternates after each point and winner must score two points more than his opponent. In doubles. partners alternate in hitting the ball. One close law in the U.S. prevents strictly defensive play to encourage hard hitting and deep defense 20-25 ft. from table; another prohibits server's imparting spin to ball except by means of his racket. (See Laws of Table Tennis and Table Tennis Topics, U.S. Table
Tennis association monthly). (C. Z.) Tennis association monthly).

TABLINUM, in archifecture, one of the most important rooms of a Roman house, usually of large size, opening off the atrium  $(q, \alpha)$ , in the centre of the side opposite the entrance. At its rear there was frequently a large window looking out on the peristyle  $(q, \alpha)$ , or colonaded inner court. It was frequently decorated with basts or pictures of the family ancestors, and took the place of the modern, formal drawing rooms after the properties of the family ancestors, and took the place of the modern, formal drawing rooms after the properties of the family ancestors, and

TABOR, a small town in Bohemia, on the Lufinice, occupied by Germany in 1939, is mainly of historical importance since it was founded in 1420 by the more advanced Husstes, who came to be known as Taborites. Standing on the summit of an isolated hill, separated from the surrounding country by the Lufaice and protected by marshes, the market place in the centre of the town is approached by very narrow streets to

render the apposeds difficult in time of war. In this market places stands a salute of Zikka, one of the most famous Husste leaders. Here also are the early 6th century diaconal church and the town hall with its museum of Husste memorials. The district around Tabor is not particularly fertile, producing mainly the hardier cereals and notations. Por (iros) 14.251.

cereals and potatoes. Pop. (1932) 14, 251.

TABORA, a town of Tanganyaka Territory, Africa, in the Unyamwear country (known officially as the Tabora district). Pop. (1936) 6,565, including 16-Europeans and 1,540 Assattes It is the headquaters of Westen province. Tabora is on the railway (completed in 1914) from Dar-es-Salaam to Kigoma, on Lake Tanganyaka, being 530 ml from the occas and 212 ml from the lake port. Another railway, 23 ml long, links Tabora to Mawaga, on Lake Victoria. Tabora has severed line government offices, churches, hospitals and schools. There are large railway workshops and an aerodrome (first used in 1920, when aeroplanes

The modern town was founded by Zanzibari Arabs, about 1820. His central position and good water supply made it an important trading centre and a place of strategic importance. The Germans bull a strong for there During World War I it was captured by the Belgan Congo troops (Sept 1916), and later passed to the British, (See UNYAMEWEZ and TANGANYIKA TREBUTORY,)

TABRIZ, chief city of the province of Azerbaijan and second largest city of Iran, lies in the valley of the An Chai (the Bitter river, which flows into Lake Urmia) at an elevation of 4,400 ft., in 38° 4' N , 46° 18' E., and 400 mi N.W. of Tehran. Overlooking the valley on the south rises the volcanic cone of Sahand (12,000 ft ). There are two runed monuments: the famous Blue Mosque (1468) with its mosaic faience, and the colossal mass of the Mosque of 'Alı Shah, locally known as the Ark or Citadel, which looms over the city like a dun-colored cliff. The marblepaved court was 937 ft. by 350 ft. and included a pool 150 ft square in the centre The vaulted sanctuary was 215 ft deep by oo ft. 10 in wide, the widest vault ever built. The building was faced in polychrome mosaic faience, the internal walls of polychrome stucco. Both were enriched by gold inlaid marble and alabaster and further ornamented by coloured marbles and silver inlaid bronzes. The walls were 26 ft. thick and the minarets probably nearly 200 ft, high. For the rest, the city consists of yellowish-gray, uniform houses intersected by a labyrinth of narrow lanes. Recently the main streets have been widened On the outskirts are beautiful gardens and the modern country houses of the wealthy. The maximum summer temperature is 100°

August, minimum in watter —15°; minfall about 9 in.
Tabriz was for a long period the great emporium of European
trade with Persia, situated as it was on the main route from
Trebizond and Erzerum, but since the opening of the Suez Canal
it has lost much of its activity. Much commerce has been diverted
by way of Bapthad. It is nevertheless a principal trade centre
and point of local distribution and collection for N.W. Iran. The
railway from Tabriz to Julia (So mil.), built by the Russians in
1916 and transferred to Persia in 1921, connects with the Caurailway from Tabriz to Julia (So mil.), built by the Russians in
1916 and transferred to Persia in 1921, connects with the Cautarily and the sedquenters of an important in grinder of the
There is a baanch of the Impe. ial Bank of Persia, a telephone
service, and the town is lighted by electricity. There is also a large
modern grain storage elevator, leather, spinning and match factories. The chief imports were textiles, sugar and tea.

Tabitz (Tauria) was probably an old city when it became the capital of Tridtes III, king of Amenia, in An. 297. In 88, in the reign of the tenth Abbasid Calipb, it was almost destroyed yearthquake, and again in roat. In 1392. Thuru took and sacked the city and, later, it fell under the sway of certain Turkana princes, from whom, in 1500, Ismali, first of the Safavis, took it; but it remained under Persia only till 1522 and then fell intermittently under Turkish tule. In 1678 Shah Abbas I won it back to Persia. In 1721 the town was again in great part destroyed yearthquake and again passed, after a sangulnary struggle, under the Turks who held it until 1730, when it was retaken by Nadir Shah.

In 1908, the revolution against the shah started at Tabriz and

the arrival of Russian troops in 1909-nominally to save Russian subjects from famine-marked the commencement of a Russian occupation of this as well as other Persian towns Tabriz became involved in World War I owing to Turko-Russian conflicts and was occupied by the Russians in 1915 and again by the Turks for

as short period in 1918 Population (census of 1940) 213,544.

(P Z C: X) TABU. Tabu, one of the few savage words that have struck

root in the English language, is of Polynesian origin and has dialectical forms (tapu, kapu, tambu) in Polynesia and Melanesia; but the form tabu (or taboo) is the one which has become popularized, because it was as tabu that Capt. Cook first discovered the notion and its associated customs at Tonga in 1771.

### I. MEANING OF TABU

Literally an adjective, meaning "marked off" (perhaps from the Polynesian ta-mark, pu-exceedingly), tabu implies that certain persons or things are unsafe for casual contact or use in ordinary life, "not to be lightly approached" (Codrington, The Melanesians, p. 188) because of supernatural penalties which would thereby be incurred There is always some occult, magicoreligious significance present Another Polynesian word, mana (q.v.), expresses conveniently its positive aspect. Mana implies the mysteriously-efficient, transferable force recognized in all remarkable, impressive, wonder-working things as well as in striking human personalities "Negatively, the supernatural is tabu, not to be lightly approached because (positively) it is many instinct with a power above the ordinary." Thus, for the Ilaspeaking peoples of northern Rhodesia, we are told, vaguelydefined forces pervade all things, neutral in themselves, but available for those who have "the secret of manipulation." forces, however, "are dangerous things to interfere with They are tonda (tabu) For an ordinary person, under ordinary circumstances, to interfere with them is forbidden; it is dangerous to himself and the community. By saying certain things, doing certain actions and eating certain foods, he may liberate these energies with fatal results to himself and his neighbours. Persons in certain conditions and things put to certain uses, come into intimate contact with these forces and are therefore tonda." (Smith and Dale, Ila-speaking Peoples of N. Rhodesia, ii. 83.)

Tabu may be either (1) inherent or (2) imposed.

(1) Inherent, Tabu .- Some things or conditions are intrinsically tabu, and infringement of their character brings its own penalty without external aid. Such inherent tabus are those associated permanently with women, the sick, the dead, strangers or temporarily with women in childbirth or warriors on campaign. Here inherent energy is discharged on all who break the tabu-

(2.) Imposed Tabu.—A common thing may become tabu through the action of a god, priest, king or chief, and the sanction of the restriction is his own power for avenging its violation. Thus, when Cook wanted to set up an observatory in the Sandwich islands, the priests tabued the place for him by setting up wands. Persons and things, places and times could be tabued. The power of imposing a tabu was a characteristically Polynesian prerogative, bound up with the theocratic powers of a prince or noble, which probably attained the highest development in New Zealand. The noble or chief, partaking of the divine essence of which he was the incarnation, was able to communicate his contagious holiness so that the objects in question could not be appropriated by anyone but a superior in rank. He might stop traffic on a river or cause great inconvenience to his people by tabuing a forest. This was generally done by putting up a pole with a bunch of rags or leaves or by erecting some corresponding noticeboard. On the other hand, just as the priest or chief could impose the tabu, he could also remove it. Thus, at Hawaii in 1819, King Rihoriho at one stroke abrogated the laws of tabu, though only to make way for le tabu, the British Sunday.

However, these two aspects of tabu are considerably involved,

for religion makes common cause with law and government, resulting in a theogratic system of controls, spiritual injunction backed by temporal power

(3) Derivative Tabus .-- A third class of tabus arises from the contagiousness of tabu It is transmitted by contact and the person or thing thus tabued becomes a new source of infection Sometimes the infection may be removed by ritual means, such as an ablution. Sometimes it is too deeply ingrained to be removed To discriminate between "things tabu," the primary sources of such contagion and "things tabued," in which tabu infection is derivative, is not always easy, since tabus as primarily matters of custom form part of the social inheritance. Thus, the clothing and discarded food of the king derive the tabu quality from his person. Further, not only what he touches, but what he sees also becomes tabu

The Ambivalence of Tabu.—Of extreme importance in the study of tabu is its ambivalent character. Either that which is tabu is holy and to be feared as the seat of mystic, supernatural power, and therefore to be avoided lest harm befall from contact with it, or lest it be defiled by human touch and its divine essence be affected, or the object is unclean and therefore tabu lest it infect man with its own evil nature. Thus from this single root sprang not only uncleanness but also holiness

# II MAJOR TABUS

(a) Tabus on Priests, Kings, Chiefs, etc.-Sir James Frazer has collected in the Golden Bough evidence of the tabus with which the semi-divine potentates, chiefs and priest-kings of primitive communities are surrounded. Thus, at Shark Point, West Africa, the king lives alone in a wood. He may never leave his house, he may not touch a woman, on no account may he quit his royal chair, even to sleep, for in that case the wind would die down and all navigation would stop. The supreme ruler at Congo is regarded as a god on earth. No subject may taste of any crop until the first-fruits have been offered to his majesty When he leaves his residence, to visit other parts of his territory, all married persons are under obligation to observe the strictest laws of continence, any violation of which would prove immediately fatal to him. Were he to die a natural death, the world would be annihilated "Among the Todas of southern India, the holy milkman who acts as priest of the sacred dairy, is subject to a variety of burdensome restrictions during the whole time of his incumbency, which may last many years. Thus, he must live at the sacred dairy and may never visit his home or any ordinary village; he must be celibate; if he is married, he must leave his wife. On no account may an ordinary person touch the holy milkman or the holy dairy, such a touch would so defile his holiness that he would forfeit his office. . . . Further, the holy milkman never cuts his hair or pares his nails so long as he holds office, he never crosses a river by a bridge, but wades through a ford and only certain fords."

The sacred person must be guarded from haim without, but others must be protected also from hurt from him as a centre of contagion. Thus in a higher civilization, should anyone wear the mikado's clothes without his knowledge, he would have swellings all over his body. The touch of the king may remove the tabu caused by his own contagion. The Tongans were subject to a form of scrofula, which they often attributed to having inadvertently touched the chief or his belongings, and the touch or pressure of the chief's foot was sought as a cure for the malady The sick man "sat down before the chief, and taking the chief's foot pressed it against his own stomach, that the food in his belly might not injure him, and that he might not swell up and die." It is possible that scrofula may have obtained its name of "king's evil" in 17th century England from the belief that it was caused, as well as cured, by contact with the majesty of kings.

In short, "the chief has mana, and is therefore feared. Men do not dread contact with the king lest they become kingly, but lest they be blasted by the superman's supermanliness.

(b) Tabus on Women,-In the "classic, well nigh universal" major tabu of the "woman shunned," the ambivalent nature of the emotion underlying tabu is especially seen. Full of mystery, especially at certain periods of het life, she is now worshipped as a goddess, now dieaded as a witch The power to bring forth children indicates the possession of mana hence the almost universal avoidance of the pregnant woman of the aborigines of the Amazon, it was ance of the pregnant woman Ut the aborigance of the Amazon, it was said "They believe that I a woman during her penganny cats of the ment, any other animal partaking of it will suffer, if a domestic animal partaking of it, will die, if a do, it will be to the future major than being, it will die, if a do, it will be to the future major than the sum of pain for the future. In Pin, a pregnant wife may not wait inpon he husband Among the Australian aborigances, women as escluded at childhirth and menstrutanion and all vessels used by them during at childbuth and menstruation and all vessels used by them curring his seclision are burned. Their very glance is poston and in some places girls, when table, are made to west broad-hummend that lest may result in "sure death" hough right, as in the case of the Aus-tanian black fellow who, when he discovered that his wife had lain on habhack during het fabled period, wholly accumbed to terror and

died within a fortnight

(c) Tabus Between Relations.—The Kirghiz woman does not look upon the face of her husband's father or elder kinsman and must never utter their names, even if they contain names of common must hever futer taret names, even it ney contain names of common objects but must use paraphirases, and, in describing a wolf carrying off a lamb through the rushes, would say "Look yonder, the howling one is carrying off the bleating one's young through the unstitude on the other side of the glytening one". There is no suggestion of hostility between the talued relatives, the stites bong entirely upon

the mutual respect shown

This avoidance between relatives of opposite seves has been closely This avoidance occurrent relatives of opposite seves has been cooseny associated with the general tabu on women. No doubt a mutual shyness between the sexes underlies these avoidances which are strongly reinforced by an admixture of the fears involved in the woman-tabu, But the tabu applies to both sexes. Woman is not avoided as woman other sentiments, especially the horror of incest, are involved

(d) **Tabu on Strangers.**—The almost universal tabu on strangers is evidence of the fear of the unknown "To guard against the baneis evidence of the feat of the unknown. "To guard against the bare-ful influence cented voluntaily or involuntarily by strangers," says Frazer, "is an elementary dictate of savage paudence," but they may be admitted after a purificatory cemony, to nearly all tabus may be neutralized by some ceremonal device Westermarck has shown how both the tabur on strangers and the widely-spread practice of hospitality can ultimately be traced to the same root The stranger is dangerous, it is therefore necessary to secure his good will at once is dangerous, it is therefore necessary to secure his good will at once for the blessing of the stranger within the gates has exceptional power, his blessing is sought as urgently as his curse is feared (e) "Sympathetic" Tabus.—Much of the attention of the sav-age is directed to the food he eats. The belief that the qualities of the

eaten pass into the eater, is an explanation of the food tabus and prejudices of savage peoples. Thus the hunter will not eat the heart of the deer he has killed lest he become timed like that animal, while of the deer he has killed lest he become time like that animal, while to eat the heart of a lon would be to gain all the fierce courage of that beast Such examples, however, do not warrant the definition of tabu as "negative mage," failing to cover the characteristics of many well-known fabus "Sympathetic tabus" many of them cermany well-known tabus "Sympathetic tabus" many of them cer-tanly are up to a point, as are also the tabus on knots at childburth, which must be observed lest delivery be impeded But if tabu were a form of mage, the penalty for its infraction would be definite and measurable, whereas the distinguishing characteristic of tabu every-where is the "infinite plate of awithness" always accompanying its viowhere is the "minute plus of awfulness" always accompanying its vio-alaton There may be certain definite results, such as preservined pun-public opinion, to which the savage is at least as keenly sensitive as covinced man. But the "minute plus," always attached to the viola-tion of tabu puts it into the realm of mystical, immeasurable dread The threat is the more dree, because left to the imagnation. "Do not meddle, or, if you do . . .

# III. TABU AS A FACTOR IN MORAL TRAINING

While excessive development of tabus m any given society forms insuperable barrier to progress, the code of tabu has an obvious Willie excessive development of noise in any given some or an insuperable barrier to progress, the code of table has an obvious ethical value. It helps men to realize that they are under obligation to the community of which they are a part. Young people begin to learn this lesson of social life at the very beginning of puberty and morporation into the life of the tribe. The tabus and probabilions with which they are surrounded, touch every phase of social, family and individual life from childbirth to burial.

Some have held that tabu is the origin of all ethics and morality. It is true that tabu has legalized and strengthened morally; and, when tabus come to be regarded as the will of the gods, a rational element so introduced and the fear element, which now contains wonder and humility, is ready for transmutation into the loving reverence of the higher religions.

TABULARIUM, the technical name of the second office or national archives building of ancient Rome, which dominates the west end of the Forum It is built along the side of the Capitoline hill and was boildered, on the side toward the Forum, by two stories of long arcades, the lower decorated with engaged Doric columns, and the upper with engaged Ionic columns Each bay of the arcade is covered by a square, cloistered or four-sided vault. The tabularium is ascribed to Ountus Lutatius Catulus (c 78 BC). It thus offers one of the earliest Roman examples of the use of engaged columns in connection with an arcade

TABULATING MACHINES are mechanisms controlled by perforated cards which are used as mechanical aids to business methods. The first modern device of this class was designed for the automatic tallying or tabulation of statistics; but with extensive development modern tabulating machines are capable of automatically figuring and printing a report based on the information given to it in the form of perforations in cards or tape Soon after the introduction of the Jacquard loom, in which the hooks lifting the warp threads were controlled by cards perforated to the desired pattern. Charles Babbage applied the principle to a calculating mechanism. Between 1834-54 he designed and partly built an "analytic engine" in which both the amount to be operated upon and the nature of the operation were entered by perforated cards

His machine was never completed. Development of the modern tabulating machine was accomplished by H Hollenth Hollerith's first contribution was a means of tallying census ieturns

Hollerith's first contribution was a means of tallying census letturns in though electrical reading of the data punched on cards and accumulating the totals in separate registers. The system was successfully used in the US, census of 1890. During the next decade notable improvements were made including automatic feeding of the cards under provements were made including automatic leading of the cards ranged provided for reading and a mandine for sorting the cards rapidly into results for reading and a made of the reading the cards rapidly into maked particulally outstanding ovidence of the possibilities of the system. The population volume was ready 1 year and 7 months from the start of enumeration, whereas it was estimated that hand tabulation of the 3 factors alone of sex, nativity and occupation would have required the services of 100 clerks for 7 years and 11 months. Since 1901 its commercial utility has been greatly increased. Whenever a transaction involves a number of amounts which are subsequently to be used as units two or more times in compiling various totals, it has been found to be generally economical to "translate" it on to a per forated card. If, for instance, the data connected with the cost of production of a certain part are recorded on a card this can then be used in computing totals of individual wages, department costs, machine costs, productive hours, etc. The tabulating method is now to found in general use throughout the world

The card upon which the data are recorded in the form of forations has a column for each number or symbol to be entered. The digits o to 9 are denoted by holes punched proportionate distances from the bettern the state of the state lagis of to g are eleuted by noise punched proportionate distances from the bottom edge of the card starting with the position. Above the o position is space for two additional perforations which are used principally for actuating certain control operations of the machine. These additional positions may also be used for special classification. aumbers, does not be to the control of the control accomplished by different machines. Three separate mechanical devices are necessary to the system: a perforating machine or punch, a sorter and a tabulator. The ordinary form of perforating machine has a set of 12 punches under which the card is advanced a column has a set of 12 punches under which the card is advanced a column at a time. By means of a skip har or stops, certain fields can be skipped where no punching is to be done. There are also more complete types of perforating machines arranged to permit automatic duplication of information already on one card on to others, to "gang" punch any predetermined number of cards with identical data, "gang" punch any predetermined number of cards with nuemical data, to number cards consecutively as they are punched. The speed with which trained operators can perforate the cards depends on the nature of the information being recorded as well as its extent. An output of 350 punched cards per hour might be considered an average perform-

Sorting the cards into the desired groups for tabulation is done at the rate of about 400 cards per minute for each digit of the class number One well-known form of sorting machine has 13 pockets, one for each possible columnat perforation and one for "rejects" The tabulator, or accounting machine, which totals the amounts perforated in given fields is capable of several different applications. The simplest form of this device consists of a set of counters actuated through a reading mechanism. Two methods of reading the caids are in use electrical and mechanical. In the former, brushes make electrual contact through the perforations thereby actuating magnets to trip the counters. The mechanical method employs a full set of pins which are brought down upon the card momentarily at rest and which penetrate the perforations to actuate the counters mechanically Pinting tabulators are arranged to either total the cards at high speeding tabulators are arranged to either total in the cards at high spectomabut 150 per minute—and then pint the total, oi list each card individually at slower speed followed by a total for the group. By means of special control features the machines automatically take totals of several fields after each sorted group and also store the amounts for grand totals. A great deal of flexibility is attainable in the way the items and totals may be made to appear on the printed sheet. Mechanism has lately been incorporated accomplishing direct subtraction without the necessity of perforating the complements of the numbers as formerly required. This permits of reports showing total credit and debit amounts and net balance. By using combinations of two or more holes in a column it is possible to list alphabetical characters as well as num-bers. With alphabetical printing, addition or subtraction automatically sensed by the machine and devices added to the printing section for handling report and bill forms, tabulating machines have become automatic accounting and billing machines (B To)
TACANAN, a small group of tribes of South American In-

dians, constituting an independent linguistic stock. The Tacanas, from whom the stock takes its name, and their related tribes, live in northwestern Bolivia, in the region just east of Cuzco, on the upper Madre de Dios river and its tributaries, and extend eastward, between 13° and 15° S. lat, as far as the Beni. They are an agricultural as well as hunting and fishing folk, of the sedentary type, showing, apparently, considerable differences in cultural development between the different tribes. In spite of their close proximity to Cuzco, no significant study of this group has ever been made

See A D'Orbigny, L'Homme Americain (Paris, 1839); N. Armentia, Navigacion del Madre de Dios (La Paz, 1887).

TACHEOMETRY, a system of rapid surveying by which the positions of points on the earth's surface-both horizontal and vertical-are determined without using a chain or tape, or a separate levelling instrument. The ordinary methods of surveying with a theodolite, chain and levelling instrument are fairly satisfactory when the ground is clear of obstructions and not too precipitous. When the ground is much covered with brush or broken by ravines, chain measurements are both slow and hable to considerable error, the levelling, too, is carried on much slower though without serious loss of accuracy. These difficulties led to the introduction of tacheometry, in which, instead of the pole formerly employed to locate a point, a staff similar to a level staff is used, having heights marked from the foot and graduated according to the form of tacheometer in use. The asimuth angle is determined as formerly. The horizontal distance is determined by two methods (1) from the vertical angle between the welldefined points on the staft and the known distance between them, or (2) fixed wires in the diaphragm of the telescope. The difference of height is computed from (1) the angle of depression or (2) elevation of a fixed point on a staff and the horizontal distance already obtained. Thus all measurements requisite to the location of a point, both vertically and horizontally with regard to the point where the tacheometer is centred, are determined by an observer at the telescope without any assistance other than that of a man to hold the staff, (See Surveying.)

TACHIENLU: see Tatsien-LU.

TACHINID FLY, the name given to any member of the family Tachinidae, of the order Diptera (q.v.). The tachinida play an extremely important part in keeping other insects under control and certain kinds have been transplanted from one country to another to help control imported and native pests. Among those imported into the United States is Compsilura concinnata for control of the gypsy moth; it attacks a large variety of na-tive caterpillars; Centeter cinerea has been introduced from Japan for control of the Japanese beetle; Microphthalma michiganensis has been introduced into New Zealand from Canada for control of white grubs; Archytas cirphis, from Mexico to Hawaii

for control of army worms; Ptychomyia remota, from Malaya to Fin for control of Levuana caterpillars in Fin Many other successful importations have been made, but the great value of tachinids is found in their attacks upon native insects. They attack chiefly, caterpillars, beetle larvae and adults, sawfies, true bugs and earwigs. Their method of reaching the host is most varied, some scatter over grass thousands of eggs, which are eaten by the host, some lay eggs on the host, often inside it: some deposit living maggots, which attach themselves to passing victims Those that lay eggs on adult beetles usually have a piercing ovipositor Some tachinids are associated with army ants, apparently attacking insects fleeing the ants. Many species fly only at dusk, a few are nocturnal, most of them are sun lovers and are found on foliage; many visit flowers and are important in their pollination The size ranges from three-eighths to three-quarters of an inch in length. While most are dull coloured, or shiny black, many are marked with red and yellow, and some are metallic green or blue Some authors recognize several families and many subfamilies but there is no good way to separate them The Dexiidae, with plumose arista, are the most frequently separated group

The classification is highly technical and many of the species difficult to separate The literature is voluminous and contained in many publications. The tachinids are one of the largest families of flies, more than 5,000 species being known from all parts

of the world, and many new ones are added each year.

BIBLIOGRAPHY —For British species see C. J. Wainwright, "The British Tachinidae," in Trans. Entomological Soc. of London (1928), for European species see P. TACHOMETER, an instrument for measuring the speed of rotation of shafts and machine elements. Most tachometers have a rotating part which must be connected with the element whose speed is to be measured. With the hand-type this driving relation is maintained only long enough to take a reading, while with the types that are mounted on a machine the instrument is permanently connected to the rotating part and indicates the speed as long as that part is in motion. The hand-operated type usually has a stem provided with a vulcanized rubber tip of conical form which can be pressed into the centre-hole of the rotating shaft Permanently mounted tachometers are driven by belt or flexible shaft, or through a mechanical coupling

There are quite a number of different principles upon which the design of a tachometer may be based. All of the principles used in speedometers (qv) lend themselves equally well to the design of tachometers. In fact, a speedometer is a tachometer placed in driving connection with a road wheel and graduated in miles per hour instead of in revolutions per minute. Thus, there are centrifugal, magnetic diag, clockwork and magneto-type tachometers. In addition there is the principle of vibrating reeds which seems to have been used for tachometers only. It is based on the fact that in most machines having large revolving parts, such as steam turbines and electric generators, vibration of the frame is synchronous with rotation of the revolving part

The Frahm vibrating reed tachometer consists of a series of calibrated steel reeds of different lengths, having one of their ends mounted in a brass block and a short length at their other end turned at right angles and enamelled white These enamelled ends are located side by side in a rectangular opening in the case With the instrument mounted on the machine (or merely held against it by hand), and the machine in operation, one or more of the reeds will respond visibly to the vibration of the machine The speed of rotation of the shaft can be gauged to a much closer limit than the difference between the speeds indicated by adjacent vibrating reeds, usually 50 revolutions per minute. Reed tachometers are made for speeds of from 800 to 12,000 revolutions per minute. Preferably the range of any particular instrument should not exceed an octave, as if it does, and the actual speed corresponds to a reed near the lower end of the scale, both the seed located there and a reed corresponding to twice this speed will vibrate.

TACHYLYTE or TACHYLITE, in petrology the glassy variety of base ignous rock as basalt or doleret Tachylytes are black in colour, with a pitch-like or resmous listic, and in the thinnest sections are typically brown and translucent, the glass being crowded with gianules of magnetie. They are found only under conditions which imply rapid cooling, and are much less common than the corresponding said volcarie glasses, putrupally on account of the greater fluudity and greater power of crystallization which basic lawas possess. The principal mode of occurrence of tachylyte is as a chilled edge or selvage to thin dikes or sills of basalt or dolerite. This edge may be only a fraction of an inch intheness and merges inward unto crystalline basalt. Tachylytes of this nature are common among the Tertiary igneous rocks of the Western 181se of Socialnd (Skye and Muji).

Exceptionally, tachylyte constitutes almost entire lawa flows, as in the Hawaian saland. The lapid cooling of the highly find laws of this region has inhibited ciystalization, grung use to vast floods of basaltic glass containing only minor amounts of crystaline material. Lastly, tachylytes occur as scoria or bombs thrown out by basaltic volcances These are well known at Stromboli. Etna and in Iceland Tachylytes readily undergo weathering and alteration, and are converted by oxidation and hydration into palagonite, a red, brown or yellow cryptocrystal-ine material

TACITUS, CORNELIUS (c. 55-120), Roman historian, lived through the reigns of the emperors Nero, Galba, Otho, Vitelhus, Vespasian, Titus, Domitian, Nerva, and Trajan All we know of his personal history is from allusions to himself in his own works, and from II letters addressed to him by his very intimate friend, the younger Pliny The exact year of his buth is a matter of inference, but it may be approximately fixed near the close of the reign of Claudius Plmy indeed, though himself born in 61 or 62, speaks of Tacitus and himself as being "much of an age" (Pliny, Epp vii 20), but he must have been some years junior to his friend, who began, he tells us, his official life under Vespasian (Hist II), no doubt as quaestor, and presumably tribune or aedile under Titus (80 or 81), at which time he must have been 25 years of age at least Of his family and birtholace we know nothing certain; we can infer nothing from his name Cornelius, which was then very widely extended; but the fact of his early promotion seems to point to respectable antecedents, and it may be that his father was one Cornelius Tacitus, who had been a procurator in one of the divisions of Gaul, to whom allusion is made by the elder Pliny in his Natural History (vii 76) But it is all matter of pure conjecture, as it also is whether his "praenomen" was Publius or Gaius The most interesting facts about him to us are that he was an eminent pleader at the Roman bar, that he was an eye-witness of the "reign of terror" during the last three years of Domitian, and that he was the son-in-law of Julius Agricola. This honourable connection, which testifies to his high moral character, may very possibly have accelerated his promotion, which he says was begun by Vespasian, augmented by Titus, and still further advanced by Domitian, under whom we find him presiding as practor at the celebration of the secular games in 88, and a member of one of the old priestly colleges, to which good family was an almost indispensable passport. Next year, it seems, he left Rome and was absent till 93 on some provincial business, and it is possible that in these four years he may have made the acquaintance of Germany and its peoples. His father-in-law died in the year of his return to Rome In the concluding passage of his Life of Agricola he tells us plainly that he witnessed the judicial murders of many of Rome's best citizens from 93 to 96, and that being himself a senator he felt almost a guilty complicity in them. With the emperor Nerva's accession his life became bright and prosperous. and so it continued through the reign of Nerva's successor, Traian, he himself, in the opening passage of his Agricola, describing this as a "singularly blessed time"; but the hideous reign of terror had stamped itself ineffaceably on his soul, and when he sat down to write his History he could see little but the darkest side of imperialism. He was an academic republican, like many of those who perished in that reign of terror They were innocent

in many cases of plotting against the emperor's life; and, no doubt, many of the plots were imagnary. But some had been ted, and Domitian was determined to take no risks. Hence academic sympathizers with republican ideals fell under suspicion and were involved in the misscriminate slaughter of those three

vears He was apparently convinced that Tiberius had been a ruler of the same type as Domitian, and that prejudiced him against the great, but gum, successor of Augustus Moreover, some of the memoirs, contemporary with Tiberius' reign, were not likely to depict him in a favourable light, and on those Tacitus had laigely drawn (For the value of this evidence see Furneaux, Tac, Ann vol 1 D 20 ad fin For Tacitus' judgment on Tiberius see sbid Introduction ch viii ) But, apait from personal prejudice, the Romans of the upper classes who lived in Rome or resorted thither tended to dislike impenal rule both socially and politically, and did, as a fact, see so much of the worst of it that they failed to appreciate the blessings it had conferred on the world outside. To his friend, the younger Pliny, we are indebted for the little we know about his later life. He was advanced to the consulship in 97, in succession to a highly distinguished man, Verginius Rufus, on whom he delivered in the senate a funeral eulogy In 99 he was associated with Pliny in the prosecution of a great political offender, Marius Priscus, under whom the provincials of Africa had suffered grievous wrongs The prosecution was successful, and both Tacitus and Pliny received a special vote of thanks from the senate for their conduct of the case It would seem that Tacitus lived to the close of Trajan's reign. as he seems (Ann ii 61; 1v 4) to hint at that emperor's extension of the empire by his successful Eastern campaigns from 115 to 117 Whether he outlived Trajan is a matter of conjecture. It is worth noticing that the emperor Tacitus in the 31d century claimed descent from him and directed that ten copies of his works should be made every year and deposited in the public libraries He also had a tomb built to his memory, which was destroyed by order of Pope Pius V. in the latter part of the T6th century

Pliny, as we see clearly from several passages in his letters, had the highest opinion of his friend's shulty and wouth He consults him about a school which he thinks of establishing at Comum (Como), his hithplace, and asks him to look out for suitable teachers and professors. And he pays (Epp. vin 33) him the high compliment, "I know that your Histories will be immortal, and this makes me the more anxious that my name should appear in them".

The following is a last of Tacitus' remaining works, arranged in their probable chronological order, which may be approximately interred from internal evidence—(1) the Dutalgue on Orators, about, for vr; (2) the Life of Agricale, 90 or 98; (3) the Germany, 98, published probably in 99; (4) the Histories (Histories), completed probably by 115 or 115, the last ventor of Trajan's reign (he must have been at work on them for many vents); (5) the Amusla, his latest work probably, written in part perhaps along with the Histories, and completed subsequently to Trajan's reign, which he may very well have outlived.

The Dialogue on Orators discusses, in the form of a conversation which Tactius professes to have heard (as a young man) between some eminent men at the Roman bar, the causes of the decay of eloquene under the empire There are some interesting remarks in it on the change for the worse that had taken place in the education of Roman lads. The style of the Dialogue is far more Ciceronian than that of Tactius' later work, and critics have attributed it to Quintilian; but its genumeness is now generally accepted. It is noticeable that the mannerisms of Tactius appear to develop through his lifetime, and are most strongly marked, in his latest book, the Annals

The Life of Agricola, short as it is, has always been considered an admirable specimen of biggraphy. The great man, with all his grace and dignity, is brought vividly before us, and the sketch we have of the history of Britain under the Romans gives a special interest to this little work.

The Germany, the full title of which is "Concerning the geog-

raphy, the manners and customs, and the tribes of Germany," describes with many suggestive hints the general character of the German peoples and dwells particularly on their fierce and independent spirit, which the author evidently felt to be a standing menace to the empire The geography is its weak point, much of this was no doubt gathered from vague hearsay Tacitus dwells on the contrast between barbarian freedom and simplicity on the one hand, and the servility and degeneracy of Roman life on the other

The Histories, as originally composed in 12 books, brought the history of the empire from Galba in 69 down to the close of Domitian's reign in 97. The first four books and a small fragment of the fifth, giving us a very minute account of the eventful year of revolution, 69, and the brief reigns of Galba, Otho, and Vitellius, are all that remain to us. In the fragment of the fifth book we have a curious but entirely inaccurate account of the Jewish nation, of their character, customs and religion, from a cultivated Roman's point of view, which we see at once was a strongly prejudiced one.

The Annals-a title for which there is no ancient authority, and which there is no reason for supposing Tacitus gave distinctively to the work-record the history of the emperors of the Julian line from Tiberius to Nero, comprising thus a period from AD 14 to 68 Of these, nine books have come down to us entire; of books v., xi. and xvi. we have but fragments, and the whole of the reign of Gaius (Cahgula), the first six years of Claudius, and the last three years of Nero are wanting Out of a period of 54 years we thus have the history of 40 years
The principal mss, of Tacitus are known as the "first" and

"second" Medicean-both of the 10th or 11th centuries The first six books of the Annals exist nowhere but in the "first Medicean" ms, and an attempt was made in 1878 to prove that the Annals are a forgery, by Poggio Bracciolini, an Italian scholar of the 15th century, but their genuineness is confirmed by their agreement (see Introduction to vol i, of Furneaux's edition of the Annals of Tacitus, Clarendon Press series, 1884) in various minute details with coins and inscriptions discovered since that period. Moreover, Ruodolphus, a monk, writing in the 9th century, shows that he is acquainted with a ms of Tacitus containing at least the first two books. Add to this the testimony of Jerome that Tacitus wrote in 30 books the lives of the Caesars and the evidence of style, and there can be no doubt that in the Annals we have a genuine work of Tacitus

Much of the history of the period described by him, especially of the earlier Caesars, must have been obscure and locked up with the emperor's private papers and memoranda. As we should expect, there was a vast amount of floating gossip, which an historian would have to sift and utilize as best he might. Tacitus. as a man of good social position, no doubt had access to the best information and must have talked matters over with the most eminent men of the day. There were several writers and chroniclers, whom he occasionally cites but not very often; there were memoirs of distinguished persons-those, for example, of the younger Agrippina, of Thrasea, and Helvidius. There were several collections of letters, like those of the younger Pliny; a number, too, of funeral orations; and the "acta senatus" and the "acta populi" or "acta diurna," the first a record of proceedings in the senate, the latter a kind of gazette or journal. Thus there were the materials for history in considerable abundance, and Tacitus was certainly a man who knew how to turn them to good account. He has given us a striking, and on the whole doubtless a true, picture of the empire in the 1st century. The rhetorical tendency which characterizes the "silver age" of Roman literature gives perhaps exaggerated expression to his undoubtedly strong sense of the badness of individual emperors, but he assuredly wrote with a high aim, and we may accept his own account of it (Ann. iii., 65): "I regard it as history's highest function to rescue merit from oblivion, and to hold up as a terror to base words and actions the reprobation of posterity," He is convinced of the degeneracy of the age, though it be relieved by the existence of truly noble virtues; and he connects this degeneracy more or less directly with the imperial regime. But it is difficult to dog-

matize as to Tacitus' political ideals. He is primarily concerned rather with ethics than with politics; though he may feel that the world is out of joint-with whatever sentimental sympathy he may regard the age of "liberty" and admire the heroic epoch of the republic-yet he appears to realize that the empire is a practical necessity, and to the provinces even a benefit. Like the Stoics, with whom otherwise he has little in common, he censures rather individual rulers than the imperial system. But "the key to the interpretation of Tacitus," it has been well said. (Dill. Roman Society from Nero to Marcus Aurelius, Bk i ch 1.) "is to regard him as a moralist rather than a politician." Perhaps the strongest work in the Annals and Histories is the delineation of character

Tacitus gives us no certain clue to his religious belief. His expressions of opinion about the government of the universe are difficult to reconcile with each other. There seems to have been a strange tinge of superstition about him, and he could not divest himself of some belief (Ann. vi 21,22) in astrology and revelations of the future through omens and portents, though he held these were often misunderstood and misinterpreted by charlatans and impostors. On the whole he appears to have inclined to the philosophical theory of "necessitarianism," that every man's future is fixed from his birth: but we must not fasten on him any particular theory of the world or of the universe. Sometimes he speaks as a believer in a divine overruling Providence, and we may say confidently that with the Epicurean doctrine he had no sort of sympathy

Tacitus' style 15 discussed in the article LATIN LANGUAGE. Whatever judgment may be passed on it, it is certainly that of a man of genius, and cannot fail to make a deep impression on the studious reader. Tacıtean brevity has become proverbial, and with this are closely allied an occasional obscurity and a rhetorical affectation which his warmest admirers must admit He has been compared to Carlyle, and both certainly affect singularity of expression. But they are alike only in the brevity of sentences; and the brevity of Carlyle is not that of an artist in enigram Tacitus was probably never a popular author; to be understood and appreciated he must be read again and again, or the point of some of his acutest remarks will be quite missed

of some of his acutest remarks will be quite missed
Tactus has been many times translated, in spite of the very great
difficulty of the teak; the number of the versons of the whole or
part is stated as 300 no (we should call it a paraphrase) was for long
one of the best known; it was published early in the 19th century,
on this was based the so-called Oxford translation, published by
Bohn in a revised edition Messrs. Church and Brodrubb's translation
and Professor Annany's (1904) (the latter of sirral i-w) are
dey's (1879); Herius's (Histories, 1889); Furneaux's (Annals, i.vi.,
1884; xi. xvd. 1891; Germania, 1894); Sponoris (Histories, 1891).
The last two editors' miroductions are particularly useful. By
if the best edition of the Agreeo'ds in English is that of Furnesux
is the strong of t

TACITUS, MARCUS CLAUDIUS, Roman emperor from Sept. 25, A.D. 275 to April 276, was a native of Interamna (Term) in Umbria. In the course of his long life he held various civil offices, including that of consul in 273. Six months after the assassination of Aurelian he was chosen by the senate to succeed him, and accepted by the army. During his brief reign he set on foot some domestic reforms, and sought to revive the authority of the senate, but, after a victory over the Goths in Cilicia, he succumbed to hardship and fatigue (or was slain by his own soldiers) at Tyana in Cappadocia. Tacitus, besides being a man of immense wealth (which he bequeathed to the state), had considerable literary culture, and claimed descent from the historian.

See Life by Vopiscus in Historiae Augustae Scriptores; also Eutropius, ix 10; Aurelius Victor, Caesares, 36; Zonaras xii. 28; H. Schiller, Geschichte der romischen Kaiserzeit, i. 1883.

TACK: SEE NAIL MANUFACTURE.

TACNA, department of Peru, to which by the terms of the 1929 settlement of the Tacna-Arica question it was transferred by Chile, Bounded north by Moouegua and Puno, east by Bolivia.

south by Tarapacá, Chile, west by the Pacific Area 4,930 sq mi Pon (1050 est ) 43,696 It belongs to the desert region of the Pacific coast There are a few fertile spots near the mountains, where mountain streams afford irrigation and drinking water and support small populations Few of its streams cross the entire width of the department, most are lost in desert sands. The climate is bot, and earthquakes are frequent and sometimes violent One railway in the department runs from the city of Tacna to Arica (a.v.), and another, constructed by the Chilean government, from Auca to La Paz, Bol The department is part of the former area, Tacna and Arica, which once formed part of the Peruvian department of Moquegua Its capital is Tacna (pop 1805, 9,418, 1940, 11,378), a small inland town 48 mi. by 1ail from Auca, in a fertile valley among the footbills of the Andes Existence is made possible in this oasis by a small mountain stream. also called Tacna, which supports a scanty vegetation. The town is the residence of a number of foreign merchants (For the Tacna-Arica question see CHILE, PERU )

TACOMA, a city of Washington, U.S., on Commencement bay, one of the arms of Puget sound, 30 mi, by water south of Seattle and 151 nautical miles from the Pacific ocean, a port of entry and the county seat of Pierce county It is on federal highways 99 and 410, and is served by The Milwaukee Road, the Great Northern, the Northern Pacific and the Union Pacific railways, by motorbus lines and by more than 50 steamship lines, with sailings to the orient, Alaska, South America, Australia and Europe, and to Atlantic and Pacific ports of the United States, The population was 143,673 in 1950, in 1940 it was 109,408 and in 1030, 106,817

The fine natural harbour is 4 5 mi. wide at its entrance between Brown's point and Point Defiance and about 25 mi long There is no bar or other natural obstruction at the entrance, and the waters are deep throughout. The climate is equable and the precipitation moderate, about two-thirds of the rain falling in the four months November to February. From the tidelands the city rises gradually to a plateau 300 ft. high The area is 52 6 sq m1, of which 5 25 sq mi are water The Olympic mountains are visible to the west and Mount Rainier (14.408 ft. high), in Ramer National park, 56 mi. S.E., seems to stand at the city's doorway. Near by are many fresh-water lakes, surrounded by evergreen forests The city's parks cover 1,617 ac , including 640 ac on Point Defiance In the heart of the city is the state historical building and museum, containing a collection of pioneer, Alaskan

and Indian relics In the north end of the city is the 40-ac. campus of the College of Puget Sound (Methodist; 1888). Two of the transcontinental railroads have extensive terminals on the water front, and other wharves have been constructed by industrial concerns. The physical development of the harbour by the public and the administration of facilities owned by the Port of Tacoma district (a municipal corporation conterminous with Pierce county) are under

the junisdiction of a port commission

The piers owned by the municipality cover 280 ac. With one of
the five finest salt-water harbours in the world, and originally established as an important lumber-production and grain-export city, Ta-coma became an important industrial centre. Among leading indus-tries are chemical and metallurical manufacturing, food processing and a great diversity of the forest products industries such as plywood and a great diversity of the forest products industries such as phywood, doors, furniture, pulp and milliwork. Total nonagricultural employment for July 1350 was 68,460. Heavy basic chemicals are produced as well alloys are among ornels in possessed. The city, in addition to being an important candy cente, a size recognized as the largest producer of pleasure and commercial boats on the Pacific costs. Near by are Fort Lewis, McChord an force base, Mt. Rainler ord-mance depot and Madigan General hospital

History,-Tacoma harbour was visited by Capt. George Vancouver INSUTY—LECOME harbor was visited by Capt. George Vancouver in 1793, and 30 years later the Hudson's Bay company established a trading post at Nisqually Commencement bay was surveyed for United States in 1844 by Lleut. Charles Wilkes. Settlement began in 185 when Nicholas Delin, a Swede, took a claim on the south shore to the bay and set up a small sawmill, from which in 1851 he singped the only and set up a small sawmill, from which in 1855, he shipped lumber to San Francisco. In 1855, the sethlers were frightened away by the opening of the Indian war, taking refuge in Ft. Stellacoom (12 mi S.W.) which had been built in 1849; but in 1864 Job Carr and his two sons, from Indiana, took claims on the west shore of the bay. Developsons, from indiana, took claims on the west shore of the bay. Develop-ment of a city dates from the arrival from Portland in 1868 of Gen Morton Matthew McCarver. He induced settlers to come; persuaded two of them to erect a sawmill, and planned a town site, confident that a transcontinental railway would soon reach Puget sound name he chose for the town was Commencement City, but this was soon dropped for the Indian word meaning a snow-covered mountain In 1873 the Northern Pacific established its terminal on Commencement bay and named it New Tacoma

A town was organized in 1874, becoming the county seat in 1880, ad in 1883 the two settlements were consolidated and incorporated as the city of Tacoma In 1880 the population was 1,098, in 1887, when the railroad was completed across the Cascades it had grown to about A boom immediately set in, attracting land speculators from all puts of the country, and three years late: (1890) the population was 36.006 There was little increase in the next decade, but between 1000 and 1910 the population give from 37,714 to 83,743, and the total microsse of the 20 years 1900 to 1920 was 157%. The impact of World Wai II, bringing new shippard and army developments, caused big

gains in population which were retained in the postwar period. TACONITE. The name taconite was applied originally to an iron-bearing formation of supposedly Taconic age (Cambrian to Ordovician) Though this was an error the name was associated thereafter with iron-bearing tocks on the Mesabi range in northern Minnesota consisting of chert (fine-grained quartz), magnetite, haematite, several silicates as minnesotaite, greenalite, stilpnomelane and amphibole and siderite. The rocks were originally chemical precipitates which now form beds of a maximum thickness of 750 ft and a length of about 100 mi along the strike Their extent down the dip is unknown In this taconite are found the high-grade iron-ore bodies which have supplied most of the iron of the U.S. As all taconite contains on an average 27% of chemically combined iron, it is considered the largest potential reserve of ore in the U.S. About 5,000,000,000 to 6,000,000,000 tons of it are near enough to the surface and contain sufficient amounts of magnetite so that its magnetic concentration to a highgrade product was in an advanced stage of development by the 1950s, ready to be shipped to the blast furnaces in significant

See J W Gruner, The Mineralogy and Geology of the Taconites and Iron Ores of the Mesabi Range, Minnesota (1946) (JN W. G.)

TACTICS. Tactics is the art of fighting battles. It is concerned with the dispositions for combat and the execution of combat It includes the employment of all the military forces on the field of battle, the execution of strategic movements prior to battle, and the use made of the different arms Thus, there is a tactics of the battle as a whole and likewise an artillery tactics, a tank tactics, an aviation tactics and many others which can be discussed separately in connection with the same battle. Military strategy is the art of concentrating forces in the theatie of operations under favourable conditions for battle. The term grand tactics came into being just prior to the time of Napoleon and was used to designate the regulation of the march of the different divisions and corps of the army in preparation for battle. It is rarely used in the 20th century, although it supplies a convenient connection between the fields of tactics and strategy

The nature of the tactics used in battle often is dependent upon the strategic dispositions of the forces, and the tactical possibilities of the forces involved will influence the strategic plan of operations. Consequently, there is no well defined line between strategy and tactics; strategy aims at assisting tactics and, in its turn, the sim of tactics is the development or completion of the strategic movement. The terms tactics and strategy, as now used, are of comparatively recent origin. Their meanings are not precisely defined. In general, however, tactics is the conduct of battle, including marches, and strategy covers the operations leading up to battle.

Tactical Objectives .- In any type of conflict one opponent overcomes the other either by superior force, by attacking him at a weak or vulnerable point, or by demoralizing or disorganizing him by surprise. From these the main tactical objectives may be deduced to attack with superior force at the point of attack; to attack a weak or vulnerable point; and to effect surprise. Surprise aims at confusion, demoralization and disorganization, It is an attack aimed at the mind and morale

At certain periods of warfare, when ideas of chivalry and of "fighting like gentlemen" were predominant, tactical skill was scorned. It would have been cowardly to suprise and deceve the opponent at such times. At other times the lattical problems involved in reaching a weak point have been too complex for soldiers to solve. This was the case during a part of World War I, when the continuous front inhibited the classic enveloping movement designed to neight the hostic perior.

Elements of Tactics—Weapons, movement and protection are the elements from which tactics are constructed and which govern the evolution of combat. Throughout history two main types of weapons have been used in attack and defence, namely missale weapons and shock weapons. Missale weapons include slings, arrows and hrearms, shock weapons are the weapons of hand-fighting, and instruments such as tanks which overcome by their crushing force.

Cavalry was said to have had shock power when cavalry charges could run down the enemy and when it attacked with sword had lance. The historical fact about the shock power of cavalry is, however, that shock almost never took place. One opponent on the other field or turned back. Shock power in that sense has always been almost nonevestent, although for centuries it will be always been almost nonevestent, although for centuries the the habit of military writers to speak of the shock power of cavalry. Elephants had shock power. Tanks have shock powebut it is not their most effective method of combat. Tanks also depend upon fire and movement.

Armies have been characterized by organizations having different rates of movement. Until the advent of motor transportation, movement was confined to the two speeds of the man on foot and the man on the horse. It was the suppernor mobility of the horsemen which made cavalry the arm of decision in warfare for a thousand years. Cavalry was able to extend negably around the flank and reach the rear, because of its superior speed Cavalry lost its pre-emmence because of its vulnerability to firearms. With the development of armoured track-laying vehicles, cavalry no longer is the most rapid moving fighting element in armies. Motor-driven track-laying vehicles, thus book over the role of cavalry as the element of decision in armies. The armour protects them from small arms, their speed is great enough to move around the flank of an enemy, and their own fighting powers enable them to break through a weak point and speed destruction.

With the motorization of foot solders and the large use of mechanized forces, cavalry was reduced to the slowest element of armies where once it was the most rapid. It still retained a superior mobility to motorized and mechanized troops in rough country, and still was useful for certain reconnaissance purposes in war. In general, however, the evolution of war practically eliminated horse cavalry.

Protection is provided by armour, earthworks oi terrain. The easiest protection to obtain is that gained by digging in the ground, but since this protection can be had only while the soldier remains in the trench, it is usable only for delensive operations. Protection by armour, on the other hand, can be used either for offensive or defensive purposes. Cavalry at one time was armoured so that it was reactically invulnerable to infantry weapons.

Armour, again in World War II and the Korean war resumed its importance in the offensive on the battlefield. The armough soldier sat behind the 14-in, chilled-steel plates of the tank he drow. Tanks tended to become the armoured offensive industry, while the foot soldier for a while assumed the role of defensive infantry.

The Evolution of Tactics—Armament determines the method of combat The man with a gun fights at a distance from his adversary, while the man with a sword must close. The method of combat determines the manner of deployment and entry into battle. This in turn determines the maner of deployment and entry into battle. This in turn determines the march dispositions which precede it. The choice of the point of attack depends upon the amament and faculties for movement and supply. Scence and invention, industry, transportation and communications influence the manufacture and the quantity of armament and munitions at the disposal of armies. Thus, the evolution of tactics fundamentally is a result of science and invention, and the evolution of industry and transportation. Armies rely heavily on tradition,

and the evolution of methods of fighting usually has been resisted by them. The few bulliant commanders who have taken advantage of the unodifications in factics made possible by the progress of armaments, industry and transportation in their time have achieved astounding successes. Napoleon is one example of this, and Napoleon was wise enough to say that tactes must be rhanged every ten years, while the German aimy of 1939 was another example.

Offensive and Defensive Action -To attack presupposes offensive action and this in its turn introduces defensive action. either to protect the attack or to resist it. When the art of wai is of high order, the offensive and the defensive are so interwoven as to be inseparable, but as this degree of perfection has throughout military history been the exception rather than the rule, these two modes of fighting may be considered separately Throughout history the relative power of attack and defence has varied. This has been due to the varying pre-emmence of weapons, movement and protection. In general, missile weapons have favoured the detensive. In the war of 1914-18 the ultimate in missile weapons, the machine gun, combined with the protection of entrenchments, immobilized the offensive. The development of the aeroplane, the tank and armoured weapon-carrying vehicles reversed the trend of defensive domination By the time of World War II, the offensive had regained its dominance as was proved by the lightning German victories in Poland and France, the Allied invasion of Europe and U.S. victories in the Pacific

Throughout history the offensive and defensive have dominated alternatively. New defensive methods usually are devised to counter new offensive weapons. Firepower ended the offensive power of armoured cavalry. The tank, in turn, countered the defensive dominance of machine guns. The great cycles of offensive or defensive supremacy formerly lasted for hundreds of years. Science and invention have speeded up the rate of swing. In World War II the offensive was supreme, after the war the power of the defensive was once more in the assendance.

Tactical Methods—Both offensive and defensive types of ormbat are worked out by inter definite tactical methods, depending upon the age under consideration. Vegetius (q,v) listed seven different formations in which an army could be charmed the common offensive tactical methods were the penetration, envelopment of one or both flanks, the turning movement and pursuit. Penetration consists of breaking through an enemy line at the chosen point with the object of creating flanks so that mobile forces can reach the rear. Envelopment consists of overtical control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the conposition of the control of the control of the control of the control of the conposition of the control of the conposition of the control of the control of the conposition of the control of the conposition of the control of the control of the conposition of the control of the conposition of the control of the conposition of the control of the conposition of the control of

Defence may be either cordon, passave or mobile In cordon defence the forces are thinly dispersed over a long line with few reserves. This method is rarely used except in the defence of rivers and coast lines Passive defence is conducted with the intention of holding in place. It may be in great force, as frequently was the case of the war of 1914-18, but does not presuppose extensive use of offensive methods such as counterstacks. The mobile, or elisatic, defence is based on the theory that any defensive position can be broken into, but that the least prepared at that time to resist them. This type of defence was developed by the Germans in 1916 and 1917 and adopted by the Allies in 1913. It has become the standard defensive method of all armies. It takes advantage of the offensive to accomplish defence

Delaying action is a defensive action intended to gain time Delaying action is conducted either on one line or two lines. The delaying force holds its line long enough to require the attacker to deploy, then withdraws to the next position before becoming seriously engaged in combat. When delaying action is conducted on two lines, the troops from the forward position withdraw through the second line and this is done successively. The distance between lines in delaying action is great enough so that the attacker's artillery will be forced to displace forward in order to bring fire to bear on the second line. The defensive-offensive sequence, or active defence, as it is usually called, which consists of the occupation of a position with a view to persuade an enemy to attack it, and then when he has exhausted himself, to counterattack from it, has played an important part in war. One form of active defence consists of withdrawing to induce the enemy to follow, and then of counterattacking This is dangerous. since the forces withdrawing may become disorganized and the planned withdrawal may be turned into a rout

Tactics and the Continuous Front,-Development of the continuous front in the war of 1914-18 was the outstanding tactical feature of that war. When the Germans invaded France in Sept 1014, they attempted to envelop the left wing of the French army and finally were stopped and thrown back at the Maine Both contenders then attempted to extend their lines and overlap the exposed flark of the other This period of operations, known as the "race to the sea," finally resulted in the extension of the front to the sea so that a continuous line almost 400 miles long was occupied by the opposing forces, from Switzerland to the English channel The former solution of attacking the enemy's rear by envelopment of an open flank could be applied no longer Soldiers were faced with an entirely new and unforeseen tactical problem to be solved. This was to break through a front with no flanks and more effectively protected with automatic weapons and entrenchments than any field fortification in all previous worfore

The continuous front was made possible by the multiplication of transport facilities and industrial capacity to supply millions of men, together with the decreased density of battle lines permitted by the fire power of 20th century armaments. It now has become a necessity as each contender strives to hold all his territory, since every national resource is required for war-making purposes No longer will any nation make its surface the manneuvre ground for marching hostile armies if it can stretch the defenders to cover the entire length of the threatened borders Due to the enormous amounts of supplies required by machine warfare, the rear of armies has become more vulnerable than ever before An interruption of a week will find a fighting army out of ammunition and helpless. If there were such a thing as an exposed and undefended flank, the rear of the armies is within a very short striking distance of air forces. No matter how the forces may be attenuated to form the continuous front, it is the one and indispensable essential to defence before which all other considerations give way

It is a complete defence to the historical solution of getting to the hostile rear by envelopment

The continuous front is not synonymous with the stabilized front. Certain military writers since the war of 1914-18, arguing from the clumsy Allied offensives of 1915-16, assumed that stabilization is inevitable. Although this was disproved by the German offensives in the spring of 1918, a whole school of military thought grew up in England and France after World War I which held that the power of defence had become so great that in any future war stabilization would occur very shortly after the commencement of the war. Two solutions were proposed. the first, by those who believed that they would not permit the continuous front to be formed again, although they were rather nebulous as to the means by which formation of fronts could be prevented; the second, composed of those who believed that the only solution was to permit the enemy to exhaust his strength attacking the supposedly impregnable defensive of their own front. Neither solution had any validity and both overlooked the new powers given the offensive by aeroplanes, tanks and increased use of high-angle fire cannon to support the infantry attack

In actuality, continuous fronts were already being formed while these theories were current The French Maginot line was a continuous front formed and garrisoned in time of peace. It was paralleled by another line, the German Westwall. In the Spanish Civil war a continuous, or perhaps discontinuous, front

more than a thousand miles long was formed almost immediately. When World War II commenced Sept 1, 1939, the German and Polish aimies both were on a continuous front

Between great nations the continuous front had become a distinguishing feature of war.

# GREEK AND ROMAN TACTICS

The Phalanx and the Legion.—There is so much difference between ancient arms and armies and modern armaments that few tactical lessons can be learned from ancient warfare Certain fundamental principles of combat may be deduced which remain permanent throughout the ages, but principles which are so fundamental that they are applicable to a boxing match, a football game or a battle between a few champions have little value in explaining tactics in the 20th century The evolution of Greek and Roman tactics proceeded from the

identical causes which force the evolution of tactics in the 20th century Armament determines the manner of fighting and the manner of fighting determines tactics The invention of powder gave missile weapons a much more important place than in the past, but their role was far from being insignificant in ancient times The ancient historians did not like to mention

FIG 1-BATILE OF them and preferred to give precedence to MARATHON (490 BC) citizen warriors who fought with the lance showing TACTICS of and sword They had little but contempt CONCENTRIC ATTACK for the auxiliary armed with a bow or

sling Attention is fixed on phalanxes and cohorts, and this has given a false idea of Greek and Roman combat The phalanx and the legion never constituted the ancient armies by themselves They were transformed continually in accordance with the progress of material means and new necessities. The ancients have deplored the decadence of tactics in various times in history, but there never has been any real decadence except from the romantic point of view

The decline of hand-to-hand fighting spoiled the iomance of combat, but it answered real needs and the reforms adopted were imposed by necessity

Cavalry was scarce in Greece and Italy because of limited numbers of horses. The infantry of the line which fought in closed ranks was organized to fight against a similar type of soldier, not against cavalry. It was formed in a phalanx of eight or twelve ranks, but this was not, as is commonly supposed, an immobilized and compressed formation. Intervals between the combatants were between three and four feet and permitted them to manoeuvre their pikes freely Such phalanxes are mobile. They can charge vigorously. Their depth is not

intended to give force to shock action. which in the sense of crushing power has always been nonexistent. On the contrary, it was necessary to have a sufficient number of combatants in each file to replace those who fall while fighting in the front ank In the ordinary battle the fronts came into contact and hundreds of duels took place during which many of the FIG. 2 -BATTLE OF fighters were exhausted, but ordinarily

(371 B C), large numbers were not killed SHOWING TACTICS OF THE The vulnerable parts of the phalanx are OBLIQUE ORDER its flanks and rear. The smallest attack

there causes disaster If the phalanx is split the number of flanks is increased, and the lightest troops could penetrate into the openings and kill the warriors with their pikes. Thus the phalanx was never subdivided It could not manoeuvre for fear of losing its unity. It was necessary to arrange it in order of battle completely before action Thus, mobile troops, either light auxiliaries or cavalry, usually decided the success of ancient combat by their

Even early cavalry without saddles or stirrups often was the element which gave victory on account of its mobility.

In the absence of cavalry it was light infantry. The heavy infantry of the phalanx was the solid holding element

The early Roman phalanx went through several transformations, first becoming the maniple legion, which was a semilight infantry, since it had abandoned the ancient pike for the pilum and the sword Its division into maniples made it more supple than the Greek phalanx It also was completed by archers and slingers who prepared and ended the action The later organization of the Roman legion into cohorts made the legion a

maneouvre unit almost equal to Fig 3 -xenophon's idea of the BATTLE OF THYMBRA (546 B C ), SHOWING TACTICS OF EX-CENTRIC the modern division. Classical Cavalry.-Cavalry entered the scene with the orientals and the Macedonians and then with the Carthaginians. It held first place in their armies with both heavy cavalry, armed with the cuirass and lance, and light cavalry, armed with bows and spears It was the active offensive element and was the arm

of decision both for Alexander and Hannibal The phalanx could not resist it except by main force and increased its weight to the point of becoming nothing but a human fortress with ranks closed to the extreme Macedonian phalanz was able to stop the charge of cavalry but it became paralyzed, unfit to conduct offensive operations by itself. The same evolution took place throughout history after that time.

The offensive spirit of the Romans led them to avoid making the legion heavy. Having been vanquished by Hannibal's cavalry, the Romans procured them- Fig selves cavalry equal to that of (331 BC), showing tactics of the Carthaginians. Scipio crossed REAR ATTACK

to Africa, not only to carry the war to his adversary, but also to get the Numidian cavalry of Massinissa. It was this that triumphed at Zama.

In the armies of Caesar, the archers and slingers were more numerous than the legionaries. They mingled with them in the cohorts and large bodies were formed from them on the wings At Pharsaha they were the larger part of the army. The empire recognized this state by admitting the archers and slingers into the legion, and the legion was reinforced still more by war machines throwing heavy darts and large stones. The Roman soldiers carried palisade planks and these were used to break the charge

The Decline of Infantry.-Cavalry was equipped with saddles and stirrups and covered itself with coats of mail and then with armour in order to protect itself from missile weapons and for cavalry combat. It had the decisive role without question. It attacked and it manoeuvred, while the infantry, massive and paralyzed, no longer had any mission except to arrest the cavalry charges. This was the condition of the Roman armies after the Antonines, and these relationships continued until the 16th and 17th centuries.

Belisarius (c. 505-565) covered his immobile phalanxes with an entrenchment. They awaited the charge of the enemy cavalry, which was showered with missiles, and then the Byzantine cavalry charged in its turn. The English operated in the same manner at

Crecy (1346) and at Poitiers (1356) For the offensive to succeed, it had to take the enemy in the flank or draw the defenders out of their prepared position. It was by these methods that the Goths were the conquerors of the Romans at Adrianople (378), the Arabs of the Byzantines, the Greeks of the Saracens (833), the crusaders of the Turks at Dorylaeum (1097) The infantry became powerless to force armoured cavalry as was shown at Hastings (1066), and at Bouvines (1214) They could not hold except behind an entrenchment and by making use of their missile weapons

Ancient battle was won by envelopment Since the defender operated on interior lines, the envelopment had to be inade by a force of superior mobility, and this force was cavalry Alexander directed his numerous cavality on the flank of his adversary while his infantry attacked the front. Hannibal crushed the Roman armies at Cannae by closing his two wings of cavalry on their flanks The infantry was too slow and too immobile to exercise enveloping manoeuvres It rarely

could do it without breaking its lines and thus exposing addi tional flanks to the attack of light troops It was cavalry alone which, thanks to its speed, could manoeuvre on the flanks It could act in many separate groups which could manoeuvre

SHOWING TACTICS OF REAR B C ). without risk, since the infantry was not able to take advantage of the openings in its more mobile foe. The centre of an army could not be penetrated The only manoeuvre was the enveloping manoeuvre and this manoeuvre was the function of the only

## mobile troops-the cavalry. THE CAVALRY AND INFANTRY CYCLES

The Evolution of Cavalry.-Under Diocletian (245-313) cavalry rose from one-tenth to one-third of the infantry and numbered some 160,000, but this great mass of horse was withdrawn from the infantry, and by being formed into a frontier guard lost its offensive spirit and, generally speaking, was no match for the barbarian horsemen who invaded the empire in the 3rd century. By the 6th century, infantry took little or no part in battles fought on ground over which cavalry, which took to armour, at this time, could move. In 814 a chronicler writes of Charlemagne and his host, "Then appeared the Iron King, crowned with his iron helm . . and round him and before him and behind him rode all his men armed as nearly like him as they could fashion themselves; so, iron filled the fields and the ways. and the sun's rays were in every quarter reflected from iron 'Iron, iron everywhere,' cried in their dismay the terrified citizens of Pavia"

The cavalry cycle reached its zenith in the 11th century. At Hastings (1066) and at Dyrrachium (1081), the English axemen were powerless against armoured horsemen. All that the infantry could do was to remain behind entrenchments and use missile weapons. To the knight of the middle ages stability was no longer afforded by the infantry mass, but by the armour he wore, his mobility being provided by his horse. As long as he was not met by equally well mounted and armouned antagonists, this combination of mobility and stability proved irresistible in the melee, the one and only end of mediaeval tactics.

With the advent of plate armour in the 13th century, mobility was sacrificed to protection, and though it still was possible to dismount the knight, so heavy had his armour become that once dismounted he was unable to move over muddy or broken country. At the battle of Tagliacozzo (q v.) in 1268, Conradin's Ghibelline knights were so heavily armoured that Charles of Anjou's cavalry. after exhausting them by repeated charges, rolled them out of their saddles by seizing them by the shoulders. As armour increased in weight, natural obstacles played a more and more important part on the battlefield. At Bannockburn (q.v.) in 1314, Bruce took up his position behind a stream, and Edward II's knights were bogged just as in Flanders tanks were ditched 603 vears later

The Influence of the Bow .-- A definite change in tactics now set in At Dupplin Moor (q v ), in 1332, Bahol and Beaumont did not heat the earl of Mar by reckless charges, but by skilful weapon co-operation. The majority of their knights were dismounted and formed into a phalanx, the flanks of which were protected by archers, while only 40 mounted knights were kept in icserve for the decision. The earl of Mar charged the phalany, which remained stable, his knights were immobilized by the archers on the flanks, and annihilated by Baliol's squadron This battle is the birthday of a new era in tactics-the tactics of the bow, pike and lance combined It forms the mould in which all the English operations of the Hundred Years' War (q v ) (1338-1453) were cast, a war which proved disastrous to the gallant but insubordinate chivalry of France, as Ciecy (qv), Poitiers (qv) and Agincourt (qv) testify From the battle of Poitiers onwards cavalry falls into a rapid decline, and as the bow and pike destroy them a new weapon arises in the crude bombards of the 14th century, which are about to revolutionize the whole art of war and introduce the infantry cycle

The Influence of Gunpowder,-The rise of infantry was due as much to social as to military reasons. Feudalism, which restricted its use, was attacked by trade as well as by gunpowder The increasing wealth of the 14th century had brought the cities into conflict with the barons, and the result was not only a widespread series of burgher wars but a steady increase in the infantry arm which was, however, powerless to attack the feudal strongholds until artillery came to its assistance. During the second half of the Hundred Years' War this difficulty was overcome, for it was due to the artillery of Charles VII more than to the visions of Joan of Aic that the English were ultimately driven out of France This monarch provided himself with a train of artillery against which mediaeval fortifications proved a poor protection, and next we find cannon used in the open field, as happened at Formigny (q v) in 1450 To all intents and purposes this battle closed the Hundred Years' Wai

Meanwhile the handgun, or Couleuviine, was being turned to advantage by Žižka, in the Hussite Wars For long it had been the custom to laager the baggage wagons in rear of the battles of knights. Žižka now turned this laager into a mobile fortress which he garrisoned with archers, crossbowmen and handgunners Once the knights had shattered themselves against it, he would issue out with his cavalry and destroy them. Thus the Hussites won the battles of Deutschbrod (1422) and Aussig (1426)

The Influence of Artillery .- While the Swiss maintained their pikes and then phalangeal formations which had proved so effective since the battle of Sempach (1386), during the second half of the 15th century such extraordinary progress was made in artillery that the wagon fortress (wagenburg) proved useless. The dismounted English and French knights once again took to horse, and as ordnance began to accompany infantry, more and more could foot soldiers work independently of cavalry and wagon forts The close of the 15th century and the opening of the 16th saw the three arms, namely, cavalry, artillery and mfantry, assuming tangible form In France the infantry were poor on account of the strength of the feudal system. In Switzerland they became decadent as they refused to change their shock tactics. In Spain they became highly efficient, a result of their struggle with the Moors, and under Córdoba, who armed his foot with sword and buckler; against the Swiss and the German landsknechts, in 1502, near Barletta, he repeated the Roman tactics of Pydna: for as Machiavelli says: "By the help of their bucklers and the agility of their bodies, having got under their pikes, and so near that they could come at them with their swords, the Spanish had the day with the slaughter of most of the Swisses."

The Development of the Musket .-- As artillery forged ahead it broke away from close support of infantry. At the battle of Ravenna (q v.) in 1512 it took the enemy in the flank, playing a decisive part in winning victory for the French under Gaston de Foix. At the same time a rapid evolution of the handgun set in. In 1520 the Spanish adopted the portable arquebus fork which stood them in good stead at Pavia in 1525 In this battle fought between the French under Francis I and the Imperialists under Lannoy, we

THE

find a remarkable tactician, namely, the marquis of Pescara, diawing up a skirmishing line of 1,500 Basque arquebusiers who, according to Brantôme, "most wonderfully, though cruelly and villainously, discounted with much ease the power of the French cavalry "

In the wars between Charles V and Francis I the bow and crossbow disappeared Artillery, owing to the development of firearms, was neglected, and seldom more than one gun to 1,000 men was found As fighting in extended order was or developed, the musketeers rapidly grew in

SQUARE INTO THE number The French adopted the line as their tactical formation; the Spanish and Austrians maintained squares, normally of 3,000 men, 25 ranks deep The squares possessed a central corps of pikes, with bas-

tions of musketcers at their corners. Later on, these solid squares were replaced by hollow ones, and at times their four sides manoeuvred as separate bodies This is the beginning of the linear formation which definitely took form during the Thirty Years' War

Gustavus Adolphus and the Thirty Years' War .-- The 15th and 16th centuries were a period of transition, broadly speaking, from the cavalry to the infantry cycle of war. Progress was remarkable in spite of the opposition against which new arms always have to struggle. Maurice of Nassau formed regiments of two battalions, each consisting of 500 men in ten ranks. Pikes were placed in the centre and the musketeers on the flanks; by successive use of small bodies he wore his opponents down, and

FROM CAPT HART, "GREAT CAPTAINS UNVEILED" (BLACKWOOD)
FIG 7 —FORMATION ADOPTED BY GUSTAVUS ADOLPHUS, WITH BAT-TALIONS DIVIDED INTO COMPANIES OF MUSKETEERS AND PIKEMEN

yet kept a reserve in hand. He reduced the numerous calibres of field guns to 24-, 12- and 6-pounders, and substituted iron balls for the hailshot hitherto used. He used his heavy artillery to commence the battle and the light to accompany the infantry and support them closely

Gustavus Adolphus reduced the ranks of musketeers to six. organized his army into brigades, each consisting of two regiments of two battalions each 1,000 strong Each battalion was divided into eight companies, each of which had 72 musketeers and 53 pikemen. In his order of battle the infantry was in the centre and the cavalry on the flanks. In the Thirty Years' War (q v.). he used his artillery to break up the Imperialist squares by overwhelming fire from a distance and then charged home. These tactics, combined with the skill of his troops in manoeuvre, won him his two great battles, namely, Breitenfeld (q.v.) in 1631, and Lutzen (q v ) in 1632. After Gustavus' death, cavalry started to discard its armour and the lance was laid aside in favour of the sword and pistol. Cavalry again became the arm of manoeuvre by falling upon the flank, or rear, of the enemy, and delivered the decisive attack To assist cavalry mobility, frontal fire was necessary, and consequently skirmishers vanish and a rigid line is formed The improvement in firearms, and the introduction of the socket bayonet by Vauban in 1687, reduced infantry to one type. The distinction between pikemen, musketeers, fusiliers and grenadiers was given up, and during the war of the Spanish Succession (1701-14) all foot were armed with the flintlock and the bayonet. Mobility was reduced to a minimum and battles were decided by order and cohesion followed by the cavalry charge.

Frederick the Great .- Marshall Saxe was the precursor of

742 TACTICS

Frederick the Great. He reorganized his armies into brigades and divisions and used this organization through entire campaigns. He made use of artillery to an extent unequalled since the days of Gustavus Adolphus He attempted to open up the dense forma-

tions of his time and ridiculed the results of infantry charges in mass formation. He also introduced the use of redoubts to break up the enemy charges and located his redoubts so that they Fig 8 -MARSHAL SAXE'S COMBI supported each other by fire

FANTRY AND CAVALRY Frederick the Great divided his infantry into companies, established a definite drill, and formed his line of battle in three ranks. His cavalry was deprived of its firearms and was taught to charge boot-to-boot and to rely on the arme blanche Initially, he attempted to forbid his soldiers to fire in the attack. But in 1758, he commenced to write that "to attack the enemy without procuring oneself the advantage of superior, or at least equal, fire is to wish to fight against an armed troop with clubs, and this is impossible." Ten years later, in his Military Testament, he wrote "Battles are won by superiority of fire" A decisive word, remarks Captain J Colin, which marks a new era of combat. He invented the "oblique order" to attempt to wash around the enemy flank without splitting his formation. Leuthen (qv) (1757) is probably the finest example of the Frederician tactics. This was modelled on Leuctra (qv). Like Alexander, he refused one wing and assaulted with the other, the refusing wing acting as a reserve to that part of the line not used in hand-to-hand combat

Not only did Frederick realize that artillery should prepare the infantry attack, but that it should search out the enemy where the terrain concealed him, and consequently he increased his

howitzers to one-third of his total guns and massed them against the defender's flank Frederick breathed only the offensive, the offensive always, in every situation, in the whole of the operations as well as on the field of battle, even in the presence of a superior enemy. He brought the art of ancient war to the highest degree it attained. It remained for Napoleon to take advantage of all the new possibilities of warfare which had been developing during the 18th century and FLANK ATTACK to commence an entirely new cycle of tactics.

NAPOLEON AND 19TH-CENTURY TACTICS

Napoleon.-Napoleon fought more battles than Alexander, Hannibal and Caesar combined. With the French Revolution, all tactical shibboleths were cast to the winds; cohesion disappeared, and man took to natural fighting, that is, skirmishing. Marshal de Broglie (q.v.) had adopted a permanent divisional organization in 1759 and had concentrated his army rapidly by the as-sembly of these units. The divisional organization and marching in small columns permitted rapid deployment on the battlefield. whereas the old procedures had required from six to eight hours to form a line of battle. Marshal de Broglie had developed the principle of dispersion with units within supporting distance, in camp and on the march, and concentration on the field of battle Gribeauval had reduced the weight and increased the mobility of artillery so that it could manoeuvre with infantry Accurate maps were becoming general, an important matter in handling dispersed forces.

The theories by which all these changes could be utilized had been expounded by Guibert, du Teil and Bourcet. Napoleon appreciated the importance of artillery. He massed his guns to deliver the decisive attack. After Aspern-Essling (q.v.) in 1809 he increased his guns from two to three to each 1,000 infantry. He also created a central artillery reserve with 126 guns, and

allotted a reserve artillery to each army corps From Wagram (1800) onwards "it is the number of pieces rather than that of battalions which henceforth serves as the measure of the relative strength of armies

Napoleon wrote "The better the infantry, the more one must husband it and support it with good batteries The invention of nowder has changed the nature of war, missile weapons The power of infantry have now become the principal ones . hes in its fire

Napoleon's tactics and strategy were intertwined. Whereas in former wars the armies could refuse or give battle as they chose. since it took so long to form the order of battle. Napoleon's march formations and high speed of marching permitted him to march toward the enemy with his plan of battle already prepared and to force the battle when he chose. His strategical scheme was to march past the enemy by a series of forced marches, protecting his flank with a natural obstacle and then to come up in the rear of the opponent, forcing him to turn and give battle at a disadvantage. His tactical scheme, or system of battle, was based on a holding attack against the enemy's front to keep him occupied. a wide envelopment or turning movement on the enemy's rear with a small force to spread dis-

TACK OF A DEMI-BRIGADE

may and confusion in their ranks. and then the decisive blow This was given by a powerful attack, usually against a flank and was prepared by the concentrated fire of a mass of artillery

The Influence of the Rifle.—Napoleon taught the armies of Europe how to fight, but none ever equalled him. With the improvements made in the rifle they continued to attempt to fight battles in the massed formations practicable in Napoleon's time Two important inventions influenced tactics tremendously, namely, the percussion cap invented in 1814, and the cylindro-conoidal bullet invented in 1823. Previously, lifles and muskets had been fired by a flint and steel, and in rainy weather frequently misfired

The percussion cap increased the rate of fire to such an extent that it signed the death warrant of the cavalry charge. The conoidal bullet revolutionized artillery tactics. In 1839 the percussion musket was issued to the British infantry, and in 1851 they were equipped with the Minié rifle, with an effective range of 1,000 yards

In 1815, cavalry, artillery and infantry were in close contact, and were operated by the general-in-chief as easily as a platoon is today. The guns frequently were placed in front of the infantry and the cavalry close behind them. All this was changed by the rifle The cavalry could no longer attack infantry, unless completely broken The guns had to retire well in rear of the infantry, and as the range of the rifle was increased so was the distance between them and the infantry they were supporting. Thus the old battle order, which in idea had changed but slightly since the days of Gustavus Adolphus, was completely thrown out of joint. To operate an army as Wellington did at Waterloo was impossible; to render its separated parts co-operative demanded intelligence and not merely a powerful voice. The Prussians seeing the difficulty attempted to overcome it by replacing the general by an army fashioned like a clock, which once wound up was expected to tick out victory. The English maintained their fox-hunting generals, and the French, contemptuous of others, since they had produced one of the greatest geniuses in history, shrouded their ignorance in the glamour of his fame

Tactics from 1849 to 1870 .- This period was noteworthy for the increasing importance and effectiveness of artillery, continual improvement in the rifle, and the failure of armies to adapt their mass formations to cope with the effects of fire. Likewise, fire was not used to its full advantage. In 1859, the French made extensive use of skirmishers in the war against Austria and Italy This was due, however, to the inferior rifle of the French The broken nature of the ground favoured these tactics In 1859, the Austrian tactics were of a defensive nature, in 1866 they were diametrically opposite, that is, they were offensive, and with these tactics they decisively defeated the Italians under La Marmora, masses of Austrians who, almost unprotected by skirnushers, attempted to rush the Prussians armed with the needle gun were decimated

The Prussian army neglected the combined employment of the different arms. It considered that the bulk of its artillery should he held in reserve for the final act of disruption, and that the mitial destruction best could be attempted by a methodical infantry fight. One-thard of the guns were used to support attack. one-third to reinforce it and the remaining third were held back in reserve. Thus the battle of Trautenau fought on June 27. 1866. and that of Nachod, on the same day, were fought almost entirely without artillery But at Koniggratz the methodical attack was replaced by the manoeuvic battle, and artillery instead of being held in reserve for some problematical decision was brought forward

In the American Civil Wai (q v ) (1861-65) the most prominent tactical lessons were the power of the rifle on the defence and the ever-increasing use of entrenchments to enhance this power It was a common saying in the Civil Wai that one soldier behind entrenchments was worth three assaulting him. And Grant, when held up by Confederate breastworks in front of Richmond, said that they were so perfect and so extensive that the power of the defence was as five to one The battles of the American Civil War were models of the enveloping manoeuvre It has been said that the Civil War was fought with Jomini's Summary of the Art of War in the pockets of all the high commanders The American Civil War also was notable for the effective use of cavalry which. instead of following the European model and attempting to imitate days of chivalry, was used as mounted infantiy. In the American Civil War, influence of railroads on the supply of armies first became important. Field telegraph and observation balloons likewise enabled commanders to issue orders to widely dispersed armies and to watch the enemy more closely

European soldiers, in general, were contemptuous of the Amerıcan Cıvıl War because very quickly the American soldier learned that massed formations were deadly and impracticable and fought habitually as skirmishers. The Europeans considered the American Civil War to be a battle of armed mobs and unworthy of study It was not until the publication of Colonel G F R Henderson's Stonewall Jackson in Great Britain in 1898 that the Civil War commenced to be carefully studied in Europe. After the war of 1914-18, it was realized that the American Civil War could have supplied many lessons for the conduct of that struggle. and the tactics of this war were studied in the years before World War II more than in any period.

In 1870 the Prussians possessed the superior gun and the French the superior rifle. Although Moltke attempted to spread his armies and conduct enveloping manoeuvres, his generals, in spite of orders, led their troops into enormous huddles in which the casualties were appalling. The battles actually were won by enveloping manoeuvres, and in spite of the army commanders. And here again the soldiers instinctively spread out as skirmishers, to fight and not to die The persistence with which armies maintained close combat formations and resisted dispersion on the field of battle probably was due to the difficulty of control of dispersed formations

Artillery had become a stable element in the war of 1870. It was shown that massed defenders could be so completely broken by gunfire that the infantry attack consisted merely of occupying the ground. It was found that infantry armed with the breech-loading rifle had nothing to fear from cavalry. It was proved essential that all the artillery should be in line to initiate the attack, and must not only crush the enemy's artillery but prepare the infantry advance by a long bombardment. Throughout the war neither the French nor the Germans succeeded in taking a single position by a frontal attack.

Tactical Theories, 1875-1900 .- In 1870-71 the French lost battle after battle, yet they came out of the war as oblivious of its lessons as did Frederick's mule after its tenth campaign From 1875 to 1900 French regulations maintained the complex system of firing line, supports, local reserves and reserves in echelon. The

at Custozza (qv) In Bohemia it was otherwise, for the solid infantly regulations did not even mention artillery, which was supposed to have completed its task by the time the infantry attack was launched. The power of fire was recognized, and in order to develop it to the full, about 1895, whole battalions were moved forward in single rank without intervals between the men, and were called "skiimishing lines". Behind these walls of rifle fire 'decisive attacks," whatever these might mean, were to be launched forward by brigades and divisions in mass. In an official report written in 1875 can be read "Troops massed in column, or in line in close order, can no longer manoeuvre, fight or even remain in position under fite." Twenty years later, this lesson having been forgotten, the regulations extol dense formations, not for marching and manoeuving only, but for the attack itself "Tromes de choc." "masse de manoeuvie" and such like metaphysical terms were invented. It was considered that well-led troops must overcome all obstacles. A ventable spell fell not only upon the army of France but on all the armies of Europe

The South African War, 1899-1902 .- The South African War did little to dispel this hallucination. Aitillery action was negligible, and infantry formations, which at first were dense, were thinned out into a line of men at from 10 to 50 paces between individuals. To command such a line was impossible. To those who could read tactics aright the outstanding lesson was the power of the rifle on the defensive At Modder river (1800) the British had 3,000 men on a front of 7,000 yd , at Colenso in the same year 4,500 on a front of 13,000 yd, and at Magersfontein (1899) 5,000 on a similar frontage. These fronts could not be pierced Again, as had been learned in 1870, frontal attacks even against weakly held positions were no longer possible. The wai ended through the gradual attrition of the Boers

The Russo-Japanese War, 1904-05.-The Russo-Tapanese

War (q v ) was characterized by increasing use of entrenchments The machine gun, when efficiently handled behind entrenchments, added enormously to the defence and the uselessness of the frontal attack was demonstrated clearly. The Japanese army followed the German doctrine of enveloping manoeuvre. Artillery was driven further and further back by the bullet until the gunners were compelled to seek cover and adopt indirect firing tactics With the increasing power of the defence, it was demonstrated that artillery had become a decisive arm of battle. No other weapon was able to disorganize the system of machine-gun fire and entrenchments In broken ground the Japanese made use of moderately thick skiimishing lines, but in open country they had the wisdom to thin them out from five to ten paces between men, the men being rushed forward in twenties, 20 to 30 paces at a time In the period between the Russo-Japanese Wai and World War I, the professional armies of Europe, with customary soldier conservatism, failed to evaluate the lessons provided by the Russo-Japanese War concerning entrenchments, machine guns and artillery.

### THE EVOLUTION OF TACTICS IN WORLD WAR I. 1914-18

French and German Tactical Doctrines Prior to World War I .- In France there was a remarkable variance between the official doctrines as published in regulations and the unofficial doctrines taught at the French general staff college Official doctrine recognized the effects of fire and the danger of fire to massed troops, but it failed to realize the extent to which fire slowed down the operations of battle The infantry was expected to fight as skirmishers, but the men were to be deployed only at one-pace intervals The mobile defence was not considered, on the defensive the infantry unit was ordered to "resist to the end; each man will die in place rather than give ground" Cols de Grandmaison and Foch were the high prophets of the unofficial doctrine of the "offensive a outrance," the headlong offensive This was the moral school of war whose object was battle "Hence the idea of shock," declaimed Foch to his students, "composed of two terms: mass and impulsion." The impulsive force was morale With enough morale the shock became irresistible. But sadly, the unarmoured bodies of the French infantry were not irresistible to machine-gun fire. In the general staff college the defensive was so stigmatized that instructors did not dare to present a defensive cavalry divisions. The attack broke down in front of the second situation in a map exercise, much less in a manoeuvic on the

Like the Fiench, German doctime sought the destruction of the enemy by offensive battle German doctrine emphasized the spirit of initiative and the enveloping manoeuvre by units of whatever size Germany adopted the line of skirmishers as the battle formation but the regulations added "It should be considered that the abandonment of close-rank formations is an evil which should be avoided whenever possible " German adherence to these formations presented the French artillery with superb targets during the early part of the war. German doctrines recognized the effect of fire and insisted upon the gaining of fire superiority in the offensive. Frequent use of field works was prescribed for the infantry and after 1011 it was required to participate in numerous fortress manoeuvres conducted in accordance with the regulations for the attack of fortified places.

To sum up, the French, as well as the German official doctrines. maintained the ascendancy of the offensive, but in a more reasonable and methodical manner in Germany than in France Both made every effort to provide the offensive with superior power by economy of force for other purposes, to gain surprise, to combine the action of all arms, to pursue vigorously and rapidly, and finally both emphasized the importance of moral superiority. Neither appreciated the effect of fire fully and neither was prepared for the use of entrenchments on the scale which developed

The Period of Manoeuvre Warfare.-The battle of the Marne showed the results of a clash between two magnificently trained armies, both imbued with the doctrine of the offensive, German losses including Jan 1915, were 747,465 men killed, wounded and missing French losses in the same period were 854,000 men, while British losses were about 101,000 The German troops had better training in manoeuvre, and hence their losses were about 25% less than those of the French and British combined. The machine gun reigned mistress of the battlefield by its material and moral effect. The second phase of the battle of the Marne was characterized by continuation of the enveloping manoeuvre on a grand scale. The initiative of the movement passed alternatively from the French to the Germans The result of this was the contest for speed which was to end toward Oct. 20 when fronts were extended to the sea

Beginning of Position Warfare.-This period covers the winter of 1014 and the year 1015. The German army commenced extensive field fortifications with trench lines protected by barbed wire entanglements and other traps before the French gradually established themselves in some sort of fashion in holes they had been forced to dig to escape the effects of fire. Thus was born a new form of war, stabilization on a continuous front. The use of field fortifications revived the old struggle between projectiles and protection, with the defender continually striving for better protection from fire, and with the attacker increasing all his efforts to crush such organization by putting into service matériel of greater and greater number and power.

The Allied offensives of 1915 showed a steadily increasing dependence upon artillery. It was the amount of artillery which determined the scope of the attack, not the numbers of infantry In the first attempt to break the German front at Perthes between Feb. 15 and March 18, the frontal attack was limited to four and one-half miles because only about 100 heavy guns were available In the Artois offensive an effort again was made to break through on a front of nine miles by five corps, with 400 pieces of heavy artillery supporting the attack with a four-hour preparation This attack showed that the rupture of a solidly organized front consisting of a single position of resistance was feasible The German realization of the same conclusion led to the development of several successive defensive lines, so the continuous front was evolving from one line to a whole series of lines to which troops could withdraw and toward which reserves could flow to block an attack

In simultaneous attacks in Champagne and Artois 1,140 pieces of heavy artillery, 500 trench mortars, caliber 53, and 30 trench

German position after having progressed 3,000 or 4,000 yd on a 12-mile front. The final check resulted from the inability of the attack, which had been disorganized by the first assault, to go up against the second position. It was clear that the capture of the second position presented difficulties which the leaders of the armies did not know how to overcome. The offensives of 1915 cost the French 1,292,000 casualties, of whom 391,000 were killed, missing or pusoners. It was strange that it was not realized what a large proportion of these losses was due to such an easily correctable mistake as the excessive density of the attack formations German losses on the French front were approximately 507,000 during the same period, a tribute to the better tactical adaptability of the German army to new conditions. Even so, the German army at this time still was attempting to hold first lines to the last man

1916-Development of Tactical Methods,-The offensive of Sept 25, 1915 had brought out the difficulty, if not the impossibility, of carrying successive hostile positions, whose depth now exceeded the effective range of artillery, in one effort. The doctrines of 1016 considered the offensive battle as a series of attacks of successive positions and not as a single and brutal action Hence, the battle was to be conducted methodically from objective to objective and always included a minute artillery preparation Minute preparations for the offensive were recognized as necessary It was finally understood that the engagement of large cavalry units, after the first phase of offensive action, had become impossible. The necessity for team work between the different arms was recognized, but no steps were taken to ensure the permanent assembly of combat teams of the combined arms in units smaller than the division

The two great offensives of 1916 were the German offensive against Verdun from Feb 21 to July 11, and the Franco-British offensive on the Somme from July 1 to the end of November. Verdun developed into a battle of attrition in which the German attackers lost 278,000 men to the French defenders' loss of 442,000 Tactical surprise was obtained by the power and rapidity of the artillery preparation which used 2,000 cannon firing for nine and one-half hours Allied offensive methods on the Somme paralleled the German methods at Verdun They hoped to wear down the enemy as well as to break the front. They failed to secure the mitial surprise such as the Germans had effected. The Germans lost as many men defending in the first two months on the Somme as they had lost attacking for five months at Verdun and had put into action nearly the same number of divisions on each front.

Here appeared definite proof of the growing power of the offensive. At the same time, troops on the defensive were beginning to make use of offensive methods, ie, the counterattack, in order to maintain the defence Although it seems unreasonable that troops in the open attacking should have fewer casualties than troops in trenches defending, this apparent paradox is not difficult to explain. It is due to the effect of artillery fire. The attacker assembles secretly a greatly superior mass of artillery, destroys the hostile machine gun emplacements, eliminates much of the defensive artillery, and thus prepares the way for his own infantry to move forward in relative safety. Although the evidence was there that the offensive was regaining the supremacy which it had lost to defensive organization and the multiplication of automatic weapons, the methods of attacking effectively and of keeping attacks going after the initial assault had not been discovered. It was not until the German offensive in the spring of 1918 that advantage was taken of the powers of the attack.

In 1916 it was first recognized that air advantage had become a new condition for success. The use of gas-filled projectiles was generalized quite extensively in 1916 British tanks made their first appearance on the Somme on Sept. 15, but they were too few in number and the infantry which accompanied them did not know how to operate in liaison with them. The offensive power of the infantry itself also had been increased by wider use of automatic rifles, hand grenades, and the 37-mm. gun. Artillery was perfecting the mechanism of fire and, starting in June at mortars, caliber 248, were used with 53 infantry divisions and Q. Verdun, the rolling barrage, regulated by the rate of the infantry TACTICS 745

and preceding its advance, was introduced. Motor transportation was used on a large scale for the first time at Verdun, then on the Somme. The "sacred road" carried a daily capacity from 5,000 to 6,000 trucks which represented a density of about one vehicle every 15 seconds.

The necessity of a mobile defense was recognized for the first time. The Germans recognized the excessive density of troops in them first lines as one of the principal causes of their excessive losses on the Somme, and prescribed greater echelonment in depth on the defense so as to constitute a fortified zone 5; to o km deep, capable of hemming in an attempt to penetiate it. The conduct of the defense was to consist of real manourier. Local attacks were to be launched to disrupt offensive preparations. Artitley fine was to be used to destroy hostile artillery. Reserves were to be used defensively in the form of complete counterattacking divisions held in the rear beyond artillery range.

1917—The Year of Extreme Solutions.—The use of artilleny was increased to save the infanty from its paritysis in front of automatic weapons and barbed wire. In the Asine offensive in the spring 2,000 pieces of heavy artillary, 172 155,5mm GPF guiss and 1,650 pieces of trench artillery were employed on a 25 m front, but the attack broke down against the secondary positions. Tanks were used under unfavourable conditions and suffered severely from German artillery. The elephaniass of shell fire reached its zenith in the third battle of Ypres (g v). This battle slated approximately three and one-half months, and each square mile of mid genied cost the British army 3,22 casualties states of Aug. 20, north of Verdon, reached the figure of one gun per seven yards of front, while at Malimano, Oct. 25, the density was one zun per sa yards of front.

In the Cambrau offensive of Nov. 20, the British used large numbers of tanks and finally attained surprise by completely dispensing with artillery preparation and commencing the battle with a tank attack. The initial success was very great, but methods of co-operation between infaintry and tanks had not been well developed. Tanks left the infaintry behind, while the cavalry, which was supposed to enter the gap, was held up by solated resistances passed over by the tanks. It was shown at Malmason that hostile artillery could be neutralized more effectively by short and intense bombardment by persistent gas than by days of attempted destruction with high explosives. This lesson, however, was to be learned by the Germans more effectively than by the Allbes and used by them in their offensives in the spring of 1918.

1918—Breatking the Continuous Front.—In the battle of Picardy, which commenced March 21, 1918, extreme measures were taken by the Germans to ensure surprise. Fifty divisions marched nine nights. Camouffaged rest areas hundreds of yards square were constructed to concest the divisions marched nine nights. Camouffaged rest areas hundreds of yards square were constructed to concest the divisions in the daytime. Wheels of all vehicles approaching the front were wrapped to make them silent. False activity was conducted at many other points equal to the necessary visible activity behind the front of the attack. Troops marching at night had orders to face about and reverse their direction of march if they were discovered by flares dropped by aerosphanes. There were 6,475 cannon and 3,532 trench mortars assembled on a 4,4 mi. front for the artillery preparation of five hours and ten minutes.

As to notical procedures, the battle was divided into two phases. Durng the first phase, or battle of position, the infantry advanced under the cover of the rolling barrage. The artillery first and plans of advance were all munutely co-ordinated by the higher commanders. The second phase commenced as soon as the limit of the rolling barrage was reached; or whenever the infantry lost its liaison with the artillery. During this phase the initiative was to be assumed by the battlelion and regimental commanders and they were to move forward searching out weakness and passing by strong points as rapidly as possible and without regard to units on either side of them. In order to make it possible for the smaller infantry units to advance, they were organized into small combat teams, each battalion having accompanying artillery and engineers so that the infantry commander would have under

his own control the power to ieduce minor resistance beyond the

Although this attack was an outstanding success and succeeded in tearing a great hole in the front between the Bittsh and French armies, the Geimans were unable to exploit the gap rapidly enough German initial superiority was roo divisions to Allied 175, or eight to seven. The actual numerical superiority was less than this Ludendouff had not counted on the slow highly more produced by the first three days, while the actual advance amounted to a fam. The lack of rapidity in forward movement gradually wore out the effects of suprises in the break-through, and French testress arrived in time to re-establish the continuous line.

The German offensive of May 27 on the Aisne repeated the initial success of the offensive of March 21 This attack also was The French had not followed General Pétain's prea summe scriptions which required that the forward defensive line should he lightly held and the main resistance should be made on a line to the rear The result was that the French reserves attempting to flow forward to support the heavily occupied front lines were en-The attack progressed from 15 to 25 km all along the front Had forces for exploitation been available early in this offensive, the road to the rear of the Allied armies was wide open again, but these did not exist The Germans had used 42 infantry divisions in this offensive by June 4, had advanced 50 km. The new military problem posed in World War I-the break-through of a continuous front-had been solved by the Germans though they had been unable to exploit its success (T. R PH ; X)

## EVOLUTION OF TACTICS UP TO WORLD WAR II

Two schools of thought concerning the power of defense grow up after World War I. One contended that the defensive was constantly growing more impregnable and that it was hopeless to attempt to break through barriers of obstacks, automatic weapons and cannon that science, invention and industry would produce. The other interpreted the lessons of 1918 to mean that a produce, the produced and conducted offensive could overcome whatever defensive advantages may have developed

While French official doctrine continued to maintain its faith in offensive operations, the general public's reaction from the casualities of World War I, which mistakenly were blamed on the offensive, supported a defensive theory. This led to the construction of the Maginot line which, according to one French general mentality of the French nation was defensive, even though the official doctrine was offensive as of the property of the proper

German doctrmes after the war developed in an entirely different way. Whereas the French doctrme prescribed the utmost in prudence and centralization, that of Germany emphasized speed in the attack and the maximum in intuature, boldense and decentralization. Every unit was expected to manoeuvre independently and the enveloping attack was stressed as the most effective form of manoeuvre. The counterstack was emphasized as the most important element in the defense.

Theories of Tank Employment—The evolution of theories for the employment of tanks went hand m hand with the evolution of tactical doctrines. The tanks of World War I had scored one great success at Cambria, although it had not been exploited and led to no result Schools of thought in tanks were represented by those who beheved in the tank as a sort of modern cavalry going off on independent missions by itself, and by those who believed that the tank was purely an infantry auxiliary, incapable of independent action.

In France the doctrine was consistently held that tanks primarily should support the infantry. The French scheme of employment was to have the artillery prepare the way for the tank attack, much as it had prepared the way for the infantry attack in World War I; then they would move out in successive waves with 300 or 400 yd. between waves The infantry would receive no artillery support but would depend upon the tanks to destroy any resistance that held it up. The French scheme did not take advantage of the speed of the tanks but instead tied them to the

ınfantry

Development of Mechanized Forces of All Arms -Ougnal conceptions of tank forces had visualized them either as iron cavalry units with some attached artillery canable of making raids but incapable of undertaking any serious operations, or as infantry supporting weapons incapable of independent action. In Germany these conceptions were discarded and a large percentage of the tank forces were organized into complete high-speed mechanized teams of all aims. Called the panzer (armoured) divisions, they consisted of one brigade of about 450 light and medium tanks and another of infantry in cross-country motor vehicles with half tracks, motorized artillery and motorized machine guns, anti-tank guns, etc Here was the first development of a fighting team with a speed different from any hitherto used in warfare. The German armoured division had a composition which made it capable of defensive as well as offensive action. It not only could overcome fair resistances with its own means, but it had enough infantry and supporting weapons to hold Aimoured divisions in Germany were organized into armoured corps. These might be composed of one armoured division and two motorized divisions, or of two armoured divisions and one motorized division, depending upon the task to be accomplished

In France the conception of armoured divisions was present. The official Instructions for the Toucacle Employment of Long Units, published in 1937, recognized in the foreword that there should be two types of teams (1) the ministry division moving at the speed of foot marching, and (2) the mechanized division moving at the speed made possible by motor. French doctrine, however, was ahead of French practice and at the outbreak of World War II in Sept 1939, France had only three mechanized divisions, whereas Germany had ten.

Cavalry .- In Germany, the cavalry was finally reduced to a single brigade of three regiments in East Prussia, and this was included as a minor element in the general German organization of "fast troops" Horses, likewise, were used in the organization of squadrons whose purpose was to conduct the close-in reconnaissance for the divisions and corps. In Great Britain, after much discussion, cavalry was almost entirely disbanded. In France, it was retained both in the metropolitan army and in the colonial annies The USSR, and Poland likewise maintained large numbers of cavalry In the United States, the development of mechanized formations was assigned to the cavalry, which much preferred the horse, with the result that horse cavalry was retained in considerable proportion in the U.S army, while mechanized development was behind that of any other great nation in the world When the German mechanized formations proved themselves so formidable in Poland, the United States was confronted with the paradox that the greatest industrial nation on earth had the least industrialized army.

Spanish Civil War.—The Spanish Civil War (July 17, 1936— March 19, 1939) was proving ground for theories and weapons developed, since the close of World War I. It was so used deliberately by Germany and Italy, and by the U.S.S.R. to a lesser extent. Other autions were inclined to discount the lessons to be learned in Spain because relatively small forces and limited amounts of matériel were used

The principal lessons from the Spanish war were: the vulnerability of light tasks to anti-tank weapons; the enormous assistance that aviation supplied to ground forces by bombing operations similar to artillery support on hostile lines and rear areas; the failure of bombing to destroy civil morale, the extreme difficulty of bombing roads and railrosads with sufficient intensity to disrupt their functioning; the vital importance of a well-trained infantry; the tremendous assistance that tanks could brung to the infantry stack; and proof that fighter aviation still was able to overcome bombers in combat.

The Doubet Theory.—Another outgrowth of the belief in the impregnability of defensive lines was the so-called Doubet theory, Gen. Giulio Doubet of Italy contended in his book Mastery of the fir that future wars would be fought on a continuous front, and that both defensive fronts would be so strong that neither contender would be able to break through. His solution to the sup-

posed invulnerability of the fronts was to pass over them with bombing planes and destroy the hostile industrial and transportation systems. General Doubet carried his theory far enough to include terioristic hombing of the civil population as a legitimate objective in the effort to make the enemy was for posace.

It was noteworthy in Germany, wheie the Doubet theory had considerable support for a time, that when the Pohish war was lought in Sept 1939 German avantion confined itself to attacks on objectives that would assist the advance of the ground forces. These objectives included Pohish avaistion and Pohish transportation facilities, as well as troops and services directly in the lear of the ground armies.

Tactical Doctrines on the Eve of World War II —The great latical problem confronting the aimes of the world after Wold War I had been to estore mobility to the battlefield. Even before the Armstre of 1918 the stalemate which had followed the appearance of the machine gun and great quantities of artillery had already seemed to be on the wase. The first use of the armound tank was one portent of future trends. The Alhes, however, had used tanks in pecceneal fashion, so that no new tactical concerv were immediately formed. Another portent was the Ludendorff attack by infiltration in March 1918. The driver failed ultradiction to the state of the process of the state of the process of the state of the process of the state of the

The development of mass-production methods for the manufacture of reciprocating engines provided the real means for restoring mobility to the battlefield. The years between World Wars I and II saw the growth of facilities for the quantity production of aeroplanes, armoured vehicles and cargo carnets. Armies no longer had to rely on the mustel power of men and animals. Relative quantity and quality in planes and tanks and the soundness of actual season of the comparative strength of the world's armies on the tacts deviated for their employment were the main criteria for assessing the comparative strength of the world's armies on the national expiration of the world's armies on the national expiration and the production of the world's armies of the world's armie

All the major nations stressed the offensive in their official doctunes But doctrine was often contradicted in actual practice. The French in particular, as mentioned above, relied on defensive measures, the Magnot line was a dominant element in tactical thinking. French plans were to hold in place defensively with infantry and artillery until the enemy wore humself out by repeated efforts, at which time the French were to launch an overwhelming offensive

In Great Bittain national apathy and small budgets retarded the development of tanks and armoured forces until the very eve of the wai. The same was true of the United States. The air forces of the two nations after World War I showed strong tendencies toward independence and separation from the airny In Great Britain this organizational change was made within a few years.

The Soviet Union, with its wealth of manpower, made vigorous efforts to mechanize at least a part of its army. The Russans experimented with light and heavy tanks and their air force was closely integrated with the ground army. It was strong in a trillery, mostly horse-drawn. The real strength of the Red army continued to be its masses of infantry.

The Japanese army was built around its infantry. Tanks were light and designed to accompany infantry units; its air force was tactical in composition and was part of the army.

When Adolf Hitler began to rebuild Germany's armed strength in volation of the treaty of Vessailles, his general staff was able to start afresh, unburdened with weapons and transport of an earlier generation. They could create an entrely new army, designed to harness the aeroplane and the armoured tank into powerful offensive weapons. The result was the Paneer-Stuka team. But at the same time the Germans did not neglect infantry. The mass of the combat force was organized into infantry divisions, The weight and firepower of the infantry-artillery team gave the German army power; the shock and speed of the Paneer-Stuka team gave it mobility. Its enemies were soon to be discomfitted and discredited by the early successes of the Wehrmacht. The

fectiveness of the army they had built so rapidly

#### EVOLUTION OF TACTICS IN WORLD WAR II

Campaigns in Poland and Western Europe, 1939-40 .- The German army's tactics in Poland in Sept 1939 and in France and the Low Countries in May-June 1940 were to be followed in the main by all the armies taking part in the war. In Poland, the German attack began with a conventional infantry-aitillery oftensive. When the Polish line had been penetrated, the armouned divisions poured through with orders to deepen and widen the break with all possible speed In World War I such penetrations normally failed to become more than shallow salients. Now the speed of armoured vehicles permitted the Germans to pass rapidly through Polish lines and stuke deep into the Polish year. These penetrations were followed by many separate engagements involving small forces of Poles which were systematically isolated and destroyed by hard-hitting German units

Meanwhile the German air force attacked communication lines and centres, troops concentrations and other targets of opportunity with light and heavy bombers and fighter planes aimed with machine guns This prevented the Polish command from reacting in time to cope with the penetration. The campaign was a brilliant justification of the air-armoured team, a Polish army of almost 1,000,000 men was destroyed in less than a month

The campaign against France and the Low Countries in the

spring of 1040, following the occupation of Norway and Denmark. combined conventional and unconventional tactics and techniques Despite the months of waiting between Sept 1939 and May 1940. the Allies had failed to cover the exposed left flank of Belgium and the Netherlands When the Germans attacked the Netherlands, Alhed reaction was not fast enough to close the corridor. Actually the German effort in the Low Countries proved to be a feint designed to lure French forces away from the Ardennes where the main effort was to be made. German success was due in part to their employment of parachute and glider-borne troops About 4,000 parachutists seized Dutch airfields, bridges and crossroads The Belgian strongpoint, Foit Eben Emael, was invested by both glider-borne forces and by a frontal attack of specially trained engineers armed with flame throwers and explosives These operations had historical importance as the first uses, on a large scale, of the tactics of vertical envelopment

While the Allies were attempting a defensive stand in the Low Countries, the Germans prepared to unleash their main effort through the Ardennes, an army group with an available strength of 86 divisions of all types was given this mission. The first movements, more like an approach march than a tactical operation, were made by three panzer corps, arrayed, according to B H Liddell Hart, in three tiers, the first two comprising armoured divisions and the third motorized infantry divisions. The advance across the forested Ardennes hills was more a logistical than a tactical achievement. However, it achieved tactical surplise. The first armour in the sector crossed the French frontier on May 12 and pushed forward without waiting for infantry to come up The leading units reached the Meuse river and that night reserves closed up On the following day, while armoured infantry began the crossing, the Luftwaffe appeared with about 1,000 aircraft to protect the effort. There, as in Poland the previous year, German dive bombers performed the functions of artillery for the leading German units Crossings were made at three points against little opposition. A gap of 50 mi was cut in the French lines behind the Moselle, and the panzer divisions drove behind the backs of Allied forces in Belgium. Fears of a French counterattack on the German left flank led the German commanders to hold their armoured and mechanized units in check for several days, and to insist that the pace be that of the slower moving infantry units. whose mission it was to protect the open flank. No counterattack materialized. The French command had paved the way for the German success when it rushed its left-wing forces into Belgium to meet the German feint.

Following the evacuation of the British at Dunkirk, 40 German divisions were turned toward the French. Facing them were 37

German generals themselves were sometimes surprised by the ef- divisions but their deployment lacked the depth and effective orgamzation needed against the swift and relentless attacks Maginot line was struck from the rear, while German infantry made holding attacks in front of it. The end of organized resistance in France soon became mevitable

The speed and completeness of this victory surprised the Allied and neutral world, and even the Germans The offense seemed to have gained ascendancy over the defense to a far greater degree than ever before The whole lesson of this operation was not immediately understood. Blame for the disaster was placed on French leadership, military and civilian, during the years between wais, while much credit was given to the new and brilliant operations of the Panzer-Stuka teams There was a tendency to overlook the great masses of German infantry and artillery which had held the French in place while mechanized units were pushing to the vital rear areas German infantry also had the important consolidating role of destroying strong points by-passed by the mechanized units, and of protecting the flanks of the armoured columns

A prime cause of the dramatic successes of German armour was Allied weakness in anti-tank weapons The occasional real successes by scattered French and British anti-tank units in destroying German armour supports this view A more imaginative high command, a better national esprit and a large quantity of modern anti-tank guns and land mines might have brought a far different decision in the battle of France Instead, the campaign created a conviction of German invincibility on the battlefield, a conviction that influenced western thinking until nazi reverses on the soviet front demonstrated that the Wehrmacht was mortal after all,

German Campaigns in the U.S.S.R.; Red Army Tactics .-The Polish and western European campaigns introduced the world to blitzkreig or lightning war Against Soviet Russia, beginning in June 1941, German successes were at first as great as those in western Europe a year earlier

The eastern campaigns of 1941 had as their objective the annihilation of the Red army. For a time, German application of the Cannae tactics of double envelopment on a larger scale than ever before were particularly effective. Large segments of Red army forces were encircled and destroyed, they were forced into such great sahents as that of Minsk, which was 250 mi deep. But two factors worked against blitzkreig poor roads, and the almost inexhaustible reserves of Russian manpower. Despite gloss errors in defensive tactics (or lack of any tactics at all) the Red army was not annihilated The ability of the soviet forces to trade space for time and their willingness to employ a scoiched earth policy in their homeland saved the Red army in the early months of the war The campaign in Russia became a war of attrition which the Germans could not hope to win With winter approaching, Hitler obstinately refused to permit the extended and isolated German forces to withdraw This was a blunder of the first order. its ultimate effect being to weaken German strength with no possibility of benefit

After an unusually severe winter marked by Russian counteroffensives against German defensive fortified areas, the Germans launched a new campaign in the summer of 1942. These attacks, tremendous in terms of distances involved, were now aimed at the economic sources of Red army power. The Red army having proved too deep in reserves for annihilation in set battles, the new strategy was to destroy its means of sustenance Tactically the campaigns were a continuation of penetration and infiltration, with German armoured columns making deep and rapid advances But Russian distances, the crude state of Russian communications and Hitler's strategic errors combined to leave the German aimies. as the second winter approached, deep in Russian territory with Red army forces on all sides.

Two campaigns in the following summer blunted the German blitzkreig for all time. But Red army opposition must be given less credit for the German failure than Russian geography, and its poor roads and railways; the Red army's defensive tactics ment little attention The stolid, unimaginative bravery of the individual Russian soldier also must be taken into account. The red partisan or guerrilla forces which attacked unceasingly and ferociously at any and all points from the Russian frontier to the most eastward penetration of the German columns were pastucially effective. In the early stages of the campaging the Red amy soldier was expected to hold inst and fight the attacker to the end. Later, as the Red army took the instantive, simple team factics of manoeuver and fine were used and there was greater and bolden use of combined arms. During the war Red army propagands often insisted that new tactics and strategy were being created by the soviet forces. Late evidence faeled to support thus claim. The Soviet Dinion fought a war of attitution, tactically unmanagnative and essentially primordial, ptiting its weight of numbers against every obstacle. Its artillery (including a great number of mortias) was used exterior to proper the production of the properties of the properti

Search for a Defense to the Tank-Plane Team—In 1914—13 the machine gun had driven infinitely info deep trenches, while attillery had greatly reduced the attacker's speed and impetus. The campaigns of 1930—5 demonstrated that the machine gun and artillery no longer dominated the battlefeld. The tank was immune to machine-gun, rine and unfanty mortar fire and could also travel over ground torn and blasted by artillery fire. The close-support aeroplane increased this new mobility. Bombing and strafing attacks on artillery communications and fire direction centres hampered the necessary laison between guns and front lines, mfantry reserves rushing up to plug a weak or penetrated sector could be delayed or even destroyed by air attacks on its columns. Thus mobility was restored; trench warfare and the continuous front almost disappeared.

The defense sought answers to the German blitzkreig. The answer to armour was defense in depth, land mines and front-line guns that could penetrate the armoured hulls of tanks. The answer to the attack aeroplane would be found, so airmen insisted, in achieving complete air superiority and driving the enemy air force out of the sky. Other defensive measures like increased anti-arcraft fire and better camoulates also proved effective

The first field gms to be used by infantry as anti-tank weapons were of small calibre (about 37 mm.). They could penetrate only very leph armour Heavier guns of 57 mm., 75 mm. and even too 3 mm. eventually appeared as infantry weapons. Special units were organized to fight tanks. In the U.S army these were known as tank-destroyer units. Essentially direct-fier artillery, they were armed with lightly-armoured, high-velocity guns, either self-propelled or towed. The self-propelled weapon was highly mobile (usually it was a half track, the rear wheels being replaced by an endless track like that on a tank). Its armour gave ittle protection and its high silhoutte made concealment difficult. The towed gm had a low silhoutet, but lacked armoured protection and speed of movement on the battlefield. U.S doctrine called for tank-destroyer gms to be massed and emplaced to over natural approach routes of hostile tanks. They were intended to ambush rather than pursue tanks.

Until late in the war (about 1904), the use of tanks to fight tanks was generally held to be undestrable. Tanks were considered to be offensive weapons primarily, and their employment against other tanks wasteful and hasardous. Atmoured commanders felt that to disperse tanks on anti-tank missions involved a risk of their not being available for counterattacks. However, the campaign rilay (and in fact wherever the terrain was ususited to deep and rapid penetrations by armoured units) was to demonstrate the defensive usefulness of tanks as anti-tank weapons. Before the war ended the principle that tanks should not fight tanks was generally abandone.

Another defense against the tank, long known as an antipersonnel and anticavalry weapon, was the land mine. To protect itself from armoured attack, a defensive force would plant these mines in front of its position, especially along natural approach rouse. Mines were not used by attacking forces except when forced into a temporary defensive position.

5. The infantryman feared the charging tank. His best defense being the ground itself, all armies taught their foot soldiers to dig the deep but narrow foxholes in which a man could crouch in com-

parative safety even though a tank rolled directly over his position. The holes also gave excellent protection from small arms, mortain and artillery fire. Only a direct bit was thirdly to be fatal. Chief weapons of the rifle-carrying infrastryman against the tank were such explosives as greandes (notably the Molotov cocktail), rockets firing basooks semploying the hollow charge and, near theen doff of the war, recoilless rifles, which in effect were light artillery press carried by one or two men.

Development of these techniques and weapons gradually resulted in defensive and offensive tactics that were quite similar in all armies Defense in depth to meet penetiations or envelopments largely replaced the stable trench warfare and continuous front of World War I Mobility and mechanization of the forces meant that centres of communication took on new importance for both attacker and defender, since advance or withdrawals necessarily followed roads and established lines of communications. The high degree of mobility made penetrations and envelopments commonplace while all-around defense became an essential factor of security No longer was it safe merely to rely on outposts to the front, the rear and flanks became equally vulnerable. This was true even of units not in the front lines when conditions were fluid, as during a major attack or break-through A variety of defensive positions was developed, all having the common virtue of affording protection from every direction

Task Forces and Other Special Combat Groups.—The appearance of weapons and techniques able to cope with tasks and close support aircraft re-established infantry as the arm of decision. The principles of infantry attack (fire and movement remained But the mobility and firepower of the aeroplane and tank altered the application of these principles. Dispersion became a cardinal rule of the battlefield, the tight and firm close formations of earlier days had to be abandonic

Cover and concealment also became factors of survival for the individual solder. The smaller units of infantry achieved more and more independence as evidence mounted that success depended largely on the initiative and skill of subordinate leaders in close contact with the enemy. Field armies of all nations tended to be divided into relatively small combat teams or task forces, equipped and organized to perform missions assigned by higher headquarters. This system put a premium on leadership, skill and initiative at all levels and decreased to some extent the control exercised by higher commanders on the course of the battle once his forces had been committed. The degree of independence varied with the policies of the high command, the nature of the task force, its mission and its ability to maintain contact with friendly forces on its flanks and to its rear.

Task forces were normally composed of small units of combined arms Some task forces were virtually small armse composed of elements of all the combat arms (infantry, artillery, engineers and communications); are power was either attached to or made an organic part of a task force, depending on the doctrine and organizational customs of the country concerns.

Assaults on fortified enemy strong points, amphibious operations and other special missions usually were given to task forces whose units were specially trained and equipped for the task because the special proceded their commitment, until everyone in each unit knew what he was to do and why The previously mentioned German assault on Port Eben Email was among the first to be performed by a force that had been assembled and intensively trained for a single specific combat task.

Eventually the composition of such forces became more or less standardized. The familiar combat team of the infantry division was a kind of task force. It was composed of a regiment of infantry, a battalou of field artillery and (when necessary) units of engineers and other arms and services. The combat commands of the armoured divisions, composed of tanks, infantry, artillers and other arms, were likewise small task forces. Their usefulness was most evident and dramatic following a penetration of the enemy's main line of resistance. Combat commands would then be assigned specific objectives deep in the enemy's rear. Working together for their mutual protection and advancement, each element of a command could supplement and offset the strength and weakness

of the other arms Infantly protected armour from close-up attacks of enemy minartry and anti-tank guns Tanks, in turn, attacked enemy machine-gun aests and protected infantry from armoured counterattack Engineers helped in the assault on fortified strong points and in bridging streams. Arthlley, following closely behind the units in contact with the enemy, performed its historic missions of neutraliargo or destroying targets dangerous to both the armour and the infantry and of extending the depth of the combat area

The task force concept was eventually extended down to the smallest combat units An infantry platoon leader, for example, might at times have under his temporary command a squad of engineers and a single tank. Larget task forces, exceeding division strength, were not uncommon for special operations, as in some

of the Pacific Island Invasions

Development of these combined arms teams gave armies greater flexibility without induly altering their traditional organizational forms. It permitted high commanders to apply forces in the strength and composition best suited to the needs of a particular situation. Thus all armies tended to become more efficient in their use of trained manpower and weapons.

Air-Borne Forces and the Concept of Vertical Envelopment—Long before human fight was a resitive, mittary thinkers had recognized the tactical results that would ensue if soldiers might fly over the enemy's lines and drop behind him. The first actual proposal for such an operation had been advanced in 1918 by U.S. Gen William Mitchell in France, but never got beyond early planning stages. The growth of the concept of air-borne forces logically contided with the development of improved aeroplanes. The theory of vertical envelopment received the earnest attention of most armles in the years before World War II.

The Germans were the first to use parachute and glider-borne troops in battle in the Netherlands and Belgium, they were also the first to use such forces on a major scale, in the successful invasion of Crete in May 1941. Crete was defended by 27,550 troops, mostly evacuees from the disastrous British campaign in Greece. They lacked sufficient weapons and equipment, particularly tanks and artillery The royal air force had evacuated the island, and the nearest air force bases in Africa were too distant for effective defensive air action. The Germans surprised the Crete garrison when they followed a heavy bombing attack with an invasion by parachute and glider troops. In the bitter fighting one German force was almost wiped out by the poorly armed defenders, but more German forces were flown in, and the several groups of British forces were surrounded and gradually decimated in piecemeal fashion. Throughout the battle the invaders received heavy air support, the bombing and strafing of aircraft providing an effective substitute for heavy artillery. Although German casualties were heavy, the success of their vertical envelopment of Crete stimulated Great Britain and the United States to further efforts in developing air-borne forces of their own. Strangely enough, an opposite reaction occurred in Germany. Hitler was appalled at what he considered the needlessly heavy losses. He concluded that the element of surprise was essential to successful vertical envelopment, and that such surprise would be almost impossible to achieve in the future This view caused Germany to neglect further air-borne efforts until after the Allied air-borne success in Sicily in 1943. In this operation, despite the fact that only a minority of the troops landed in the assigned drop zones, the air-borne forces contributed much to the establishment of the beachhead by destroying German and Italian strong points and especially by delaying a German armoured division's counterattack on the sea-borne forces.

In the Normandy landings of June 6, 1944, three air-borne divisions (two U.S., one British), flying in 3,93 sircraft and 867 gilders, landed before daylight at several points behind the beaches. The primary missions were to disorganize the German rear destablish defensive areas on the east and west side of the planned beachhead. The British division landed on its zone and accomplished its missions. The U.S. divisions performed effectively although they were hadyl dispersed in dropping and lost much of their equipment. The accidental dispersal of the U.S. forces accidents.

tually proved of tactical advantage to them. The German defense plan aganst vertual envelopment had not envisaged so much dispersal of the opposing forces, so that German defense units were unable to group and gight according to plan Instead, small unit supposes of adsponted on the plan fasted of the plan special control of the plan spe

Allied air-horne operations in the Netherlands in Sept. 1944, although partially failures, were of a scale and type indicative of possible future trends in this form of tactics The three air-borne divisions that had dropped in Normandy were joined by the Polish 1st brigade and British and US troop-carrier groups to form an air-borne army For the first time there existed in one organization air-borne forces and the means of transporting them. This important development gave the air-borne army commander control over the planes assigned to escort and support the operation. The unusual tactical plan demonstrated the flexibility possible in aerial envelopment. The three air-borne divisions and the brigade were to be dropped along a single axis of communication from south to north. The two southernmost divisions were to seize bridges over intervening streams and provide a corridor for the rapid advance of the British and army The third division and the Polish brigade were to seize the bridge over the lower Rhine at Arnhem and await relief by the 2nd army Firm German resistance, however, delayed the ground advance, and the air-borne forces at Arnhem were all but destroyed by German armoured counterattacks This confirmed what had been feared, that airborne forces as then equipped could not hold indefinitely against armoured forces beyond the time set for the link-up with friendly ground forces

In the crossing of the Rhine north of Wesel by the British and army on March 23-24, 1945, two air-borne divisions (one British, one U.S.) supported the attack with a close-in daylight landing. The two divisions were flown in a single flight, 1,572 aerojions and 1,365 gliders carrying 17,122 officers and men, 0.44 peaps, 266 artillery pieces and mortans and hundreds of tons of suppless. Cover over the drop zones was provided by 900 fighter aircraft, while 1,253 fighters provided a screen east of the Rhine. So complete was air superiority that the few aircraft losses resulted entirely from anti-aircraft defenses.

Amphibious Operations—The crossing of even a lightly defined water barrer has always been considered among the most hazardous of tactical operations. Until World War II, the hisstory of amphibious operations had not been one to inspire confidence in their feasibility. Among the failures of note were the attempted invasion of England by the Spanish Armada in 1504, San and the costly and ill-fated Dardanelles campaign of the Allies in 1915. But in World War II, the total number of overwater assaults, successful and otherwise, exceeded those of all earlier wars combined.

There were two reasons for this. The first was the nature of the war itself. Especially in the Pacific, where the seizure of island bases became a major factor in the advance, many amphibious operations took place. In Europe such operations ranged from the one at Narvik in 1940 to the mammoth invasions of the channel and Mediterranean coasts in June and Aug. 1944. The latter operations were strategic in scope, being essential to the gaining of an Allied toe hold in western Europe in order to meet and destroy the German armies. A number of amphibious operations off the coasts of Europe were primarily tactical in nature. Examples include the two small flanking operations on the north coast of Sicily during the Allied campaign for that island in 1943, and the attempt to outflank the Germans in Italy by establishing the Anzio-Nettuno beachhead in 1944. Although Allied forces retained the Anzio beachhead at great cost, this operation failed to achieve its projected aim of forcing the Germans to evacuate their strong positions and retreat to the north of Rome.

748B TACTICS

The second reason for the many amphibious operations was that they had become feasible because of the development of special techniques and machines for overwater assault. The early amphibious successes of the Japanese against the Philippines, Malaya, the East Indies and the Aleutians were accomplished without many of these refinements. The Japanese had developed an assault boat mounted with a machine gun and other improvised equipment, but these were primitive compared with the sweet types of landing craft developed by the United States and Great stamplishous tanks, weapons and personnel carriers, small craft that fired batteries of rockets toward shore, specialized craft as amphibious tanks, weapons and personnel carriers, small craft that fired batteries of rockets toward shore, specialized communication equipment for the direction of navial firepower and tactical air power operating from accraft carriers.

The special British anophibous forces known as commando units staged a number of raids on the European coast during the years that Hitler ruled western Europe, the most notable of these being the Dieppe raid in the summer of 1942. No other nation followed the British method of forming these units with soldiers, sailois and airmen on a permanent basis. U.S. practice was to form a joint command for a specific operation, assigning army, marrine, navy

and air force units as needed

Despite the vast technical developments, amphibious assults against a defended coast continued to be costly and hazardous. Overwhelming strength in men and firepower, placed at decisive points, was essential for success. Such concentrations contributed to the canadities when attacking beavily defended beaches. In the Pacific, heavy U.S. losses in amphibious operations could be laid in part to fanatic Japanese opposition, and in pait to the smallness of the islands. The latter factor, by instituting operations could force for tactical movement, usually worked against the landing forces.

The time limit imposed on the navy command was another critical factor in these operations. It alose from the need to protect the invasion fleet against counterattacks by enemy submarines, surface ships and carrier-based or other hostile aircraft.

Amphibous assaults are featured by the concentration of forces in a relatively small area. Manoeuve is impossible until the beachbad is secured and the assaulting forces consolidated. Even with supporting aerial bombardment, naval gonfre and rocket fire from small craft, the first mnutes or even hours on the beach-head constitute the critical stage during which the valour and skill of men armed with rifles and machine guns determines the outcome.

Two theories of tactical defense against amphibious assault were favoured at various times. One is that the assaulters should be met on the beach with fire and prevented from landing. The other theory is to permit the landing and then to launch a strong counterattack before the invading forces can regroup and consolidate. Neither theory proved superior during World War II. In at least one instance a disagreement on this point became a boon to the invaders In 1944 the German command was divided on the question of defensive tactics to be used against the expected invasion of France Field Marshal Karl von Rundstedt, commander in chief of German forces in the west, favoured light resistance to the actual landing, with the main strength being reserved for counterattack. Field Marshal Erwin Rommel, commander of German forces in France, believed that the landing should be contested from the first landing on the beaches This led to a compromise. German infantry was on the beaches at Normandy but the armoured units were located well inland. This lessened the defensive effectiveness of both elements.

The invasion of Leyte Island in the Philippines in 1944 by U.S. forces under Gen. Douglas MacArthur featured deception and surprise; the Japanese expected the blow at another point. Consequently the beachbead was established with little opposition; the heavy fighting occurred inland a short time later. In the invasion of Okiasaw the U.S. roth army was permitted to land unepoposed, after which 'the Japanese attacked the beachbead. Neither of these tatckila methodsp. prevented the landings and subsequent advances from the beachbead. Superior U.S. firepower and teamwork of the combined earns operations both types of defense by the

Tapanes

By the end of World War II the tactics of amphibitous assault and been developed to a degree never before attained A seusof successful operations had proved that trained, intelligently led forces of any nation whose industrial potential could produce the necessary quantities of complex and costly modern arms and equipment could successfully assault any costs having tenan suited to the establishment of a beachhead and eventual manocurvabulity inland Ironically, the amphibitous assault renched this high degree of usefulness at the same time that a new weapon was born, one effect of which was to make the concentration of forces in numbers for such an assault extremely dangeous An atomic bomb, employed at the time of greatest concentration, could almost certainly disperse, if not completely destroy, the largest amphibition force

Conditions of Terrain and Climate.—Terrain and climate impose definite limits on tactical methods. In theory, these factors cause adaptation of standard tactics rather than tar-reaching changes. It is seldom that the adaptation is so unconventional as

to become something altogether different

Special units trained for operations under specific conditions were used frequently in World War II The US langers were élite troops, trained for all types of operations The British commandos were trained almost solely for amphibious operations The US marine corps raider battalions were essentially strong scouting and patrolling units, trained to operate behind enemy lines in all conditions of terrain. In Burma the British developed long-range penetration groups which, supported and supplied by air power, operated far behind enemy lines, establishing road blocks, attacking enemy headquarters and supply dumps U.S -Canadian special service force, organized and trained for arctic duty, eventually did its fighting in the mountains of Italy, Although several U S divisions in training were first designated as light and mountain divisions, all but one were eventually trained and equipped as standard infantry divisions before being committed to combat

Except in the deseats of Africa, where the tactics of armoured units came to full flower, unusual terain conditions encountered in World Wai II usually precluded the use of machines and large forces. In the jungles of the southwest Pacific and Burma, small forces generally manoeuvred along trails and streams, with the dense jungle providing a measure of security on the flanks. The objective usually was to secure bases and artifields for future operations to deny their use to the enemy. A frequent sectral aim was to cut on the flanks of the control of the

In all battles fought in mountains, infantry proved to be the arm of decision Armour and artillery supported infantry in the mountains of Italy whenever possible However, infantry's most useful support office was provided by its own accompanying weapons, especially mortass which could be carried to spots inaccessible to field gains. On Attu, in the Astunan, filemen shattled snow, can defrexing temperature at the strength of th

Japanese Tacties.—National characteristics and traductors often influenced Japanese tactics. The Japanese conquest of Malaya in the spring of roas combined amphibious and jungle was fare in a model of tactical skill and efficiency. The biltr of Malaya and the capture of Singapore were accomplished with very little armous and artillery support with the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the Malayan peninsula, dragging small two-whele clark loaded with supplies, machine guns,

mortars and ammunition

When the Japanese began to meet equal or superior forces capable of fighting them with then you take tool inflution and isolation, they siftered a succession of defeats, and it was then that their national characteristics and truditions began to appear in Japanese takes. Mental inflexibility was owdent in their insistence upon following set plans even when the stutution had rendered the original orders entirely unfeasable. Japanese commanders of all echolons displayed; a marked lack of multiture, a fact that made their tactor; rigid and, in time.

TAD 749

easily discernible to Allied commanders. The Japanese banzar attack was simply the culimination of this characteristic obtuseness. The banzai can haidly be called a tactic, since it served no military purpose except to destroy a few of the enemy in a suicide attack. It was

Influence of Technical Developments.—In Europe World War II seemed to end as it had begun, with mechanized forces and air power sweeping across Europe But if we consider the full import of five years of technical developments and then influence on tactics, the

similarity between 1940 and 1945 is seen to be superficial

By 1945 the attack seemed to be as superior to the defense as it had been in the spring of 1940 But the British and French in 1940 were not equipped to stand up against the Panzer-Stuka teams, just as in 1945 the Germans lacked the new weapons needed to match the offensive power of the Alhed mechanized forces and the Red army infantly Germany probably would have had such weapons had not Hitler wasted the German scientific and technological effort on guided missiles which, designed for the destruction of London, were not developed until Lon-

don had ceased to be a military target

By 1945 an effective defense system required thousands and even
millions of land mines, artillery firing shells equipped with the new minions of and mines, actuacy fring stems equipped with the new poximity fuze, and rocket-firing weapons employing the principle of the hollow charge. These weapons, used intelligently and in sufficient numbers, could almost certainly stop any infantry-tank attack. Radar and the proximity-tuzed shell in anti-artial artillery guns might have and the proximity-tured shell in anti-attent artillery guns might have effectively protected the German anims from Albiel lettical an power effectively protected the German anims from Albiel and the Albiel Setter land mines were devised faster than were deviced faster than were deviced factering and exploding them Proximity-fued attillery was much more effective than the conventional type—perhaps ten times more, according to Vannevar Bush, wattrue durects of US scientific re-

search and development search and development

The appearance of recoilless rifles, firing shells of light artillery calible but light enough to be carried by one or two infantrymen, greatly added to the firepower of this arm. The use of radar to spot ground targets was another important development.

The Atomic Bomb and Postwar Tactics,-The atomic bombs employed at Hiroshima and Nagasaki were at first interpreted as the end of conventional military and naval forces. Later and more sober judgments based on study of the results in Japan tended to be less judgments based on study of the results in Japan tenden to be less settleme. Such factors as high cost and scarcity were said to militate against the use of atomic bombs against an army of fleet properly deployed for defense against them. Great concentrations of troops are as those which massed for the major amphibious landings in World War. II would be particularly vulnerable, but even then the defending nation would probably weigh the cost of attempting to destroy the invaders with atomic bombs against the cost of meeting the threat with its conventional forces-its army, navy and air force, equipped with modern weapons and machines.

Scientific and technological advances of the kind discussed above had, in the opinion of most military thinkers, given the defense an advantage over the attacker, in the air, on land and at sea acvaniage over the attacker, in the air, on iand and at sea. While the ascendancy of defense over offense, or vice veias, had always been short-lived throughout the history of war, the situation following World War II suggested certain conclusions regarding tactical trends

Tanks, for example, had lost much of their terro; for infantiymen

med with improved tocket-firing weapons of tecoilless rifles defender heavily mined his strong points, used modern anti-aircraft guns against agrial attack and had other weapons equal to those of the

attacker, the advantage would rest on his side

on the other hand, the attacker had new methods of destroying a haden enemy protected by several feet of reinforced concrete and steel Radia could spot the defender's strong point, which could then be attacked by rocket-ning tactical suicraft, heavy artillery and ground combat troops armed with hollow-charge weapons.

One fact seemed certain: to protect themselves from the increased firepower of new weapons, both attacket and defender would have to deploy over wider areas The mitiative and responsibility of the small unit leader would be greater than ever before; he would command a

greater variety of weapons and would need greater tactical skill in em-

ploying them

With large amphibious operations less feasible, interest in the trans-With large amphibious operations less feasible, interest in the trans-portation of armies by air moreased. But here too the defensive portation of armies by air moreased but here too the defensive combat would involve some of the same problems of concentration combat would involve some of the same problems of concentration and mass faced by large amphibious forces. Nevertheless, air-boine transport of ground combat units held considerable promise following world Wer II. Agreal envelopment as a surprise and shock action had reast strategic and tactical possibilities; whether it would be suited to operations on a larger scale than were attempted in World War II depended partly on developments in aircraft and in methods of landing. The parachutist armed only with his individual weapon seemed headed are paracturust armed only with ins individual weapon seemen headed for obsolescence, except as the spearhead of a greater force following him. Transport planes that could land and take off from unprepared an strips, and planes that could carry tanks, artillery and vehicles were some of the more pressing needs in this field. Most of the world's armies at mid-20th century appeared to be stressing air transportability in

1050 were, in numbers of forces involved and in scope of military actions, compatable to several decayer campaigns of World Wai II What new developments Korea produced, however, were not in the field of tactical docturies or techniques but rather in the fields of weapons and logistics

and logistics. Viewed factically, much of the Kotean fighting can be compared with that which took place in Italy at various times between 1943 and 1945. The ternam and chimate of Korea, in fact, were probably more influential that those of Italy in determining offensive and defensive deployments. For example, even more than in Italy troops and vehicles were a the contraction. fined to a few roads, which meant movements in long columns and the induction of opportunities for surprise and deception in the attack The defender generally was at an advantage over the attacker for this

The United Nations forces in Korea developed important new logistical techniques, such as the evacuation of wounded by helicopter as well as the use of these versatile arrusaft in the short-haul transport of personnel and supplies. This development was closely ideated to the personnel and supplies. or personner and supplies. This development was closely infante to active because it represented a solution to the unusually difficult condi-tions of terrain which otherwise might have stalled all progress in some phases of the fighting New types of weapons (such as the 35-in tocket launcher), first used in Korea, improved the effectiveness of troops but did not cause any marked changes in tactical formations or in fundamental tactical doctrines

inches hunter of that uses in more designs in technal formations or indimental actival doctrines.

TAD, the pen name of Thomas Aloysius Dorgan (1877-1929), US journalist, boxing authority and cartoonist, who was

born in San Francisco, Calif., on April 29, 1877.

At an early age he joined the art department of the San Francisco Bulletin, where he worked as a cartoonist and comic

In 1902 he was employed by William Randolph Hearst, becoming a political cartoonist of the New York Journal. When Hearst, a candidate for the office of mayor of New York, ran against George B. McClellan in the election of 1905, Dorgan produced effective cartoons saturizing Hearst's opponent

Dorgan did not continue as a political cartoonist, however, concentrating his interests instead on sports, particularly boxing Not only did he publish sketches of fighters and commentaries, which were widely syndicated throughout the country, his pen name Tad (the mitials of his name) becoming well known, but he also served as an unofficial boxing referee and was recognized as an authority on the sport.

Tad also developed comic-strip characters, such as "Silk Hat Harry" and "Judge Rummy" which he used in his daily amusing

cartoons based on social satire

Tad was responsible for the wide currency of many slang expressions. Among them were "The first hundred years are the hardtheir technical and training efforts

siohs. Among them were "The first hundred years are the hardThe Korean War.—The Korean campaigns which began in June
est"; the simile "As busy as a one-armed paper hanger with the hives"; "23, skidoo"; and "Yes, we have no bananas." He died at Great Neck, L I, on May 2, 1929

TAEL. The tael (Chinese, hang), a Chinese unit of weight, when applied to silver was long used as a currency unit There have been many taels of varying weight, generally in the neighbourhood of 14 oz.

The cut rency tael was seldom musted in the form of a coin, but served as a standard money of account, actual transactions being completed with ingots of silver, with bank notes or checks expressed in taels, or with silver coins, especially the Spanish and Mexican dollars which flowed into China in great volume in the 18th and right entures. Be a silver imported into China was remelted and cast in ingots weighing about 50 taels, of a special shape called "shose" (from the Dutch word scharty meaning boat) of syces (literally, fine silk, hence, fine silver). Each shoe was marked by the public assaying office with its weight and fineness, from which data its value in currency taels was computed. Sycee formed a large part of bank reserves down to 153.

The most important currency tael was the Shanghai tael, adopted in 1857 to espace the Spannsh dollar which was becoming scarce. The fine-silver equivalent was 518 512 grams. Since China was not a silver standard while the rest of the world was on a gold standard, the exchange value of the Shanghai tael fluctuated with the price of silver in London and New York, ranging from around 6s or \$1 50 before 1893 to as low as 15. 2d or 38 conts in 1931. If was the bass for wholesale trade and for-eign exchange transactions in China's most important commercial city.

Of the numerous other taels used as moneys of account at various times and places, two deserve mention. The k'uping or treasury tael was used under the Manchu dynasty for the payment of taxes, 100 k'uping taels equalled 100 fo Shanghai taels. The Haukwon or customs tael was adopted in 1858 for the valuation of imports and exports and for the fixing of duties, 100 Haukwan taels equalled 111 a OSnanghai taels.

From ancient times the money of the masses for small transactions was the said, (x) but from the latter part of the roth century retail trade gradually began to be conducted with Mexican and, later, Chinese silver dollars, fractional silver cons, and to-cash copper pieces Finally, in April 10,33, the tale was officially abolished and replaced by the new Chinese standard dollar or yuan at a fixed rate of Shanghai tels y; so equal 100 yuan The new coin weighed at y grains, oSh nea, and its exchange value, of course, fluctuated with the world price of silver, See Cattrax: Production, Commerce and Communications;

**TAENIA**, in architecture, the uppermost member of the architerave  $(\eta, v)$  of one of the classic orders. (See Orders.) In the Tusean and Doric orders it is a projecting filled from which, in the Doric order, hang the regulae (q, v), and guttae (q, v). In the Long, Corinhian and Composite orders it is moulded with an ovelo or cyma reverse as the main form and usually carved.

TAFARI MAKONNEN, RAS: see Makonnen, Ras

TAFFANEL, CLAUDE PAUL (1844-1908), French flutist and conductor, was born in Bordeaux, Fr., on Sept 16, 1844, and studied at the Paris conservatory.

From 1864 until 1890 he played first flute of the Paris Opéra orchestra and from 1867, at the Société des Concerts du Conservatoire Appointed a professor at the Paris conservatory in 1893, he served as conductor of both orchestras from 1890 until 1903.

Taffanel died in Paris on Nov. 22, 1998

TAFFETA, a term structly denoting a light, thin and plain texture of silk possessing a high sheen or gloss and finished in a manner that imparts to it the "rattle" or "scroop" peculiar to certain types of closely woven, plain silk textures produced from spun silk yara. The warp and weft may be of corresponding deigher or counts, approximately, while the number of warp threads and picks per inch may also correspond.

Taffeta is sometimes embellished with a very small brocade or "float" figuring of warn or wett, and may either be woven from skein-dyed yarn, or else piece-dyed after weaving. Some qualities of taffeta fabrics are artificially, "loaded", i.e., weighted, with me-

talic salts, and are therefore more liable to split or crack when creased or folded It is used chiefly for dress, millinery and similar numbers

The word "taffeta," however, is now applied as a description of many other varieties of fabrics produced from silk, wool, cotton and combinations of these materials

Chifion taffeta so of a softer texture and finish than that of ordinary taffeta. One variety of taffeta is produced from a slik warp and Botany wool weft, another variety, described as "wool taffeta." is woven entirely of fine wool yarm both for warp and weft, which makes a fine and close texture of light weight, with a smooth sur-

Some varieties of taffeta are produced from a cotton warp and fine Botany weft, while others are woven entirely with twofold cotton yarn of fine counts, and finished with a stiff "finish" to

simulate the "scroop" peculiar to silk fabrics
TAFF VALE CASE. A number of employees of the British
Taff Vale Railway company had a dispute with the firm in Aug.
1900 and walked out on strake Led by two officers of the Amajamated Society of Railway Servants, the employees attempted to negotiate with the company, which held, however, that it would confer with only its own employees.

During the strike, which was settled about two weeks later after the board of trade intervened, the company petitioned the court of chancery for a witl of injunction against the union officers, forbidding the watching and besetting of certain railway property. The company based its request on the provisions of the Conspiracy and Protection of Property act of 1875 declaring such action illegal.

The union, on the other hand, held that it was not liable for damages caused by its agents during a strike since it was neither a corporation nor an individual, the injunction, therefore, should not be granted.

Justice Sir George Farwell (1845-1915) decided, however, that the union was a corporate body although it was neither a corporation nor a partnership and hence hable for payment of such dam-

His decision was strongly contested by labour, since, it was argued, it was a direct threat to labour's right to strike. The court of appeal reversed Farwell's decision, granting the union costs. On appeal to the house of lords, however, the court of appeal sustained Farwell's opinion, holding that the union, a legal entity, could be sued.

The effect of that decision was nullified by the Trade Disputes act of 1006.

(See also Trade [Labour] Unions: Great Britain: Later Legal History)

TAFILALT or TARILET (i.e., "The Country of the Fidia," as its nahalitants are called, because descended from the Antana tribe of Hillid, settled there in the 11th century), unportant casas of the Moroccoan Sahara, ten days journey south of Fez, across the Atlas. It is celebrated for its dates, to the successful cultivation of which, soon after the arrival of an ancestor of the religning dynasty of Morocco (hence called the Filidi Sharifs, 1e, descendants of Mohammed): a Da 12so, the dynasty owed its rise.

Tafilalt is a succession of ksurs (fortified villages) and palm groves which correspond to the zone irrigated by the Wad Ziz, and stretch over a length of about 50 km. The largest centre is

Bu-Am, an important market.

The sedentary natives, who were exploited by the Ati-Atta nonads, live in poverty on their palm groves. The midustry is the tanning of goatsians to obtain fidal: leather, which has a great reputation. The takeaut (Z'marra articulata) yields gall for tanning. After 1648 it was the custom of Moorish sultans to dispatch superfluous soons and daughters to Tafiliki. In fili, the central portion, formerly existed the town of Siglimasa, founded by Miknikas Berbers in 757 s.C. I was on the direct caravan route from the Niger to Tangier, and attained a considerable degree of prosperity.

The first European to visit Tafilalit was Rene Caillie (1828), the next Gerhard Rohlfs (1864) A later visit to the oasis by W. B. Harris is described in his book Tafilet (London, 1895).

TAFT 750A

TAFT, ALPHONSO (1810-1801). US lawyer and public official, was born in Townshead, Vt, on Now 5, 1810. Intermittently teaching school to finance his education, he studied at Amberst academy and Yale college. He was graduated from Yale and served as a tutor there while he studied law. In 1838 he was admitted to the bar

Taft settled in Cincinnati, O, where he established a successful law practice He served on the bench of the superior count of Cincinnati, resigning on Jan 1, 1872

Under Pies Ulysses S Grant he served for short periods as secretary of war and later attorney general, 1876-77

Taft was unsuccessful in his attempts to win the Ohio Republican gubernatorial nomination in 1875 and 1879 He later held diplomatic posts in Austria-Hungary and Russia

Charles Phelps Taft (q v) was a son by his first wife, Fanny Phelps, whom he married in 1841

William Howard Taft (q v.), a son by his second wife, Louisa Torrey, whom he married in 1853, became the 27th president of the United States

Taft died in California on May 21, 1891.

TAFT, CHARLES PHELPS (1843-1929), US editor and lawer, born at Cincinnali, O, on Dec 2t, 1843, was the halfbrother of William Howard Taft (qv), whom he aided in his successful campaign for the presidency of the United States

The son of Alphonso Taft  $(q \, v)$  and Fanny (Phelps) Taft, his first wric, Charles Taft attended public schools in Cuncinant, Phillips academy, Andover, Mass, and Yale university, New Haven, Conn, where he was graduated with a bachelor of arts degree in 1864 and a master of arts degree three years later H had also studied law at Columbia university, and in 1866 was awarded a degree in law and admitted to the bar.

He studied further at Heidelberg and also in Berlin and at the Sorbonne, Paris Returning to the United States, Taft, who had practised law for a short period before going to Europe, again

began to follow that profession in 1869.

That served as joint editor of The Ceneumant Superior Court Reporter, 1870-73, and also prepared a codification of the Ohio school laws. He became a member of the Ohio house of representatives in 1871 and in the following year was defeated as a candidate for the U.S lower house In 1894, however, he was elected to the US house of representatives, serving in the 54th congress from 1800 to 1807.

In 1879 Taft purchased, with his father-in-law, David Sinton, a controlling interest in the Cincinnati Times Taft consolidated the Times with the Star in 1880, the new paper being named the Times-Star, and became editor and later the only owner. The

paper prospered under his management.

He played an important part in the election of William Howard Taft in 1908, advang the presidential candidate and providing financial aid. In the following year Charles Taft, who had been nommated to run for the U.S. senate, withdrew as a candidate. He continued to support the Republican party, and served as a presidential elector at large from Ohio in 1904 and as president of the Ohio electronic college in Jan. 1905.

In addition to his newspaper business, Charles Taft had interests in real estate, state utility companies and major league baseball clubs. His philanthropic acts included an endowment of \$1,000,000 given, with his wife, to the Cincinnati Symphony orchestra

and contributions to the Cincinnati law school.

Taff died on Dec. 31, 1929.

TAFT, HELEN HERRON (1861-1943), was born in Cincinnati, O, on June 2, 1867, the fourth of eight children, and lived there until 1900. She met William Howard Taft (q.v.) after he had begun to practice law and they were married in 1886.

Most remarkable of her achievements during her early matried life was the organization of the Clincinnati Symphony orchestra, for which she raised considerable sums of money. When her huse band was appointed head of the cruil commission which organized the government of the Philippine Islands in 1900, she and her three children (Robert Alphonos, Helen, Charles Phelips) accompanied lum to Manila. She was of much assistance to her husband in his relations with the Filipinos; her receptions at Malacatian palace

after Taft became governor were an important means of bringing Americans and Filipinos together. She was also instrumental in saving the mediaeval walls of the old city of Manila, which were threatened with demolition in the interests of efficiency.

After her return to Washington, DC, in 1904, when Governor Taft became secretary of war, Mrs Taft was influential in persuading Pres Theodore Roosevelt that her husband should be a candidate for the presidency rather than accept an appointment to the US supreme court Shortly after the inauguration in 1909 she was taken seriously ill and never entirely recovered her health During the last two years in the White House, however, she took her full part in all official functions and interested herself especially in the development of Potomac park Japanese cherry trees had been sent to her as a personal gift by the mayor of Tokyo and she supervised their planting around the basin which later became the site of the Jefterson memorial After a period of eight years away from official life, most of which was spent in New Haven, Conn , Mrs Taft returned to Washington, D C , in 1921, when the ex-president was appointed thief justice, and lived there untıl her death on May 22, 1943

Bibliography —Mrs Tait's reminiscences, Recollections of Full Fears (1914), Henry F. Pringle, The Life and Times of William Howard Taft (New York, Toronto, 1939) is based in part on Mrs Tait's correspondence with her husband (H T Mc)

TAFT, LORADO (1860-1936), US sculptor, was born at Elmwood, Ill, on April 29, 1860 He graduated from the University of Illinois, where he first worked in sculpture, in 1879 and then studied at the École des Beaux-Arts in Paris until 1883, remaining in that city with but brief interruption until 1885 It was on the modern French school that his style was formed. Establishing himself in Chicago in 1886, he taught sculpture at the Art institute and began his long career of public lecturer. He was elected to the National academy in 1911. He participated actively in the formation of plans for public education in art, and served (1914-17) as director of the American Federation of Arts Aside from many portraits, included among his works are "Sleep of the Flowers and "Awakening of the Flowers" for the Columbian exposition (1893), "Despair" (1898); "Solitude of the Soul" (1900), the colossal "Black Hawk" at Oregon, Ill. (1912), Thatcher Memorial Fountain, Denver, Colo. (1918), and the "Fountain of Time" (1920) intended as part of a monumental complex of sculpture to be erected in Chicago

In 1903 he published The History of American Sculpture, the first comprehensive work on the subject, revised in 1924, his Some Modern Tendencies in Sculpture was published in 1920.

(JCT)

TAFT, ROBERT ALPHONSO (1889—1953), United States senator from Ohio and son of Wilham Howard Taft, 27th president of the United States, was born in Cincinnati, 0, on Sept. 8, 1889, the attended the public schools of Cincinnati and the Taft school at Watertown, Conn; was graduated from Yale university with a B.A. degree in 1910 where he stood first in his class, graduated from Harvard university with an LLB, degree in 1913 where he was first in his class and editor in chef of the Harvard Law Review. In 1913 he passed the Ohio bar examination with highest honours in the state. In 1914, he married Martha W, Bower

After practising law in Cincinnati, Taft served during World War I, 1517–16, as assistant counsel for the United States Food administration. In 1919 he was counsel for the Amenican Relief administration in Europe From 1920 through 1938 he practised law in Cincinnati, establishing a reputation as one of the ablest lawyers in Ohio. During this period, 1921–26, he was a member of the Ohio house of representatives where he became Republican floor leader and speaker of the house. He served in the Ohio senate in 1931 and 1932.

Shortly after his election to the United States senate in 1938, Taft became a natuonal political figure. He was re-elected to the senate in 1944 and re-elected again in 1950 by a majority of 4,337, coc votes, one of the largest ever given a candidate for U.S. senator from Ohio. With each U.S. senator being responsible only to one of 48 constituencies, leadership in the senate is often more tutlar than real. Taft, however, excelled in the essential political tutlar than real. Taft, however, excelled in the essential political

750B TAFT

capacity for work gave him a mastery of legislative facts far beyoud the narrow range of committee specialization. His honesty, integrity and patriotism were never responsibly questioned. His Republican colleagues in the senate selected him in 1047 as chairman of the senate Republican policy committee, a position he held until his election as senate majority leader in Ian 1953. It is difficult for anyone outside the congress to evaluate precisely the worth of one of its members. Much of the actual work is done in closed committee meetings and in informal conferences. The congress itself is the only point at which all the myriad facts and pressures coalesce Perhaps the most meaningful tribute to Senator Taft's stature is that he was regarded by his colleagues, Democrats as well as Republicans, with unprecedented respect and esteem

Taft lacked many of the traits commonly associated with a good politician in the United States He was thought by many to be cold and austere. His genial personality and gentle humour were reserved for friends and for direct personal contacts. He had no trace of demagoguery. His appeal was to logic, rarely to emotion. He championed unpopular causes. He disdained the use of wit, eloquent speech and brilliant metaphor He spoke bluntly. armed only with facts and simple statements of his principles His willingness to make an unequivocal statement on any controversial issue frequently embarrassed his political managers. Typical was his forthright condemnation of the Nucemberg trials as vengeance by the victors decked out in the trappings of justice Whether or not enemy leaders were tried under ex-post facto laws was not an issue that would ever come before the senate. His bold expression of his convictions contrary to prevailing public opinion flouted all conventional norms of good politics.

Taft was generally regarded as a conservative in American politics. In recognition of his leadership of the more conservative political party, he was nicknamed "Mr Republican" by the Ameucan press But even in the field of social-welfare legislation, he was not inflexibly wedded either to the status quo or to his former position. He was an original sponsor of legislation providing for public housing for low-income groups He sponsored legislation authorizing federal aid to state governments for the improvement of medical care and education and of the living standards of the

On the other hand, Taft was an uncompromising opponent of legislative measures which, in his judgment, undermined personal incentives for economic betterment or demanded excessive government intervention in the lives of its citizens. He consistently opposed compulsory health insurance on the ground that government control of the medical profession made the promised benefits illusory He opposed peacetime price and wage controls His political philosophy was perhaps best stated in 1948 when he described the "one great issue in the world today" in these words. "It is that of government operated by a free people on the basis of freedom and justice for every individual, on the one hand, against the totalitarian state on the other-the kind of state which concentrates in a central government power to direct the lives of all its people, its agriculture, its commerce and its industry" Taft often defined the basic domestic issue in American life as one of "liberty versus socialism '

It was in the field of labour law that Taft won his greatest legislative fame In the nation-wide transportation strike of 1946, Pres. Harry S. Truman made a personal appeal to the congress for legislation authorizing him to draft striking workers into the army "on such terms as he might impose." The house of representatives passed the bill immediately, and the senate seemed likely to follow suit. Notwithstanding the intense pressure for drastic action, Taft blocked it in the senate by utilizing its rule of unlimited debate,

When the Republican party won control of congress in the elections of 1946, Taft had the choice of becoming chairman of either the senate finance committee or the senate labour committee. Typically, he chose the more politically explosive assignment. As chairman of the labour committee he guided to passage over a presidential veto the Labor-Management Relations act of 1947, popularly known as the Taft-Hartley law. He defended it as imposing on labour unions obligations comparable to those imposed

art of compromise His exceptional intellect and almost legendary on management Labour union leaders, almost without exception, denounced it as a "slave labout" law. They mobilized their forces to defeat him in 1950. No senatorial campaign in U.S. history attracted so much nation-wide interest. Taft's overwhelming viitory was interpreted by his followers as proof that no economic group in America is cohesive enough to decide the outcome of an election through bloc voting on isolated issues

Prior to United States participation in World War II, Taft opposed measures calculated to increase the chances of involvement For that stand, he was trequently criticized as an "isolationist After the war he recognized the United States' new position of world leadership. He urged ratification of the United Nations charter Because of Soviet Russia's intransigence, however, Taft had little faith in the UN as a shield against aggression. In opposition to the Truman administration and many Republicans as well, he advocated reduced foreign aid expenditures, greater emphasis on retaliatory air power and less on ground defense forces in western Europe, increased attention to far eastern problems, and congressional approval of executive decisions to send American troops abroad

Taft was three times an unsuccessful candidate for the Republican nomination for president. In the Republican national convention of 1940, he lost the nomination to Wendell Willkie, in 1948 to Thomas E Dewey, and in 1052 to Dwight D Eisenhower Despite the bitterness of the prenomination struggle in 1952, Tait and his followers united wholeheartedly behind Eisenhower It was widely predicted that the differences between Eisenhower and Taft, particularly on foreign policy issues, would make close cooperation between the White House and the Capitol impossible Taft, however, was determined to make the first Republican administration in 20 years an unqualified success Most observers agreed that he was emmently successful in bridging the constitutional gap dividing executive and legislative authority which is so essential in the American ideal of freedom and yet so often productive of discord and maction

Taft died of cancer in New York city on July 31, 1953 His body lay in state in the rotunda of the Capitol-an honour accorded to only 12 others. He was buried near his home in Cincinnati in the cemetery of the Indian Hill church

BIBLIOGRAPHY.—See indexes for the Congressional Record, vol 84-99, under heading "Tafs, Robert A (a Senator from Ohio)", Robert A Taft, A Foreign Policy for Americans (New York, 1951) (J W Ba)

TAFT, WILLIAM HOWARD (1857-1930), the 27th president and tenth chief justice of the United States, was born in Cincinnati, O, on Sept. 15, 1857 His father, Alphonso Taft, was attorney general in Pres U. S Grant's cabinet (1876-1877) and minister to Austria (1882-84) and to Russia (1884-85) William Howard Taft graduated second (salutatorian) in his class at Yale college in 1878, and at the law school of Cincinnati college, in 1880, dividing the first prize for scholarship. In the same year he was admitted to the Ohio bai. In 1881 he was appointed assistant prosecuting attorney of Hamilton county (in which Cincinnati is situated), but resigned in 1882 on being appointed U.S. collector of internal revenue for the first district of Ohio.

In 1883 he returned to the law. From 1885 to 1887 he served as assistant solicitor of Hamilton county, and in the latter year was appointed judge of the superior court of Ohio, to fill a vacancy, being elected in the next year. In 1890, he was appointed solicitor-general of the United States by Pies Benjamin Harrison. In 1802 he was appointed U.S. circuit judge for the sixth circuit.

From 1806-1000 Taft also served as professor and dean of the law department of the University of Cincinnati

Governor of Philippines .- In 1900 he was appointed by Pres William McKinley to the presidency of the Philippine commission. He served as such from March 13, 1900, to Feb. 1, 1904, becoming governor ex officio on the establishment of civil government, on July 4, 1901 (see PHILIPPINE ISLANDS). The delicate matter of confiscated church lands was arranged by Taft in a personal interview with Pope Leo XIII, in the summer of 1902. The pope sent a special delegate to appraise the

TAFT 751

lands, and the sum of \$7,239,000 was paid for them in Dec 1003 Secretary of War .- In Feb 1904, Taft returned to the United States to become secretary of war In Sept 1906, on the downfall of the Cuban Government and the intervention of the Limited States he took temporary charge of affairs in that island (Sept-Oct ) In the next year (March-April) he inspected the Panama canal and also visited Cuba and Porto Rico. He again visited the Philippines to open the first legislative assembly (Out 16, 1907) On this tout he visited Japan, and on Oct 2, at Tokyo, made a speech which had an important effect in quieting the apprehensions of the Japanese on the score of the treatment of their people on the Pacific coast. While secretary of war. Taft entirely reorganized the work of carrying on the construction of the Panama canal, and selected Col George W Goethals, whom President Roosevelt put in entire charge of the work From that moment the enterprise assumed a new vigour, the work was completed and was opened to traffic in 1913

President .- In 1908 Taft was favoured by President Roosevelt as his successor, and in the November election, was vic-torious over William Jennings Bryan, the Democratic nominee. by a popular majority of 1,269,900 votes (Taft, 7,679,006 Bryan, 6,409,106) and by a majority of 159 votes in the electoral college. In accordance with his pre-election pledge, he called the Congress to meet in extra session on Maich 15, 1909, to revise the tariff. The final bill known as the Payne-Aldrich Act was approved by the president on Aug 5, 1909, although in many respects it was not the measure he desired. The income of the Government under the Dingley tauff had proved inadequate to meet its current expenses, the estimated deficit for the fiscal year ending July 1, 1909, being \$100,000,000 He therefore recommended to the Congress the adoption of resolutions to amend the Constitution by expressly granting Congress power to levy an income tax without apportionment among the several States For the purpose of meeting the immediately anticipated deficiency in the revenues, he recommended the adoption of a provision in the Tariff Bill imposing an annual special excise tax upon corporations organized for profit, measured by a percentage on their net incomes Pursuant to these recommendations a proposed amendment to the Constitution was passed by both Houses of Congress, afterwards ratified by the requisite number of the States, and became the 16th amendment, and there was included in the Payne-Aldrich Act a provision imposing the proposed annual special excise tax upon corporations, measured by 1% of their net incomes

Payne-Aldrich Tariff Act.—While the Psyne-Aldrich Act was much citized, because it failed to reduce duties on imports to the extent expected, yet it marked a distinct step towards a lower scale of import duties, and opened the door to the free exchange of commerce with the Philippones. By the enactment of the maximum and minimum tariff provisions, it placed a powerful weapon in the hands of the Amencan Government for the protection of American commerce against unduly discriminatory practices by foreign Governments. It also, for the first time in American history, provided for the establishment of a tariff board to study the questions which lie at the foundation of the protective system.

While Congress was considering the Tariff Bill, the president called upon the heads of the departments of Government to prepare, in advance of the usual time, their estimates for the fiscal year ending June 30, 1911, admonishing them to reduce expesses wherever it could be done. These estimates were then considered by the president and cabinet, and for the first time in American history, a comprehensive budget was prepared. As a result of these efforts, a cut was made of about \$5,500.000 in the estimates for the fiscal years 1910 and 1911. In June 1910, the Congress granted the president's request for an appropriation to enable him to employ competent persons to study the methods of transacting the public buseness of the executive departments and other Government establishments, and to recommend such legislation as might be necessary to carry into effect changes found to be desirable that could not be accomplished by executive action alone. President Taft caused a commission to be

organized, and as a result of its studies, sent to Congress four special messages transmitting the reports of the commission, dealing with particular subjects, pointing out defects in the organization and conduct of the business and changes that might be made advantageously

Federal Budget Urged .- In his message of Jan 17, 1912. the president called attention to the fact that the United States was the only great nation whose Government was operated without a budget, and recommended the adoption of an annual budget Nothing was done by Congress in these matters, but many, if not most, of the improvements in the organization and conduct of the administrative branch of the Government which have been adopted in more recent years were first formulated and recommended by President Taft He also recommended to Congress the enactment of amendments to the interstate commerce law, the establishment of a postal savings bank system, the enactment of laws giving the interstate commerce commission the power to determine upon the uniform construction of appliances used by railway trainmen in the operation of trains and to intervene and investigate the reasonableness of a proposed increase in railway rates before they became effective. of amendments making the Employer's Liability Act more easy to enforce; of laws carrying out with intelligent discrimination the principle of conserving the national resources, the estabhishment of a national health bureau, requiring publicity of campaign contributions, regulating the procedure of Federal courts concerning the issue of injunctions, and readjusting the regulations concerning postage of second class mail matter. Most of these recommendations were embodied in laws passed by the Congress By executive order, the President placed the positions of secretaries in the diplomatic service in much the same position as those in the consular service, and introduced into both the principle of appointment for reasons of ascertained fitness and promotion by merit

Arbitration Treaties .- In 1910 and 1911, President Taft negotiated with the Governments of France and Great Britain identical treaties, signed on Aug 3, 1913, intended to be models for a series of treaties providing firstly, for the arbitration of all differences which might arise between the parties which it was not possible to adjust by diplomacy, and which were justiciable in their nature, and secondly, for the creation of a joint high commission of inquiry, to which should be referred for impartial investigation, any justiciable controversy between the parties before submission to arbitration, and also any other controversy, even if the parties were not agreed that it fell within the scope of the first article, the report of such commission not to be regarded as a decision on the questions submitted. The first of these provisions embodied in effect the agreement reached in the treaty between the United States and France of Feb 6, 1928 The second furnished a model for the treaties negotiated by Secretary Bryan in 1914, known as the Bryan Conciliation Treaties. Together, they represented a greater advance in provisions for the peaceful settlement of international controversy than any the world had known The U.S Senate qualified its approval by such extensive reservations, that the president withdrew the treaties from further consideration. In 1010, President. Taft initiated negotiations with the British Government for the establishment of a reciprocal trade agreement between the United States and the Dominion of Canada, Instead of embodying the desired tariff changes in the formal shape of a treaty, it was agreed that the Governments of the two countries should use their utmost efforts to bring about such changes by concurrent legislation at Washington and Ottawa It was further agreed that a considerable list of articles produced in both countries should be reciprocally free. As to another group, common rates of duties upon importation from either country into the other were fixed The proposed legislation was, however, defeated in the dominion parliament, and the effort failed

As the construction of the Panama canal approached completion, a bill was introduced in Congress to provide for its operation and for the government of the Canal Zone Taft was of the opinion that as the United States had built the canal at its own expense, it was entitled to permit the use of the canal by American merchant ships without payment of tolls Great Britain claimed that this would be a violation of the Hay-Pauncefote Treaty While not admitting the contention, the president expressed his willingness to arbitrate the question. The bill, as passed, embodied the president's views, but the next Congress modified the act by removing the discrimination

Other Events in Administration .- President Taft's administration was characterized by a systematic and vigorous en-forcement of the antitrust laws. The decisions by the U.S. Supreme Court in 1911, of the prosecutions which had been initiated by Pres Theodore Roosevelt against the Standard Oil trust and the American Tobacco combination, and which were argued in the Supreme Court by Atty Gen. George Wickersham, gave an authoritative interpretation to the act, which was at once put into effect by the Department of Justice, and for the first time after the enactment of the law in 1890, a careful, systematic effort was made by the Government to enforce its provisions. Both the oil trust and the tobacco combination were dissolved in such manner as to restore healthy competition in those industries without destruction of the value of their securities held by innocent parties A large number of combinations in restraint of trade were either put an end to by judicial process, or voluntarily desisted from a continuance of the practices which had been adjudged to be illegal

During Taft's administration, many vacancies occurred in the Federal judiciary. He was called upon to appoint six justices of the Supreme Court, including a chief justice On the death of Chief Justice Fuller, in 1910, President Taft nominated as his successor, Associate Justice Edward D. White, a Democrat. a former Confederate soldier, and a Roman Catholic-a nomination which was confirmed by the Senate at once

Conservation of the natural resources of the nation was one of the subjects which had greatly occupied the attention of the president and his administration. While Taft was in full sympathy with the objects of this policy, he did not approve of some of the means adopted by that administration. In making up his cabinet, he did not include James R. Garfield, secretary of the interior under President Roosevelt, and on Jan. 7, 1910, he dispensed with the services of Gifford Pinchot, the forester. These men, with a number of other adherents of Roosevelt, initiated a campaign against President Taft, based upon the representation that he was opposed to the conservation policy of Roosevelt. Their first attack upon his Administration was directed against Richard Ballinger, who had succeeded Garfield as secretary of the interior. A complaint by L R Glavis, an agent in the land office in the department of the interior, of Ballinger's action with regard to certain coal land entries in Alaska known as the Cunningham claims, which President Taft on investigation held to be unfounded, and which led to the dismissal of Glavis from the service, gave rise to a Congressional investigation into the conduct of the interior department by Ballinger. After prolonged hearings a report was made by the committee exonerating Ballinger, but failing to win the confidence of the public, he resigned in the spring of 1911.

In the regular Republican convention at Chicago, Ill., the total number of delegates summoned was 1,078, with 540 necessary to a choice. Taft had 561 votes on the first and only ballot and was declared the nominee. Roosevelt and his progressive supporters, claiming that part of his delegates had been stolen through the action of a hostile committee, refused to accept the results of the convention, organized one of their own, known as the "Bull Moose" convention, nominated Roosevelt for the presidency and carried on an aggresive campaign against Taft, which resulted in splitting the Republican vote in almost every State, and thus electing Woodrow Wilson, the Democratic nominee, as president. The electoral vote was: for Wilson, 435, Roosevelt, 88 and Taft, 8. The popular vote, however (Wilson, 6,285,214; Roosevelt, 4, r26,020; Taft, 3,483,922), showed a much closer contest. This Party schizm served in large measure to obscure the merits of President Taft's administration.

Subsequent Career. On retiring from the presidency in

1913, Taft became Kent professor of law at Yale, but devoted much time to lecture engagements. In the same year he was elected president of the American Bar association, and in 1914 first president of the American Institute of Jurisprudence, organized to improve law and its administration. Taft was an active promoter of the League to Enforce Peace, but after U.S entrance into World War I, he supported the Administration, taking the ground that victory was necessary to the attainment of lasting peace In 1918, he was appointed by President Wilson a member of the national war labour board for arbitrating labour disputes In 1919, he endorsed the peace treaty of Versailles, regarding its most important part to be the Covenant of the League of Nations He spoke throughout the country on behalf of the League uiging reservations if these would secure intification. On the death of Chief Justice Edward White, on June 30, 1921, he was appointed chief justice by Pres Warren G Harding He died in Washington on March 8, 1930

In 1886 he had married Helen Herron (1861-1943),

Int 1000 the aud marited treefin faction (1001—1943).

Talt is the author of Popular Government, its Essence, its Performance, and its Perils (1913). The Anti-Trust Act and the Supreme Court (1914). The United States and Pance (1914). TAGALOG, a tribe of central Luzon, Republic of the Philippines, formerly head-hunters, particularly on occasions of the deaths of prominent tribesmen, they made wood or stone figures to accommodate the souls of deceased persons (Relacion de las Islas Philipinas, anon., c. 1595) They are now Christians and make excellent soldiers, sailors, artisans, etc They cultivate rice on irrigated terraces. Women have equality with men They are the most cultured of the various peoples in the Philippine Islands

and have made rapid advance in recent years

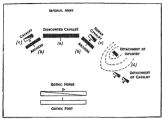

TAGANROG, a Russian seaport in the Rostov Oblast, R.S.F.S.R., in 47° 12' N , 38° 50' E , on the north shore of the Gulf of Taganrog, northeastern arm of the Sea of Azov. Pop (1939) 188,808 It is connected by rail with the north, and also with Rostov-on-Don to the east. It has three harbours and several grain warehouses. The anchorage is 5 to 6 ft. at the loading pier, but there is no regular port accommodation, and the usual anchorage ground, 18 to 20 ft deep, is 25 to 30 mi. from Taganrog. It is icebound for three or four months in winter, and the depth of water near the town may be diminished as much as 7 ft by a prolonged east wind Its imports include fruits (dried and fiesh), nuts, oil, wine, coffee, tobacco, woollen goods, cement and manufactured iron goods, and its exports are grains, macaroni. linseed, rape seed, caviare, wool, butter and oilcake Many of the exports are brought by lighters or local steamers from Rostov-on-Don. The town has a fishing industry and manufactures metal goods (especially instruments) and paper. A colony was founded on the site by Pısan merchants in the 13th century, but was destroyed by the Mongols Later it was occupied by the Turks Peter the Great attempted to gain possession of the promontory, but it was not annexed to Russia until 1769. Its commercial importance dates from the construction of the railway linking it with Kharkov. The Anglo-French fleet bombarded the town in 1855. War II. Taganrog was captured by the Germans during World

TAGES, a minor Etruscan deity, the grandson of Jupiter, and founder of the art of divination in Etruria According to the story, during the ploughing of a field near Tarquinii a being of boyish appearance sprang out of the furrow. The shouts of the ploughman (Tarchon) brought to the spot all the people of Etruria, whom the boy proceeded to instruct in the art of divination. Having done this, he suddenly disappeared. His instructions were for some time handed down orally, but were subsequently committed to writing and formed the twelve books of Tages, containing a complete system of Etruscan lore

TAGINAE, BATTLE OF (A.D. 552). The battle of Taginae was fought in July 552. It terminated the Gothic Wars of the Emperor Justinian, and was won over the Gothic King Baduila by the cunuch Naises, a general who in ability ivalled the great Relsarius, his contemporary Tagnene is situated below the Apenmes near modern Gubbio Narses had crossed the head of the valley of the Chassio when Baduila arrived and seized its main outlet The Goth ranged the whole of his horsemen in front, his infantry, mostly acthers, he drew up in second line His aim was to ride down the imperial army in one terrific charge

Belisarius had noted the weakness in the Gothic tactics, namely, that there was no co-operation between lance and bow Narses

BATTLE OF TAGINAE (JULY, A D. 552), WON BY NARSES, GENERAL OF THE EMPEROR JUSTINIAN, OVER BADUILA, KING OF THE GOTHS

now aimed at this co-operation, but in a novel form which closely resembles the combined tactics made use of by Edward III. at Crécy He dismounted his cavalry (\*Peederat\*) and formed a phalaim 8,000 strong, on the wings of which he drew up 8,000 arches with their outer flanks thrown forward In rear of these he posted his Roman cavalry to combine fire and shock His left flank he rested on a small hill, which he occupied by a force of infantry and at the foot of which he deployed a few squadrons of cavalry.

At noon Badulla, ignoring the archers, suddenly charged his enemy's centre, expecting to overwhelm it, for infantry be held in contempt. He was met by a tremendous converging fire of arrows which slow and dismounted hundreds of his knights. After several assaults he clinched with the mpenal centre—sts protective base of action—which held him firm whits his faints were piled with arrows. At length, exhausted, the Gothic horsemen broke back, when immediately Narses launched his mounted squadrons driving them in confusion on to their infantry which were ridden over The victory was complete.

TAGLIACOZZO, a town of the Abruzsi, Italy, in the province of Aquita, 5 cm i. by rail E.N. E. of Rome and 10 mil. Wo of Avezano. Pop. (1936) 3,693, town; 10,320, commune. It lies 4,438 ft, above sea-level, at the mouth of the deep ravine of the Imele It contains several old churches, notably S. Franceso, with a fine rose window in the fiquel, and mediareal houses The palace, built at the end of the 14th century by the Orani, is fine, with interesting pathings in the interior. At the Orania is fine, with interesting pathings in the interior. At Industrial Safe 3 at the Cost place with the best the most of the contract of the cost place and the cost place of the cost place.

TAGORE, SIR RABINDRANATH (1861-1941). Indian poet and author, was born in Calcutta on May 6, 1861, the youngest son of Maharshi Devendranath and grandson of Prince Dwarkmanth Tagore. After a private education in India he was sent to England in 1871 to study law, but soon returned to India, and while still quite young commenced writing for Bengali periodicals. In 1001 he established the finous Santinitaten, a school at

Bolpur, 93 mi from Calcutta, which developed into an important educational institution conducted on unconventional lines In 1913 Tagore was awarded the Nobel prize for literature, and utilized the amount, £8,000, for the up-keep of his school He visited Europe on several occasions and travelled also in Japan and the United States He accepted a knighthood in 1915, but in 1919 resigned it as a protest against the methods adopted for the repression of disturbances in the Punjab In later years, however, he offered no objection to the use of this title Tagore was interested in politics only in so far as it concerned the deeper life of India, and he desired that the nationalist movement consider social reforms before political freedom By his abundant writings, which are permeated by a sense of the beauty of the universe, by a love of children and of simplicity, and by a consciousness of God, Tagore did much to interpret for the west the more serious reflections of the people of Bengal In 1929 he took up painting He died Aug 7, 1941

His most important works which have been translated into

His most impottant works which have been translated into English are Galanjul (1934), The Crascent Moon (1932), Chitra (1934), The Fost-Office (1934), The Gardenser (1934), One Hundred Poems of Kabr (1935), Fratl-Gathering (1936), Study Buds (1936), Nationalism (1937), My Reminiscences (1931), Red Oldender (1934), Broken Ties (1935), Letters to a Friend (1938), The Religion of Man (1931) See E. Tagore, Poet and Diamatist (Oxford, 1926)

TAGUS, the second longest river of the Iberian peninsula Its length is 565 mi, of which 171 are on or within the frontier of Portugal, and the area of its basin is 30,500 sq mi. The basin is comparatively narrow, and the Tagus, like the other rivers of the Iberian tableland, generally flows in a rather confined valley, often at the bottom of a rocky gorge, as at Toledo and Alcántara, below the general level of the adjacent country. The river rises on the western slope of the Muela de San Juan (5,282 ft), a mountain which forms part of the Sierra de Albarracin, 88 mi. E of Madrid Thence the Tagus flows at first north-westwards, but, after receiving the Gallo on the right, it flows west, and then south-west or west-south-west, which is its general direction for the rest of its course Regular river navigation begins only at Abrantes, a few miles below which the Tagus is greatly widened by receiving on its right bank the impetuous Zezere from the Serra da Estrella Passing Santarem, the highest point to which the tide ascends, and the limit of navigation for large sailing vessels and steamers, the river divides below Salvaterra into two arms which enclose a deltaic formation, a low tract of marshy alluvium known as the Lezirias, traversed by several minor channels. Both branches terminate in a broad tidal lake immediately above Lisbon (q v.) The Tagus estuary, though partly blocked by a bar of sand, is one of the chief harbours of south-western Europe,

TAHITI, the largest and most important of the Society Islands (part of French Oceania) in the central South Pacific ocean The island lies in 17° 38' S latitude and 149° 25' W longitude It is 33 mi. long, northwest to southeast, and consists of the deeply dissected cones of two ancient volcanoes joined by a narrow isthmus of low land, the whole fringed by a coral barrier reef lying from I to 2 mi offshore. The northern cone is roughly circular in plan, about 20 mi. across, and rises to a height of 7,339 ft. Numerous secondary cones rise from its ravined sides and there is a narrow plain completely encircling the base. To the southeast and joined to the larger cone by an 1sthmus 1 mi. wide, the second cone rises to a height of 4,341 ft The oval-shaped peninsula thus formed has a northwest-southeast length of 14 mi and a breadth of 8 mi Tahiti has an area of about 402 sq mi. and a population (1941) of 23,133 The chief town and seat of the French administration is Papeete at the northwestern end of the island. Its population in 1941 was 11,614 of whom about one half were French. The island produces coco-nuts, bananas, sugar cane, and other tropical plants as well as phosphates. The chief exports included copra, phosphates, vanilla, mother-of-pearl, and rum

sent to England in 1877 to study law, but soon returned to India, History.—Though known to the Pacific explorers of the late and while still quite young commenced writing for Bengali period-roth, and early 17th centures, no attempt at colonization or posiicals. In 1901 he established the famous Santimitetun, a school at twe European control of Tahuti was made unity-4. Unsuccess.

ful colonial efforts were made by the Spanish in that year and by British missionaries in 1797. Inter-island wars were mainly responsible for the failures though the attempts were favoured by the support of the local rulers, Pomare I and Pomare II The latter fled with the missionaires of 1797, but returned with them in 1812, having renounced heathenism, and regained his power in 1815 For a time missionaries made good progress-a printing press was established (1817), and coffee, cotton and sugar were planted (1819), but soon there came a serious relapse Pomare II died of drink in 1824 His successor, Pomate III, died in 1827, and was succeeded by his half-sister Armata, "Queen Pomare (IV)" In 1836 French Catholics attempted to open a mission in Tahiti Queen Pomare, advised by the English missionary and consul, Pritchard, refused her consent, and removed by torce two priests who had landed surreptitiously. In 1838 a French frigate appeared under the command of Abel Dupetit-Thouars, and extorted from Pomare the right of settlement for Frenchmen Pritchard opposed this, and caused Pomare to apply for British protection, but this was a failure, and the native chiefs compelled the queen, against her will, to turn to France. A convention was signed in 1843, placing the islands under French protection, the authority of the queen and chiefs being expressly reserved Dupetit-Thouars now reappeared, and, alleging that the treaty had not been duly carried out, deposed the queen and took possession of the island. His high-handed action was not countenanced by the French government, but while, on formal protest being made from England, it professed not to sanction the annexation, it did not retrace the steps taken. Two years were spent in reducing the party opposed to French rule, and at length, by agreement with England, France promised to return to the plan of a protectorate

Queen Pomare died in 1877, and her son Ariane (Pomare V) abdicated in 1880. In the same year Tahiti was proclaimed a French colony In 1903 the whole of the French establishments in the Eastern Pacific were declared one colony, and the then existing elective general council was superseded by the present administration. After this federation trade increased

TAILLE, the equivalent of the English tallage (q v), was in France the typical direct tax of the middle ages, just as the word tonlieu was the generic term for an indirect tax. Other words used in certain districts in the same sense as taille were queste (questa, quista), fouage (foragium), cote. The essence of the tax denoted by these names was that the amount was fixed en bloc for a whole group of persons, and afterwards divided among them in various ways. In ancient French law we find three forms of taille: the taille servile, taille seigneuriale and taille royale.

The taille servile can scarcely be termed a tax; it was rather a tax which had degenerated into a source of profit for certain individuals. Every lord who possessed serfs could levy the taille on them, and originally this was done arbitrarily (a volonté) both as to frequency and amount. It always remained a characteristic feature of serfdom, but was limited and fixed, either by contracts or concessions from the lord (taille abonnée), or by the customs.

The taille seigneuriale was a true tax, levied by a loid on all his subjects who were neither nobles nor ecclesiastics, but the writer

holds that, when fendalism was set up, the right to levy it did not belong to every lord, but only to the lord having the haute pustice But he levied it by right, without the necessity for any contract between him and those who paid it. He fixed the sum to be paid by each group of inhabitants, who then had to see that it was assessed, collected and paid to the lord, electing commissaries (breud hommes) from among themselves for this purpose The seignional taille, like the servile, had the character of a personal tax (taille personelle), a sudimentary tax on income, every man being taxed according to his wages or other income. The king originally had only the right of levying the taille in places where he had retained the exercise of the haute justice. At that time there was no royal taille, strictly speaking, it was only the seigniorial taille transferred to the Crown, but it was one of the first taxes his right to levy which upon all the inhabitants of the domain of the Crown, whether serfs or toturiers, was recognized. The general taille, for the benefit of the king, became more frequent, and tended to become permanen. This transformation was confirmed, rather than effected, by the ordonnance of 1439 Its immediate object was, not the regulation of the taille, but the organization of the compagnes d'ordonnance, ve, the heavy cavalry which the king from that time on maintained on a permanent footing Military expenses thus becoming permanent, it was natural that the taille, the tax which had long been devoted to meeting the expenses of the royal wars, should also become permanent This was contained implicitly in the ordonnance of 1433, which at the same time suppressed the seigniorial taille, as competing too closely with the royal taille by imposing a double burden on the taxpayer A kind of seigniorial taille continued to exist besides the servile taille, but this kind presupposed a title, a contract between the taxable rotusies and the lord, or else immemorial possession, which amounted to a title (See France Law and Institutions)

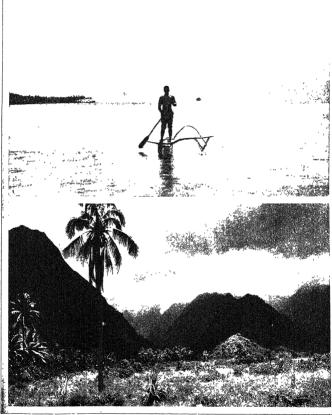

Throughout the pays d'élections the taille was almost universally personal (taille personnelle); ie, a tax on the whole income of the taxpayer, whatever its source. It was also a distributory tax (impôt de repartition), every year the king in his council fixed the total sum which the taille was to produce in the following year, he diew up and signed the brevet de la taille (warrant), and the contribution of the individual taxpayer was arrived at in the last analysis by a series of subdivisions

In certain districts the taille was real (taille reelle); i.e , a tax on real property It was not an equal tax falling on all landowners, but the question as to whether a certain estate was to be taxed or not was decided according to the quality of the property, and not that of the owner The biens nobles (fiefs) and the biens ecclesiastiques were exempt, tenures roturières however, by whomsoever held, were taxed A small part of the pays d'élections was also pays de taille réele But it was the chief form of tax in the pays d'états, and even there an attempt had generally been made to check the exemption of nobles' property It has been shown that in these districts the taille had originally been personal, having become real by a curious evolution In these districts there were cadastres, or compoin-terriers (land registers), which allowed of a non-arbitrary assessment; and at the end of the ancien régime merely needed revision.

In certain provinces where the royal taille was levied there were neither élections nor généralités, and the whole administration of the tax was in the hands of the intendants These were the provinces of the east and north, which were united to the Crown at a period when the power of the intendants was already fully developed; they were sometimes known as pays d'imposition.

TAILLEFER, the surname of a bard and warrior of the 11th century, whose exact name and place of birth are unknown. He accompanied the Norman army to England in 1066, and obtained permission from William to strike the first blow at the battle of Hastings, where he was killed. Mention of Taillefer is made by Guido, bishop of Amiens, in his Carmen de bello Hastingensi, v. 931-944 (in Mon. Hist Brit., 1848) and by Henry of Huntingdon in his Historia Anglorum (in Rer. Brit med. gevi script., p.

763, ed., Arnold, London, 1879); and his prowess is depicted on the Bayeux tapestry The statement of Wace in the Roman de Roy, 3rd part, v 8035-62, ed Andresen (Heilbronn, 1879), that Tailefer went before the Norman army singing of Charlemanne and of Roland and the vassals who died at Roncevaux has been considered important in demonstrating the existence of a comparatively early tradition and song of Roland

See W Spatz, Die Schlacht von Hastings (Berlin, 1896), Ficeman, History of the Norman Conquest

TAILOR, one who cuts out and makes clothes (Fr tailleur, from tailler, to cut, Lat talea, a thin 10d, a cutting for planting) Formerly the tailor, or cissor, made apparel for both men and women, and not merely outer garments, but also articles of linen and the padding and lining of armour -- whence the style ' Taylors and Linen Armourers" applied to the Merchant Taylors Comnany of the City of London in their earliest charters. But the word is now generally limited to those who make the outer (cloth) garments for men, and less frequently for women, though a phrase such as "shirt-tailor" is occasionally met with. In modern usage, too, it commonly has the implication that the gaiments are made to the order, and to the measure, of the individual purchaser, as opposed to ready-made clothing, which means articles of apparel manufactured in large quantities in a series of stock or standard sizes, such that any purchaser may expect to find among them one that will fit him with more or less accuracy. The clothing trade was originally confined to goods of the poorest grades, but it has come, both in Great Britain and in America. to include articles of good, though not of the first, quality It probably first came into existence at seaport towns, where, to meet the convenience of sailors returning from long voyages and requiring their wardiobes to be replenished at short notice, the "outfitters" kept stocks of ready-made garments on sale, but it made no considerable progress until after the middle of the roth century, when the introduction of the sewing-machine brought about the possibility of manufacturing in large quantities. Its development was attended with gradually increasing subdivision of labour and, to a large extent, with the disappearance of the tailor as a skilled craftsman

The first step was for a garment, such as a coat, to be completed by the toint efforts of a family Then followed the "task system. which in America was the result of the influx of Russian Iews that began about 1875. Under it a team of three men, with a "messer" and a girl to sew on the buttons, divided the work between them Payment was made by the "task," se, a specified number of garments, the money being divided between the memhers of the team in certain proportions. Often several teams would be run by a contractor, who naturally selected the cheapest workshops he could find and packed them as full of workers as possible, and when through stress of competition he had to accept lower prices the plan he adopted was to increase the number of garments to a task, leaving the pay unaltered. The result was the introduction of many of the worst features of the "sweating system." the workers having to work excessively long hours in order to finish the task, which in some cases meant as many as 20 coats a day. In the "factory" or "Boston" system the subdivision is still more minute, and as many as 100 persons may be concerned in the production of one coat The amount of tailoring skill required in a worker is even further reduced, but the premises come under the regulation of the factory laws. The factory system has also cheapened production in a legitimate way, because it has enabled mechanical power for driving sewing-machines, and also expensive labour-saving machinery, to be introduced to an extent not practicable in small shops. (See CLOTHIERS, WHOLESALE.)

TAIN, royal and small burgh, county of Ross and Cromarty, Scotland Pop. (1951) 1,602 Area, 36 sq mi. It is within I mi of Dornoch Firth, 25½ mi. N.E. of Dingwall by the L M.S.R. The name is from the Icelandic thing, "assembly" or "court." The industries include distilling and woollen manufactures, and the town is a market and distributing centre. In the centre of the town is a picturesque tower, once a gaol Duthac (locally called Duthus), a saint of the 11th century, is believed to have been a native, and the ruined chapel near the station is supposed to

have been his shime. To the collegiate church of St. Duthus, a Decorated building, founded by James III in 1471, James IV made several pilgimages in penance for his father's death. The building was used as the parish church till 1815, when it fell into disrepair, but it was restored between 1871 and 1876 It has monuments to Patrick Hamilton, the martyr, and Thomas Hog (1628-1692), the Scottish divine Three and a half miles SE. are the remains of the Early English abbey of Fearn, founded at Edderton in 1230 by Farquhar, 1st earl of Ross, and transferred hither in 1338 Patrick Hamilton became titulai abbot in 1517, and after his martyidom the abbey was added to the bishoping of

TAINE, HIPPOLYTE ADOLPHE (1828-1893), French critic and historian, the son of Jean Baptiste Taine, an attorney, was born at Vouziers on April 21, 1828 J B Taine died on Sept 8, 1840, leaving a moderate competence to his widow, his two daughters, and his son. Taine was educated at the Collège Bourbon, where he formed lifelong friendships with Prévost-Paradol, for many years his most intimate friend, Planat, the future "Marcelin" of the Vie Parisienne, and Cornélis de Witt, who introduced him to Guizot when the latter retuined from England in 1846 Taine passed from the Collège Bourbon to the Roole Normale, but in 1851 he was refused the fellowship in philosophy which was universally regarded as his due Nevertheless the minister of public instruction appointed him to a piofessorship at Toulon, which he exchanged for one at Nevers But he refused to express explicit approval of the coup d'état of Dec 27, 1851 Consequently he was removed to an inferior post, next year saw a further step downward, and he accordingly applied for, and received, indefinite leave of absence. In a few months his two dissertations, De personis Platonicis and the essay on La Fontaine's fables were finished, and May 30, 1853 he took his doctor's degree. This was the last act of his university career, his life as a man of letters was now to begin

No sooner had he deposited his dissertations at the Sorbonne than he began to write an essay on Livy for one of the comnetitions set by the Academy. Here again the moral tendency of his work excited lively opposition, and after much discussion the competition was postponed till 1855; Tame toned down some of the censured passages, and the work was crowned by the Academy in 1855. In the beginning of 1854 Taine, after six years of uninterrupted eifort, broke down and was obliged to rest The year 1854 was an important one in the life of Taine His enforced leisure, the necessity of mixing with his fellowmen, and of travelling, tore him from his cloistered existence and brought him into more direct contact with reality. He lived with his mother in the Isle Saint-Louis, and now he once more associated with his old friends, Planat, Prévost-Paradol and About He made the acquaintance of Renan, and through Renan that of Sainte-Beuve, and he renewed friendly relations with M. Havet, who for three months had been his teacher at the École Normale These years (1855-56) were Taine's periods of greatest activity and happiness in production. In 1855 he published seventeen articles in the Revue de l'Instruction publique, and twenty in 1856 on the most diverse subjects, ranging from Menandei to Macaulay From 1857 onwards he was a regular contributor to the Journal des Débats.

But he was seeking a larger field. In January 1856 his history of English literature was announced, and in 1855-56 he published in the Revue de l'Instruction publique a series of articles on the French philosophers of the 19th century, which appeared in a volume at the beginning of 1857 In this volume he energetically attacked the principles which underlie the philosophy of Victor Cousin and his school. The book closes with the sketch of a system in which the methods of the exact sciences are applied to psychological and metaphysical research. The work itself met with instantaneous success, and Taine became famous In 1858 appeared a volume of Essais de Critique et d'Histoire: in 1860 La Fontaine et ses Fables, and a second edition of the Philosophes Français.

In 1864 Taine succeeded Viollet-le-Duc as professor of the history of art and aesthetics at the École des Beaux Arts. Renan's 756 TAIT

appointment at the Collège de France and Taine's candidature for the Polytechnic School inda alarmed Mgr Dupanloup, who m 1863 issued an Avertssement à la Jeunesse et aux Pères de Feamlle, which consisted of a volent attack upon Taine, Renan and Litté. Renan was suspended, and Taine's appointment to Sant Cyr would have been cancelled but for the intervention of the Prancess Mathilde In December 1863 his Histone de la Littérature Anjañae was published, piefaced by an introduction in which Taine's determinist views were developed in the most uncompositioning fashion. In 1864, Taine sent this work to the Academy to compete for the Prix Bordin M de Falloux and Mgr Dupanloup attacked Taine with vollence, he was warnly defended by Guizot finally, after three days of discussion, it was decided that as the prize could not be awarded to Taine, it should not be awarded at all. After three attempts to secure admission to the Academy Taine was elected in November 1878.

The period from 1864 to 1870 was perhaps the happiest of Taine's life. He derived pleasure from his employment at the Beaux Arts and Saint Cyr, which left ample leisure for travel and research In 1865 appeared La Philosophie de l'Art, in 1867 L'Idéal dans l'Art, followed by essays on the philosophy of ait in the Netherlands (1868), in Greece (1869), all of which short works were republished later (in 1880) as a work on the philosophy of art In 1865 he published his Nouveaux Essais de Critique et d'Histoire; from 1863 to 1865 appeared in La Vie Parisienne the notes he had taken for the past two years on Paris and on French society under the sub-title of "Vie et Opinions de Thomas Frédéric Graindorge," published in a volume in 1867, the most personal of his books, and an epitome of his ideas. In 1867 appeared a supplementary volume to his history of English literature, and in January 1870 his Théorie de l'Intelligence. In 1868 he married Mademoiselle Denuelle, the daughter of a distinguished architect. He had made a long stay in England in 1858, and had brought back copious notes, which, after a second journey in 1871, he published in 1872 under the title of Notes sur l'Angleterre.

Tame, deeply shaken by the events of 1870, now felt that it was the duty of every Frenchman to work solely in the interest of France On Oct 9, 1870 he published an article on "L'Opmon en Allemagne et les Condutions de la Paix," and in 1871 a paraphlet on Le Suffrage Universel, and his intention of writing on the French Revolution returned in a new and definite shape. He determined to trace in the Revolution of 1789 the reason of the political matshulty from which modern France was suffering From the autumn of 1871 to the end of his life his great work, Les Origines de la France Contemporane, occupied all has time, and in 1834 he gave up his professorahup in order to devote himself wholly to his task; but he succumbed before it was finished.

dying in Paris on March 9, 1893.

Les Orienes de la France Contemboraine. Taine's monumental achievement, stands apart from the rest of his work. The problem which Taine set himself was to inquire why the centralization of modern France is so great that all individual initiative is practically non-existent, and why the central power, whether it be in the hands of a man or of an assembly, is the sole and only power; also to expose the error underlying two prevalent ideas:—(1) That the Revolution destroyed absolutism and set up liberty; the Revolution, he points out, merely caused absolutism to change hands. (2) That the Revolution destroyed liberty instead of establishing it; that France was less centralized before 1780 than after 1800. This also he shows to be untrue. France was already a centralized country before 1789, and grew rapidly more and more so from the time of Louis XIV. onwards. The Revolution merely gave it a new form The Origines differ from the rest of Taine's work in that, although he applies to a period of history the method which he had already applied to literature and to the arts, he is unable to approach his subject in the same spirit; he loses his philosophic calm; he cannot help writing as a man and a Frenchman, and he lets his feelings have play; but what the work loses thus in impartiality

it gains in life.

Taine was the philosopher of the epoch which succeeded the

appointment at the Collège de France and Taine's candidature era of romanticism (1820-50) in France The ideal of the newer for the Polytechnic School had alarmed Mgr Dupanloup, who generation was truth, their watchword liberty, to get as near as in 1859 issued on Avertisement à la Jenuese et aux Pères de possible to scientific truth became their object. Taine must ever Famille, which consisted of a volent attack upon Taine, Renan be regarded as one of the most authoritative spokesmen of this

Taine served science unfalteringly, without looking forward to any possible fruits or result. In his work we find neither enthusiasm nor bitterness, neither hope nor yet despair, merely a hopeless resignation. The study of mankind was Taine's incessant preoccupation, and he followed the method already described. He made a searching investigation into humanity and his verdict was one of unqualified condemnation In "Thomas Graindorge" we see him aghast at the spectacle of man's brutality and woman's folly In man he sees the primeval savage, the gorilla, the carnivorous and lascivious animal, or else the maniac with diseased body and disordered mind, to whom health, either of mind or body, is but an accident. Taine is appalled by the bête humaine, and in all his works we are conscious, as in the case of Voltaire, of the terror with which the possibilities of human folly inspire him It may be doubted whether Taine's system, to which he attached so much importance, is really the most lasting part of his work For Taine was an artist as well as a logician, an artist who saw and depicted what he saw in vital and glowing language. From the artist we get his essay on La Fontaine, his articles on Balzac and Racine, and the passages on Voltaire and Rousseau in the Ancien Régime Moreover, not only was Taine an artist who had not escaped from the influence of the romantic tradition, but he was by his very method and style a romanticist. His emotions were deep if not violent, his vision at times almost lurid He sees everything in startling relief and sometimes in exaggerated outline, as did Balzac and Victor Hugo Hence his predilection for exuberance, strength and sprendour; his love of Shakespeare, Titian and Rubens, his delight in bold, highly-coloured themes Tame's influence was great, and twofold. On his own generation

it was considerable; during the epoch in which he lived, while a wave of pessimism was sweeping over French literature, he was the high priest of the cult of misanthropy, in which even science was held to be but an idol, worthy of respect and devotional service, but not of faith In its turn came the reaction against positivism and pessimism, and an attempt at spiritual repascence Around a man so remarkable as Taine a school is certain to form itself; Taine's school, which was one of positivist doctrines, rigid systems and resigned hopelessness, was equally certain to produce at some time or another a school of determined opponents to its doctrines and system If, therefore, the tone which pervades the works of Zola, Bourget and Maupassant can be immediately attributed to the influence we call Taine's, it is also the influence of Taine which is one of the ultimate causes of the protest (M. Bc : X) embodied in the subsequent reaction.

embodied in the subsequent reaction.

TAIT, ARCHIBALD CAMPBELL (1811-1839), English divine, archbishop of Canterbury, was born at Edinburgh on Dec. 21, 1811, of Presbyterian parents. He entered Balliol college in 1830 as a Snell exhibitioner from the University of Glasgow. He became fellow and tutor of Balliol and was also ordained deacon (1836) and priest (1838), and served the curacy of Baldon. He never symnathized with the principles of the Tractarian

movement, and on the appearance of Tract 90 in 1841 he drafted the famous protest of the "Four Tutors" against it, but this was his only important contribution to the dispute In 1842 he succeeded Arnold as headmaster of Rugby, and, after a serious illness in 1848, accepted a less strenuous appointment as dean of Carlisle in 1849 During his residence at Carlisle he served on the University Commission, restored his cathedral and did much excellent pastoral work There too he suffered the great sorrow of his life He had married Catharine Spooner at Rugby in 1843, in the spring of 1856, within five weeks, five of their children died of scarlet fever He was consecrated bishop of London on Nov 22, 1856 He became archbishop of Canterbury in 1868 His last years were interrupted by illness and saddened by the death in 1878 of his only son Craufurd, and of his wife

Tait was constant in his attendance in parliament, and pressed on many measures of practical utility. The modification of the terms of clerical subscription (1865), the new lectionary (1871) the Burials Act (1880) were largely owing to him; for all of them, and especially the last, he incurred much obloquy at the time The Royal Commissions on Ritual (1867) and on the Ecclesiastical Courts (1881) were due to him, and he took a large

part in the deliberations of both

Tast was less successful in dealing with matters which called for the higher gifts of a ruler, and especially in his relations with (a) the liberal trend in modern thought, and (b) the Catholic revival (1) His object in dealing with questions of faith, as in dealing with the ritual question, was primarily a practical one he wished to secure peace, and obedience to the law as he saw it Consequently, after his sympathies had led him to express himself favourably towards some movement, he frequently found himself compelled to draw back. He expressed a qualified sympathy with some of the writers of Essays and Reviews, and then joined in the censure of it by the bishops (1861) The same kind of apparent vacillation was found in his action in other cases, eg, in the Colenso case (1863), and in the controversy as to the use or disuse of the Athanasian symbol (1872) (#) Tait was concerned with the Catholic revival during the whole of his episcopate, and above all on the side of ritual. He had to deal with the St. George's-in-the-East riots in 1859, and the troubles at St Alban's, Holboin, in their earlier stages (1867), he took part as assessor in the Privy Council judgment in the Ridsdale case (1877); he was more closely concerned than any other bishop with the agitation against confession in 1858, and again in 1877. His method throughout was the same he endeavoured to obtain a compliance to the law as declared by the courts; failing this, he made the most earnest efforts to secure obedience to the ruling of the Ordinary for the sake of the peace of the Church; after this, he could do nothing In fact Tait could hardly realize anything but the connection between the English Church and the State From such a position there seemed to be no escape but in legislation for the deprivation of the recalcitrant clergy; and the Public Worship Regulation Act (1874) was the result. A widespread feeling of indignation spread not only among High Churchmen. but among many who cared little for the ritual practices involved. At length, when A. H. Mackonochie was on the point of being deprived of his benefice of St. Alban's, Holborn, for contumacy, the archbishop, then on his deathbed at Addington, took steps which resulted in the carrying out of an exchange of benefices (which had already been projected), which removed him from the iurisdiction of the court. This proved to be the turning-point; and the ritual difficulty was afterwards dealt with from a different' point of view, and the Public Worship Regulation Act became practically obsolete. The archbishop died on Dec. 3, 1882.

See R. T. Davidson and D. Benham, Life of Archbishop Tait, 2 vols. (1891); A. C. Tait, Catharine and Craufurd Tait (1880). TAIT, PETER GUTHRIE (1831-1901), Scottish physicist, was born at Dalkeith on April 28, 1831. After attending the Academy at Edinburgh and spending a session at the University, he went up to Peterhouse, Cambridge. As a fellow and lecturer of his college he remained in Cambridge until 1854, and then left to take up the professorship of mathematics at Queen's college, Belfast. There he joined Thomas Andrews (q.v.) in re-

searches on the density of ozone and the action of the electric discharge on oxygen and other gases From 1860 to 1901 he was professor of natural philosophy at Edinburgh, where he died on July 4, 1901.

His earliest work dealt mainly with mathematical subjects, and especially with quaternions (q v), of which he may be regarded as the leading exponent after their originator, Hamilton With the help of Hamilton and Philip Kelland (1808-1879), he wrote two text books, Elementary Treatise on Quatermons (1867), and Introduction to Quaternions (1873). He also produced original work in mathematical and experimental physics In 1864 he published a short paper on thermodynamics, and from that time his contributions to that and kindred departments of science became frequent and important. He worked on thermoelectricity and thermal conductivity, its variation with temperature and its relation to the electrical conductivity of the same material, (See HEAT)

From 1879 to 1888 he was engaged on difficult experimental investigations, which began with an inquiry into the corrections required, owing to the great pressures to which the instruments had been subjected, in the readings of the thermometers employed by the "Challenger" expedition (q v) for observing deepsea temperatures, and which were extended to include the compressibility of water, glass and mercury. Between 1886 and 1892 he published a series of papers on the foundations of the kmetic theory of gases; and about the same time he carried out investigations into impact and its duration

A selection only from his papers, published by the Cambridge University Press, fills three large volumes With Lord Kelvin he collaborated in writing the well-known Treaties on Natural Philosophy. "Thomson and Tait," as it is familiarly called, but only the first part

of it was ever completed.

Tait collaborated with Balfour Stewart in the Unseen Universe which was followed by Paradoxical Philosophy

TAI-YUAN (Yangku), capital of the province of Shansi, China, first noticed about A D. 450, but greatly developed after the expulsion of the Mongols by the building of a great wall in 1377. Its exposure to attack from Mongolia was the reason for this. It is situated on the Fen-ho river, in a well-peopled plain with many good villages, and is at an altitude of about 2,560 ft. above sea level The valleys of the plain nearly all have coal mines Tai-yuan's normal population was estimated between 80,000 and 220,000 By 1911 Tai-yuan was connected by rail with Chengting on the Peiping-Hankow line. Before 1935 a railway along the Fen river south to Yungtsi and north to Yuanping was completed which was later extended south to Fengling and north to Tatung on the Peiping-Suiyuan railway. Meteorological observations kept there show a rainfall of 11.6 in per annum, mainly from May to August, more than half the total falling in July, the month of highest average temperature (766°). The January average temperature is as low as 18.0°, and the January average minimum is 45°. The Japanese took Tai-yuan in 1937.

TAJIK, a subject race of Afghanistan, but the original Persian possessors of the soil, who still speak their mother tongue. The word as now used properly means Arab and was applied to those communities where Arabs settled at the time of the first Arab conquest They are agriculturalists, organized in village communities, sometimes tenants of Afghan overlords, with headmen in their own villages They are Sunnites. See Tribes and Castes of the Punjab and N.W. Frontier Province, vol. iv (1914).

TAJIK REPUBLIC, a state member of the U.S.S R., so constituted in 1929, having been created in 1924 an A.S.S.R. of the Russian S.F.S.R. It is bounded north by the Kirghiz S.S.R., south by Afghanistan, west by the Uzbek S.S.R., and east by Chinese Turkestan, It consists of mountain and plateau of the

Pamir-Alai system, west of the Sarikol range,

Geography and Climate.-The boundary between Russia and Afghanistan, as laid down by the Pamir Boundary commission in 1895, goes along the Lake Victoria Yashil-Kul affluent of the Oxus and eastwards along the Nicholas range, dividing the Great and Little Pamirs, so that all the head of the Little Pamir and the Wakhan valley lie in Afghanistan. The Alichur, Rang Kul, Kargosh (Kara Kul) and Sarez Pamirs are in the Tadzhik republic; a

penur (Persian par-mur or foot of the mountum peak), as a valley stretching urward on a long slope to the mountum peak, and these high level valleys (Lake Virtena Yashi-Kul hav an altitude of 13,400 ft). are mainly of glacual formation. The chief ridges crossing the republic are the Turkestan, Zarashan, Hissar, Trans-Alia, Peter the Gleat and Darvas Mt Leinn (formerly Mt Kaufmann) (23,386 ft.) together with Mt Stalin (24,590 ft) are the highest peaks in the US St.

The eastern part of the republic is characterized by broad flatbottomed valleys, with a series of lakes and low watersheds, and by a severe and dry climate, with an average January temperature as low as that of Novaya Zemlya. The range between day and might temperature is the greatest in the woild, and in mine years only 2 3 m of ram were recorded, this region is bleak and deserted. Of the lakes, Karak-ull (q\*v) is the Jargest, others are Shor-kul, Rang-kul, Yashi-kul, Zor-kul and Sarea. The last was formed in 1917, from the Murged (Battang) river after an earthquake m consequence of which the stream was dammed up by a huge avalanche, Lake Yashi-kul was formed in a similar way

The Amu-Daia or Osus is the chief waterway, and under the name of Pandhy, serves as a boundary between Tadhukstan and Afghanistan, it rises in the Hindu Kush as the Vakhan-darya Most of the glacer-fed streams in the republic are thibutares of the Amu Daia and flow in a southwesterly direction. Along the right bank of this stream and in the lower course of its ributantes, the Kadimugan and Vaksha, is a desert, with a hot dry summer,

which receives less than 10 in, of rainfall per annum

Fauna and Flora.—The valleys on the west are deeper than those on the east and are divided by high, snowy ridges. The northwestern lower slopes are well clad with forest, since they receive more moisture and are less parched in summer. The southwestern slopes are less favourable to vegetation, and a southeastern slope, which means great heat in summer, accompanied by dry winds from Mongolia, is least favourable. Thus in accordance with altitude, slope and type of soil many varieties of vegetation are represented, saxual scrub, jungle grass, especially in the valleys of the Surkhan, Vaksha and Kyayi-Su, where the tiger and deer are to be found, decidious and coniferous forest, and alpine and sub-plape pasture.

Along the northwest runs the upper course of the Zarafshan, with its tributary, the Fan, but the Zarafshan valley there is infertile and difficult to irrigate because of the irregularity of the surface. The most fertile regions are the valleys in which Diu-

shambe and Kurgan-Tyube are situated.

Population and Industry—The types of dwelling are as varied as the climate and vegetation, e.g., fell tents for the nomasi, loses brick walls with a thatch of reeds for the primitive cultivator, the houses are always low, whatever that irve, because of the frequent earthquakes. The chief occupation is slock raising of semi-monadic type, e.e., restricted to certain summer and winter pastures, true nomadism is fast dying out. The disturbances following the 1921 revolution muted diminished the herds. The numbers of assess and mules, so essential for transport in this difficult region, soon regained their former level; cattle, sheep and goats slowly increased, but the numbers of camels and horses long remained below rorq; level, Irrigation cultivation of cotton, rice, olives, wines and fruits in the more favoured valleys is making a steady progress Wheat and blardy as the cheef grain crops.

There are valuable minerals, including coal in the Un-Tyube district and the Zanfahn hasin, fron in the latter district and in the valley of the Vanch, where manganese also occurs. These minerals and gold are worked in a primitive way in some localities. Lead, sulphur, asbeatos and salt are reported, and there are hot springs, especially at Stalmabad. The natural wealth is, however, unsurveyed and there is little prospect of great exploitation in the present absence of means of transport, though some of the towns have enterprises to develop products from agricultural raw inaterials. There are small peasant weaving, carpentry, leather and million industries to supply local needs only.

The link with Uzbekistan is a winding road from Derbent to Stalinabad, which can be used by motors from April to October only. A railway to link Stalinabad via Termez with the trans-

Caspian line was constructed about 1932
The population consists of Tadzhiks, 746%, and Uzbeks, 212%, the rest being Kirghiz, Kazaks, Turkmens, Arabs and Jews It numbeted (1939) 1,485,691 (rural 1,233,209, urbar 25,1882), having been much dimmished in the post-1977 disturb-

ances, when many fugitives took refuge in Afghanistan Area, 55,545 sq mi

The literacy rate is low throughout the republic and in the Badakshan area it is probably less than 2% Education is difficult in this wild country and not more than 12% of the children of school age are provided for, medical help is almost entirely lacking The Tadzhiks are Mohammedans, but not of a strict type, and in the remoter areas much primiture nature worship survives Stalinabad (we DIUSHAMME) (pop in 1939, 82,540) is the administrative centre

The Mountain Badalshan Autonomous Area was created within Tadahistan in 1975, with Khorog (pop 1933, 1,200) as its centre; it has an area of 33,591 sq mi. If consists of the mountain thot in the southeast, of winch 75% is stony and sandy high desort. The climate is severe, average Janusity temperature  $-4^5$  F, average July  $+50^5$  F. on the east, and  $+14^5$  F, +71 6° F. on the east, and  $+14^5$  F, +71 6° F. on the west. The population in 1933 was 55,700 and consisted 588% Tadahists and 11 4% Kara-Kirghia. In the east are nomad herdismen raising hoises, mules, asses, camels, sheep and goats, while in the west scanty crops of rye and wheat supplement herding Hunting and trapping of marten, fox and otter are additional sources of income and gold is extracted in a primitive way

Billiousaphy —In English, S. G. Littledale, Across the Panin from North to South (1892), W. R. Rickmers, The Duado of Turbestan (1921). In Russan, P. S. Nararov, Trueds in the Panin; (1890), Y. D. Golovini, To the Panins (1902); A. I. Dimitra-Mamonov, Ordon and Computer (1903). A. R. Boburnish, Monstain Tribes of the Pani (1908).

TAJ MAHAL, the tomb built at Agra, India, by Shah Jahan for his wife, Mumtaz Mahal, where he is also buried. It was begun in 1632 (in which year the Shah ordered the stopping of all other Hindoo temple-building), and was completed by 1650 The Taj Mahal is the most perfect example of the Mogul style and is by some considered the most beautiful building in the world The tomb proper consists of a domed, square, white marble building, raised on a terrace from the corners of which rise four slim, white minarets. The whole is set in an exquisite garden surrounded by a red sandstone wall; a gate and a mosque are subsidiary elements in the composition. The tomb building itself is 186 ft square, with a dome 58 ft in internal diameter rising to a total height of 210 feet. The building is said to have cost over £3,000,000 It was probably designed by an architect named Ustad Isa, traditionally supposed to have been either Turkish or Persian For a complete description see Agra See also Indian Architecture.

TAKIN, a hollow-horned uminant (Budoreas taxcolor), which inhabits the southeast corner of Thete, while a second form is found farther east, in the Moupin district. The taken is clumisly built, with yellowish-brown or gray hair and currously curved horns, which recall those of the gnu. Its nearest relatives appear to be the myskore (av n. CSe BOUDLE.)

to be the musicozen (gw.). (See Bovubae.)

TAKIA, MAKAN, a desert area in Central Asia. This unit is the major division of that portion of the Tarim basin what stretches westwards from the lower course of the Tarim river to the Parmirs. Its borders on the west, north and east are formed by the Timaft, Yarkand and Tarim never sepsectively

Speaking generally, the Takla Makan is a region of bare drift sand and moving sand dunes, a waterless area, except for the Khotan and Kerlya rivers, which carry water northwards into the desert from the Kunlun. This sand dune desert is absolutely munhabitable, except for a few scattered settlements along the banks of these rivers. These sandy wastes are found all the way down the right bank of the Tarim river to its confluence with Lake Kara-Buran, and then continue up the Charchan Darya and almost as far west as Keriya. The sand dunes proper of the Takla Makan occupy chiefly the south and southwest of the tregion, where the full force of the northeast wand is felt.

Between the lower Tarm river and the Chaichan Darya, the surface conformation is different from that of the rest of the Takla Makan. Here the sand dunes are interrupted by tracts of periectly level soil entirely destitute of sand. In the southernmost part of this area there are patches of reeds and tamarisks.

and wells are to be found in this locality

In the west, stretching from Yangi Hissar to the left bank of the Yarkand river, there is the region of moving sands known as Ordam Padshah In the east, beyond the left bank of the Tarım river, there is a zone of high and barren sand ridges, extending beyond the river and filling the area between the foot of the Kuruk Tagh hills and the belt of wind-eroded desert along the western side of the ancient salt-encrusted Lop lake hed. In this region the sands are much less frequent than in the Takia Makan itself Here the soil is of loose saline clay, bare in some places, overgrown in others with tamarisk bushes. The plants bind the soil with their roots into a solid mass, the intervals between the masses of plants being subject to the full erosive force of the winds. The drift-sand accumulates around the bushes and gradually a billock of sand and tamarisks is formed These hillocks are between 7 and 14 ft high, and cover large tracts in this eastward extension of the sandy desert In the sand dune desert proper of the Takla Makan, there are two systems of dunes; one system, of the high chains, stretches from east to west, while the transverse dunes run from north to south, or north-east to south-west. The steeper faces of the dunes are, for the most part, turned towards the south, the south-west and the west, that is, away from the direction of the prevailing winds, but in some regions face east

Vegetation and animal life are extremely scarce. The former is practically confined to various steppe plants, kanish (teeds), tamarisks, almost invariably growing on root mounds, and poplars. The animals are hares, rats, and one of two other rodents, foxes,

and, in a few places, the wild camel,

The climate is one of extremes In the Charchan desert a temperature of -22° Fab seen observed in the depth of winter, and snow sometimes falls heavily there. During the sandstorns as much as 10° or 12° F below zero. On the other hand, a temperature as high as 86° Fab seen recorded at the end of April This desert can only be crossed safely in the winter, when it is possible to transport ice on the backs of camels. Sometimes, or days together, the desert is enveloped in an impenetrable dust huze, which tokes and smothers every living creature

In the second half of the 13th century, Maico Polo left a vivid description of this desert and related legends associated

with it. (See also SINKIANG, TARIM.)

TAKORADI, a port on the Gold Coast, Brutish West Africa, in 4° go N, 13° 45 W. The main breakwater, 1½ mi long, is built on a reef which extends a to 3 mi from the rocky foreshore. The lee breakwater is ½ mi long. the enclosed area is 270 sc. and mit shape up to 40 ft. draught can lie Shaps 400 ft long and 20 ft draught can lie alongsed the wharves. The port is excellently equipped and can handle 5,000 tons of cargo daily It is the terminus of the western railway to Kumasa, is the chief port of the Gold Coast, and the only deep water harbour between Sierra Leone and Nigeria, 1e., on 1,300 mi, of coast On high ground overlooking the harbour is a model towaship, built to accommodate 150,000 inhabitants. The port was opened to general traffic in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin in 1928 Pop (1948) 44,150 including Sckodin includ

TALAING, a name given to the Mon people of Pegu in Burma, now largely absorbed into and indistinguishable from the Burmas nation. The Mon are a remnant of the oldest known coultastion of southeast Asia (see article Asia), speaking a Ianguage which connects with scattered survivals from the Mundas, in Chhota Nagpur and the Khasis of Assam to Cumbodia, and probably also to Yunnan and the Malay archipelago. The Mon, however, got their culture, their religion, now Buddhist but originally Hindu, and their literature from the Tellingana cost of South India; and from the Tellingas, whose culture they took and whose foreign blood they absorbed into their own stock, came the name Talaing. This culture was again passed on to the Burnese conquerors of Pegu, and Burnese is written in the Talaing alpha-

bet Burmese law is largely derived from Talaing monastic writ ings, and Burmese historical tradition is full of Indian nomenclature and Indian legend (See G. E. Harvey, History of Burma (J. H. H.) TALANA HILL, ACTION OF, Oct. 20, 1895; see Sourin

AFRICAN WAR, 1899-1902

TALAR, the throne of the Persian monarchs which is carved on the rock-cut tomb of Danus at Nakst-i-Rustan, near Persepols

TALAYERA DE LA REINA, a town of central Spain, mhe perome of Toledo, on the right bank of the river Tagus, and on the Madrid-Cacers railway. Pop (1940), 16,500 (mus. 1854); Talavera is of great antiquity, the Caesobrag of the Romans Portions of the triple wall which surrounded it remainstanding, and the Anco de San Pedro is one of its Roman gates testored Among the ancient buildings are the Torres Albarrans, built by the Moors in the 10th entury, and the Gothic collegate church. The bridge of thuty-five arches across the Tagus dates from the 15th century.

Talayera, Battle of, 1809 .- For the operations which culminated in the famous battle of Talavera, between the English and the French, and those which followed that engagement, see PENINSULAR WAR Sir Arthur Wellesley (afterwards Duke of Wellington), the British commander, acting in co-operation with Lieutenant-General Cuesta's Spanish army, took position on July 27, 1809, on the Upper Tagus, protected by his advanced guard His line, facing due east, ran north from the right bank of the river to a ridge running parallel to the Tagus, beyond which ridge, also parallel to the river, lay the Sierra de Montalban Cuesta's men with their right flank resting on the river held Talavera itself and the close country to the northward of it, Wellesley's right connected with Cuesta's left, and his line stretched away northwards to the ridge already mentioned. The Sierra was not, on the first day, occupied, and even on the inner ridge itself the division of General Hill was, from a misunderstanding, very late in taking up its position. The whole front was covered by a rivulet running from the ridge to the Tagus The battle was begun by the attack of two French divisions on the British advanced guard, which retired into the main position with severe loss and in some disorder Marshal Victor's forces followed them up sharply, and soon came upon Wellesley's line of battle For some time the retention of the ridge (owing to the delay of Hill's Division) was in doubt, but m the end the arrival of Hill's troops secured this all-important point for the Allied left. Meanwhile the Spaniards (though there was at first a temporary panic amongst them) and the right divisions of the British repulsed an attack in the plain, and the day closed with the armies facing each other along the rivulet and on the ridge The losses had been heavy on both sides Early on the 28th the battle was renewed by a furious attack on Hill's troops, whose left was now prolonged to the Sierra by the Allied cavalry and a division borrowed from Cuesta. King Joseph Bonaparte and Jourdan his chief of staff, who were present, were averse to fighting on this present ground, wishing to wait for Soult, whom they expected to come in on Wellesley's rear, and it was only after long discussion that the king gave a reluctant assent to Victor's plan of attack. That commander's divisions once more tried to oust Hill from the ridge, and once more failed before the steady volleys of the British line and the charge of the cavalry posted in this quarter (though, owing perhaps to defective ground-scouting, this nearly ended in disaster). At the same time Sebastiani's IV. corps, after a heavy bombardment, assaulted the Allied centre in the plain. Here the British and Spanish battalions held their own firmly, and a counter attack by Mackenzie's division hurled back the French in disorder. Yet another attack followed these failures, and came very near to achieving a great success This time Lapisse's division of Victor's corps attacked the Allies' left centre, composed of the British Guards. The French columns were again checked by the British line, but here the counterstroke, unlike Mackenzie's, was carried too far, and the troops in the ardour of incautious pursuit were very severely handled and pushed back to the position by the French reserves; but Wellesley decided the day by a counter attack with the 48th regiment, made with great intrepidity and

steadiness. The Guards, with splended discipline, resumed their positions, and eventually the French fell back. Failure all along the line and heavy losses left King Joseph no alternative but to retire towards Madrid The French lost, 7,685 men out of 46,138 present, the British 5,365 out of 26,641; the Spanish lossess were officially returned at 1,200 rout of 300ms 26,000 present

TALBOT (FAMILY). This is one of the few families in the English aristocracy which traces alike its descent and its surname from the Norman conquerors of England The name of Richard Talbot occurs in Domesday Book as the holder of nine hides of land in Bedfordshire under Walter Giffard. There is no evidence that he came over to England with the Conqueror himself; and, as he did not hold of the king in capite, it is clear that he was not a leader. Talbot being a personal nickname and not derived from a place, those who bore it were not of necessity connected, and the early pedigree is obscure. But a Geoffrey Talbot took part with the empress Maud against King Stephen, and a Hugh Talbot held the castle of Plessis against Henry I for Hugh de Gournay, and afterwards became a monk at Beaubec in Normandy. RICHARD TALBOT, with whom the proved pedigree begins, obtained from Henry II, on his accession the lordship of Linton in Herefordshire, and from Richard I the custody of Ludlow Castle His descendants for some generations appear to have been wardens of various castles on the borders of Wales, and intermarried with the great families of this region Under Edward II. a Gilbert Talbot was head of the house, and invaded Scotland in the king's company, but afterwards took part with Thomas of Lancaster against the king. He, however, was pardoned, and obtained from Edward III a confirmation of the grant of the manor of Linton and other lands, being also summoned to parliament as a baron (1331).

His son RICHARD, who married a daughter and co-heiress of John Comyn of Badenoch, laid claim to lands in Scotland in her right, and, when restrained from entering that country by land (Edward III having then made an alliance with King David), he joined in an expedition which invaded it by sea in the interests of Edward Baliol. Three years later he was taken prisoner, and redeemed for 2,000 marks, after which the king made him governor of Berwick He took part also in Edward's wars against France, as did likewise his son Gilbert, who succeeded him. His wife brought him Goodrich Castle on the Wye, and at this time the family possessed lands in the counties of Oxford, Gloucester, Hereford and Kent Gilbert's son Richard added to this inheritance by marrying the heiress of Lord Strange of Blackmere, and himself became under Richard II one of the heirs of the earl of Pembroke, thus adding to his estates, lands in Berkshire, Wilts, Salop and Essex. Another Gilbert Talbot, grandson of the last, claimed to carry the great spurs at the coronation of Henry V., and had a commission to receive the submission of Owen Glendower and his adherents. He also distinguished himself in the invasion of Normandy. He left no male issue, and was succeeded by his brother John.

Hutherto the head of the house had borne the name of Lord Talbot; but this John, after obtaining by marriage the title of Lord Furnival, was for his services created earl of Shrewsbury. (See Shrewsbury, John Talbot, 157 Barl Op.)

Jours, the second earl of Shrewsbury, was the 1st earl's son by his first wife He had been knighted at Leicester (1446) along with the unfant king Henry VI, had served in the wars of France, and been made chancellor of Ireland during his father's lifetime, when he was only Lord Talbot, Afterwards he was made lord high treasurer of England, and in 14,59 was rewarded for his services to the house of Lancaster with a grant of roo marks a year out of the lordship of Wakefield, forfeited by Richard, duke of York, But next year he and his brother Christopher were skin at the battle of Northampton, fighting in the cause of Henry VI. His son John succeeded him, and then his grandson George, who fought for Henry VI. at Stoke, and whom King Henry VIII. sput as his licutenant against the rebels in the Pillerfinging of Grace.

FRANCIS, the 5th earl, took part in the invasions of Scotland under Henry VIII, and Edward VI., and was one of the two peers

who alone opposed the bill for abolishing the pope's juusdiction under Ehzabeth His son George, who succeeded, was the earl to whom the custody of Mary Stuart was committed, his task being rendered the more difficult by the intrigues of his second write, Bess of Hardwick, the builder of Chatsworth, who was thrice marned before her unon with him Two sons of this last earl succeeded one another, and the title then devolved on the lineal descendants of Sir Gilbert Talbot of Grafton in Worcestershire, third son of John, the 2nd earl.

Charles, the 12th earl, was raised by William III to the dignity of a duke, but as he left no son this title died along with him in 1718, and the earldom of Shrewsbury devolved on his

cousin Gilbert, a Roman Catholic priest

From this time the direct line of Sir Gilbert Talbot of Grafton began to fail A nephew three times succeeded to an uncle, and then the title devolved upon a cousin, who died unmarried in 1856 On the death of this cousin the descent of the title was for a short time in dispute, and the lands were claimed for Lord Edmund Howard (now Talbot), an infant son of the duke of Norfolk, under the will of the last earl, but the courts decided that, under a private act obtained by the duke of Shrewsbury shortly before his death, the title and bulk of the estates must go together, and the true successor to the earldom was found in Earl Talbot, the head of another line of the descendants of Sir Gilbert Talbot of Grafton, sprung from a second marriage of Sir Gilbert's son, Sir John Talbot of Albrighton. The head of this family in the beginning of the 18th century was a divine of some mark. William Talbot, who died bishop of Durham in 1730 His son Charles, who filled the office of lord chancellor, was created Bason Talbot of Hensol in Glamorganshire in 1733, and his son William was advanced to the dignity of Earl Talbot in 1761, to which was added Ingestre, the barony of Dyneyor, with special remainder to his daughter, Lady Cecil Rice, in 1780 Then succeeded a nephew, who was created Viscount and Earl Talbot, and assumed by royal licence the surname of Chetwynd before Talbot, from his mother

All the titles just mentioned have been united in the line of the Earl Tallot who successfully claimed the Shrewsbury title as the 78th earl, the earldom of Shrewsbury (1442) being now the oldest existing that is not merged in a higher title The family seasts (Alton Towers and Ingestre Hall) and the chief estates are in Staffordshire. The old badge of the family was a "tialbot" or running hound

running hound (J. Gar; J. H. R.)

TALBOT, MARY ANNE (1778–1808), the "British Amazon," was born in London on Feb. 2, 1778. She believed herself to be the illegitimate child of the 1st Earl Talbot Early in her career she eloped, in the disguise of a boy, with a captain In 1792 she was a drummer in Flanders. In the capture of Valenciennes her love, was killed, and Mary Anne deserted and became cabin boy on a French lugger, which she asserted was captured by the British, who transferred her to the "Brunswick," where she served as a powder monkey, being wounded in Lord Howe's victory of June 1, 1794 For this she later received a small pension When the wound healed she again went to sea, was captured by the French, and imprisoned for a year and a half. Her sex was not discovered until shortly afterwards she was seized by a pressgang She finally became a household servant to Robert Kirby, a London publisher, who included an account of her adventures in his Wonderful Museum (1804) and in Life and Surprising Adventures of Mary Anne Talbot (1809). She

died on Feb. 4, 1308.

TALBOT, WILLIAM HENRY FOX (1800-1877), Eng-lish discoverer in photography, was born at Lacock abbey, Wils, on Feb 11, 1800, and died there on Sept. 17, 1877. He was educated at Harrow and at Trinity college, Cambridge. Before L J. M. Daguerre exhibited in 1839 pictures taken by the sun, Talbot had obtained similar success, and as soon as Daguerre's discoveries became known he communicated the results of his experiments to the Royal Society In 1847 he made known his discovery of the calcippe or Talbotype process, and after the discovery of the collodion process by Frederick Scott Archer in 1851 he devised a method of instantaneous photography. With Rawlinson

inscriptions from Nineveh His works include Pencil of Nature (1844), Hermes or Classical and Antiquarian Researches (1838-39), Illustrations of the Antiquity of the Book of Genesis (1839), English Etymologies (1846)

TALBOT OF HENSOL, CHARLES TALBOT, IST BARON (1685-1737), lord chancellor of England, the eldest son of William Talbot, bishop of Durham, a descendant of the 1st earl of Shrewsbury, was educated at Eton and Oriel college, Oxford, and became a fellow of All Souls college in 1704 He was called to the bar in 1711, and in 1717 was appointed solicitorgeneral to the prince of Wales. Having been elected a member of the House of Commons in 1720, he became solicitor-general in 1726, and in 1733 he was made lord chancellor and raised to the peerage with the title of Baron Talbot of Hensol He died on Feb 14, 1737 Talbot enjoyed the reputation of a wit, he was a patron of the poet Thomson, and Butler dedicated his Analogy to the lord chancellor

See Lord Campbell, Laves of the Lord Chancellors and Keepers of the Great Seal (8 vols London, 1845-69), Edward Foss, The Judges of England (London, 1848-64), Lord Hervey, Memoirs of the Reign of George II (London, 1848), G. E. C., Complete Peerage, vol vii. (London, 1896)

TALC, a mineral which in its compact forms is known as steatite, or soapstone It was probably the μαγνήτις λίθος of Theophrastus, described as a stone of silvery lustre, easily cut The name word comes indirectly from the Arabic talq, and is not connected with Swed talja, to cut It was confused with mica by the older writers, and even now mica is sometimes known in trade as tale, while the term was formerly applied to foliated gypsum

Talc is occasionally found in small hexagonal and rhombic plates with perfect basal cleavage, which are supposed to be monoclinic, and often occurs in foliated masses, sometimes with a curved surface, readily separating into thin, very flexible, non-clastic laminae The plates give a six-rayed percussion-figure Talc has a hardness of only about 1, and a specific gravity of from 26 to 28 Its extreme softness and its greasy feel are characteristic The lustre on the cleavage face is pearly, or sometimes silvery, and one of the old names of the mineral was stella terrae, while German writers sometimes called it Katzen-

silber The colour is white, grey, yellow or frequently green Talc is a magnesium silicate, H<sub>2</sub>Mg<sub>2</sub>S1<sub>4</sub>O<sub>12</sub>. It is generally regarded as a hydrous silicate, but the water is expelled only at a very strong heat, and may therefore be regarded as basic. By the action of heat the hardness of the mineral is greatly increased. Pseudomorphs are known after actinolite, pyroxene, etc, and the mineral has probably been generally formed by the alteration of ferro-magnesian silicates. Talc occurs chiefly in crystalline schists, usually associated with chlorite, serpentine and dolomite Fine examples of apple-green colour are found at Mt Gremer, in the Zillerthal, Tirol. Talc-schist is a foliated rock composed chiefly of tale, generally associated with quartz and felspar; but all soapy schists are not necessarily talcose.

The steatites of Pliny was a stone resembling fat, but otherwise undescribed Being easily cut, steatite has always been a favourite material with the carver: it was used for Egyptian scarabs and other amulets, which were usually coated with a blue vitreous glaze; it was employed for Assyrian cylinder-scals and for other ancient signets, and ancient steatite carvings are found among the ruins of Rhodesia. By the Chinese steatite is largely used for ornamental carvings; but many of their "soapstone" figures are wrought in a compact pyrophyllite (q.v), which is essentially different from talc. The name agalmatolite is often applied to the material of these figures, and was suggested by M. H. Klaproth from the Greek ἄγαλμα, an image. Pagodite is an old name for Chinese figure-stone

Steatite is usually a white, grey, greenish or brown substance, occurring in veins or nodular masses or in lenticular bedded deposits Pseudomorphs after quartz and dolomite occur near Wunsiedel in Bavaria. In some cases it is a product of the alteration of pyroxenic rocks, and the commercial mineral may be very impure. The ease with which steatite may be worked, coupled

and Hincks he was one of the earliest to decipher the cuneiform with its power of resisting heat, has led to its employment for vessels for household use, whence it is called "potstone"-the lapis ollaris of old writers; it is also used, especially in America, for sinks, stoves, firebricks, foot-warmers, tips for gas-burners and electric switchboards, and, when ground, as a filler for paper, for leather-dressing, for covering steam-pipes, as an ingredient in soap, for toilet-powder, for certain paints and as a lubricant A fine granular variety, known as "French chalk" or "Spanish chalk," is used by tailors for marking cloth; slate pencils are made of steatite and pyrophyllite, and in Burma steatite pencils are used for writing on black paper. In the oxyhydrogen flame, steatite has been fused and drawn out into threads, like quartz-

Steatite- and talc-schists are widely distributed and have occasionally been used as building stones. When first raised the stone is soft, but hardens on exposure Soapstone from Gudbrandsdal is used in the cathedral of Trondhjem, Norway Veins of steatite occur in the serpentine of the Lizard district, Cornwall, and the mineral was used under the name of soap rock in the manufacture of the old Worcester porcelain. In North America its distribution is very extensive

A fibrous steatite from New York State, used in the manufacture of paper, is known as agalite Rensselaerite is a wax-like 'talcose substance, passing into serpentine, from St Lawrence county, N Y, named by E Emmons in 1837 after S. Van Rensselaer, of Albany, N Y Beacounte is an asbestiform talc from Michigan, named by L W Hubbard. The term pyrallolite was given by Nils G Nordenskiold to a mineral from Finland, which appears to be talc pseudomorphous after pyroxene Talcoid was K F Naumann's name for a white lamellar mineral from near Pressnitz in Bohemia A blue earthy mineral from Silver City, New Mexico, known locally as "native ultramarme," is a magnesum silicate

TALCA, a province of Chile, bounded on the north by Curicó, east by Argentina, south by Linares and Maule and west
by the Pacific The area, since being separated from the province of Cuncó, 18 3,722 sq.mi; pop (1951) 174,047 In the east the Andean slopes cover a considerable part of its territory, and in the west another large area is covered by the coast range Between these is the central valley of Chile in which the population and industries of the province are chiefly concentrated. The lower mountainous parts are well wooded. The intermediate plain is fertile and devoted to wheat, grapes and stock. The capital of the province is Talca (pop 1944, 50,464), on the Rio Claro, 156 mi. by rail south of Santiago The city, founded in 1692 and revived in 1742, has a variable climate.

TALCAHUANO, a seaport of the province of Concepción, Chile, on the bay of Talcahuano, 8 mi. NW of the city of Concepción, Pop (1944) 35,774. It has the best harbour on the Pacific coast of South America and is one of the most important ports of southern Chile. The Chilean government established its chief naval base there.

TALE, a general term, in the usual acceptance of the word, for fictitious narratives, long or short, ancient or modern (O.Eng. talu, number, account, story; the word is common to many Teutonic languages; cf. Ger. Zahl, number, Erzählung, narrative, Du taal, speech, language). In this article "tale" is used in a stricter sense, as equivalent to the German "Volks-marchen" or the French "conte populaire." Thus understood, popular tales mean the stories handed down by oral tradition from an unknown antiquity So understood, popular tales are a subject in mythology. The Homeric epics, especially that of the Odyssey, contain adventures (those, for example, of the Cyclops and the husband who returns in disguise) which are manifestly parts of the general human stock of popular narrative. Other examples are found in the Rigueda, and in the myths which were handled by the Greek dramatists The Thousand and One Nights (a v) is full of popular tales, and popular tales are the staple of the mediaeval Gesta Romanorum, and of the collections of G Straparola and other Italian storytellers In all these the story, long circulated among the people, is handled with conscious ait. In Histoires ou contes du temps passé of C Perrault (Elzevir, 1697), we have one of the earliest collections of tales which were taken down as they were told by nurses to children The success of Perrault's tales brought the genre into fashion, and the Comtesse d'Aulnoy invented, or in some cases adapted, "contes," which retain popularity But the precise and scientific collection of tales from the hps of the people is not much earlier than the 19th century The chief impulse to the study was given by the brothers Jacob and Wilhelm Grimm The first edition of their Kinderund Haus-Marchen was published in 1812 The English reader will find a considerable bibliography of popular tales, as known to the Gumms, in Mis Alfred Hunt's translation, Grimm's Household Tales, with Notes (1884) In addition to the marchen of Indo-European peoples, the Grimms became acquainted with some Malay stories, some narratives of Bechuanas, Negroes, American Indians and Finnish, Estonian and Magyar stories

See the bibliography in the translation of Grimm already referred to, the Massonneuve collection, Lev Littératures populaires, Sir James Frazer's The Golden Bough See also Novel (A L, X)

TALENT, the name of an ancient Greek unit of weight, the heaviest in use both for monetary purposes and for commodities (see Measures and Weights, Ancient) (Lat talentum, adaptation of Gr τάλαντον, balance, weight, from root ταλ-, to lift, as in τλήναι, to bear, τάλας, enduring, cf Lat tollere, to lift, Skt tule, balance) The weight itself was originally Babyloman, and Egyptian kerker and the Syrian and Palestinian kikkai were denved from it. The Attic talent was divided into 60 mines at 100 drams each. The weight of the Attic talent was approximately 57 75 lb

In mediaeval Latin and also in many Romanic languages the word was used figuratively of will, inclination or desire, derived from the sense of balance, but the general figurative use for natural endowments or gifts, faculty, capacity or ability is derived from the parable of the talents in Matt. xxv

TALFOURD, SIR THOMAS NOON (1795-1854) English judge and author, the son of a brewer, was born at Reading on May 26, 1795. He was educated at Hendon, and at Reading grammas school. At the age of 18 he was sent to London to study law under Joseph Chitty, the special pleader. Early in 1821 he joined the Oxford circuit, having been called to the bar at the Middle Temple in the same year. He became a sergeantat-law in 1835, and a judge of the common pleas in 1849 He was MP for Reading, and carried an international copyright bill against stormy opposition in 1842 Charles Dickens dedicated the Pickwick Papers to him On the literary side, he contributed to various magazines, and his legal writings on literary subjects included "On the Principle of Advocacy in the Practice of the Bai" (Law Magazine, Jan. 1846), and his famous Speech for the Defendant in the Prosecution, the Queen v Moxon, for the Publication of Shellev's Poetical Works (1841).

But Talfourd cannot be said to have gained any position among men of letters until the production of his tragedy Ion, which was privately printed in 1835, and produced in the following year at Covent Garden theatre. Other less successful plays followed Talfourd died in court during the performance of his judicial duties, at Stafford, on March 13, 1854 Talfourd was also the author of The Letters of Charles Lamb, with a Sketch of his Life (1837); Recollections of a First Visit to the Alps (1841) Vacation Ramblas and Thoughts, comprising recollections of three continental tours in the vacations of 1841, 1842 and 1843 (2 vol., 1844); and Final Memorials of Charles Lamb (1849-50).

TALGARTH, a small town and civil parish in Breconshire, Wales, situated on the Ennig near its junction with the Llynfi (a tributary of the Wye), in the N.W. section of the Black mountains. It is served by the Western Region railway route. Pop

S E of Talgath, and commands the pass to Crickhowell and the eastern part of the vale of Usk The region shows evidences of Norman and English penetration and an early distinction between the lowland (English Talgarth) and the upland (Welsh Talgarth) in which the Welsh laws of property, etc., prevailed until the end of the middle ages The region has associations with early nonconformity and there is a Congregational church at Tredwestan founded in 1662 Howel Harris, one of the founders of Welsh Methodism, was born in 1713 at Trevecca, 1 mi SW, and there in 1752 he established a religious "family." Trevecca college is now a Welsh Methodist preparatory school

TALIENWAN, an open bay or roadstead on the east side of the Liaotung peninsula, Manchuna It was leased to Russia by China in 1898 with the naval fortress of Port Arthur, from which it is 40 mi distant, the lease being transferred to Japan m 1905 The Russian town of Dalny (now Dairen) was built upon the west side of the bay, which is known as Port Victoria Talienwan is in railway connection with Niuchwang and Peking and is also connected with Europe by way of the Siberian railway It was the rendezvous of the British fleet during the Anglo-China War of 1860, whence the names Port Arthur and Port Victoria See DAIREN

TALIESSIN, a late 6th-century British bard, to whom is attributed the collection of poems known as the Book of Taliessin. See Welsh Language and Literature.

TALLADEGA, a city of Alabama, US, the county seat of Talladega county, 57 mi E of Birmingham, in the foothills of the Blue Ridge, at an altitude of 554 ft. It is served by the Southern, the Louisville and Nashville and the Atlantic Coast Line railroads, and is on federal highway 241 Pop (1950) 13,186 It is in a fertile agricultural and dairying region, with marble and limestone quarries and iron mines The chief industrial products are cotton textiles, cottonseed oil, machine paits, pipe fittings, soil pipe, lumber, woollen worsted fabric and yarn The Alabama School for the Deaf and Blind and Talladega college (Negro coeducational, 1867, Congregational) are located there Near by are Cheaha State park, Talladega National forest (largest in the state) caverns and mineral springs The name Talladega, also applied to mountains south and east of the town, is Indian for "border town" as its site was on the edge of the Cieck Indians' land Andrew Jackson defeated a large force of Red Stick Indians there in 1813

TALLAGE was a tax which in England could be imposed by a feudal lord upon his unfree tenants The king could tallage the towns and his demesne manors. A lesser lord could tallage his demesne manors The royal tallage of the boroughs to some extent took the place of Danegeld under Henry II, the latter tax having ceased to be profitable Growing prosperity made tallages justifiable. Moreover Henry had a better machinery for the assessment and collection of tallage than any king before him. His judges, financial as well as legal experts, were going round the shires more frequently than any previous royal ministers They could assess the tallages, and the exchequer (q v) could see that they were paid The tax might be arranged by the judges in one of two ways; they might bargain with the town or manor to provide a definite sum for the king, or they might tallage the individual burgesses. The former practice was more usually followed. In the 13th century the custom of summoning representatives from the boroughs to meet the king and his magnates in parliament grew more frequent and the practice of taking tallages from the towns began to fall out of use, since grants were made to the king in the parliament. Nevertheless he kept his right of tallaging the boroughs. Edward I took a tallage in 1304, his son in 1312. His grandson tried to take one in 1332, but because of opposition took a grant from parliament instead. In the 12th century the lord seems to have been able to tallage his men at will. his exactions were bounded only by the custom of the manor, which might either limit his right narrowly or allow him considerable latitude in the matter. Beginning with the inquest of sheriffs in 1170 the kings took more and more interest in the relations between lord and man, and in time the right of the lord to tallage (1931) 1,882. A fortified station (Dinas) occupies a hill 2½ mi. his men was closely restricted. He had to obtain a heence from

the king before he could take a tallage. The right of towns, too, to tax individual burgesses was very narrowly limited. The king would allow a tallage to be taken for a necessary public work, or for the payment of sums due to him, but he kept a careful watch on the taking nowers of the borough madistrates. DM S)

TALLAHASSEE, the capital city of Flouda, ÜS, and the county seat of Leon county, in the nothern part of the state, on federal highway 90, midway between Jacksonville and Pensacola, and 20 m N of the Gulf of Mexoc. It has a municipal aniport, and is served by the Georgia, Flouda and Alabama and the Scahoural Au Libic railways Population was 27,237 in 1950 by the federal census and 16,240 m 1940. It has a fine location, being stutated on a full 216 ft above sea level, in a region of rolling hills, numerous lakes and streams, giant magnolia trees and majestic oaks which are hung with Spanish

The streets are wide and well-shaded. The state capitol, the supreme court and library building, the governor's mansion and other public buildings are displicad and pleasing.

other public buildings are dignified and pleasing
Tallahassee is the seat of the Florida State university and the
Florida Agricultural and Mechanical college for Negroes It has

a commission-manager form of government
Tradition says that the Spaniards, about 1638, fortified a hill
near the present site of Tallahassee, during a war with the Apalachee Indians About 1818 most of the Indians were diven out
of this region and a settlement was made by the whites, and in
1844 Tallahassee was chosen by the US government to be the
cential of the territory of Elorida.

From 1821 it was the home of Charles Louis Napoleon Achille Murat (1807-47, the eldest son of Joachim Murat), who became an American citizen and matried a grandniece of George Washington. Floiida's oithnance of secession was adopted by a state convention meeting in Tallahassee on Jan 10, 1867

# TALLBOY: see HIGHBOY.

TALLEMANT, GÉDÉON, SIEUR DES RÉAUX (1619-1692), French author, was born at La Rochelle on Oct 2, 1610 He belonged to a wealthy middle-class family of Huguenot persuasion, the name Des Réaux he derived from a small family property in Bourbonnais Tallemant married his cousin Elisabeth de Rambouillet His half-brother had married a d'Angennes, and this connection secured for Tallemant an introduction to the Hôtel de Rambouillet Madame de Rambouillet was no admirer of Louis XIII, and she gratified Tallemant's curiosity with stories of the reigns of Henry IV and Louis XIII But the society of the Hôtel de Rambouillet itself opened a field for his acute and somewhat malicious observation. In the Historiettes he gives finished portraits of Vincent Voiture, Jean-Louis Guez de Balzac, Francois de Malherbe, Jean Chapelain, Valentin Conrart and many others, Blaise Pascal and Jean de la Fontaine appear in his pages; and he chronicles the scandals of which Ninon de l'Enclos and Angélique Paulet were centres They are invaluable for the literary history of the time He died in Paris on Nov 10, 1692.

Des Réuux was a poet of some meut and contributed to the Guinale de Julie, but it is by his Historetete that he se remembered The work remained in manuscript until it was edited in 1831–35 by MM. de Châteaugnon, Jules Taschereau and L. J. N. de Monmerque. Several editions were published later, including one by G Mongréden (8 vol. 1933–34). Tallemant spoke frequently of witing Mémoires pour la régence d'Anne d'Autre, but no manuscript has been found and there is no proof that he ever began writing them. See also E Magne, La joyeuse jeunesse de Tallemont des Réaux (1921), La fin troublée de Tallemont des Réaux (1921), La fin troublée de Tallemont des Réaux (1921).

TALLEYRAND-PĒRIGORD, CHARLES MAURICE DE (1754-1858). Fench diplomatist and statesman, was born at Paris on Feb. 12 or 13, 1754, the son of licutenant general Charles Daniel de Talleyrand-Perigord His parents, descended from ancient and powerful families, were in constant attendance at the court of Louis XV. In his third or fourth year, while under the care of a nurse in Paras, he fell from a chest of drawers and injured his foot for life. This accident darkened his prospects; for though by the death of his delder brother he should have represented the family and entered the army, yet he forfeited the rights to primogeniture, and the profession of arms was thence-

forth closed to him. At the age of 8 he was sent to the Collège d'Harcourt at Paris, and, at 13 to 81. Sulpice, where he conceived a dishie of the doctines and discipline thrust upon him After a visit to his uncle, the archbishop of Reims, he returned to \$1 sulpice to finish his pielminary training for the church, but in his spare time he read the works of Montesqueu, Voltaire and other writers who were beginning to underrime the authority of the enceir rêgime, both in church and state. As subdeacon he winessed the coronation of Louis XVI at Reims, but he did not take pinest's orders until four years later. While rejecting the authority of the church in the sphere of dogma and intellect, he observed the proprieties of life, and respected the outward observances of reliation.

During his life at Pauls he frequented the salon of Madame de Genlis, and there formed his ideas in favour of political and collections, and there formed his ideas in favour of political and social reform. After taking his heentate in theology in March 1778, he gave hittle more attention to theological studies. Nevertheless his ability and his social position gained for him in the year 1780 the position of agent-general of the clergy of France The growing claims of the state on the exchequer of the clergy made his duties re-possible. At the extraordinary assembly of the clergy in 1782 he made proposals, by one of which he sought, though in vain, to redress the most glaring grevances of the underpaid curé. Though the excellence of his work as agent-general in the years 1780–86 was fully acknowledged, yet he did not gain a bishoptic until the beginning of the year 1789, probably because the king disliked him as a freethinker. He now became hishop of Autun, and was installed on March 13

The Revolution.—The first important act of the new bishop was to draw up a program of the reforms which he desired to see carned out by the states-general of France. It comprised the following items: the formation of a constitution which would strengthen the monarchy by calling to it the support of the whole nation, the drafting of a scheme of local self-government on democratic lines, the reform of the administration of justice and of the criminal law and the abolition of the most burdensome of reducid and class privileges. This program was adopted by the clergy of his diocese as their cahrer, or book of instructions to their representative at the states-general, namely Talleyrand

His influence in the estate of the clergy, however, was cast against the union of the three estates in a single assembly, and he voted in the minority of his order which in the middle of June opposed the merging of the clergy in the national assembly The folly of the court, and the weakness of Louis XVI at that crisis, probably convinced him that the cause of moderate reform and the framing of a bicameral constitution on the model of that of England were hopeless Thereafter he inclined more and more to the democratic side, though for the present he concerned himself mainly with financial questions. In the middle of July he was chosen as one of the committee to prepare a draft of a constitution, and in the session of the assembly which the comite de Mirabeau termed the orgse of the abolition of privileges (Aug 4) he intervened in favour of discrimination and justice. On Oct. 10, four days after the insurrection of women and the transference of the king and court to Paris, he proposed to the assembly the confiscation of church lands to the service of the nation, but on terms rather less rigorous than those in which Mirabeau (q v.) carried the proposal into effect on Nov 2. He identified himself in general with the left of the assembly, and supported the proposed departmental system which replaced the old provincial system early in 1790. At the federation festival of July 14, 1790 (Feast of Pikes) he officiated at the altar reared in the middle of the Champ de Mars. This was his last public celebration of mass For a brilliantly saturical but not wholly fair reference to the part then played by Talleyrand, the reader should consult Thomas Carlyle's French Revolution, vol ii, bk. i, ch. 12 The course of events harmonized with the anticlerical views of Talleyrand, and he gradually loosened the ties that bound him to the church He took little part in, though he probably sympathized with, the debates on the measure known as the Civil Constitution of the Clergy, whereby the state enforced its authority over the church to the detriment of its allegiance to the pope. obedience to the new decree. Talleyrand and three other bishops complied out of the thirty who had seats in the Assembly. The others, followed by the greater number of the clergy throughout France, refused, and thenceforth looked on Talleyrand as a schismatic He did not long continue to officiate, as many of the so-called "constitutional" clergy did, for, on Jan 21, 1791, he resigned the see of Autun, and in the month of March was placed under the ban of the church by the pope.

Just before his resignation he had been elected, with Mirabeau and Sievès, a member of the department of Paris, and for some eighteen months he supported the cause of order in the turbulent capital Though he was often on strained terms with Mirabeau. their views generally coincided Talleyrand's reputation for immorality, however, was as marked as that of Mirabeau While excelling Mirabeau in suppleness and dexterity, Talleyrand lacked the force of character possessed by the great "tribune of the people", and his influence was gradually eclipsed by the Girondins and the Jacobins

Debarred from election to the second National Assembly (known as the Legislative) by the self-denying ordinance passed by the "constituents," Talleyrand, at the close of 1791, sought to enter the sphere of diplomacy for which he was well equipped by his mental qualities and his clerical training. The condition of affairs on the continent seemed to French enthusiasts to presage an attack by the other Powers on France. In reality those Powers were far more occupied with the Polish and Eastern questions than with the affairs of France; and the declaration of Pilnitz. drawn up by the sovereigns of Austria and Prussia, which appeared to threaten France with intervention, was recognized by all well-informed persons to be "a loud-sounding nothing" The French foreign minister, Delessart, believed that he would checkmate all the efforts of the émigrés at the continental courts provided that he could confirm Pitt in his intention of keeping England neutral For that purpose Delessart sent Talleyrand, well known for his Anglophil tendencies, to London, but in the unofficial or semi-official capacity which was rendered necessary by the decree of the Constituent Assembly referred to above rand arrived in London on Jan. 24, 1792, and found public opinion so far friendly that he wrote off to Paris, "Believe me, a rapprochement with England is no chimeia" Pitt received him cordially; and to Grenville the envoy stated his hope that the two free nations would enter into close and friendly relations. each guaranteeing the other in the possession of its existing territories, India and Ireland being included on the side of Britam. The British government returned no definite answer to this proposal, but Tallevrand was convinced that Great Britain would not intervene against France unless the latter attacked the Dutch Netherlands.

He returned to Paris on March 10, to persuade the foreign minister (Dumouriez now held that post) of the need of having a fully accredited ambassador at London. The ex-Marquis Chanvelin was appointed, with Talleyrand as adviser. But the overthrow of the monarchy on Aug, 10 and the September massacres rendered hopeless all attempts at an entente cordiale between the two peoples; and the provocative actions of Chauvelin undid all the good accomplished by the tact and moderation of Talleyrand. The latter now sought to escape from France, where events were becoming intolerable; he succeeded in obtaining a passport to leave Paris on Sept. 14, and landed in England on the 23rd, avowedly on private business, but still animated by the hope of averting a rupture between the two governments In this he failed. The provocative actions of the French Convention, especially their setting aside of the rights of the Dutch over the estuary of the Scheldt, had brought the two nations to the brink of war, when the execution of Louis XVI. (21st of Jan. 1793) made it inevitable. Talleyrand was expelled from British soil and made his way to the United States. There he spent thirty months in a state of growing uneasiness and discontent with his sur-

roundings
The Directory.—The course of events after the Thermidorian reaction of July 1794 favoured his return to France. Thanks to

When the Assembly sought to impose on its members an oath of the efforts of Daunou and others his name was removed from the list of émigrés, and he set sail for Europe in November 1795. Landing at Hamburg in the January following, he spent some time there in the company of his friends Madame de Genlis and Reinhard, and when party rancour continued to abate at Paris, he returned thither in September After a time he was recommended by Madame de Stael to the Director Barras for the post of minister of foreign affairs. He gained the post of foreign minister, entering on his duties in July 1797

Talleyrand, despite the weakness of his own position (he was as yet little more than the chief clerk of his department), soon came to a good understanding with Bonaparte, and secretly expressed to him his satisfaction at the terms which the latter dictated at Campo Formio (Oct 17, 1797) The coup d'état of Fructidor (September 1797) had perpetuated the Directory and led to the exclusion of the two "moderate" members, Carnot and Bathélémy, but Talleyrand saw that power belonged really to the general who had brought about the coup d'etat in favour of

the Jacobinical Directors headed by Barras

With the renewal of war on the continent Talleyrand had little or no connection. His powers as minister were limited, and he regretted the extension of the area of war Moreover, in the autumn of 1797 his reputation for political morality (never very bright) was overclouded by irregular dealings with the envoys of the United States sent to arrange a peaceful settlement of certain disputes with France Talleyrand refused to clear himself of the charges made against him as his friends (especially Madame de Stael) urged him to do; and the incident probably told against his chances of admission into the Directory, which were discussed in the summer of 1708 A year later he resigned the portfolio for foreign affairs (July 20, 1799), probably because he foresaw the imminent collapse of the Directory If so, his premonitions were correct Their realization was assured by the return to France of the "Conqueror of the East" in October The general and the diplomatist soon came to an understanding, and Talleyrand tactfully brought about the alliance between Bonaparte and Sievès (q v) (then the most influential of the five Directors) which paved the way for the coup d'état of Brumaire (See FRENCH REVOLUTION and NAPOLEON I )

Talleyrand's share in the actual events of the 18th, 19th Brumaire (9th, 10th of November) 1799 was limited to certain dealings with Barras on the former of those days About midday he took to Barras a letter, penned by Roederer, requesting him to resign his post as Director. By what means Talleyrand brought him to do so, whether by persuasion, threats or bribes, is not known; but on that afternoon Barras left Paris under an escort of soldiers. With the more critical and exciting events of the 19th of Brumaire at St Cloud Talleyrand had no direct connection, but he had made all his preparations for flight in case the blow failed His reward for helping on the winning cause was the ministry for foreign affairs, which he held from the close of December 1700 on to the summer of 1807. In the great work of reconstruction of France now begun by the First Consul, Talleyrand played no unimportant part. His great aim was to bring about peace, both international and internal. He had a hand in the pacific overtures which Bonaparte, early in the year 1800, sent to the court of London; and, whatever may have been the motives of the First Consul in sending them, it is certain that Talleyrand regretted their failure. After the battle of Marengo an Austrian envoy had to come to Paris in response to a proposal of Bonaparte, and Talleyrand persuaded him to sign terms of peace. These were indignantly repudiated at Vienna, but peace was made between the two Powers at Lunéville on Feb 9, 1801.

As regards French affairs, Talleyrand used his influence to help on the repeal of the vexatious laws against émigrés, nonjuring priests, and the royalists of the west. He was also in full sympathy with the policy which led up to the signature of the Concordat of 1801-2 with the pope (see CONCORDAT); but it is probable that he had a hand in the questionable intrigues which accompanied the closing parts of that complex and difficult negotiation At the end of June 1802 the pope removed Talleyrand from the ban of excommunication and allowed him to revert to

the secular state On Sept 10, 1803, owing to pressure put on him by Bonaparte, he married Madame Grand, a dsvorcée with whom he had long been living

During the meeting of Italian notables at Lyons early in 1802 Talleyrand was serviceable in manipulating affairs in the way desired by Bonaparte, and it is known that the foreign minister suggested to them the desuability of appointing Bonaparte president of the Cisalpine Republic, which was thenceforth to be called the Italian Republic In the negotiations for peace with England which went on at Amiens during the winter of 1801-2 Talleyrand had no direct share, these (like those at Lunéville) being transacted by Napoleon's eldest brother, Joseph Bonaparte (q v ) On the other hand he helped the First Consul in assuring French supremacy in Switzerland, Italy and Germany In Germany the indemnification of the princes who lost all their lands west of the Rhine was found by secularizing and absorbing the ecclesiastical states of the empire This unscrupulous proceeding, known as the Secularizations (February 1803), was carried out largely on lines laid down by Bonaparte and Talleyrand, and the latter is known to have made large sums of money by trafficking with the claimants of church lands

While helping to establish French supremacy in neighbouring states and assisting Bonaparte in securing the title of First Consul for life, Talleyrand sought all means of securing the permanent welfare of France He worked hard to prevent the rupture of the peace of Amiens in May 1803, and he did what he could to prevent the sale of Louisiana to the United States earlier in the vear These events, as he saw, told against the best interests of France and endangered the gains which she had secured by war and diplomacy Thereafter he strove to moderate Napoleon's ambition and to preserve the European system as far as possible. The charges of duplicity or treachery made against the foreign minister by Napoleon's apologists are in nearly all cases unfounded This is especially so in the case of the execution of the duc d'Enghien (March 1804), which Talleyrand disapproved. The evidence against him rests on a document which is now known to have been forged On the assumption of the imperial title by Napoleon in May 1804, Talleyrand became grand chamberlam of the empire, and received close on 500,000 francs a

The Empire.-Talleyrand had rarely succeeded in bending the will of the First Consul He altogether failed to do so with the Emperor Napoleon. His efforts to induce his master to accord lement terms to Austria in November 1805 were futile, and he looked on helplessly while that Power was crushed, the Holy Roman Empire swept away, and the Confederation of the Rhine set up in central Europe In the bargainings which accompanied this last event Talleyrand is believed to have reaped a rich harvest from the German princes most nearly concerned On July 6, 1806, Napoleon conferred on his minister the title of prince of Benevento, a papal fief in the Neapolitan territory

In the negotiations with England which went on in the summer of 1806 Talleyrand had not a free hand, they came to nought, as did those with Russia which had led up to the signature of a Franco-Russian treaty at Paris by d'Oubril which was at once disavowed by the tsar. The war with Prussia and Russia was ended by the treaties of Tilsit (7th and 9th of July 1807) Talleyrand had a hand only in the later developments of these negotiations; and it has been shown that he cannot have been the means of revealing to the British government the secret arrangements made at Tilsit between France and Russia, though his private enemies, among them Fouché, have charged him with acting as traitor in this affair.

Talleyrand had long been weary of serving a master whose him in the council and took him with him to the interview with the Emperor Alexander I. at Erfurt (September 1808). Talleyrand disapproved of the Spanish policy of Napoleon which culminated at Bayonne in May 1808; and the stories to the contrary may in all probability be dismissed as idle rumours. On Talleyrand now fell the disagreeable task of entertaining at his new mansion at

Valençay, in Touraine, the Spanish princes virtually kidnapped at Bayonne by the emperor They remained there until March 1814 At the close of 1808, while Napoleon was in Spain, Talleyrand entered into certain relations with his former rival Fouché  $(q\,v\,)$ , which aroused the solicitude of the emperor and hastened his return to Paris He subjected Talleyrand to violent reproaches, which the ex-minister bore with his usual ironical calm

After the Danubian campaign of 1809 and the divorce of Josephine, Talleyrand used the influence which he still possessed in the imperial council on behalf of the choice of an Austrian consort for his master, for, like Metternich (who is said first to have mooted the proposal), he saw that this would safeguard the interests of the Habsburgs, whose influence he felt to be essential to the welfare of Europe He continued quietly to observe the course of events during the disastrous years 1812-13; and even at the beginning of the Moscow campaign he summed up the situation in the words, "It is the beginning of the end." Early in 1814 he saw Napoleon for the last time, the emperor upbraided him with the words: "You are a coward, a traitor, a thief You do not even believe in God You have betrayed and deceived everybody. You would sell even your own father" Talleyrand listened unmoved, but afterwards sent in his resignation of his seat on the council It was not accepted. He had no share in the negotiations of the congress of Châtillon in February-March 1814. On the surrender of Paris to the allies (Maich 30, 1814), the Emperor Alexander I. took up his abode at the hôtel Talleyrand, and there occurred the conference wherein the statesman persuaded the tsar that the return of the Bourbons was the only possible solution of the French problem, and that the principle of legitimacy alone would guarantee Europe against the aggrandizement of any one state or house As he phrased it in the Talleyrand Memoirs. "The house of Bourbon alone could cause France nobly to conform once more to the happy limits indicated by policy and by nature. With the house of Bourbon France ceased to be gigantic in order to be great' These arguments, reinforced by those of the royalist agent de Vitrolles, convinced the tsar, and Talleyrand, on April x, convened the French senate (only 64 members out of 140 attended), and that body pronounced that Napoleon had forfeited the crown Ten days later the emperor recognized the inevitable and signed the Act of Abdication at Fontamebleau. The next effort of Talleyrand was to screen France under the principle of legitimacy and to prevent the schemes of partition on which some of the German statesmen were bent. Thanks mainly to the support of the tsar and of England these schemes were foiled; and France emerged from her disasters with frontiers which were practically those of 1792.

The Restoration.-At the congress of Vienna (1814-15) for the settlement of European affairs, Talleyrand, as the representative of the restored house of Bourbon in France, managed adroitly to break up the league of the Powers (framed at Chaumont in February 1814) and assisted in forming a secret alliance between England, Austria and France in order to prevent the complete absorption of Poland by Russia and of Saxony by Prussia. The new triple alliance had the effect of lessening the demands of those Powers and of leading to the well-known territorial compromise of 1815. Everything was brought into a state of uncertainty once more by the escape of Napoleon from Elba; but the events of the Hundred Days, in which Talleyrand had no share-he remained at Vienna until June 10-brought in the Bourbons once more; and Talleyrand's plea for a magnanimous treatment of France under Louis XVIII. once more prevailed in all important matters. On July 9, 1815, he became foreign minister and president of the council under Louis XVIII., but diplomatic and other difficulties policy he more and more disapproved, and after the return from led him to resign his appointment on Sept. 23, 1815, Louis, how-Tilsit to Pans he resigned office Nevertheless Napoleon retained vever, naming him high chamberlain and according him an annulty of 100,000 francs. The rest of his life calls for little notice except that at the time of the July Revolution of 1830, which unseated the elder branch of the Bourbons, he urged Louis Philippe, duke of Orleans (q v.), to take the throne offered to him by popular acclaim. The new sovereign offered him the portfolio for foreign affairs; but Talleyrand signified his preference for the embassy in London In that capacity he took an important part in the aegotiations respecting the founding of the new kingdom of Belgium In April, 1834 he crowned his diplomatic career by signing the treaty which brought together as allies France. Great Britain. Spain and Portugal, and in the autumn of that year he resigned his embassy. During his last days he signed a paper signifying his reconciliation with the Roman Catholic Church and his regret for many of his early actions. The king visited his death-bed His death, on May 17, 1838, called forth widespread expressions of esteem for the statesman who had rendered such great and varied services to his country. He was buried at Valençay He had been separated from the former Madame Grand in 1815 and left no heir.

TALLIEN, JEAN LAMBERT (1767-1820), French revolutionary, was born in Paris in 1767. He entered a printer's office, and by 1791 he had reached the position of overseer of the mining department of the Monitour While thus employed he conceived the idea of the journal-affiche, and after the arrest of the king at Varennes in June 1791 he placarded a large printed sheet on all the walls of Paris twice a week, under the title of the

Ami des Citoyens, journal fraternel

This enterprise, financed by the Jacobin Club, made him well known to the revolutionary leaders; and he made himself still more conspicuous in organizing the great "Fête de la Liberté" on April 15, 1792, in honour of the released soldiers of Château-Vieux, with Collot d'Herbois. He was active in the events of Aug to, and was made clerk to the Revolutionary Commune of Paris, At the close of September he resigned his post on being elected a deputy to the Convention by the department of Seine-et-Ose. He took his seat upon the Mountain, and was one of the most vigorous Jacobins, particularly in his defence of Marat, on Feb 26, 1793; he was elected a member of the Committee of General Security on Jan. 21, 1793. He took an active part in the coups d'état of May 31 and June 2, which resulted in the overthrow of the Girondists. On Sept. 23, 1793, he was sent with Claude Alexandre Ysabeau (1754–1831) to Bordeaux This was the month in which the Terror was organized under the superintendence of the Committees of Public Safety and General Se-

Tallien showed himself one of the most vigorous of the proconsuls sent over France to establish the Terror in the provinces and soon awed the great city. Among his prisoners was Thérèse, the divorced wife of the comte de Fontenay, and daughter of the Spanish banker, François Cabarrus, one of the most fascinating women of her time, and Tallien not only spared her life but fell in love with her. Suspected of "Moderatism" on account of this incident, Tallien increased, in appearance, his revolutionary zeal but from the lives Thérèse saved by her entreaties she received the name of "Our Lady of Thermidor," after the 9th of Thermidor. Tallien was even elected president of the Convention on must strike at his own colleagues in the committees if he was royal. He is known to have become organist at Waltham abbey.

to carry out his theories, but they determined to strike first, and on the great day of Thermidor Tallien opened the attack upon Robespierre and his friends were guillotined, and Tallien, as the leading Thermidonan, was elected to the Committee of Public Safety He suppressed the Revolutionary Tribunal and the Jacobin Club and fought bravely against the insurgents of Prairial. He was supported by Therèse, whom he mairied on Dec 26, 1791, and who became the leader of the social life of Paris His last political achievement was in July 1795, when he was present with Hoche at the destruction of the army of the émiei és at Ouiberon, and ordered the executions which followed

Tallien's political importance came to an end with the Convention for, though he sat in the Council of Five Hundred, the moderates attacked him as terrorist, and the extreme party as a renegade Madame Tallien also tited of him, and became the mistiess of the rich banker Ouvrard Bonaparte took him to Egypt in his great expedition of June 1798, and he edited the Décade Egyptienne in Cairo But General J F Menou sent him away from Egypt, and he was captured by an English cruiser and taken to London, where he had a good reception among the Whigs and was well received by Fox. On returning to France in 1802 he obtained a divorce from his wife (who in 1805 married the comte de Caraman, later prince de Chimay), and was for some time without employment. At last he was appointed consulat Alicante, and remained there until he lost the sight of one eve from vellow fever. On returning to Paris he lived on his halfpay, and his latter days were spent in poverty. He died in Paus on Nov 16, 1820.

on Nov 16, 1820.

Tallien left an interesting Discours sur les causes qui ont produit la Révolution française (1791) and in Mémoire sur l'administration de Révolution française. Revolution française franç

TALLINN, or (German) REVAL, primary scaport and capital of Estonia, in 59° 26' N., 24° 46' E, on a bay in the south coast of the Gulf of Finland. Est. pop (1939) 145,002. The port, frozen over about 45 days each winter, accommodates vessels drawing 30 ft. The chief exports are textiles, cereals, timber, paper and Portland cement, and the imports foodstuffs, cotton and coal The town has textile, paper, cement and timber industries The remains of the Toompea citadel (1539) and the ancient city wall with many of its towers make Tallinn picturesque. Many new buildings dominate the town, including a town hall. The Art Museum has a fine collection of modern Estonian painting and sculpture

A Danish settlement on the high Silurian crag known as the Domberg existed in 1003, and the Danish king, Valdemar II, built a castle in 1210. It was captured by the Livonian knights in 1228. but returned to the Danes in 1237. Merchants from Lubeck and Bremen settled here in the 13th century, and 1t became a port of the Hanseatic league. It was fortified early in the 14th century and in 1343 sustained a siege by the revolted Estonians. Valdemar III sold Estonia to the Teutonic knights in 1346, but on the dissolution of the order, in 1561, Estonia and Reval surrend-ered to the Swedish king, Erik XIV, A great conflagration in 1433, the pestilence of 1532, the bombardment by the Danes in 1560, and the Russo-Livonian War destroyed its trade. The Russians besieged Reval in 1570 and 1577 and in 1710 it was surrendered to Peter the Great, who erected a port for his Baltic fleet. His successors continued to fortify the access to Reval from the sea, especially in the early years of the 19th century. It passed from Russian to Estonian rule in 1918, but fell to Russia in 1940, and to Germany in 1941. In World War II the shipping sections were heavily bombed

TALLIS (TALLYS, TALYS OF TALLISIUS), THOMAS (c. 1515-1585), justly styled "the father of English cathedral music," was born probably before 1515 It has been conjectured that, after singing as a chorister at old Saint Paul's under Thomas March 24, 1794. Robespierre began to see, however, that he Mulliner, he obtained a place among the children of the chapel where, on the dissolution of the monstery in 1540, he received, in compensation for the loss of his preference, 200 in Sugardian and 200 for reward. In the library of the British Museum there is preserved a volume of imstreatises on music, once belonging to the abbey, on the last page of which appears his autograph. "Thomas Tallys"—the only specimen known. Not long after his dismissal from Waltham, Tallis was appointed a gentleman of the chanel royal.

One of the earliest compositions by Tallis to which an approximate date can be assigned is the well-known Service in the Dorian Mode, consisting of the Venite, Te Deum, Benedictus, Kyrie, Nicene Creed, Sanctus, Gloria in Excelsis, Magnificat and Nunc Dimittis, for four voices, together with the Preces, Responses, Paternoster and Litany, for five, all published for the first time, in the Rev John Barnard's First Book of Selected Church Music, in 1641, and reprinted, with the exception of the Venite and Paternoster, in Boyce's Cathedral Music in 1760 (Boyce's omission of the very beautiful Venite is hard to account for ) That this work was composed for the purpose of supplying a pressing need, after the publication of the second prayer-book of King Edward VI in 1552, there can be no doubt Written in the style known among Italian composers as lo stile famigliare, ie, in simple counterpoint of the first species, nota contra notam, with no attempt at learned complications of any kind, it adapts itself with equal dignity and clearness to the expression of the verbal text it is intended to illustrate. In self-restraint the Litany and Responses bear a close analogy to the Improperia and other sımılaı works of Palestrina

Tallis raised the English school to a height which it was to maintain until the death of its last representative. Orlando Gibbons, in 1625 Though this school is generally said to have been founded by Dr Tye, there can be no doubt that Tallis was its meatest master, and that it was indebted to him alone for the infusion of new life and vigour which prevented it from degenerating, as some of the earlier Flemish schools had done, into a mere vehicle for the display of fruitless erudition Like every other great musician of the period, he produced occasionally works confessedly intended for no more exalted purpose than the exhibition of his stupendous skill. In his canon Miserere nostri (given in Hawkins's History of Music) the intricacy of the contrapuntal devices seems little short of miraculous, yet the resulting harmony is smooth and normal, and only the irregular complexity of the thythm betrays the artificiality of its structure. The famous forty-part motet, Spem in alsum, written for eight five-part choirs, stands on a far higher plane, and the tow de force of handling freely and smoothly so many independent parts is the least remarkable of its qualities. It was edited by Dr A H Mann in 1888 (London, Weekes and Company) (In the sixth volume of Tudor Church Music [Oxford University Piess, 1928] all the forty parts are printed on one page ) The art with which the climaxes are built up shows that Tallis's object in writing for forty voices is indeed to produce an effect that could not be produced by thirty-nine But this illustrates one phase only of Tallis's many-sided genius, which shines with equal brightness in the eight psalm tunes (one in each of the first eight modes) and unpretending little Veni Creator, printed in 1567 at the end of Archbishop Parker's First Ouinquagene of Metrical Psalms

In 1575 Tallis and his pupil William Byrd—as great a contrapuntist as himself—obtaned from Queen Elizabeth royal letabeth royal canding music-paper for twenty-one years; and, in virtue of his privilege, they issued, in the same year, a joint work, entitled Cantiones gone do arguments Sacrae vocantin, quinque et exportism, containing sixteen motets by Tallis and eighteen by Byrd, all of the highest degree of excellence Some of these motets, adapted to English words, are now sung as anthems in the Anglican cathedral service But no such translations appear to have been made during Tallis's lifetime; and there is strong reason for belleving that, though both he and Byrd outwardly conformed to the new religion, and composed music expressly for its use, they meanined Catholics at heart.

Tallis's contributions to the Cantiones Sacrae were the last

of his compositions published during his lifetime. He died on November 23, 1585, and was burred in the parish church at Greenwish, where a quanti tryined epitaph, preserved by Strype, and repunted by Burrey at oyal during the heavings, recorded the fact that heavings for the property of the property o

TALLOW, the Substitution of the for running tannals, but commercially obtained by the Substitution of the Commercially obtained by the Substitution of the Commercially obtained by the Commercially obtained by the Commercial of t

Mutton tallow differs in several respects from that obtained from over 11 is whiter in colour and harder, and contains only jabout 39% of olem Newly rendered it has hittle taste or smallbut on exposure it quickly becomes ranced Sweet mutton tallow melts at 46° and solidnifes at 36° C, when old it does not melt under 49°, and becomes solid or reaching 44° or 45° C. It is sparingly soluble in cold ether and in boiling alcohol. (See Oils, FATS AND WAXES)

TALLOW TREE, the common name of a small tree, Sophumschlertom, stample Euphoblicacea, a nature of China, but cultivated in India and other warm countries. The seeds are thickly
coated with a white greasy substance—so-called vegetable tallow
—from which candles are made, and which is also used in soapmaking and dressing cloth. The butter tree or tallow tree of Senta
Leone is Pentudesma butty acca, family Guttiferne. The funt,
which is 4 to 5 in. long and about 3 in. in dimanter, has a thick
fleshy find abounding in a yellow greavy funce which is used as
butter

TALLY. The woodes tally used in reckoning comes from two primative notions, that of nothing (exering) a piece of wood for counting, as Robinson Crusoc did, and that of the boken six k shared between two parties to a bargain, the developed tally combines both. Use of this double tally, once prevalent all over Europe, is still frequent in the less advanced countries and not unknown in most. In England, though now nearly obsolets, it was exceedingly common mediaevally and its methods were highly developed; it endured long in certain connections; and its nomen-clature survives in many words; to score at cricket (in Pickwirle's day "ion notify) derives from the single tally, and the verb "to tally" comes obviously from the double one; and other derivatives are many, if not quite so direct.

In England, however, the chief interest of the tally centres in its public use This is earlier even than the very early "exchequer" organization (see EXCHEQUER); by a date not long after 1100 it was a settled system—a system, moreover, carefully differentiated from any private one and used for money only, and the tally continued to be the recognized form of receipt for payments into the Royal Treasury down to 1836 During this long period, though there were modifications of wording, it changed little outwardly save for a continually increasing length; the oliginal offine being extended in one extreme example which still surveys at the Bank of England to 816 inches. This, however, is due solely to the increased number of thousands (notches of the thickness of a man's hand) which the tally might be required to

show, and (apart from any difficulty due to the writing) a 13th century clerk could have interpreted it, the revolutionary changes lie, not in the tally's form, but in its employment

The Assignment System .- At a very early date anticipation of the royal revenue became habitual and in this practice the tally was invaluable, nothing was easier than to "levy" a tally for a sum due for payment later and to "assign" this as payment to a royal creditor Probably, at certain periods, creditors themselves had little objection to a practice which, in an age of difficult transport and clumsy currency, held many advantages At the same time it might obviously lead to the lowering of royal credit and to endless confusion in accounts Assignments were, in effect, payments, but tallies were essentially receipts, and as such, from the 13th century onwards, were all entered on "receipt rolls" and, later, figured in numerous supplementary series of records. Moreover an "assignment" tally frequently went wrong, and the mediaeval administrator could think of no better device than to substitute a fictitious "loan" on the roll, so as to square the account The roll of "receipts" might thus include actual payments of cash, sums credited long before they were paid or due, and entries which indicate no payment at all, but rather a debt to be cleared later The difficulties of the modern historian desiring to use these (exceedingly important) records, with none of the contemporary clerk's expert knowledge, needs no emphasis

The Last Tally, 1826 .- By Pepys' time tally-making at Westminster had become a ritual involving numerous officials, much delay and many fees, and from then onwards periodical attempts were made to destroy it But vested interest successfully withstood reform till the 18th century; and it was not till 1826 that the last tally was levied and a system of "indented cheque receipts" substituted A few years later (1834) reforming zeal celebrated its triumph by destroying (in the furnaces which heated the House of Lords) the whole accumulation of ancient tallies. with disastrous results; the old Houses of Parliament were burned and, incidentally (till the casual discovery in 1909, in the Chapel of the Pyx, of about 1,300 Exchequer tallies, practically all "stocks" of the 13th century), English historians were left without an essential clue to the understanding of some of the richest record series in the national collections

Bibliography.—See Hilary Jenkinson, "Tallies," Archaeologia, lxii (1911) and lxxiv. (1924). For tallies in a foreign country see M Gmur, Schweizerische Bauernmarken und Holzurkunden (Berne, 1017

TALMA, FRANÇOIS JOSEPH (1763-1826), French actor, was born in Paris on Jan. 15, 1763. His father, a dentist there, and afterwards in London, gave him a good English education, and he returned to Paris, where for a year and a half he practised dentistry. He made his début at the Comédie Française as Seide in Voltaire's Mahomet (Nov. 21, 1787). Talma was among the earliest advocates of realism in scenery and costume, being aided by his friend the painter David. His first essay in this direction took the form of appearing in the small rôle of Proculus in Voltaire's Brutus, with a toga and Roman headdress, much to the surprise of an audience accustomed to 18th century costume on the stage whatever the period represented might be. Talma possessed in perfection the physical gifts of a great tragedian. At first somewhat stilted and monotonous in his manner, he became by perfection of art a model of simplicity. Talma married Julie Carreau, in whose salon were the principal Girondists.

In 1808 the emperor had taken him to Erfort and made him play the Mort de César to a company of crowned heads. Five years later he took him also to Dresden. Talma was also a friend of Joseph Chénier, Danton, and Camille Desmoulins. In Chénier's anti-monarchical Charles IX, produced on Nov. 4, 1789, a prophetic couplet on the destruction of the Bastille made the house burst into a salvo of applause, led by Mirabeau. This play aroused political dissensions in the Comédie Française which led Talma to establish a new theatre known for a time as the Théâtre de la République, on the site of the present Théâtre Français. Here he won his greatest triumphs. He made his last appearance on June 11, 1826, as Charles VI, in Delaville's tragedy, and he died in Paris on Oct. 10, of that year,

Talma was the author of Mémoires de Lehain, précédés de réflewons sur cet acteur et sur l'art thédiral, contributed to the Collection des mémoires sur fair d'ensaitages, and published separately (1850) as Réflewons de Talma sur Lehain et l'art thédiral. See Mémoires de FJ Talma, écrit par lui-même, et recueills et em se no drès sur papers de sa famille, by Alex Dumas (1850), J. B. J. P. Regnault-Warm, Mémoires sur Talma (1950).

TALMAGE, THOMAS DE WITT (1832-1902), American Presbyterian preacher, was born near Bound Brook, N.J., on Jan. 7, 1832. He was educated at the present New York university and at the Reformed Dutch theological seminary at New Brunswick, New Jersey In 1856 he became pastor of a Reformed church at Belleville, N J, thereafter holding pastorates successively at Syracuse, Philadelphia, Brooklyn and Washington, District of Columbia During the last years of his life he devoted himself to editing, writing and lecturing He died in Washington on April 12, 1002

TALMUD, the great Rabbinical thesaurus which was reduced to writing during the second, fourth and sixth centuries of the Christian Era

Contents.-The Talmud (Hebrew "teaching, learning") consists of the Mishnah (Heb "[oral] repetition, teaching"), a systematic collection of religious-legal decisions developing the laws of the Old Testament, and the Gemārā (Aramaic "completion, decision," or perhaps also "teaching"), supplementary material, legal and otherwise. Mishnah stands in contrast to Migrā "reading, scripture", its Aram equivalent is Mathnīthā, from těnā, "to repeat," whence the appellation Tannā, "teacher These and the terms Gemara, Talmud, etc., are more fully explained in H L Strack's invaluable Einleitung in den Talmud (Leipzig, 1908), pp 2 sqq The whole was in two great recensions, Palestinian and Babylonian. Other material related to the Mishnah is preserved in the Tosephta (Aram. "addition") and the Midrashim, and since all these, together with the Targumin, represent the orthodox Rabbinical literature connecting the Old Testament with mediaeval and modern Judaism, the reader should also consult the articles Jews (parts it, and ni ); MIDRASH, TARGUM, and for more detailed and critical treatment the references given to the Jewish Encyclopedia

The Mishnah is a more or less careful arrangement of the extant Oral Law (see below). It forms the foundation of the Gemara, and is divided into six Sědārīm or Orders, each containing a number of Massektöth ("weavings," of the etymology of "text") or Tractates. These are subdivided into Peragim ("sections") or chapters, and these again into paragraphs or sentences (Mishnavoth) For a full list of these and of editions and translations, see Jew Ency

The Origin of the Mishnah .- A careful distinction was drawn between the Written Law, the Mosaic Torah and the rest of the Scriptures (apage min), and the Oral Law, or Töräh by Mouth (חף שְּבָשׁל מְּחִי). The latter has become codified in the Mishnah. The traditional view is well illustrated in the words ascribed to R Simeon Lakish, 3rd century A.D: "What is that which is written, 'I will give thee the tables of stone, and the Law and the Commandment, which I have written, that thou mayest teach them (Ex xxiv 12)?' 'Tables,' these are the Ten Words (the Decalogue); the 'Law' is the Scripture; 'and the commandment, that is the Mishnah: which I have written, these are the Prophets and Writings (ie, The Hagiographa), to teach them, that is the Gemara-thus instructing us that all these were given to Moses from Smai," Literary and historical criticism places the discussion on another basis when it treats the Mosaic Torah in its present form as a post-exilic compilation (about 5th century B C ) from sources differing in date, origin and history There is no a priori reason why other legal enactments should not have been current when the compilation was first made; the Pentateuchal legislation is incomplete, and covers only a small part of the affairs of life. Laws must be adjusted from time to time to meet changing needs, and new teaching must justify itself by a reinterpretation of the old writings. Just as the stern common law of the Semites was modified by the milder legislation of the Pentateuch, so, in process of time, further developments ensued Rabbinic law turned the Lex Talionis into monetary compensation. The

Pharisees were the liberalizing party and stood for the Spirit of the Scriptures, to the letter of which the conservative Sadducees clung (For an illuminating example see J Z Lauterbach in Heb. Umon College Annual, IV Cincinnati, 1927, pp. 173 seq ) It is probable that this process was largely an unconscious one, and even if conscious, the analogy of the conventional "legal fiction" and the usual anxiety to avoid the appearance of novelty is enough to show that it is not to be condemned. Contemporary custom or ideals could appear to have ancient precedents, or by means of an exegetical process they could be directly connected with old models In the Old Testament many laws in the Mosaic legislation are certainly post-Mosaic and the value of not a few narratives lies, not in their historical or biographical information, but in their treatment of law, ritual, custom, behef, etc. Thus, the problem of the origin or antiquity of the unwritten Oral Law, a living and fluid thing, lies outside the scope of criticism, of greater utility is the study of the particular forms the laws have taken in the written sources which from time to time embody the ever-changing legacy of the past

Growth of the Mishnah and Gemara.—According to the traditional view the canon of the Old Testament closed with the work of Ezra He was followed by the Sopherim, "scribes" (or the men of the great Synagogue), to the Maccabaean age, and these again by the "Pairs" (zūgōth, Gr ζυγόν) the reputed heads of the Sanhedrin, down to the Herodian age (150-30 BC) The last culminate in Hillel (q v) and Shammai, the founders of two great rival schools, and to this famous pair the work of collecting hălākōth ("legal decisions") has been ascribed. The ensuing period of the Tanna'im, "teachers" (about AD. 10-220), is that of the growth of the Mishnah (On the various teachers, especially the Haggadists, see W Bacher, Agada der Babylon Amoraer, pub. Strassburg, 1879, A d Tannasten, pub 1884, new edition begun in

1903, A. d Pal Amoraer, pub 1892)

Among the best known representatives of the schools are Rabban (a title given to Hillel's descendants) Gamaliel, the Phil-Hellene and teacher of the apostle Paul (Acts xxii, 3) and his son Simeon (Josephus, Life, § 38 seq, Wars, iv 3, 9), and Rabban Johanan b Zakkai, founder of the seat of learning at Jamnia (Jabneh) A little later (about AD. 90-130) are the famous Gamahel 11, Eliezer b Hyrqanos (at Lydda), and Ishmael b Elisha, the last of whom founded the school at Usha and is renowned for his development of the rules of exegesis framed by Hillel. With Rabbi Aqība (q v) and the synods of Jamma (about A.D 90 and 118) a definite epoch in Judaism begins. At Jamma, under the presidency of Gamaliel II. and Eleazar b. Azariah, a collection of traditional halakoth was formed in the tractate 'Edwyyoth (larger than and not to be identified with IV., 7). Here, likewise, was discussed the canonicity of the Song of Songs and of Ecclesiastes, and it is probable that here Aqība and his colleagues fixed the official text of the canonical books. Agība had an important share in the early development of the Mishnah (Strack, pp. 19, 89); and, in the collecting of material, he was followed notably by the school of Ishmael (about AD 130-160), which has left its mark upon the early halakic Midrashim The more interesting names include R. Meir, a well-known haggadist, R. Simeon b. Yohai, R. Jose b. Halaphta and R. Jehudah b. 'Ha'i. But, as collections of decisions were made by prominent teachers from time to time, confusion was caused by their differences as regards both contents and teaching (Sotah, 22a; Shabb. 138b). Consequently, towards the close of the second century a thoroughly comprehensive effort was made to reduce the halakoth to order.

Judah, grandson of Gamaliel II., known as the Prince or Patriarch (nāsī'), as Rabbēnū ("our teacher"), or simply as "Rabbi" par excellence, was the editor. He gathered together the material, using Meir's collection as a basis, and although he did not write the Mishnah as it now is, he brought it into essentially its present shape. His methods were not free from arbitrariness; he would attribute to "the wise" the opinion of a single authority which he regarded as correct; he would ignore conflicting opinions or those of scholars which they themselves had afterwards retracted, and he did not scruple to cite his own decisions.

The period of the 'Amorā'im, "speakers, interpreters" (about AD 220-500), witnessed the growth of the Gemara, when the now "canonical" Mishnah formed the basis for further amplification and for the collecting of old and new material which bore upon it In Palestine learning flourished at Caesarea, Sepphons, Tiberias and Usha, Babylonia had famous schools at Nehardea (from the 2nd century AD), Sura, Pumbeditha and elsewhere Of their teachers (who were called Rabbi and Rab respectively) several hundreds are known. R Hiyya was redactor of the Siphra on Leviticus, to him and to R Hoshaiah the compilation of the Tosephtā is also ascribed. Abbā Arīka or Rab, the nephew of the first mentioned, founded the school of Sura (AD 219) Rab and Shemuel (Samuel) "the astronomer" (died AD 254) were pupils of "Rabbi" (10, Judah, above), and were famed for their knowledge of law; so numerous were their points of difference that the Talmud will emphasize certain decisions by the statement that the two were agreed The Gemara is much indebted to this pair and to Johanan b Nappāhā (199-279) The latter, founder of the great school of Tiberics, has indeed been venerated, on the authority of Marmonides, as the editor of the Palestinian Talmud; but the presence of later material and of later names, e.g., Mani b Jona and Jose b Abin (Abin), refute this view The Babyloman Rabbah b Nahmani (died c 330) had a dialectical ability which won him the title "uprooter of mountains" His controversies with R Joseph b Hiyya (known for his learning as "Sinar"), and those between their disciples Abaye and Raba are responsible for many of the minute discussions in the Babylonian Gemara Meanwhile the persecutions of Constantine and Constantius brought about the decay of the Palestinian schools, and, probably in the 5th century, their recension of the Talmud was essentially complete In Babylonia, however, learning still flourished, and with Rab Ashi (352-427) the arranging of the present framework of the Gemara may have been taken in hand. Under Rabba Tosepha'a (died 470) and Rabina, ie, Rab Abina (died 499), heads of the academy of Sura, the Babylonian recension became practically complete

Finally, the Sabōrā'ē, "explainers, opiners" (about 500-540), made some additions of their own in the way of explanations

and new decisions

The Palestinian Recension of the Mishnah and Gemara is called "the Talmud of the Land of Israel," or "T of the West"; a popular but misleading name is "the Jerusalem Talmud" It is an extremely uneven compilation. "What was reduced to writing does not give us a work carried out after a preconcerted plan, but rather represents a series of jottings answering to the needs of the various individual writers, and largely intended to strengthen the memory" (Schechter) Political troubles and the unhappy condition of the Jews probably furnish the explanation; hence also the abundance of Palestinian haggadic literature in the Midrashim, whose "words of blessing and consolation" appealed more to their feelings than did the legal writings. The Pal. Talmud did not attain the eminence of the sister recension, and survives in a very incomplete form, although it was perhaps once fuller. It now extends only to Orders I.-IV, with the omission of IV. 7 and 9, and with the addition of part of VI. 7.

The Two Versions.-The Babylonian Talmud (or Tal. Babli) contains the Gemara to 361 tractates, but the material is relatively very full, and it is about three times as large as the Pal... although the Gernara there extends to 39 tractates. In the latter the Gemara follows each paragraph of the Mishnah; in the former, references are usually made to the leaves (the two pages of which are called a and b), the enumeration of the editio princeps being retained in subsequent editions. The Mishnah is written in a late literary form of Hebrew; but the Gemara is in Aramaic (except the Baraithas), that of the Bab. T. being an Eastern Aram, dialect (akin to Mandaitic), that of the Pal. T. being Western Aram. (akin to Biblical Aram, and the Targums). Greek was well understood in cultured Palestine; hence the latter recension uses many Greek terms which it does not explain; whereas in the Bab. T. they are much less common, and are sometimes punningly interpreted. The Pal. Tal. is the more concise, but it is remarkable for the numerous repetitions of the same passages; these are useful for the criticism of the text, and for the light they throw upon the incompleteness of the work of compilation. The Bab Tal, on the other hand, is diffuse and freer in its composition, and it is characterized by the exuberance of Halakah, which is usually rather subtle and far-fetched Both Talmuds offer a good field

Especially interesting are the Barasthas which are preserved in the Gemara in Hebrew, they are "external" decisions not included in the more authoritative Mishnah, but they differ from and are sometimes older than the Mishnic material, with which they sometimes conflict (so in particular as regards the rejected decisions of the school of Shammar). They usually begin. "our Masters taught," "it is taught," or "he taught," the verb tēnā (cf. Tannā'im, "teachers") being employed (see further Jew Ency. in. 513 seg ) Parallel to the Mishnah is the Tosephia, an independent compilation associated with R Nehemiah (a contemporary of Meir and Simeon b Yohai), Hiyva b Abba and others, it is arranged according to the Mishnic orders and tractates, but lacks IV 9 and V. 9-11. The halakoth are fuller and sometimes older than the corresponding decisions in the Mishnah, and the treatment is generally more haggadic. The method of making the discussions part of an interpretation of the Old Testament (halakic Midrash), as exemplified in the Tosephta, is apparently older than the abstract and independent decisions of the Mishnah-which presuppose an acquaintance with the Pentateuchal basis-and, like the employment of narrative or historical Midrash (eg, in the Pentateuch, Chronicles and Jubilees), was more suitable for popular exposition than for the academies

The Responses of the Geonim.—The Palestman Talmud, although used by the Qarastes in their controversies, fell into neglect, and the Bahylonian recension became, what it has since been, the authoritative guide. With the Geonim, the heads of Sura and Pumbeditha (about 589-1038), we enter upon another stage The "canonical" Mishnah and Gemara were now the objects of study, and the scattered Jews appealed to the central bodies of Judaism in Babylonia for information and guidance. The Geonim in their "Responses" or "Questions and Answers" supplied authoritative interpretations of the Old Testament or of the Talmud, and regulated the application of the teaching of the past to the changed conditions under which their brethren now lived. The legal, religious and other decisions formulated in the pontifical communications of one generation usually became the venerated teaching of the next, and a new class of literature thus sprang into existence (See Gaon.)

Meanwhile, as the Babylonian schools decayed, Talmudic learning was assiduously pursued outside its oriental home, and some Babylonian Talmudists apparently reached the West. However, the fortunes of the Talmud in a hostile world now become part of the history of the Jews, and the many interesting vicissitudes cannot be recapitulated here (See JEWS) To the use of the Pal. Talmud by the Qarastes in their controversies with the Rabbis we owe the preservation of this recension, incomplete though it is To the intolerance of Christians are no doubt due the rarity of old mss., and the impure state of the text of both Talmuds. At the same time, the polemics had useful results since the literary controversy in the 16th century (when Johann Reuchlin took the part of the Jews) led to the editio princeps of the Babylonian Talmud (Vienna, 1520-23). A change shows itself in the second edition (Basel, 1578-81), when the tractate Abodah Zārāh was omitted, and those passages which offended the Christians were cancelled or modified

Characteristics.—Owing to the nature of its contents the Talmud stood sorely in need of aids and guides, and a vast amount of labour (of varying value) has been devoted to it by Jewish scholars.

Neither the Mishnah nor the subsequent Gemara aimed at presenting a digested corpus of law. It is really a large collection of opinions and views, a remarkably heterogeneous mixture of contents, for which the history of its growth is no doubt largely responsible. It appalls the reader with its irregularity of treatment, its variations of style, and its abrupt transitions from the spiritual

sight. Like the Koran it is often concise to obscurity and cannot be translated literally, it presupposes a knowledge which made commentaries a necessity even, as we have seen, to the Jews themselves. The opening of Order II 6, for example, would be ununtelligible without a knowledge of the law in Levit xxiii 42 "A booth (the interior of which is) about 20 cubits high is disallowed R Judah allows it One which is not ten hands high, one which has not three walls, or which has more sun than shade is disallowed 'An old booth?' (marks of quotation and interrogation must be supplied) The school of Shammai disallows it; but the school of Hillel allows it," etc. In the Gemara, the decisions of the Mishnah are not only discussed, explained or developed, but all kinds of additional matter are suggested by them Thus, in the Bab Gem to III 5, the reference in the Mishnah to the Zealots (Σικάριοι) is the occasion for a long romantic account of the wars preceding the destruction of the Second Temple In IV 3 the incidental prohibition of the cutting up of a roll of Scripture leads to a most valuable discussion of the arrangement of the Canon of the Old Testament, and other details including some account of the character and date of Job There are numerous haggadic interpolations, some of considerable interest Prose mingles with poetry, wit with wisdom, the good with the bad, and as one thing goes on to suggest another, it makes the Talmud a somewhat rambling compilation. It is scarcely a law-book or a work of divinity, it is almost an encyclopaedia in its scope, a store-house reproducing the knowledge and the thought, both unconscious and speculative, of the first few centuries of the Christian era

Estimates,-Ordmary estimates of the Talmud are often influenced by the attitude of Christianity to Judaism and Jewish legalism, and by the preponderating interest which has been taken in the religious-legal side of the Rabbinical writings. The canonization of oral tradition in the Mishnah brought the advantages and the disadvantages of a legal religion, and controversialists have usually seen only one side. The excessive legalism which pervades the Talmud was the scholarship of the age, and the Talmud suffers to a certain extent because accepted opinions and isolated views are commingled. To those who have no patience with the minutiae of legislation, the prolix discussions are as irksome as the arguments appear arbitrary But the Talmudical discussions were often merely specialized and technical-they were academical and ecclesiastical debates which did not always touch every-day life; sometimes they were for the purpose of reconciling earlier conflicting views, or they even seem to be mere exhibitions of dialectic skill (cf., perhaps, Mk. xii 18-23) It may be supposed that this preddection for casuistry stimulated that spirit which impelled Jewish scholars of the middle ages to study or translate the learning of the Greeks. Once again it was-from a modern point of view-old-fashioned scholarship; yet one may now recognize that in the development of European science and philosophy it played a necessary part, and one can now realize that again the benefit was for common humanity rather than for the Jews alone. In any case, the Talmud must be judged, like other authoritative religious literature, by its place in history and by its

Results of Criticism .- The Talmud itself is still the authoritative and practical guide of the great mass of the Jews, and is too closely connected with contemporary and earlier Palestinian history to be neglected by Christians. With the progress of modern research the value of this and of the other old Rabbinical writings is being re-estimated, and criticism has forced a modification of many old views. Thus, an early reference to the title of a work does not prove that it is that which is now current; this applies, for example, to the tractate Edwyjoth (see Jew Ency vni 611), and to the Midrash Siphre, which frequently differs from that as known to the Talmud (sb, xi 331). It has been found that a tradition, however tenacious or circumstantial, is not necessarily genuine, and that, too, in spite of the chain of authorities by which its antiquity or genuineness appeared to be confirmed. Implicit reliance can no longer be necessarily placed upon the reputed authorship or editorship of a work; yet, although many of the to the crude and trivial, and from superstition to the purest inviews of mediaeval Jews in this respect prove to be erroneous

(eg, on the authorship of the Zöhar; see Kabbalah), they may sometimes preserve the recollection of a fact which only needs restatement (eg, R Johanan as the editor of the Pal Talmud). Finally, the Talmud comes at the end of a very lengthy develop-

rmany, the raimon comes at the end of a very lengthy development of Palestinian thought. It is in the direct line of descent from the Old Testament—intervening literature having been lost

-the essence of which it makes its own

Forced by events of history, this legacy of the past was subjected to successive processes and adapted to the needs of successive generations and of widely different historical and social conditions Legal compendiums and systems of philosophy served their age and gave place to later developments, and the elasticity of interpretation which characterizes it enabled it to outlive Karaites and Kabbahsts It also escaped the classicism of the Renaissance with its insistence upon the test-either fact or fiction. As an oriental work among an oriental people the moral and spiritual influence of the Talmud has rested upon its connection with a history which appealed to the imagination and the feelings, upon its heterogeneity of contents suitable for all moods and minds, and upon the unifying and regulative effects of its legalism. The relationship of Talmudism to the Old Testament has been likened to that of Christian theology to the Gospels; the comparison, whether fitting or not, may at least enable one to understand the varying attitudes of Jewish thinkers to their ancient sources With closer contact to the un-oriental West and with the inevitable tendencies of modern western scholarship the Talmud has entered upon a new period, one which, though it may be said to date from the time of Moses Mendelssohn (see Jews), has reached a more distinctive stage at the present day. In the weakening of that authority which had been ascribed almost unanimously to the Talmud, and invariably to the Old Testament, a new and greater strain has been laid upon Judaism to reinterpret its spuit once more to answer the diverse wants of its adherents. This is part of that larger and pressing psychological problem of adjusting the "authority" ascribed to past writings to that of the collective human experience, it does not confront Judaism alone, and it must suffice to refer to the writings of "Reformed Judaand a must sounce to refer to the writings of "Ketormed Judaism"; see, e.g., C. G. Montefiore, Liberal Judaism (1903); Truth in Religion (1906); I. Abhahams, Judaism (1907); Permanent Values (1924), and the essays of S. Schochter.

Values (1924), and the essays of S. Schochter.

BERLICORANY—E. Deutsch's article on the Tahmad in the Quarterly Review, Oct. 1867 (repunted in hu Listerry Remans), is noteworthy for the great interest it anoused. For other introductions, see J. Z. Lautenbach, "Mishnah," and W. Bacher, "Tahmud" in the Jew. Ewey, S. Schechter, "Allahud", in Lattings 'Dict. 1869, E.R. E', and all S. Funk, Eststehung der Tahmud" (Lapzig, 1910). More compression of the Calmud (New York, 1903), and especially H. I. Strack, Essethung in den Tahmud (New York, 1903), and especially H. I. Strack, Essethung in den Tahmud (Lepizig, 1908, every concise, but replies with bibliographical and may be supplemented from the critical Jewish plumais, e.g., the Jewish Montaschrift f. Gatch. at Wissenschoft des Judentowns (Breslau), the Peter Danby, The Mishnah (Eng. trans., 1933); Isidore Epstein (ed.), The Babylonian Tahmud (1938).

TAM. JACOB BEN MEÏR (1100-1171), a grandson of Rashi (q.v.), was the most famous French glossator (tosafist) on the text of the Talmud. In 1147 he was attacked and injured by a disorderly band who had attached themselves to the Crusaders. He escaped to the neighbouring Troyes, where about 1160 was held the first of the Jewish Synods, for which the Rhinelands became celebrated. At this meeting it was laid down that disputes between Jew and Jew were not to be carried to a Christian court, but were to be settled by fraternal arbitration. New conditions of life had arisen owing to the closer terms on which Jews and Christians lived, and Jacob Tam was foremost in settling the terms which were to govern the relations, from the Jewish side. His practical ordinances (Takkanoth), connected with marriage and divorce, trade and proselytism, as well as with synagogue ritual, bear the stamp of enlightened independence within the limits of recognized authoritative tradition and law. Of his legal work the most important was collected in his Sefer ha-yashar. He was also a poet and grammarian.

See Gross, Gallia Judaica (index); M. Schloessinger in Jewish Encyclopedia, vn 36-39.

TAMAI, BATTLE OF, March 13, 1884. This is memorable as the occasion on which the charge of the Sudanese tribesmen, followers of Osman Digna, broke the British "square," although eventually repulsed For an occount see Ecver AND SUBAY CAN-PRIONS (1883-1900)

TAMAQUA, an anthracite-mining borough of Schuylkill county, Pennsylvanna, USA, 15 mm NE of Pottsville, on the Tamaqua (Little Schuylkill) ruse, severed by the Central of New Jersey, the Lehigh and New England and the Reading railways Pop (1959) 11,563, 1940 federal census was 12,486 There are many collentes in the borough and its immediate environs, and vanious industres (including foundress and machine shops, powder mills, shut factories, tubing manufacture, baby bottle manufacture and knitting mills) Settlement dates from 1799 Anthracite was discovered in 1791 and the first coal company was organized the net year. In 1829 a town was laid out, which in 1833 was incorporated as a botough. The name is an Indian world meaning "tunning water."

TAMARIND, the name popularly applied to the pods of a legumnons tree, which are had externally, but within filled with an acid jucy pulp containing sugar and varieus acids, such as citric and fartaric, in combination with potash. The acid pulp is used as a lanature, the pods being largely imported both from the East and the West Indies. The tree is now widely distributed in tropical countries, but it is generally considered that native country is in eastern tropical Africa, from Abyssinas southward to the Zambea. The name (meaning in Arabic "Indian date") shows that it entered mediaeval commerce from India, where it is used, not only for its pulp, but for its seeds, which are astringent, its leaves, which furnish a yellow or a red dye, and stimber. The tree (Tamarindus sindica) attains a height of 70 to 80 ft., and bears elegant pinnate foliage and purplish or orange veined flowers arranged in terminal raceness

TAMARISK. The genus Tamarix gives its name to a small group of shrubs or low trees constituting the tamarisk family, Tamaricaceae. The species of tamarisk and of the very closely allied genus Myricaria giow in salt-deserts, by the sea-shore, or in other more or less sterile localities in warm temperate, subtropical, and tropical regions of the eastern hemisphere. long slender branches bear very numerous small appressed leaves, in which the transpiring surface is reduced to a minimum Tho flowers are minute and numerous, in long clusters at the ends of the branches or from the trunk. Each has 4-5 free senals. and as many petals springing with the 4-ro stamens from a fleshy disk. In Tamarix the stamens are free, while in Myricaria they are united into one parcel. The fruit is capsular, and contams numerous seeds, each usually with a long tuft of hairs at one end. The value of these shrubs or trees hes in their ability to withstand the effects of drought and a saline soil; they grow where little else can flourish. On this account the common tamarisk, T. gallica, the salt cedar, is planted on seaccasts, and affords shelter where none other could be provided. T. articulata, the Athel tree, native to western Asia, has been introduced as a windbreak in desert areas in southern California. Several species are cultivated as ornamentals. For tamarisk manna, see Manna.

TAMATAVE (known by the natives as Tōamāxina) (pop. 159371 ar.,455), the chief seaper of Madagascar, is nearly on the cartre of the eastern coast in 18° 10° S., 49° 32° E. It owes its importance to the eastern coast in 18° 10° S., 49° 32° E. It owes its majoratina to the eastern coast in 18° 10° S., 49° 32° E. It owes its considerable of the eastern coast in 18° 10° S., 49° 32° E. It owes its large of the eastern coast in 18° 10° S., 40° S. The town is built on a sandy peninsula on which are crowded numerous houses, with good shops and merchants' offices in the main thoroughfares. Tamatave is the seat of several foreign consuls, as well as of numerous French officials, and is the chief port for the capital and the interior. Imports consist principally of piece-goods, fart-accous foods, and from and stell goods, and exports of gold dust, raffa, hides, caoutchous and live animals. The town possesses several meat preserving factories. Communication with Europe is maintained by steamers of the Messageries Martitimes and the

Havraise companies, and also with Mauritius, and from thence to culture and general social conditions, see Voronezh, noting how-Ceylon, by the British Union-Castle line Of the whole foreign trade of Madagascar, 46 per cent is through Tamatave. The town is connected with the interior of the country by a network of roads and railways Since 1895 the native population has

settled in a new village to the northwest

TAMAULIPAS a northern Gulf-coast State of Mexico.
Area 30,726 sqmi. Pop. (1950) 716,029. The central and southern parts of the state are mountainous, but there are extensive fertile plains in the north sloping gently northeast toward the Rio Grande, and the coastal zone is sandy, much broken by lagoons, and sparsely inhabited Except in the north this coastal zone is only 5 to 7 mi, wide, but the footbills region back of this is usually well wooded and fertile, and the low alluvial river valleys penetrate deeply into the sierras. There are four important rivers in the state-the Rio Grande del Norte or Rio Bravo, which forms the boundary line with the United States, the Conchas or Presas, the Soto la Marina and the Tamesi Pánuco forms the southern boundary for a short distance A peculiar feature of the hydrography of Tamaulipas is the series of coastal lagoons formed by the formation of new beaches across the indentations of the coast. The climate is hot and humid on the coast, but is pleasant on the more elevated lands of the interior The rainfall is abundant, especially on the mountain slopes of the south The principal industry is agriculture. Sugar, cereals, tobacco, cotton and coffee are produced, and probably fruit may be raised successfully. Stock raising receives some attention, and hides and cattle are exported. The preparation of ixtle fibre for export is becoming an important industry Copper is mined and extensive deposits of petroleum and asphalt are being exploited. Railway communication is provided by the Mexican National, which crosses the northern end of the state east and west, and runs southeast from Monterrey to Tampico. The line from San Luis Potosi to Tampico crosses the state's southern tip

The capital of Tamaulipas is Ciudad Victoria (pop. 1950, 31,815), a small sterra town on the Monterrey and Tampico railway, about 120mi from Tampico. Among other towns may be mentioned Tampico (qv.) (1950, 94,342), Ciudad Madero (1950, 41,074), Nuevo Laredo (1950, 57,669), Matamoros (qv) (1950, 18,215) and

Reinosa (1950, 34,076), the latter three being on the U.S. horder.

TAMAYO Y BAUS, MANUEL (1829-1898), Spanish dramatist, came of a family connected with the theatre, his mother being the eminent actress, Joaquina Baus. The earliest of his printed pieces, Juana de Arco (1847), is an arrangement from Schiller, as also is Angela (1852), while Virginia (1853) is a dramatic essay in Alfieri's manner. La Locura de Amor (1855) established Tamayo's reputation as Spain's leading playwright Hija y Madre (1855) is a failure, and La Bola de Nieve (1856) is notable solely for its excellent workmanship. Tamayo's straitened means during the next few years forced him to put original work aside and to adapt pieces from Léon Laya, Jules Sandeau and Émile Augier. In this period he produced only one original piece, Lances de Honor (1863), which turned upon the immorality of duelling, and led to a warm discussion among the public.

TAMBOV, a region of the Russian S.F.S.R., surrounded by those of Voronezh, Ryazan, Penza, Saratov and Stalingrad. Area 13,745 sq mi. Pop. (1939) 1,882,139 (rural 1,601,115, urban 281,024). It is much smaller than the pre-1917 province of the same name, part of which is now in Ryazan region, and is included in the Black Earth area (Central) (q v.) It consists of an undulating plain (450-800 ft.), intersected by deep ravines and broad valleys; the Don and its tributaries, the Voronezh, Vorona and Khoper, drain it toward the south, and the Tsna links it with the Oka on the north. Cretaceous and Jurassic deposits, thickly covered with boulder clay and loess, conceal the underlying Devonian and Carboniferous strata. Phosphorite beds exist in the northeast and are used for the production of chemical manure; iron is mined in the Lipetsk district, which also has mineral springs, and limestone, clay and gypsum are worked. The soil is black earth, very fertile in the Borisoglyebsk district, but having a lower humus content toward the north, where wild cherry and almond abound. For climate, the difficulties of agri-

ever that Tambov has a smaller annual rainfall

The population is mainly Great Russian in origin, settlement beginning from the principality of Moscow at a very early date, but Tatar raids prevented active colonization until the end of the 17th century, when landowners who had received large grants of land from the tsars began to bring their serfs from central Russia There were some Finnish tribes in occupation, and the Mordva still form an independent group in the region. After the 1917-20 civil war, and the retreat of Denikin's army (1920), the region was infested by bandits, and recovered slowly from the devastation that followed. Prosperity began with establishment of railway construction works at Tambov

TAMBOV, chief town of the above region, situated on the Tsna river (non-navigable), and at a railway junction, in 52° 45' N, 41° 23' E Pop. (1939) 121,285 It has smelting works, a railway repair shop, steam flour mills, distilleries and brick works. The absence of a navigable river lessens its trading importance, though it has a grain elevator. The town was founded in 1636 as a fort against Tatar and Kalmuck raids, was a station for part of Peter the Great's army during his attack on Azov, and later was centre of Tambov province, created in 1796.

TAMERLANE: see TIMUR.

TAMILS, the Sanskrit generic appellation for the south Indian peoples and their languages, which passed through various stages-Dravida, Dramida, Dramila, Damila Bishop Caldwell fully explains this in his Comparative Grammar of the Dravidian Languages (2nd ed , 1875, p 10 seq ) The term Tamulic or Tamulian has occasionally been employed as the designation of the whole class of Dravidian peoples and languages The Tamils proper are smaller and of weaker build than Europeans, though graceful in shape. The hair is plentiful, and occasionally curly The skin varies from brown to black. Of medium stature, they are in general long headed with medium noses They are enterprising, and wherever money is to be earned there will Tamils be found, either as merchants or in the capacity of domestic servants and labourers. The tea and coffee districts of Cevlon are peopled by about 950,000; Tamils serve as coolies in the Mauritius and the West Indies; in Burma, the Straits, and Siam the so-called Klings are all Tamils. They have settlements in east and south Africa.

Language.—Tamil is still the principal language of the Madras Presidency; in Tanjore and Tinnevelly it is supreme. In Coimbatore it is dominant, is second in Chittoor and the Nilgiris (Census of India 1921, vol xiii). Tamil is a sister of Malayâļam, Telugu, Kanarese, Tulu; and, as the oldest, richest and most highly organized of the Dravidian languages, is typical of that family. The one nearest akin to it is Malavalam, originally a dialect of Tamil, but now differing from it in pronunciation and in idiom, in the retention of old Tamil forms obsolete in the modern language, and in having discarded all personal terminations in the verb, the person being always indicated by the pronoun. Also, the proportion of Sanskrit words in Tamil is less than in any other Dravidian tongue.

The modern Tamil characters originated "in a Brahmanical adaptation of the old Grantha letters corresponding to the socalled Vatteluttu," or round-hand, an alphabet once in vogue throughout the whole of the Pandyan kingdom, as well as in the South Malabar and Coimbatore districts, and still sparsely used for drawing up conveyances and other legal instruments It is also used by the Moplahs in Tellicherry, while in Malabar it continued in general use down to the end of the 17th century. The modern Tamil characters, which have changed but little for the last 500 years, differ from all the other modern Dravidian alphabets both in shape and in their phonetic value. Their angular form is said to be due to the widespread practice of writing with the style resting on the end of the left thumb-nail, while the other alphabets are written with the style resting on the left side of the thumb.

The Tamil alphabet is sufficiently well adapted for the expression of the twelve vowels of the language (a, â, i, î, u, û, e, ê, o, ô, ei, au), the occasional sounds of ö and ü, both short and TAMILS 773

long, being covered by the signs for e, ê, i, î, but it is utterly madequate for the proper expression of the consonants, masmuch as the one character k has to do duty also for kh, g, gh, and similarly each of the other surd consonants ch, t, t, p represents also the remaining three letters of its respective class. The letter k has, besides, occasionally the sound of h, and ch that of s Each of the five consonants k, ch, t, t, p has its own nasal In addition to the four semivowels, the Tamil possesses a cerebral r and l and has retained a liquid &, once peculiar to all the Dravidian languages, the sound of which varies in different districts. There is, lastly, a peculiar n, differing in function but not in pronunciation from the dental n. The three sibilants and h of Sanskrit have no place in the Tamil alphabet, but ch often does duty as a sibilant in writing foreign words, and the four corresponding letters as well as 1 and ksh of the Grantha alphabet are now frequently called to aid Many of the Sanskrit words imported into Tamil at various periods have therefore assumed disguises under which the original is scarcely recognizable examples are ulagu (loka), uruvam (rûpa), arukken (arka), arputam (adbhutam), natchattıram (nakshatram), ırudı (rıshı), tîrkam (dîrgha), arasen (râjan)

Tamil has borrowed from Hindustan, Arabic, and Persain a large number of revenue, political, and judicial terms, and more recently a good many English words have crept in, such as tratis, treaty, patiar, butler, åkt, act, hulbb, clib, kawarner, govenin, pinnalahådu, penal code, sikku, sick, mejastrættis, magistrate Of Tamil words which have found a permanent home in English may be mentioned curry (kari), mulligatawny (milagu, pepper, and tamifr, colo water), cheroic (surtist), pariah (paperyam).

The Older Literature.-The early existence, in southern India, of peoples, localities, animals and products the names of which, as mentioned in the Old Testament and in Greek and Roman writers, have been identified with corresponding Dravidian terms, goes far to prove the high antiquity, if not of the Tamil language, at least of some form of Dravidian speech (Caldwell, loc. cst., Introd, pp 81-106, Madras District Manual, i. Introd, pp 134 seq.) But practically the earliest extant records of the Tamil language do not ascend higher than the middle of the 8th century of the Christian era, the grant in possession of the Israelites at Cochin being assigned by the late Dr. Burnell to about A.D. 750, a period when Malayalam did not exist yet as a separate language. There is every probability that about the same time a number of Tamil works sprung up, which are mentioned by a writer in the 11th century as representing the old literature (Burnell, loc cit., p. 127, note) The earlier of these may have been Saiva books; the more prominent of the others were decidedly Jain. Though traces of a north Indian influence are palpable in all of them that have come down to us (see eg., F. W. Ellis's notes to the Kural), we can at the same time perceive, as we must certainly appreciate, the desire of the authors to oppose the influence of Brahmanical writings, and create a literature that should rival Sanskrit books and appeal to the sentiments of the people at large. But the refinement of the poetical language, as adapted to the genius of Tamil, has been carried to greater excess than in Sanskrit; and this artificial character of the so-called Sen-Tamil is evident from a comparison with the old inscriptions, which are a reflex of the language of the people, and clearly show that Tamil has not undergone any essential

change (Burnell, loc ett, p. 142).

The rules of Sen-Tamil appear to have been fixed at a very early date. The Folkshophyme, the oldest extant Tamil grammar, is assigned by Dr. Burnell (On the Aindra School of Sonskrit Grommarious, pp. 8, 55) to the 8th century (best edition by C. Y. Tämodaram, Pillei, Madras, 1885). The Virasidiyam, another grammar, is of the 11th century. Both have been superseded by the Normall, of the 15th century, which has exercised the skill of numerous commentators, and continues to be the leading native authority (English editions in Pope's Third Tamil Grammar) and an abridgment by Lazarus, 1884). The period of the prevalence of the Jains in the Päqdya kingdom, from the 9th or roth to the 13th century, is justly termed the Augustan age of Tamil literature. To its earlier days is assigned the Nidadsyyar, an ethical

poem on the three objects of existence, which is supposed to have preceded the Kural of Tiruvalluvan, the finest poetical production in the whole range of Tamil composition Tradition, in keeping with the spirit of antagonism to Brahmanical influence, says that its author was a pariah It consists of 1,330 stanzas on virtue, wealth and pleasure It has often been edited, translated and commented upon, see the introduction to the excellent edition published by the Rev Dr Pope, in which also a comprehensive account of the peculiarities of Sen-Tamil will be found To the Avvei, or Matron, a reputed sister of Tiruvalluvan, but probably of a later date, two shorter moral poems, called Attisuds and Konrewêyndan, are ascribed, which are still read in all Tamil schools Chintâmans, an epic of upwards of 3,000 stanzas, which celebrates the exploits of a king Jivakan, also belongs to that early Jain period, and so does the Divakaram, the oldest dictionary of classical Tamil The former is one of the finest poems in the language, but no more than the first and part of the third of its thirteen books have been edited and translated Kamban's Râmâyanam (about AD 1100) is the only other Tamil epic which comes up to the Chintâmani in poetical beauty

comes up to the Combandon in posecular deaductions which appeared in the period of the Saiva reevistal productions which appeared in the period of the Saiva reevistal productions with the production of Saiva reventions of Saiv

1875-76)

After a period of literary torpor, which lasted nearly two centuries, King Vallabha Deva, better known by his assumed name Ativîrarâma Pândyan (second half of the 16th century), endeavoured to revive the love of poetry by compositions of his own, the most celebrated of which are the Neidadam, a somewhat ex-travagant imitation of Sri Harsha's Sanskrit Naishadham, and the Verrivêrkei, a collection of sententious maxims. Though he had numerous followers, who made this revival the most pro-lific in the whole history of Tamil literature, none of the compositions of any kind, mainly translations and bombastic imitations of Sanskrit models, have attained to any fame. An exceptional place, however, is occupied by certain Tamil sectarians called sittar (1e, siddhas or sages), whose mystical poems, especially those contained in the Swavakyam, are said to be of singular beauty Two poems of high ment, composed at the end of the 17th century, also deserve favourable notice-the Nitinerivilakham, an ethical treatise by Kumaragurupara Desikan, and the Prabhulingalilei, a translation from the Kanarese of a famous text-book of the Vîra-Saiva sect. See the analysis in W. Taylor's

Catalogus, vol. il. pp. 83,7–47.

Catalogus, vol. il. pp. 83,7–47.

The Modern Period, which may be said to date from the beginning of the last century, is ushered in by two great poets, one native and the other foreign. \*Tōyumdnavam, a philosopher of the panthesite school, composed 1,453 starnas; \$\fotag{doi:10.10}\$ which have a high reputation for sublimity both of sentiment and style; and the Italian Jesuif Joseph Beschi (d. 1742), under the name Viraminumi, elaborated, on the model of the \$Chindmani, a redigious epic \*Tōmbūnari, which, though marred by Dlemishes of taste, is classed by native critics among the best productions of taste, is classed by native critics among the best productions of taste, is classed by native critics among the best productions of their literature. It treats of the history of St. Joseph, and has been printed at Pondicherry in three volumes, with a tull analysis. English influence has here, as in Bengal and elsewhere in India, greatly tended to create a healthier tone in literature both as to style and seatiment. As one of the best Tamili translations of English books in respect of diction and idiom may be mentioned the \$Bdioxydphrida, or "Little Merchants," published by the Vernacular Text Society. Madras. P. Percival's collection of Tamil Provents (3 and ed., 1875) should also be mentioned.

The copper-plate grants, commonly called fasanams, and stone

inscriptions in Tamil, many of which have been copied and translated (Archaeological Survey of Southern India; vo. iv.; R. Sewell, Lists of the Antiquarian Remans in the Presidency of Madra; vols 1, in), are the only authentic Instorical records. (See also Sir Walter Elliot's contribution to the International Numismato Orientiala, vol in pt. 2) As early as the time of the Chinese traveller Hsuan Tsang, books were written in southern india on talpot leaves, and Albiruil mentions this custom as quite prevalent in his time (1031). It has not died out even descriptions of the control of the Control of the National States is now the largest depository of Tsanil polin-leaf mas, which have been described in Wishor's Calalogue of the Matchanie Collection (Calcutta, 1282, a vols.), W Taylor's Catalogue (Madras, 1857, a vols.), and Condaswany Iyer's Catalogue (Vol. 1, 1861)

The art of printing, however, which was introduced in southern India at an early date, while it has tended to the preservation of many valuable productions of the ancient literature, has also been the means of perpetuating and circulating a deal of literary rubbish and lasciviousness which would much better have remained in the obscurity of manuscript. Dr. Burnell has a note in his Elements of South Indian Paleography (and ed , p 44), from which it appears that in 1578 Tamil types were cut by Father João de Faria, and that a hundred years later a Tamil and Portuguese dictionary was published at Ambalakkâdu. At present the number of Tamil books (inclusive of newspapers) printed annually far exceeds that of all the other Dravidian vernaculars put together The earliest Tamil version of the New Testament was commenced by the Dutch in Ceylon in r688; Fabricius's translation appeared at Tranquebar in 1715 Since then many new translations of the whole Bible have been printed, and some of them have passed through several editions

The German missionary B Ziegenbalg was the first to make the study of Tamil possible in Europe by the publication of his Grammatica Damulica, which appeared at Halle in 1716. Some time later the Jesuit father Beschi devoted much time and labour to the composition of grammars both of the vulgar and the poetical dialect. The former is treated in his Grammatica Latino-Tamulica, which was written in 1728, but was not printed till cleven years later (Tranquebar, 1739). It was twice repunted, and two English translations have been published (1831, 1848). His Sen-Tamil Grammar, accessible since 1822 in an English translation by Dr. Babington, was printed from his own ms (Clavis humansorum Isterarum sublimioris Tamulici idiomatis) at Tranquebar in 1876. This work is especially valuable, as the greater portion of it consists of a learned and exhaustive treatise on Tamil prosody and thetoric. (See, on his other works, Graul's Reise, vol. IV p. 327.) There are also grammars by Anderson, Rhenius, Graul (in vol. ii of his Bibliotheca Tamulica, Leipzig, 1855), Lazarus (Madras, 1878), Pope (4th edition in three parts, London, 1883-85), and Grammaire française-tamoule, by the Abbé Dupuis (Pondicherry, 1863). The last two are by far the best. The India Office library possesses a ms. dictionary and grammar "par le Rév Père Dominique" (Pondicherry, 1843), and a copy of a ms. Tamil-Latin dictionary by the celebrated missionary Schwarz, in which 9,000 words are explained About the like number of words are given in the dictionary of Fabricius and Breithaupt (Madras, 1779 and 1809). Rottler's dictionary, the publication of which was commenced in 1834, is a far more ambitious work. But neither it nor Winslow's (1862) come up to the standard of Tamil scholarships; the Dictionnaire tamou français, which appeared at Pondicherry in 2 vols. (1855-62), is superior to both, just as the Dictionarium latino-gallico-tamulicum (ibid, 1846) excels the various English-Tamil dictionaries which have been published at Madras.

F. Müller, Grundriss der Sprachwissenschaft, Vienna, 1884, m 1 162-246; G. U. Pope, First Lessons in Tamil, 7th ed, Oxfond, 1994, and The Mäddiyár, Oxford, 1893, and J. Vinson, Manuel de la langue tamoule, Paris, 1903 (R Rr, X)

TAMLUK, a subdivisional town of India, in the Midnapore district of Bengal on the nver Rupnaryan. Population (1941), 12,079 Under the name of Tamralpita, it was a scaport at which the Chinese Buddhist pilgrims enhasted, it may also be identified with Tamalites noticed by Ptolemy as being on the rivet Ganges The channel connecting the town with the sea survived till the riph century, when the Portuguese had a settlement here, and then silted up. Tamluk is now 60 m from the sea, and the issue of the old city the deep beneath inver sit

TAMMANY HALL. Quite as old as the US government, this powerful political organization in New York city has, with only occasional intermissions, not only ruled that city since the year 1800, but at times has execised great influence in state administration and even in national affair.

Its Origin—Before the Ameican Revolution groups proclaiming featly to King George III were organized in societies bearing the names of St. George, St. Andrew and St. David. To counter their aims the revolutionsits formed associations called the Sons of Laberty or the Sons of St. Tammany Tammany or Tammanend was an Indian chief noted for his wisdom, benevolence and love of liberty. In ridicule of the imported saints, revolution is studied Tammany a saint. With the achievement of American independence the Sons of Laberty and the Sons of St. Tammany dissolved.

When the delegates of New York state met to adopt a federal constitution, the discussions evidenced the existence of a unified aristocratic group During the Revolution many estates owned by opponents of the American cause had been confiscated. But there remained some large estates in possession of tamilies which either supported the Revolution or were not hostile. The proprietors of these estates, often vested with almost feudal powers, constituted the core of the aristocratic party To resist these influences, William Mooney, an upholsterer in New York city, founded the Society of St Tammany or Columbian Order, on May 12, 1789, a fortnight after the establishment of the national government. His purpose was the creation of a society native in character and democratic in principle and action. Its officers were given Indian titles, the society's chief was Grand Sachem and his fellow chiefs Sachems The democracy comprehended in Tammany's original period was not, however, that of later times For more than three decades after its organization Tammany represented the middleclass opposed to the pretensions and power of the aristocratic

class opposed to the pretensions and power of the aristocratic party; it did not then represent the lower classes.

At first, the Society of St Tammany was nonpartism in the sense that it had no distinct political miniators but expressed its democratic factor of the property of the pro

"Sammany Hall Organized"—Caseff critisjens made by the opposition that a private society was engaging in polities resulted in a separation of social from political functions. In 1805 the Society of St. Tammany obtained from the legislature a charter incorporating it as a benevolent and charitable body on the charter incorporating it as a benevolent and charitable body in militation was now created as an apparently distilled to the controlled the political mechanism; the leaders of the two organizations were either identical or the men directing the political arm had their representatives as Sachems. The political organization had their representatives as Sachems. The political organization by in the fact that the society was continuously the owner of the Tummany like that the society was continuously the owner of the Tummany and garden house to the Tummany and part of the party regularity became binding upon a majority of voters, to factled the evited could proporly claim to be the Tummany organization or

any part of it. This happened in 1828, 1838, 1853 and 1857 when the Sachems, as trustees of the building, evcluded factions from meeting in Tammany Hall

Until 1806 Tammany Hall remained an agitational political club, Democratic, party In that year was begun a thorough organization of Democratic voters The main features of this comprehensive plan were general, nonunating, corresponding and ward committees. In the meetings and of making all necessary arrangements for elections Composed originally of 30 members, this committee was gradually expanded until it had many thousands of members penetrating every Tammany Hall's strength was greatly increased when, in 1820, it

decided as a matter of policy to support a New York state constitu-tional amendment abolishing property qualifications for voting Effec-tive in 1822, this amendment brought a new and ever-increasing voting tive in 1622, this amendment origin a new and ever-increasing voting element into politics and generally into Tammany Hall. The change produced by manhood suffrage was not immediate. For some years more Tammany was led by bankers and merchants who used their power for self-enrichment. The Workingmen's party, in 1829, and

more Tammany was led by bankets and metchants who used their power for self-enthement. The Workingment's party, in 1829, and its successor, the Equal Rights party, or against on 1829, as successfully a more than the general communities and Tammany Hall of this element.

Gang Control and "Boss" Rule.—The period especially from 1826 onward was one m which heavy immigration, notably flish, pouted into New York city Impecunous and objects of religious and scan prepatice, numbers of the Irish, unable to get work, banded and a call prejudice, numbers of the 1 rish, unable to get work, banded in street gangs Unlike other political parties, Tammany Hall wel-comed immigrants, facilitated their naturalization and gave then their The astute, unscrupious and engaging Fernando Wood organized the gangs as a political power within Tammany Hall, securing his own advancement, 1s well as assuring Tammany the redoubtable support of men equally useful in overawing opposition, packing primaries or committing frauds at the polls Wood had been a powerful but not a supreme leader With the ascendency of William M Tweed but not a supreme reason with the ascendency of william M feed on 1867, Tammany Hall came under the sway of a single leader or boss. The son of a chairmaker, Tweed had won his way through ward politics, had been a member of "The Forty Thieves" board of aldermen in 1851-52, manipulating his unprincipled way to the rule of Tammany Hall. Corruption reached its climax under Tweed when York city was plundered of an amount conservatively estimated at \$45,000,000 in direct spolation, but innging as high as \$200,000,000 when reduced taxes and fraudulent bond issues are also considered Only \$876,000 was ever recovered Tweed died in jail, but most of

Univ spychocow are ever recovered. Twees died in jul, but most of which we will be a many and the late of the most of the most of the most of the most of the most of the most of the most of the late of the most m overthrowing I weed to reorganize Tammany Hall. Superficial, this move in movies affected the composition and characteristics of the Tammany organization at large. The real resuscitating factor was the attachment of New York city's tenement house masses to an organization the distinct leaders of which evercised a human relationship, coming into direct contact with them, treating them politically as equals and giving a helping hand to those in want or trouble. This one large service outweighed all of the denuncations of Tammany by Republican business opponents who often had their own less spec

one large sevice outweighed all of the denincations of 'Assmany by incular but more indicate system of corruption. After Kelly's death in 1886, Richard Croker succeeded as Tammany Halls boss and he was followed by Charles F Murphy in 1992. During this period many were perhaps no greater than the contemporary frauds and corruptions committed by financial, insuance and other corporations. Tammany In Rocent Years—with the accession of Judge Commany in Rocent Years—with the accession of Judge Commany in 1994, came evidence of a still more altered Tammany Hall. Different from his predecessor, Judge Olvany was a university graduate and lawyer, having served in the court of peneal sessions, in contrast allower, having served in the court of peneal sessions, in contrast allower, having served in the court of peneal sessions, in contrast allower, having served in the court of peneal sessions, in contrast allower, having served in the court of peneal sessions, in contrast allower than the contrast of the court of the court of the contrast of the court prompted Welker's resignation and Samuel Seabury's report, prompted Welker's resignation and discredited Curry Tammany leaders refused to indorse the moderate reforms made by acting mayor isaders retused to indorse the moderate reforms made by acting mayor McKee and choes John P. O'Brien of the old school to fill out the unexpired term. The city rose in revolt and a Fusion tacket formed under Seabury's direction successfully ran Procello H. LaGuardia for mayor. These successive defeats weakened Curry's leadership and in July 1934 he was replaced by James J. Dooling.

During the 13 years of the LaGuardia administration, which has been called the best administration New York city ever emboyed, a farmanay's hardy was characterized by the organization, defended a consistency of the organization, defended a consistency of the organization, defended a consistency of the organization of the consistency of the organization of the consistency former postmaster general and Prasdent Roosevelt's campaign maser until the block with the president over the third term issue in 1940, extressed considerable influence in Tammany Hall's afturs from 1940, extressed considerable influence in Tammany Hall's afturs from 1940, extressed considerable influence and the state of the term of the term of the state of the Tamman and the state of the Tamman and the state of the Tamman and the state of the Tamman and the Tamman Democratic national chairman in 1940, controlled the party Kelly and Plynn between them exercised greater influence on the affairs of the Democratic party in New York city during that period than any of

Democratic party in New York city during that period than any of the leaders of Tammany Hall Thomas E. Dewey, who had won a seputation for gang busting as district attorney, easily defeated the Tammany candidate for governor of New York, John J. Bennett, J., who also was strongly supported by President Roosevelt There was

wuo aiso was strongy supported by President Roosevelt. There was more gloom in Tammany Hall and additional predictions in the press that Tammany was finished forevel in the munerapid election of 1945, when LaGuardia was no longer a candidate, Tammany supported William O'Dwyer again for mayor O'Dwyer, who also had strong support of the American Lebor party, DAMPET, who aso had strong support of the American Labor parks sletchy was elected by one of the largest pluralities in New York's history It is significant that although before its echapse by the LaGuardan administration candidates had considered Tammany endousement an asset, during the municipal campaigns of both 1941 and 1941 the Demociatic manyoralty candidate thought it waste to tepudate Taministration of the control Exemoviate mayorany canoniate mought it wiset to repudiste Tammany Tammany's ability to turn out the vote for its candidates was once more established, however, in 1945
See Gustavus Myers, The History of Tammany Hall, 'The New Tammany,' The Centery Magazine, Aug. 1256, D. T. Lynch, Boss Tweed, M. R. Werner, Tammany Hall (1928) (M. R. W. X.)

TAMMERFORS: see TAMPERE

TAMMUZ, Sumerian, Babylonian and Assyrian god, who died and lose annually with dying and reviving vegetation, originally Dumu-zi, "the son who rises, goes forth (from the nether world)," but generally interpreted "faithful son" Philologically both interpretations are correct, and no Accadian commentary exists to explain which meaning was accepted by them.

The interpretation as "the son who rises," "the resurrected child," accepted in this article, is new and differs from all views held in the standard works on this cult It is clear, however, that the main principle of this cult is the resurrection of the dying god. and the verb zi stands for the root zig to rise up, not zid, to be and the verb 22 stands for the root 22 to rise up, not 322, to be faithful (See S Langdon, Sumerian Laturgies and Psalms, p. 287, 17, 18 tubba-za usrga-za, "In thy fall and in thy resurrection.")

There are many titles of the youthful god, loved by his sister,

the earth and heaven goddess, Innini (Ishtai), who descends yearly into Aralû (under-world) at the time of his death to bring him back to earth in her bosom. Since he represents the mystery of life and death, as seen in the withering vegetation of the hot Mesopotamian summer, and the rapid renewal of its life at the season of the spring rains, Tammuz is the patron of flocks and irrigation as well as of vegetation Titles such as god Sipa, the shepherd, umun mirsi, lord of the flood, god Ab-ú, father of vegetation, god Zulumma, god of the date palm, are not so old as those which reveal theological speculation concerning the brother, lover and husband of the earth mother. Theology gave rise to this, the most widely spread and profoundly religious aspect of West Asiatic and Egyptian religion (where it appears as the cult of Osiris and Isis). Dumu-zi appears in the oldest texts without a divine title, c. 3200 B.C., and in Sumerian texts of Eannatum of Lagash (c. 2850 BC.), as god Dumum-apsu, "risen child of the deep," describing him as the son of the god of the nether sea of fresh waters, Ea, Enki, a title confined apparently to early Lagash, where he appears more often under the title Ningiszida. "Lord of the faithful tree," a title which developed into an independent deity. In the legend of Eridu, in which Adapa is sent to the gates of heaven for judgment because he had broken the wings of the south-wind, he found Tammuz and Ningiszida at the gate of heaven; they offered him bread and water of life, which he, on the advice of the water god of Eridu, refused and

been identified with the stars Castor and Pollux or, perhaps, Procyon and Sirius

The liturgical wailings for Tammuz during the period of his sojourn in Aralû are numerous and describe every aspect of the theological doctrines concerning him They are invariably composed in Sumenan, rarely with Accadian interlinear translation. These wailings occurred at midsummer, and the sixth month of the calendar at Lagash from the 28th to the 24th centuries is named the "month of the festival of Tammuz," corresponding to September if the year began near the spring equinox. There is a variant name for this month at Nippur, called "month of the mission of Innini," referring to her descent to Aralû in search of her departed lover The Babylomans retained the old name of the fourth month and for some reason described it as the "month Tammuz," corresponding to July, retaining the name "month of the mission of Innini" for the sixth month (Elul). In this month (fourth) Tammuz is said to have been bound, and the liturgies speak of his having been drowned among flowers which were thrown upon him as he sank beneath the waves of the Euphrates. He is described as the shepherd who left his flocks, as the shepherds sat in the fields wailing for Tammuz

There is a strange inconsistency in the hymns of these wailings concerning the relation of the mother goddess to her lover, Tammuz. In the early Sumerian texts she is his sister, but soon the Semitic view that she is his mother prevails. The two theories appear inconsistently together throughout the entire history of the cult He is, however, invariably the husband and lover of the otherwise consistently described virgin goddess of love, Innin, Gestinanna, Bêlit-sêri (queen of the field of the lower world), and the cult is particularly associated with the great city Brech, home of the cult of Anu, the heaven god, and Innini In all ceremonies connected with his cult his mother or sister is invariably associated with him, and it is the one aspect of Sumerian and Babylonian religion which may be described as universal and not largely confined to any local tradition Badtibira, Pantibiblas of the Greek, near Erech, seems to have been the original seat of the cult, and in the Sumerian tradition of the ten pre-diluvian kings, the name of one at Badtıbıra is Dumuzisipa, "Tammuz the shepherd"; one of the names of Tammuz is Tibira. No great temple was built to him, and a few casual references to a temple of Tammuz at Umma, Ur, Lagash, Agade, clearly refer to shrines in the temple of the local deity reserved for the wailings and mystic ceremonies of the cult Worship of Tammuz spread far beyond the lands to which the Sumerian religion was principally confined. Ezekiel speaks of it as firmly installed at Jerusalem in his time; it is mentioned in the Christian era in Mandean and Syriac literature, and survived among the Ssabeans at Harran as late as the middle ages. At Byblus, in Syria, he was identified with the West Semitic Adonis,

In astrology Tammuz was identified with Aries; in the magic rituals he is symbolized by a white kid, and he is also connected with the ram, which led to this astral identification. Under the title Sibzianna, "faithful shepherd of heaven," he was identified with Orion. During the period of deified king worship in the Dungi period of Ur, and in the time of the Isin dynasty, the deified kings habitually identified themselves with Tammuz and were worshipped as husbands of the mother goddess. For this reason it has been argued that the cult arose in prehistoric times. when a king was put to death as a sacrifice to the earth mother in order to secure the good will of the desty of vegetation. There is, however, no evidence for this in the earlier texts, and so far as Sumerian religion is concerned, the theory must be dismissed as unproved He was held to be a god of healing, bestower of health, and one who, like all other deities, had power over the demons

It is obvious that a cult which is based upon the death and resurrection of a propitiating god, and upon the love of a divine mother who walls for her son, has direct connection with the facts and the theological views based upon them, which gave

thus lost immortality Tammuz and Ningišzida appear to have Marduk of Babylon was identified with Tammuz At the Nisan or new year festival at Babylon, Bêl (Marduk) was said to have been imprisoned in the lower world, and a priestess weeps at his sepulchre A malefactor was slain with Bêl and they descend together to the land of darkness Beltis, his wife, descends to hell to seek him, and Bêl's garments are given Ishtar (mother of Tammuz) Bêl was laid in a sepulchre, from which he soon comes forth. This Marduk transformation of the national Tammuz cult is only another effort of the priesthood of the capital to enlarge the worship and importance of the local cult It obtained nowhere else in Babylonia and Assyria, and may be regarded as a true interpretation of what transpired regularly in the Tammuz cult itself. That the cult had direct influence upon the origins of Christianity cannot be denied, and the Greek cult of Adons owes its essential content to the Sumerian Tammuz

of Adons owes its essential content to the Sumerian Tammus Bibliotocarky—S. Langdon, Tammus and Bibliato (Oxford, 1914); H. Zimmern, Der Babylonische Gest Tamis (Leipzis, 1909), W. W. Baudssin, Adons und Einnin, for connections with West Semitic capitale cults (Leipzis, 1917). For the hymns of the Tammus-Inhita wainings, St. Lammerin, Samerust-babylonische Tamishider (Paris, 1909). H. Tor the Marduk-Hel ritual of the new year festival at Babylon in the late Marduk, 1918). S. Langdon, The Babylonaux Epit of Creation, (Colford, 1921). Death and Resurrection of Bel-Marduk, 2006. (Oxford, 1923).

TAMPA, a city on the west coast of Florida, U.S., at the head of Tampa bay (Gulf of Mexico), 330 mi S.E. of Pensacola and 220 mi N.W. of Key West; a port of entry and the county seat of Hillsborough county It is on federal highways 41 and 92, has two municipal airports with breakwater to accommodate seaplanes.

The city is served by Eastern and National air lines, by the Atlantic Coast Line and the Seaboard railways, steamship lines, operating to both U.S. coasts and foreign ports, and motorbus lines, covering Florida and adjacent territory and connecting with lines to all principal cities in the U.S. The population was 124,073 in 1950 and 108,391 in 1940.

The city hes at the mouth of the Hillsborough river, which flows into Hillsborough bay, an arm of Tampa bay The climate is delightful with an average temperature of 71.8,° an average annual precipitation of 49.36 in. and an average of 67% of the "possible sunshine" in the year. Tampa first became a resort in the 1880s, hotels are open the year round. It is a centre for tarpon fishing and winter headquarters of the Cincinnati Reds, major league baseball team, Royal American Shows, and annual meeting place of the National Pistol tournament, Tin Can Tourists of the World, Women's Open Golf tournament and Dixie Tenms tournament.

It has a municipal golf course, tennis courts, yacht basin, fishing pier and provision for all the usual sports and recreations. The Gasparilla Carnival and Florida State fair is an annual event of national prominence in February,

Thousands of visitors stop in the city during the year, and the city provides adequate facilities for their entertainment. It is the industrial city of the state, ships more phosphate rock (1,582,-369 tons in 1949) and manufactures more clear Havana cigars (535,013,758 in 1040) than any other city. Its water-borne commerce was 5,436,202 tons in 1949. Industries include shipbuilding and manufacture of canned citrus fruit, cement, tin containers, fertilizers and boxes.

The city has many public schools, a university and vocational schools. There are more than 150 cigar factories. Tampa has a large wholesale and retail trade. In 1927 after seven years under a commission-manager form of government, the city modified its charter to provide for a mayor with broad authority and a council of 12 district representatives.

Tampa was the name of the Indian village which De Narváez birth to Christianity. But the form of the cult which apparently and De Soto found there in 1528 and 1539. The harbour, accordmost directly affected the origins of Christianity is that in which ing to tradition, was a favourite resort of pirates, including the picturesque Capt José Gasparılla, whose memory is kept alive in the annual carnival In 1823 the US government established a fort (Fort Brooke, an important base of supplies in the second Seminole War, abandoned in 1860) and around it grew up a civil settlement. In Nov 1862 Tampa was taken by Federal gunboats During the Spanish-American War (1898) it was the point of embarkation for US troops that invaded Cuba Theodore Roosevelt and his Rough Riders were encamped there for several weeks In 1880 the population was only 720 Between 1880 and 1800 the cigal industry was established, the first railroad reached the city and the first hotel for tourists was built. By 1890 the city had a population of 5,532, which was shown to have increased to 15.839 in 1900, 37,782 in 1910 and 51,608 in 1920 The opening of the Panama canal (1920) greatly enhanced the importance of the post, and within a few years its traffic was doubled Tampa was one of the principal foci of the Florida "rush" of 1924-25. The city was incorporated in 1855

TAMPERE, formerly Tammerfors, an industrial city of Finland in 61° 28′ N, 23° 45′ E, on the rapids connecting Lakes Nasi-jarvi and Pyha-jarvi, and at a railway junction Pop (est, 1040) 80.005′ If manufactures textiles, paper and leather goods

TAMPICO, a city and leading port of Mexico, in the state of Immulipas, on the north bank of the Pánuco river, about 6 mi. from the Gulf of Mexico. In summer the climate is hot and humid, although a sea breeze modifies the temperature somewhat In winter the temperature falls to freezing on occasional days when "northers" blow down along the Gulf coast. Tampico is almost surrounded by swampy lands and lagoons

The eastern and poorer part of the town stands on low ground only or of at howe the nuver, and is subject to inundations. However, a modern sewer system, up-to-date street paving and a better water supply, constructed after the beginning of the 20th rentury, greatly improved the sanitary condition and reduced the death rate from epidemics. The western part rises about 150 ft, consists largely of residential districts and 15 provided with still better sanitary equipment. The business section is well built, largely of stone and brock, while many of the newer structures are of reinforced concrete and rise to six and seven stories. The city is well sumbled with say and electric help.

Tampico has excellent transportation facilities, one railway line running north-northwest to Monterrey and another westward to San Luis Potosi, connecting there with the railway to Mexico City; a third short but important line leads southwestward through the oil fields to Pánuco. Although a bar exists at the mouth of the Pánuco river, jetties have been built and the depth was increased by dredging so that vessels drawing up to 33 ft. can approach the water front of the city, while scows and other boats of light draught can go up the river for more than 100 mi. The Chijol canal, begun in 1901, affords a waterway 6 ft. deep and 25 ft wide for about 75 mi, southward through the oil fields to Túxpan Modern port works, spacious enough to accommodate at the wharves 14 vessels at a time, steel sheds and warehouses, a union railway station within easy reach of the water front and excellent equipment for loading oil tankers make Tampico the most un-todate harbour in Mexico. Excellent air service is available to Mexico City, Veracruz, Brownsville, Tex., and other points,

Tampico owes its importance to the fact that four of the most productive oil fields in the country (the Ebano, Paiuce, Husateca and Tüpan) are situated within about 100 mi, of its site. Until 1901 it was a second-rate port, outlet of the fertile but relatively undeveloped hinterland, with a very bad reputation for health and sanitary conditions. The raped exploitation of petroleum resources resulted in a marked increase of population from about 10,000 in 1900 to 14,956 in 1921 and 10 \$34.47\$ in 1940. Population (census 1950) was 94,342. For several years Tampico ranked as the greated of the the world. Clusters of steel petroleum-storage tanks extend along the river, particularly on the southern shore, from its mouth to a few miles above the city. Pipe lines lead from the near-by fields, while fleets of scows bring oil from farther up the river. Pipe lines and barges together are capable of transporting approximately 1,200,000 bbl. of oil daily from the fields to the port of Tampico.

Up river from the port agricultural activities have been stimulated, fruits, vegetables and grams being grown to supply the local food demands. Up-standard standard 
Besides the connected directly with the oil business, the inmatter of the connected directly with the oil business, the indirect of the connected directly and for the building of rought
busts, and electic light and power plant, factories for making
ice, clothing and fruit preserves, sawmills, etc. In addition to
petroleum, the exports meduce silver building (from San Luis
Potosi, Aguascahentes, Torreón and Monterrey), xitle fibre, sugar,
thides, live cattle, cottonseed cake, honey, fustic, sarsaparilla,
coffee and copper ores. Substantial imports of all commodities
are received for the surrounding territory. (J. W. May.)

TAMWORTH, mumcapality, Inglis county, New South Wales, Austr, on the Peel and Cockburn rivers, 285 mi by rail north of Sydney. Pop. (1947) 12.071. It is the centre of the Liverpool plants, and near by at Bungera diamonds are found It is also the market of a pastoral and agracultural distinct. Brewing maling, steam, saw and flour milling, coachbuilding and the manufacture of boots and galvanized iron are its principal industries.

TAMWORTH, market town, municipal borough, Lichfield parliamentary division, Staffordshire, England, on the river Tame The rural district of Tamworth is in the Tamworth division, Warwickshire Pop. (1951) 12,889 Area, 4.18 sq mi It is 110 mi NW, of London on the London Midland Region railway castle, situated above the Anker, is chiefly of the Jacobean period, but is enclosed by massive ancient walls. After being bestowed on the Marmions by William the Conqueror, the castle was for many years an important fortress. The town was formerly surrounded by a ditch of which only traces remain. The church of St. Editha (8th century) was rebuilt, after the Danes burned it, by Edgar, who made it collegate, the existing Decorated building was erected after a fire in 1345 The free grammar school, refounded by Edward IV, was rebuilt in 1677 and again in 1867. The charities include Guy's almshouses (1678), endowed by Thomas Guy, founder of Guy's hospital, London Coal, fire clay and blue and red brick clay are dug in the neighbourhood. In the town are a clothing factory, paper mills and manufactories of small wares. The borough was extended in 1932 and given additional powers. Tamworth (Tamwurda, Thamworth, Tomworth) is situated near the Roman Watling street. It was burned by the Danes and restored in 913 by Aethelflead, who built the fort which was the origin of the later castle The town was again destroyed by the Danes in 943. It is mentioned in Domesday Tamworth was incorporated by Elizabeth in 1560 by letters patent, which state that it is an "ancient mercate town," and suggest that the charters had been lost or burned. The governing charter in 1835 was that of Charles II, incorporating it under the title of the bailiffs and commonalty of the borough of Tamworth in the counties of Stafford and Warwick. Edward III granted two fairs, still kept up in 1792, to be held respectively on St. George's day and the day of the Translation of St Edward; another ancient fair, in honour of St. Swithin, or perhaps originally of St. Editha, is still held (July 26). Tamworth sent two members to parliament from 1562 to 1885.

TANA, a lake of northeast Africa, chief reservoir of the Abhai or Blue Nile. Tana lies between 11° 36′ and 12° 10′ N. and 37° 27′ and 37° 40′ E., 5,650 ft. above the sea, on the northeen portion of the Abyasimian plateau. Its greatest length is 47 mil, its greatest breadth 44 mil, and it covers approximately 1,100 sq. mil, having a drainage area, including the lake surface, of about 5,200 sq.mil. The shorts are well defined, generally flat, but at places the mountains descend somewhat abruptly into the water. Elsewhere the land rises in gentle undulations, except at

the mouths of the larger tributary streams, where are alluvial plains of considerable size At the south-east end the lake forms a bay about 11 miles long, and from three to eight miles across From this bay the Abbai issues The whole coast-line is considerably indented and many narrow promontories jut into the lake The island of Dek (eight m long by four broad) is in the south-western part of the lake. Near it is the smaller island of Dega Numerous islets fringe the shores

Lake Tana is fed by three large rivers and by many petty streams The chief tributary is the Little Abbai, which enters the lake at its south-west corner This river, and the Abbai itself or Blue Nile which issues from the lake, are regarded as one and the same stream and a current is observable from the inlet to the outlet Next in importance of the affluents are the Reb and Gumara. which run in parallel courses and enter the lake on its eastern side The outlet of the lake is marked by openings in a rocky ledge, through which the water pours by two or three channels, in a succession of rapids, uniting within a couple of miles into one river—the Abbai with a width of 650 ft

The average annual ramfall in the Tana catchment area is estimated at 31 ft, and the volume of water received by the lake yearly from this source and from affluents at about 6,572,-000,000 of cubic metres The average seasonal alteration of the

lake level is not more than about 11 metres

Three technical missions have been sent by the British and Egyptian Governments conducted respectively by Mr. Dupuis (1903), Mr Buckley (1916) and Mr Grabham (1920-1) to report on the feasibility of utilizing the lake as a reservoir with the object of regulating the supply of water (3,500 million cu m in a normal year) discharged from the lake into the Blue Nile for irrigation needs in the Sudan and Egypt. As a result a scheme of works has been proposed, and it is estimated that these works, in addition to securing a more even distribution of water during the year, would by storing the surplus water in years of heavy rainfall form a reserve of 8,000 million cum to tide over the deficiency in years of bad supply. The Abyssinian Government, however, has consistently opposed the project.

Tana has been identified with the Color Palus of the ancients, which was described by Ptolemy as a chief reservoir of the Egyptian Nile and the source of the Astapos, which was certainly the Blue Nile In 1625 it was visited by the Portuguese priest Jeronimo Lobo, and in 1771 by James Bruce. It was formerly known by the name of Dembea.

Known by the name of Demicia.

See Ninz and Absyssinia, and the authorities there cited. The British Blue Book, Egypt, No. 2, 1904, which contains a special report (with mass) upon Lafe Tana. Also the mest valuable Report of the Mission to Lake Tana (1920-21) issued by the Egyptian Ministry of Public Works in 1925.

TANA, a river over 500 m. long, in Kenya Colony, which gives its name to the Tanaland province of that British protectorate. Its sources are along the watershed close to the eastern wall of the eastern rift-valley, and it enters the Indian Ocean in 2° 40' S., about 110 m. north of Mombasa. One series of its numerous headstreams traverses the Kikuyu plateau north of the Athi, others flow from Mount Kenya, all following a south-easterly direction until intercepted by the main stream which flows northeast until, when nearing the equator, it turns eastward afterwards sweeping southward to the sea. It receives tributaries only along its upper course but on entering the plain it flows along a tortuous course, has low banks, is in part forested and inundated at high water, but away from the river the country appears to con-sist of dry plains covered with mimosa scrub. The river fre-quently divides in its lower course, has many backwaters and has often changed its course, especially its place of entering the sea. It is navigable for 150 m. from its mouth. North of the Tana is the Ozi, a small river connected with the Tana by the Belazoni canal

TANAGER, the name of birds of the family Tanagridae, allied to the Fringillidae (see FINCH), and distinguished by their feebler conformation and more exposed nostrils. They are confined to the New World, and are specially characteristic of the tropical forests of Central and South America, only in a small proportion reaching Mexico, and four species breeding in the U.S.A.

The tanagers have been examined systematically by P L Sclater, he admits the existence of 375 species, which he airanges in 59 genera, forming six subfamilies, Procniatinae, Euphoniinae, Tanagrinae, Lamprotinae, Phoenicophilinae, and Pitylinae These are of very unequal extent, for, while the first of them consists of but a single species, Procesas tersa, the third includes more than 200.

Nearly all are birds of small size, the largest barely exceeding a song-thrush Most of them are remarkable for their gaudy colouring, and this is especially the case in those forming the genus Tanagra Generally among the tanagers, both sexes are nearly alike in plumage. Insects, especially in the larval condition, and bernes afford the greater part of their food. They have a pleasing song, and build a shallow nest, in which the eggs, generally three in number, and of a greenish-blue marked with brown and purple, are laid

The scarlet tanager (Piranga erythromelas) nests in the eastern USA, west to the Plains and north to New Brunswick and Manitoba, wintering in South and Central America The male is scarlet, with black wings and tail, the female is olive green, lighter below, with dusky wings and tail. The song is reminiscent of the Ameri-

can robin, but is inferior

The summer tanager (P. rubra) does not reach farther north than New Jersey and Kansas The male is 10sy 1ed, the female olive-yellow above, dusky saffron below. The song is superior to that of P erythromelas

The remaining species, P ludoviciana, the males of which are mostly yellow and black, with the head only red, does not appear eastward of the Missouri plains, and has not so northerly a range Another species, P hepatica, has shown itself within the limits

of the United States. In all these the females are plainly attired TANAKA, GIICHI, BARON (1863-1929), Japanese statesman and general, born in Yamaguchi, graduated at the military cadet's school in 1886, and the staff college in 1802. He was minister of war in the Hara and Takahashi cabinets in 1918-21, and 1920 He became leader of the Seivukwai Party in 1926, and formed a government in April 1927, himself taking the ministry

of foreign affairs He died on Sept. 28, 1929
TANAQUIL, the Etruscan name of the wife of Tarquinius Priscus, or of one of his sons After her immigration to Rome she is said to have received the name Gaia Caecilia. She was famous for her prophetic gifts. There was a statue of her as Gaia Caecilia in the temple of Sancus, which possessed magical powers She was celebrated as a spinner of wool, and was supposed to exercise influence over Roman brides. Tanaqual and Gata Caecula are, however, really distinct personalities. The anecdotes told of Gaia Caecilia are aetiological myths intended to explain certain usages at Roman marriages

See Livy, 1. 34, 41; Pliny, Nat. Hist, viii. 74, xxxvi 70; Schwegler, Romische Geschichte, bk. xv. 8.

TANCRED (d. III2), nephew of Bohemund and a grandson of Robert Guiscard on the female side, was the son of a certain Marchisus, in whom some have seen a marquis, and some an Arab (Makrizi). He took the Cross with Bohemund in 1096, and marched with him to Constantinople. Here he refused to take an oath to Alexius, escaping across the Bosporus in the disguise of a peasant; but after the capture of Nicaea he followed the example of the other princes, and became the man of Alexius. At Heraclea, in the centre of Asia Minor, he left the main body of the Crusaders, and struck into Cilicia, closely followed by Baldwin of Lorraine. He made himself master of Tarsus, and when he was evicted from it by the superior forces of Baldwin, he pushed further onwards, and took the towns of Adana and Mamistra. He joined the main army before Antioch, and took a great part in the siege. In the beginning of roop he was in Raymund's army, but he soon left the count, like many other pilgrims (see Ray-MUND IV); and he joined himself to Godfrey of Lorranc in the final march. After the capture of Jerusalem he went to Nablous, and began to found a principality of his own. He took part in the battle of Ascalon in August; and after it he was invested by Godfrey with Tiberias and the principality of Galilee, to the north of Nablous. In 1100 he attempted, without success, to prevent Baldwin of Lorraine (his old enemy in Cilicia)

from acquiring the throne of Jerusalem Failing in this attempt, and being urgently summoned from the North to succeed Bohemund in the government of Antioch, he surrendered his smaller possessions to Baldwin He acted as regent in Antioch until 1103, when Bohemund regained his liberty. He regained the Cilician towns for Antioch (1101), and recaptured Laodicea (1103); he imprisoned Raymund of Toulouse, and only gave him his liberty on stringent conditions, and he caused the restoration of the deposed patriarch of Jerusalem, Dagobert, if only for a brief season, by refusing to aid Baldwin I on any other terms When Bohemund was set free, Tancred had to surrender Antioch to him In 1104 he joined with Bohemund and Baldwin de Burg (now count of Odessa in succession to Baldwin of Lorraine) in an expedition against Harian, in which they were heavily defeated. and Baldwin was taken prisoner. Tancred, however, profited doubly by the defeat He took over the government of Edessa in Baldwin's place; and in 1105 Bohemund surrendered to him the government of Antioch, while he himself went to Europe to seek reinforcements. Ruler of the two northern principalities. Tancied carried on vigorous hostilities against his Mohammedan neighbours, especially Ridwan of Aleppo; and in 1106 he succeeded in capturing Apamea. In 1107, while Bohemund was beginning his last expedition against Alexius, he wrested the whole of Cılıcia from the Greeks; and he steadfastly refused, after Bohemund's humiliating treaty at Durazzo in 1108, to agree to any of its stipulations with regard to Antioch and Cilicia To the hostility of the Mohammedans and the Greeks, Tancred also added that of his own fellow Latins. When Baldwin de Burg regained his liberty in 1108, it was only with difficulty that he was induced to restore Edessa to him. But it was against the emirs of Northern Syria that his arms were chiefly directed; and he became the hammer of the Turks He died in 1112, leaving the government to his brother-in-law, Roger de Principatu, until such time as Bohemund II should come to his inheritance

SUCH LIME AS BOHEMUMG 11 SHOULD CORE TO HIS IMPLEMENTS BELLEGARDY—TARRICKS Getal were recorded by Ralph of Caen, who drew his information from Tancred's own conversation and reminiscences. Kuglier has written a work on Bohemund and Tancred (Tahmeen, 1869); and Tancred's career is also described by Rey, in the Levie de Toffent Lein, iv. 334-340.

TANCRED (d 1194), King of Sicily, an illegitimate son of Roger the eldest son or King Roger II, was crowned in January 1100 in succession to William II. (q.v.). He was supported by the chancellor Matthew d'Ajello and the official class, while the rival claims of Roger II.'s daughter Constance and her husband, Henry VI , king of the Romans and emperor, were supported by most of the nobles. Tancred was a good soldier; but he was illsupported in his task of maintaining the Norman kingdom, faced with general apathy, threatened by a baronial revolt, and menaced by Richard Coeur-de-Lion, at Messina, 1190. Henry, skilfully winning over Pisa, Genoa and the Roman Commune, isolated Tancred and intimidated Celestine III., who, on April 14, 1191, crowned him emperor at Rome. He, however, failed to capture Naples in August and retired north, leaving garrisons along the frontiers of the Regno. Tancred now sought to win over the towns by extensive grants of privileges, and at Gravina (June 1192) was recognized by the pope, whose ineffectual support he gained by surrendering the royal legateship over Sicily. In 1192 and 1193 he successfully opposed the Apulian barons, but his death at Palermo (Feb. 20, 1194) a few days after that of Roger, his son and joint-king, made Henry's path clear.

TANDY, JAMES NAPPER (1740-1803), United Irishman, born in Dublin in 1740, was a prominent reformer and supporter of Lucas and Grattan. He first won popularity by his attacks on municipal corruption and his proposal to boycott English goods in retaliation for the restrictions imposed on Irish commerce. In 1780 Tandy was expelled from the Dublin volunteers (see Flood, HENRY), but he continued his revolutionary agitation, and in 1791 co-operated with Wolfe Tone in founding the Society of United Irishmen, of which he became the first secretary. A challenge sent to the attorney-general resulted in his

he joined a number of Irish refugees. Having gained the ear of the French Government, Tandy was given command of a coivette, a small force of men, and a quantity of arms for distribution in Ireland Arriving at Donegal, however, he learnt that Humbert's expedition had failed, and he thereupon fled to Hamburg. The refugees were surrendered on a peremptory demand from the British Government Condemned to death, he was finally reprieved owing it is said to Bonaparte's intercession.

Tandy's exploits completely captured the popular imagination, and he is still remembered as the hero of the "Wearing of the Green" In France, where his release was regarded as a French diplomatic victory, he was received in March 1802, as a person of distinction; and when he died, on Aug. 24, 1803, his funeral was attended by the military and an immense number of the

civil population

TANEGASHIMA, an island south of Kyushu, in Kagoshima prefecture, Japan, in 30° 50' N. and 131° E, 36½ mi long and 7½ mi broad at its widest part The first Japanese word for firearms was Tanegashima, because it was there that Fernão Mendes

Pinto landed c 1542, carrying a musket.

TANEIEV. SERGIUS (1856-1915). Russian composer and theorist, was born on Nov 13, 1856, in the Vladimir government He studied under Nicholas Rubenstein and Tschaikowsky at the Moscow conservatoire. After a short career as a concert pianist he went back to Moscow as professor of instrumentation, then first professor of pianofotte and, in 1885, director. He died at Moscow on June 15, 1915 His published works include a symphony, five string quartets, a dramatic work, Orestes (performed in St Petersburg 1895), a cantata, John of Damascus, and choruses for male voices and for mixed voices. He also wrote a treatise on counterpoint.

TANEY, ROGER BROOKE (1777-1864), American jurist, was boin in Calvert county, Md, March 17, 1777. He graduated from Dickinson college, Carlisle, Pa, in 1795, and began studying law at Annapolis in 1796 He served in the State Senate in 1816-21, was attorney general of Maryland in 1827-31; and in July 1831 entered President Jackson's cabinet as attorney general of the United States. He was the President's chief adviser in the attack on the U.S. Bank, and was transferred to the treasury department in Sept. 1833, for the special purpose of removing the Government deposits. As a result, the Senate refused to confirm his appointment as secretary of the treasury

On Dec. 28, 1835, he was nominated chief justice of the U.S. Supreme Court. After strong opposition, the nomination was confirmed on March 15, 1836. During President Jackson's administration (1829-37), the personnel of the supreme bench was entirely changed. Five of the seven judges in 1837 were his appointees. The majority of them were Southerners who had been educated under democratic influences As a result, the State sovereignty influence was occasionally manifest, as for example, in the opinion (written by Taney) in the *Dred Scott* case (1857, 19 Howard, 393) that Congress had no power to abolish slavery in territory acquired after the formation of the National Government. Judge Tancy died Oct. 12, 1864.
An authoritative biography is Samuel Tyler's Memoir of Roger Brooke Tancy (1872).

TANGA, a seaport of Tanganyika, East Africa, opposite the random, a scaport of langanyira, East Arrica, opposite the island of Pemba in 5° of S., 39° 7′ E. Pop. (1948) 5,546 non-natives including 335 Europeans and 3,953 Asiatics. In 1952 the population was 22,100. The town is regularly laid out on elevated ground on the southern shore of Tanga bay, amid coconut groves and avenues of mango trees. The harbour is entered by a broad imprisonment (1792), but on his release Tandy assisted in raising but tortuous channel five to eight fathoms deep. Tanga is the then fied to America, and in 1798 proceeded to France, where At one time par, of the sultanate of Zanzibar, Tanga passed into German possession in 1888 In 1914, a British force from India attempted to capture the town but was compelled to reembark It was occupied by the British under Gen Jan Christiaan Smuts, July 7, 1916. In 1937, 33% of Tanganyika exports passed through the poor. (P. W. I)

TANGANYIKA, A British trust territory of east central Africa, is bounded on the east by the Indian ocean, on the south-east by Mozamboque, on the southwest by Nyassland and Northern Rhodesia, on the west by the Belgian Congo, on the northwest by Nyaunda-Urund and Uganda and on the northwest and north by Kenya II includes Mafia island The total area is 362,688 sq mi. which includes 1,9,982 sq mi! of landa waters.

#### PHYSIOGRAPHY

Geology—Most of Tanganyika is composed of ancent crystalline rocks of sevenil Pre-Cambran systems In the west, however, Archaean or early Palaeosoic unnetamorphosed unfossilierous sedimentary systems, the Karagwe-Ankolean and Bukoban, cocur, the latter with associated volcanics. Rocks of Karroo Age, mainly nomantin, ear fairly widespread; they have their greatest extension in the south central area of the country, with small outcrops scattered between there and the northern coastal area; coulbearing strata are known only in the southwest region of the territory.

Mesozoic and later marine sediments occur in a belt along the coast, widest at about the parallel of 7° S and narrowing especially to the north. The oldest dated Mesozoic marine rocks are of Bajocian Age, although Liassic beds have been believed to be present. In a number of inland basin areas, lake sediments of Pleistocene to Recent Age occur, and surface "duricrusts" are widespiead, especially in the granitic plateau areas. A northern volcanic area of the territory is a continuation of that more extensively developed in Kenya Volcanic activity has continued since Tertiary or possibly late Cretaceous times, at present being very slight. The rocks are mainly of alkaline types. A smaller volcanic focus is situated in the southwest of the territory near the northern end of Lake Nyasa. The rocks of both areas are termed "rift volcanics," being associated with the great disturbances of Tertiary and Quaternary times, which gave rise to the East African rift valleys and associated faults that control the major tectonic features of the (C. B. Bt.)

Physical Features — Through the middle of the country runs, from north to south, the Great Rift valley, which for much of its length has lost the troughlike characteristics so noticeable in Kenya and is seen as a cliff of varying health, the eastern wall being scarcely discentible. The rift forks just north of Lake Nyasa, one arm containing lake Tanganyaka and, outside the territory, Lakes Klvu, Edward and Albert; the other containing Lake Manyara, Lake Natron and, in Kenya, Lakes Magadi, Navashan and Rudolf. The greater part of the country consists of an immense plateau, varying in allitude between 3,co and 4,co of t.

The mountain systems are grouped mainly in the northeast and southwest, but there is a great ridge of high land between the two. In the north are the peaks of Kilimanjaro (19,565 ft.) and Meru (14,566 ft.) and the "winter highlands" further west, containing the famous game-filled Ngorongoro "crater." To the southeast of Kilimanjaro, running down toward the port of Tanga, are the Pare and Usambara ranges. In the south, grouped round the northern of Itake Nyssa, are the Luvingstone mountains, the Kipengeer nage, the Porton mountains, Mt. Rugwe and, further west, the Utipa highlands. To the east of the broad ridge of high land connecting the two main mountain systems is the isolated block of the Uluguru mountains, just south of the Central railway at Morogoro. In the Songea district of the Southern province lies another range, the Matengo highlands.

The country, although appearing well watered on the map, has few permanent rilyers and the greater part of the vast central plateau is devoid of running water for half the year or more. The main rivers flowing into the, Indian ocean are the Pangani, which rises in the snows of Kilimanjaro; the Wami, whose tributary, the Mkondoa, is one of the two major rivers to pierce the central

idge, the Ruvu or Kingani; the Rubij, with its many tibuaries from the south and centre of the country, chief among them the Rusha, the Kilombero and the Mbaragandu, and farther south the Matandu, Mbemkuru, Lukuleda and Ruvuma, the last forming almost the whole of the southern boundary. The only rivers navigable for any distance are the Rufin, navigable for about 50 m for small vessels, and the Kagera, similarly navigable for about 90 mi. The Mort, Mara and Kagera flow into Lake Victoria, the Malagaras into Lake Tanganyika and the Songwe and Ruhuhu nto Lake Nyasa. The Wembere, Manyonga and Sibiti, which have a seasonal flow only, drain a large part of the eastern side of the central plateau and discharge into Lake Eyasa, which lies in a subsidany fissure of the eastern Rit't valley.

Although it has no rivers of any great consequence, Tanganylka forms the divide whence the three greatest nivers of the African continent take their rise, namely, the Congo, the Nile and the Zambezi, flowing respectively into the Atlantic, the Mediterranean and the Indian ocean. The watersheds of the three systems do not meet at any one point, being separated by a large depression (in the central plateau) which has no outlet to the sea

Lake Victoria (26,828 sq.m.) is about the size of Scotland and lies 3,717 ft. above sea level. Lake Tanganyika (qv) is about 470 m. long and on the average about 30 m. wide and lies 3,534 ft. above sea level. Other lakes are Rukwa in the southwest and Eyasi, Manyara and Natron in the north. (The whole of Lake Nyasa is in Nyasaland—the boundary running down its eastern shore)

Climate.-The monsoons play a prominent part in the climate of the country The northeast monsoon sets in about November and gives way to the southeast monsoon (which becomes the southwest monsoon north of the equator) in March or Apul, the latter continuing to blow until it in turn is replaced by the northeast monsoon Altitude is another factor in deciding the kind of climate which any particular place will have Those sides of the mountains (eg, Kılimanjaro) which face the prevailing winds receive several times as much rain as those in the "rain shadow" on the leeward side Very broadly, the country may be divided into three zones (r) The northern coastal belt, an area about 100 mi, wide, extending from Dar es Salaam to the Kenya border, (2) the lake region within about 50 mi of Lake Victoria; (3) the interior plateau, with which must be associated the southern coastal belt. The northern coastal belt is characterized by high humidity, two pronounced rainy seasons-one from November to January, the other from March to May-and by temperatures which range from an average of about 72° F in the cool season (June-September) to an average of about 85° F. in the hot season. The average annual rainfall at Dar es Salaam is about 40 in.

In the lake region the lake exercises a moderating effect on the temperature and there is a diurnal variation of only about 13° F or 14° F. In the cool season the temperature is about 63° F. and in the hot season about 82° F. The presence of this great body of water has also a pronounced effect on the rainfall of the region: those areas which lie to the east of the lake receive about 30 in, to 40 in. per annum; while those to the west, where the prevailing winds blow, receive as much as 80 in to go in The interior plateau is characterized by a single rainy season (although this is often broken in places by a long gap, with disastrous effects on the local crops), by a wide diurnal range of temperature (which at Tabora sometimes exceeds 36° F.) and by a somewhat meagre and often badly distributed rainfall, averaging between 30 in, and 40 in over most of the area, although at Rungwe at the head of Lake Nyasa it reaches as much as 100 in, per annum. The cool season temperatures average about 60° F. and the hot season about 83° F.

Vegetation.—Characteristic of the coastal regions are the cocount palm, mangrove and casuarina; of the central areas the miombo (Brackystegia) woodland, the grotesque baobab and the symmetrical candelabra (a species of Euthoria); and of the forests myule (Chlorophora excelsa), yellowwood (Podoarpiu) and cedars of various kinds. the last three being vuluable commercially.

Fauna.—The country is unsurpassed in the number and variety of the wild life to be found within its borders Among the large animals elephant, giraffe, rhino, hippo and buffalo are widespread.

Antelope of numerous varieties occur, including impala, Thomson's and Grant's gazelle, duker of vaious kinds, bushbuck, teedbuck, waterbuck, topa, oyv, puku, eland, wildebeeste, harrebeeste, roan, sable, orbh, dik-dik and greater and lesset kudu Of the carmwores there is a similar warrety lion, leopaid, cheetah, serval and civet cats, hyensa and hunting dogs being common in many areas

Rareties are the chumpanzee, found only in the mountains to the north and south of Kigoma on Lake Tanganyka, the stuttinga, an antelope found only in certain swamps, and the gerunuk, another antelope, found in a few places in the Northein and Tanga provinces only. There are many varieties of snakes, lizatids, chameleons and amphibbans, and over 1,000 varieties of birds, including a litre number of same birds.

More than two-thirds of the country is infested by the tsetse fly, of which there are several varieties, Glossina morsitans being the most widespread.

HISTORY

Written records prove that knowledge of the east coast of Africa—
—the Azaman coast—has evasted in parts of Asa and Europe ence
before the Christian era. The Persphia of the Erytheraem Sea
contains a detailed mariner's guide to the coast, from the Rea
to what is now Portuguese East Africa, or Mozambique. In it reference is made to the island of Menouthis and to the town of
Rhapta. The former was either Zamabai or Pemba, the latter is
thought to be either Pangani or a town in the delta of the Ruji
river. There are also Egyptian records of still earlier times, although debut factation of the places they name is difficult. Plotted
writing about A. D. 150, gives some account of East Africa as it was
then known.

It is not surprising that contact should have been established with the neighbouring coasts of Arabia, Persia and India, since the monsoons or trade winds could hardly have been better devised for such traffic For part of the year they blow from the northeast, carrying the voyager directly to the East African coast, and for the remainder of the year they blow from the southwest, carrying him directly home again. The earliest settlers were Arabs and Persians who established themselves at easily defensible places, or small islands, such as Lamu, Mombasa, Pangani, Zanzibar, Mafia and Kilwa In these places, certainly from the 10th century AD and probably from very much earlier times, they built up flourishing civilizations of their own, the relics of which are still clearly to be seen The kind of civilization which the Portuguese were so surprised to find on their arrival in these waters in 1408 was predominantly Arab (though with a strong Persian flavour in places) and Mohammedan

The Portuguese were only interested in these settlements as stopping places on the road to India and the far east and it was essential for their purposes that the "Moors," as they called them, should acknowledge the suzeranty of Portugal The history of the coast in the 14th and 15th centuries is one long account of rebellion, bloody repression and further rebellion on the part of first one and then another of the petty coastal kingdoms. When they invoked the aid of the Omani Arabs the end of Portuguese domination was hastened, and after 1727, when the Arabs took Mombass, the Portuguese retired to the south of what is now Tanganyika and never again recovered their power over the Azanian coast. During their 200 years "rule they had made little or no altempt to colonize (in the modern acceptance of the term) or to explore the interior.

It was not until the imam of Museat, Seyyid Said bin Sultan, moved his capital to Zanzabri in 1828 and encouraged his Omani Arabs to journey into the interior that anything further was known of it. Seyyid Said was a remarkable man, who realized the strategic position of Zanzibra and whose deliberate policy it was to encourage trade and to build up his little island as the entrepôt of East Africa. He introduced the clove to the islands of Zanzibra and Pemba and today they produce the great bulk of the world's supply. Less to his credit was his encouragement of the save trade in the interior. Arabs, financed by Indian traders from Cutch, Gnijarat and other places on the west side of India, penetated further and further into the hinterland and brought back,

Antelope of numerous varieties occur, including impala, Thomson's as well as slaves and ivory, stories of the vast lakes far in the

These stories teached the ears of the first missionaries at Mombass, and J. L. Krapf and J. Rebmann compuled from them their stories and the properties of the stories of the stories and the stories of

Then came the Germans, including Franz Stuhlmann and O Baumann, but in particular Karl Peters In 1884 Peters founded the Union for German Colonization and later that year set off for East Africa, journeyed inland from Bagamoyo, and concluded various treaties with chiefs in the interior. In Feb. 1885 he obtained an imperial charter of protection. In 1886 a joint commission consisting of Great Britain, France and Germany defined the extent of the sultan's dominions as a ten-mile strip along the coast in addition to the islands of Zanzibar, Pemba and Mafia Germany's sphere of interest over a large part of the interior was recognized Its attempt to occupy the country was, however, bitterly opposed by the Arabs, and fighting occurred at many places on the coast On Jan r, 1891, a protectorate was proclaimed and the country was thenceforward administered by the imperial German government. But for many years the history of German rule was one of almost incessant bloodshed, the Chagga, the Nyamwezi, the Gogo, the Hehe and other tribes having in turn to be suppressed. Probably the most serious and widespread of all the uprisings was that in 1905-06 of the tribes between Lake Nyasa and the sea, known as the Mau Mai rebellion.

The Germans were thus faced with a difficult problem of admistration, and it was not surprising that in attempting to solve it they took steps to reduce the power of the chiefs, in many places removing them altogether and replacing them by haufts or abidos, usually of Arab or Swahil extraction and alien to the area. The Germans devoted much time, money and energy to the development of plantation agriculture, introducing such trops as susal, rubber, ice and cinchon, and experimenting with many others They built two railways, the Tanga line from Tanga to Moshi, and the Central line from Dar es Salam to Kigoma

World War I set back the developing economy of the country considerably For more than four years the German forces, under the skilled and daring leadership of General von Lettow-Vorbeck, defied the numerous British, Belgian and other Allide columns gathered to defieat them. The linabitants suffered from the passage through the country of large bodies of troops and in particular from the demands of both sides for porters.

On Jan. 31, 1920, a royal commussion was issued, appointing Sir Horace Byatt administrator of German East Africa—soon to be renamed the Tanganyika Territory and entrusted to Great Britain as a mandate Belgium assumed a mandate at the same time over the provinces of Ruanda and Urundi.

The necessary reconstruction after the upheaval caused by the war was taken in hand, but with the limited resources available proceeded slowly. In April 1935 Str Donald Cameron was appointed governor and soon after his arrival set to work to establish in Tanganyika the system of indirect rule which had proved so successful in Nigeria.

The authority of the chiefs was revived, native treasuries were set up, and native courts established in which the local customary law was administered. At the same time considerable economic advances were made, a railway was built from Tahora to Myanza and the Tanga line extended to Arusha, roads were improved, and considerable attention devoted to the production of economic crops by the local inhabitants. A legislative council was established in 1926, World War II again retailed development greatly, and the necessity to devote the country's resources to the furtherance of the war effort meant that social and other services suffered in consequence. The territory received 5,000 Polish refugees and 5,000 Ralians as part of its war effort and housed them in special camps Through the country, along the Great North road, passed the motorized convoys proceeding from South Africa to the middle east. Africans from Tanganyika served in the forces, mostly in the 6th battalon of the King's African Rifles and in the battalions formed from it, and a small Tanganyika Naval Volunteer force was also formed.

In 1946 a ten-year development and welfate plan was drawn up and a separate development budget prepared. Consideable progress was made with the implementation of the plan, later replaced by another which covered the years 1950–56. The failure of the groundnut scheme dumng 1947–21 was a butter disappointment to those who had sought to utilize the wide open speces of Tanganyika for the production of falts but they had barguined without the conditions of soil, weather and transport obtaining in the marginal areas chosen and had badly miscalculated the value and reliability of machinery on such land. The scheme was converted into one of large-scale agricultural research and experiment in these marginal areas.

Alongaste development in the economic sphere considerable progress was being made in local government. The accent was no longes so much on reinforcing the authority of the chief or other native authority as on broadening the basis of rule by the gradual introduction of more representative arrangements, especially by the establishment of councils on which commoners as well as the traditional rulers held places. Advances in this sphere were notable in some areas and among certain of the more progressave tribes.

In 1949 a committee was set up to review the constitutional structure in the territory and make representations for future constitutional developments. The most important recommendation was that proposing parity of representation in the legislative council for the tree many groups—Europeans, Aanan and Africans This recommendation was accepted by the British government for immlementation at a later date.

# POPULATION

The total census of 1048 showed that the numbers of the three main groups were as follows: Africans 7,332,539, Asians 59,512; Europeans 10.648. The 1952 partial census showed that the Asians had increased to nearly 80,000 and the Europeans to nearly 18,coo. The African population was not counted in 1952, but it was calculated that several of the large tribes were increasing at the rate of about 2% per annum and that in 1953 the total was about 8.000.000. About 120 tribes are generally recognized, but research may show that this number should be increased The great majority of them are Bantu but there has been a considerable intrusion of Hamitic influences with some Nilo-Hamites and, in one area, Nilotes. The Masai, perhaps the best-known outside Tanganvika of its many tribes, are Nilo-Hamitic in origin and have retamed almost unimpaired the characteristics peculiar to their race. In the south there have been intrusions of Zulu (Angoni) people, and traces of their influence remain, not only in the Southern province, but in isolated areas as far north as Lake Victoria.

The largest tribes are the Sukuma, numbering nearly 1,000,000, buding in the Lake province; the Nyamwea, numbering nearly 4,00,000, and the Ha, numbering nearly 3,00,000, both of whom live in the Western province; the Makonde, also numbering nearly 3,00,000, living in the Suthern province; the Gogo, numbering about 27,000, living in the Guttal province; the Haya, numbering about 27,000, living in the Bukoba district of the Lake province, and the Chaga, numbering about 25,000 and living on the slopes of Mt. Killmanjaro. Other tribes, with numbers varying between 15,000 and 20,000 are the Hele, Nyahyus, Nyaturu, Luguru, Zaramo, Iramba and Bena, Tribes of special ethnological interest are the Mubul (Tarpey) whose langues has so far defeated all attempts at classification, the Sandawi, who speak a "click" language allied to that sooken by the Hottentets of South

Africa, and certain aboriginal tribes such as the Hadzapi (or Tindiga) of the Lake Eyasi area, and the Kiko oi Nyahoza, who live in the Malagarasi swamps

The Arabi were the first non-Africans to settle in the country and although in 1952 they numbered only 13,000 in the past they exerted a very great influence, especially on the coastal area, where the Lingua franca, Swahili, developed from intercourse between them and the local people, and where the great majority of the population is Mohammedan. Indian influence has been more recent, although there have been Indian traders for several generations in some of the coastal lowns. They are nearly all engaged in commerce or trade, most of the retail trade and a considerable amount of the wholesale trade being in their hands. They are also to be found as clerks, artisans and skilled workers in a great variety of occupations. The 1952 census showed that, of the Asian population, 1,1,000 were Hindus, 30,000 Mohammedans, 3,000 Sikhs and 3,000 Gons and 3,000

The vast bulk of the African population is pagan, but in 1952 there were thought to be about 1,500,000 Mohammedans and about 1,200,000 Christians Twenty different Christian missions operate in the territory.

Chief Towns.—The principal seaports of Tanganyika are Dare Salaam (pop 100,000 and Tanga (22,100). Mtwara, lyng near the Portuguese border, is an entirely new port with deepwater berths and is espected to become a town of considerable importance with the development of the Southern province. Other ports are Pangani (2,400), Bagamoyo (3,700), once famous as the starting point of most of the early expeditions into the in-

terior, Kilwa (2,00), Lindi (10,800) and Mikindani (6,300). The chief inland towns are, Moregoro (1,400), Kilosa (3,100), Dodoma (13,800), Tabora (14,000), Kigoma (1,600), all on the Central line, Korogwe (3,000), Mobil (3,000) and Arusha (7,700) on the Tanga line; Mwanza (13,800) and Bukoba (3,600) on Lake-Victoria; Timga (3,000) and Mebya (5,500) in the Southern Highlands province. Ujiji, near Kigoma, has a population, almost wholly African, of nearly 10,000.

Education .- In the early days education was largely in the hands of the missionary societies, but beginning about 1024 the government increased the services provided, and in 1952 nearly £1,000,000 in a budget of £14,000,000 was spent on education There are European, Asian and Goan education authorities who are responsible for the organization of education for their respective communities, for the maintenance of schools, and for the control and management of funds A ten-year plan for education was drawn up in 1947 and was revised as circumstances and requirements altered. Many of the voluntary agencies and private schools receive grants-in-aid from government. Teacher training colleges are situated at suitable centres throughout the territory. Higher education is provided at Makerere college, Uganda There is a trade school at Ifunda near Iringa in the Southern Highlands province and in 1953 a technical college was being built in Nairobi. There is also a natural resources school at Tengeru near Arusha in the Northern province

In 1932 about 250,000 children were attending primary schools and 17,500 attending middle and secondary schools. Fifty-three Tanganyika Africans were attending courses at Makeiere college in 1952. Adult and community education has received special attention in recent years and a separate department of government (the social development department) has been set up to deal with these matters.

# ADMINISTRATION

The bases of the administration of the territory are the trusteship agreement approved by the general assembly of the United Nations at New York on Dec 13, 1946, and varnous orders in council. In practice the system does not differ greatly from that in neighbouring British dependences, the country being administtered by a governor who is assisted by an executive council consisting of official and unofficial members. The laws of the territory are enacted by the governor with the advise and consent of a legislative council, on which again there are both official and unofficial members, the officials being in a majority.

The governor is a member of the East Africa high commission. an interterritorial body with legislative and other powers, which administers certain services common to Kenya, Uganda and Tan-

ganyika, such as posts and telegraphs, railways and harbours There is a high court, with other courts (in particular the district courts) subordinate to it, and there is a system of local or

native courts administering local customary law

Local government in rural areas is in the hands of native authorities, consisting of councils on which, as a rule, traditional chiefs and commoners are both represented. There are 30 towrships and one municipality (Dar es Salaam) The membership of jownship authorities varies but usually consists of the district commissioner as chairman, a number of officials such as a medical officer and a representative of the public works department, and a number of unofficial persons of the various races concerned, who are usually in a majority

### ECONOMICS

Resources, Production and Trade.—Before the advent of the European, Tanganvika's principal products were ivory and slaves The Germans made great efforts to establish various plantation industries, principally and most noticeaply sisal, but also coffee, tea, cinchona, rubber and cotton. Under British administration more attention was paid officially to the development of economic crops by the indigenous inhabitants and the result has been that the bulk of the cotton, maize, rice, groundnuts and simsim is produced by Africans, who are also responsible for most of the production of hides and skins, clarified butter, beeswax and honey, and for a large percentage of the coffee production. At the same time, the sisal industry-the premier industry in the country-was built up, largely by non-African enterprise, until it occupies its present position, Tanganyika being the world's biggest exporter of sısal.

There is an important livestock industry, the stock population being estimated at approximately 6,000,000 head of cattle and about the same number of sheep and goats. Pigs are kept in a few areas. Meat in various forms is canned at a large factory near Dar es Salaam The clarified butter industry produced 40,233 tins (of 36 lb) in 1952, and hides and skins to the value of £688,421 were exported in that year.

The country is primarily an agricultural one, but the mining industry has grown steadily until, in 1952, exports of minerals amounted to £6,230,000 or 13 2% of total exports. The principal minerals making up this percentage were diamonds, gold, tin, salt, mica, kaolin, lead concentrates, tungsten concentrates, magnesite, copper, lime and graphite Williamson's diamond mine at Mwadui near Shinyanga in the Lake province is potentially one of the richest in the world and was largely responsible for the rise in the value of diamonds exported to £4,600,000 in 1952. The area to the east of Lake Tanganyika, in the Mpanda region,

is proving to be highly mineralized. A branch railway line has been constructed to reach it and a considerable production of silver-lead (galena) and other minerals is expected.

Forest products do not occupy a prominent part in the territory's economy, accounting for only 1.2% of exports (£566,822) in

Total exports in 1952 amounted to £47,019,948, of which £27,-439,006 was to the British Commonwealth, the United Kingdom accounting for £19,673,945: trade with other countries amounted to £19,567,437 of which the U.S.A. accounted for £9,955,872. Total imports were valued at £37,494,783, £25,399,053 worth from the British Commonwealth, of which £17,669,801 was from the United Kingdom Imports from foreign countries were valued at £11,430,497, the U S.A. accounting for £1,647,194.

Trade figures for 1951 were: imports £31,642,000; exports £41,-497,000. In 1939 the corresponding figures were: imports £3,275,-004; exports £4,264,838. The chief imports are textiles of all kinds, especially cotton piece goods, machinery (including agricultural machinery), food products, beverages, tobacco, chemicals, clothing, base metals and manufactured goods of all kinds. These imports come mainly from the United Kingdom, India, Japan, Kenya and Uganda, South Africa, the United States, Ger-

many and the Benelux countries The principal exports, in older of value, in 1952, were sisal, coffee, cotton, diamonds, gold, oil seeds, hides and skins, and meat

and meat products The principal countries of destination of these exports were the United Kingdom, the United States, Australia and Germany. The main items of revenue are customs and excise, licences; various taxes such as the native house and poll tax, the non-native

poll tax and income tax, fees, rents and royalties, and various other miscellaneous sources.

Communications.-One of the great handicaps has been the lack of adequate means of communication over such a vast countiy The Germans built two railway lines, the Central line from Dar es Salaam to Kigoma on Lake Tanganyika (773 mi) and the Tanga line from Tanga to Moshi (219 mi.) Under Bitish administration a branch line was constructed from Tabora to Mwanza on Lake Victoria (238 mi ) and another from Kaliua to Mpanda (131 mi.), the Tanga line extended to Arusha (54 mi ), and a new line built in the Southern province from Mtwara to Lumusule Juu (205 mi ). The Central and Tanga lines are linked by a road between Morogoro and Korogwe. There is a hik with the Kenya system at Voi The possibility of a link with the Rhodesian system has been examined On Lakes Victoria and Tanganyika there are regular steamship services linking the main ports

A large program of road works was begun in 1949, and it was expected that when completed this would give the territory four north-south main roads of good standard and also four main eastwest roads, it would open up road communication with the capital and put an end to the situation wherein, during the rains, Dai es Salaam was cut off from the rest of the country by road. In addition to the main roads there are some 14,000 mi of secondary roads of varying standards, but many with good gravel surfaces

Local air communications are largely the concern of the East African Airways corporation, which is subsidized by the East African governments and which provides regular services between the more important towns and with the neighbouring territories Communications with the Congo are provided by Sabena an lines and there is air communication with the rest of the world by such air lines as the British Overseas Airways corporation, South Aftican airways, Central African airways, as well as by other lines through Nairobi

The Tanganyika government has two aeroplanes of its own. which are used for survey work and for cross-country journeys by its officials. The country is unusually well supplied with aerodiomes and landing strips.

There is telegraphic and telephonic communication between the

main towns and Dar es Salaam, and a radio telephone service to most parts of the world. Some remote stations, to which there is no telegraphic service, are served by post office radio stations. The territory is well served by shipping lines, no less than 15

operating regular services to and from Dar es Salaam.

1935—); Annual Reports on Tanganyika to the United Nations (Lake Success). For a full bibliography see Handbook of Tanganyika (London, 1954). There is a considerable German literature, especially H. Meyer, Dav Deutsche Kolondinietich, 2 vol. (Leping and Vienna, 1950) which contains a bibliography.

"ANC-MYNIKA, LAKE, which gives its name to the British trust territory of Tanganyika, is situated in East Africa. It is the least through the contains a bibliography.

longest freshwater lake in the world (420 mi.) and the second deepest (4,708 ft.) but is comparatively narrow, varying in width from 15 mi, to 50 mi. It covers an area of about 12,700 sq.mi. and forms the boundary between Tanganyika and the Belgian Congo. It occupies the southern end of the western arm of the Great Rift valley and for most of its length the land rises steeply on both sides from its shores. Although its waters are drinkable, they tend to be slightly brackish

The lake was first visited in 1858 by R. F. Burton and J II. Speke, who reached Ujiji, the place where in 1871 H. M. Stanley "flound" David Livingstone. The southern half was first circum-lavagated by V L. Cameron in 1874, when the Lukuga outlet was discovered, and the whole lake was surveyed by Stanley in 1876. The lake is fed by a number of rivers but is not the centre of an extensive dranage area.

The largest river is the Malagarasi, which rises to the north of Kugoma and describes a huge arc before discharging into the lake only some 50 mi due south of its source. Others are the Russisi (Ruzza), which carnes the overflow from Lake Kivu, and the Kalambo, on which is situated one of the highest waterfalls in the

world (over 700 ft )

The lake is stuated on the dividing line between the floral regions of east and west Africa, and the oil-palm, so characteristic of the latter, is found on its shores. Rice is grown in suitable areas on the lake littotal. An agreement was being negotiated in 1953 with the Belgian authorities to stabilize the level of the lake. Fishing for dagaa, a small fish not unlike whitebalt, is carried on by African shstermen in diagrout cances at night by the light of flares, and dired fish valued at over £125,000 was exported to the Congo in 1951.

Hippopotam and crocodiles abound m the waters of the lake, and n places the rare west Afracan sharp-mouted crocodile, erocodilus cataphractus, occurs. The butd lite is most varued, because of the lake's situation between the east and west Afracan regions. The mountains north and south of Kigoma are the only places in Tanganyuka where the chimpanzee is to be found

There had been considerable traffic across the lake before the arrival of the European, but this had nearly all been from west to east, so that many of the numerous tribes now living on its eastern borders trace their origins to areas in the Congo They are predominantly Bantu, with traces of Hamitic (Tusi) millioned in the north and of Zulu (Angony) in the south. The areas of both sides of the lake suffered heavily in the past from the depredations of slave traders.

The chef (towns on the lake are Usumbura, Uvrza, Albertville (all Belqua), Kgoma, Ujij, Karena, Mtakuja, Kpuh, Mpulungu (all Brutsh). Both British and Belgaan steamers ply on the lake traversing its length in about four days. Communications across the lake are from Kigoma, the terminus of the railway line from Dar es Saham, to Albertville, whence there is a rail link to the Lualash river.

Binilomatrix — Accounts of the discovery and early exploration of lake Tanganyida are to be found in the works of such explorers as Sr R F. Burton, David Livingstone, V L. Cameron, H. M. Stanley, K. Cameron, L. Cameron, H. M. Stanley, M. Cameron, C. Lappig, and V. Stanley, M. Stanley, M. Cameron, C. Lappig, and V. Stanley, M. H. Schner, C. Cameron, C. Lappig, and V. Lappig, and

TANGERINE, a small thm-skinned type of orange belonging to mandarin orange species (Citrus retuculata). The principal distinguishing characteristic of the tangerine in comparison with the rest of the mandarin species is deeper orange yellow colour

of the peel of the tangerine. (See Orange.)

TANGERMUNDE, a town in the Prussian province of Savony, Germany, on the Elbe, 43 mi. N.E. from Magdeburg by rail. Pop. (1939) 13,790.

Tangermunde has iron foundries, shipbuilding yards, refineries, and other industrial establishments, and enjoys a considerable river trade in grain and leather. It has numerous brick buildings of the 14th and 15th centuries.

The castle, built in the 14th century, was the residence of the margraves of Brandenburg.

margraves of brandenourg

TANGIER (locally TANJA), is a seaport of Morocco, on the Strait of Gibraltar, about 7 mi. E. of Cape Spartel, between two

eminences at the northwest extremity of a spacious bay.

As seen from the sea, the town rises gradually in the form of an amphitheatire, with the citadel, the remainder of the English mole and York castle to the right, the commercial quarter in the central valley, and the road to Tetuan running along the beach to the left. The main thoroughfare leads from Bab el Maiss (Gate of the Wort) to the Bab el Suk (Gate of the Market piace) known to the English as Catherine Gate. New European quarters have been built, to the north of Tanger (the Marchan quarter) to the west (on the 'Mountain') and to the south (quarter the beach good in all weather except during a strong east wond, but large vessels have to anchor about a mile out. A deep-water harbour was begin in 1025 but was far from complete in 1045.

The population of the city was 79,886 in 1940, of which 50,250 were Moslems, 7,100 Jews, 15,486 Spanish, 1,642 French, 1,389 English and 4,017 others, in 1947 the total was estimated as 104,000 The trade of Tangier amounted to 106,074,116 fr in 1936 (imports 94,693,880 fr, cyports 11,380,986 fr.) but decreased considerably during World War II. After 1945 however, Tangier's financial postion, as the only free money market, was extemply good, and it was one of the few administrations with a large budget surplis

History to 1923.—The ancient Tingis stood very near the modern site of Tangier Under Augustus i became a free city of the Roman empire, and when Otho placed the western half of Mauretana under a procurator, he called it Mauretana Tingian It was held successively by Vandals, Byzantines and Alabs, and when Mulai Idins passed from Tiempen to Fee in 798, Tangier was "the oldest and most beautiful city" of the Maghrib After many futle attempts the Portugues obtained possession of it in 1471, it passed with Portugal to Span in 1580, returning to the independent Portugues in 1656

In 1652, as part of the downy of Catherme of Braganza on her marrange to Charles II, it came unto the possession of the Englanhy, who defended it against Mulai Ismail in 1680 but in 1684 decided, on account of expense, to abandon it to the Moors The sulfans made Tangier the seat of foreign representation, to keep Fee free from extraneous influences, and captuilatory rights were granted to western nations (1630–1880) as well as certain powers of samtary control.

A special regime for Tangier, growing out of the interest of Great Britann in the Straits of Gibralbar, was envisaged in the Moroccan arrangement of 1994 between Britann and France on the one hand and France and Spain on the other, and in the Algeciras act (1906) Tangier's international character was fully recognized. The principle was reiterated in the protectorate convention of 1912 and in the France-Spains convention of the same year.

In 1913 Great Britain, France and Spain began negotiations to create a "Tangier zone" with an international regime When, however, World War I broke out Spain withdrew, apparently in the hope of acquiring Tangier for itself.

The Statute of 1923.—It was not until 1923 that Tangier's status was at last regulated Though France's position in Morocco had become stronger, Britain was still determined on an international form of government; and Spain supported this demand,

Negotiations culminated in the statute of Tanger, which remained in force down to 1940. It was signed by Britain and France in 1933 and by Spain in 1944. All states signatory to the Algedras act (except the Central Powers and Russa) were immediately invited to adhere to it, and all did so except Italy and the ILS.A

The statute was declared valid for 12 years from the date of ratification (1924), with automatic renewal for further like periods unless a contracting party demanded revision at least six months before expiry. Its main provisions were as follows.

1. The Tanger zone was to be permanently neutralized, though roops proceeding to or from the French or Spanish zone of Morocco might cross the territory after notification to the administrator. A police force, not exceeding 250 Moroccans, under a Belgian officer with French and Spanish subordinates, was to be at the disposal of the administrator.

- 2 Native administration and control over all Moslem institutions was to be entrusted to a mendoub representing the sultan.
- 3 A legislative assembly of a6 members was to be instituted, consisting of 17 Europeans (four French, four Spanish, those British, two Itahan, one American, one Belgian, one Dutch and one Portuguese, nominated by their respective consuls) and 6 Moslem and 3 Jewish subjects of the sultan (nominated by the mendoub)
- 4 A committee of control, composed of the consuls of powers signatory to the Algeciras act (former enemy countries excluded), was given a power of veto over the enactments of the legislature and charged with ensuing observance of the statute
- 5 An administrator-general, head of the executive, and two asstant administrators for health and finance, were to be appointed for an initial period of six years by the sultan at the instance of the committee of control, these were to be of French, Spanish and British autonably respectively. Appointments after this were to be assigned by the assembly to nationals of the signatories of the Algerizas act.
- 6 An international mixed court was to administer justice in all matters affecting foreigners. It was to consist of one French, one Spanish, and two British judges, with a Frenchman and a Spaniard as public prosecutors for crammal and civil matters (all capitulatory rights were therefore abolished, save in the case of Italy and the US A).
- 7 A port commission was also established, consisting of one member of the sultan's government, one of the legislative assembly, one of the committee of control.

The statute was clearly a compromise between the conflicting ambitions of France and Spain to incorporate Tangier in their respective zones and the British determination to preserve its intenational character. France secured preponderance in the administration, helped by the fact that as the international zone was a concession from the Moroccan government, itself under French protection, native and foreign affairs were virtually in French hands, Spain was allotted a secondary role

The interests of Tanger uself were in the main disregarded; the city had no say in the administration but was burdened with heavy administrative and judicial expenses and largely baulked of its natural economic interland by the fiscal policy of the French and Spanish zones. After 1933 budget deficits were chronic and were met only by unwilling contributions from the French and Spanish governments. There was also a heavy unfavourable (tade balance.

An Italian request for participation and Spanish dissatisfaction with the working of the whole system led to the revision of the statute in 1928. Italy acquired a share in the administration roughly equivalent to Britain's, se, three Italians were administed to the legislative assembly. An additional assistant administrated to the Italian nationality was appointed as director of judicial services for the remainder of the first six-year period, and an Italian magistrate was added to the mused court. Spain secured a more effective suppression of arms-smuggling and of political disturbances.

But Spain, still aspiring to incorporate Tangier in its zone, subsequently presented demands for joint control with France over the native Moslem and Jewish population; for a rotation of Frenchisen and Spaniards as chief administrators; and for posts in the customs. These demands, provever, were not favourably restricted to the customs. These demands, provever, were not favourably restricted to the customs. After an unpublished Francessan and the Spaniah civil vars. After an unpublished Francessan and a redistribution of posts had been drawn up in agg, the leg dastive assembly put forward a proposal to appoint a Spanish definition of the state of the custom of the state of

Spanish Occupation, 1940-45.—After the collapse of France and Italy's entry into World War II, Spanish troops occupied Tanger on June 14, 1940; and in Nov. 1940 the Spanish authorities incorporated it into the Spanish zone of Morocco, dissolving the

international administration and appointing the Spanish commander of the occupying forces as its governor-general, to act as

delegate of the Spanish high commissioner in Morocco
Early in 1941 Britain concluded an interim agreement with
Span, which, without prejudice to British and third-party rights
under the intensitional statute, guaranteed free entance into and
departure from Tanger to British subjects and the continued
functioning of British enterprises in the zone. Spain also formally
undertook to keep the zone demnithatrazed.

Post-War Provisional Regime.-In August 1945 a conference on Tanglei was held at Paris by representatives of Britain, France, the United States and the USSR. It was found impossible to draw up a new international statute since the USSR refused to co-operate with Gen. Franco's Spain; Britain, France and the United States, on the other hand, held that Spanish interests could not be ignored. Finally a compromise was reached. if Spain withdrew its troops at the request of the four powers, a provisional regime, based on the statute of 1923, as modified in 1928, was to be set up for six months, Spain was to be allowed to participate in this regime by having a Spanish consul on the control committee and a Spaniard sitting in the legislative assembly, the United States and the USSR, were to be invited to collaborate; and after six months had elapsed (by which time, it seemed, Franco's regime might have been overthrown), a new conference was to be held, to which all powers signatory to the Algeciras act (excluding former enemy countries) and the USSR were to be invited, to draw up a permanent international statute for Tangier USSR agreed to this arrangement only after declaring in the strongest terms reservations about Franco's regime and its intention of sending no representative to Tangier as long as Franco's Spain was allowed to take part in its administration Spain accepted the decision of the Paris conference, though protesting strongly that it had been reached without consulting Madrid, and the provisional regime came into force in Oct. 1945 Spanish troops were withdrawn; the mendoub was restored, and a Portuguese administrator, Admiral Luiz Antonio de Magalheas Correia, took over from the Spaniards

Under the Paris agreement it had been decided that the principal interested powers, France, Spain, and Britain, should no longer hold any of the most important posts in the administration, these were to be left to smaller powers, such as Belgium, the Netherlands, Portugal and Sweden. Britain renounced its former preponderant share in the administration of justice Spain retained only its membership of the control committee and the legislative assembly France renounced the right to have a Frenchman as administrator general but managed to insert clauses in the agreement which stipulated not only that a Frenchman should remain as second in command of the police but also that a new post, that of assistant administrator of Moroccan affairs, should be created for a Frenchman. Moreover, before anyone else had arrived, the French succeeded in recruiting enough officials to staff the administration and all the necessary police, and also, as under the statute of 1923, they continued to nominate the Moroccan members of the legislative assembly, while Moroccan interests in the control committee were represented only by a French consul-general.

France thus retained a preponderant share in the administration, though the influence of the United States, preserving its capitulations there as elsewhere in Morocco, made itself increasingly felt. After six months, General Franco's regime was still in power in Spain, no new conference on Tangier was called, and the provisional administration was maintrance.

A new factor in the situation after World War II was the growing dissatisfaction of the Morocans with their subordnate position. Though they had nine representatives (six Moslems and three Jews) in the legislative assembly—more than either France and Spam (four each) or Britain and the United States (three each)—they had no representative on the control commission which could veto the decisions of the assembly and was the real governing body. The sultan of Morocco, on his visit to Tangler in April 1947 (the first visit of any sultan since 1889), was said to have suggested that a new statute should be drafted in the near future granting fuller nghts to Moroccans under his authority.

1948, after signing a peace treaty with the Allies, on the invitation of France and Britain with the concurrence of all the signatories to the Algeciras act (except those excluded in 1919) and the U S .-

On March 30, 1952, the 40th anniversary of the Fez treaty which had imposed the French and Spanish protectorates on Morocco, a violent riot of the Moroccan Nationalist party took the international authorities by surprise. In June it was decided to create a motorized police corps with a Spaniard as its commander and a Frenchman as his deputy

TANGO, a slow, graceful dance in two-four time It probably originated with the African Negroes; in 1911 it became popular in a modified form in America and subsequently in Europe. It has much in common with the Cuban habanera.

TANG SHAO-YI (1860-1938), Chinese statesman, a native of Kwangtung, the first foreign-trained Chinese to rise to high office, was one of the leaders of the Chinese nationalist movement. He was educated at Columbia university, New York city, and in 1896 became consul general in Seoul in succession to Yuan Shih-kai He organized the Tibet convention of 1906 He was appointed special envoy to the United States (1908) In 1912 he became first premier of the Chinese republic. He retired in 1923 but became a special adviser to the new nationalist government in 1927 Tang was assassinated in his home at Shanghai on

Sept 30, 1938.
TANGUAY, EVA (1878-1947), U.S vaudeville and musical comedy star, who was born in Marbleton, Que, Can., went to the US with her paients at an early age. An expressive child, she showed a talent for acting and obtained her first footlight role at the age of eight in Little Lord Fauntleroy. She later went "through the mill," acting in variety, stock troupes and musical comedies, and by the time she was 20 she was regarded as a finished comedienne At the turn of the century, Miss Tanguay shocked Victorian audiences with her daring costume-or lack of costume -and her risqué songs, and by 1910 she was an established and popular star of the theatre. Her earnings were phenomenal but she lost her fortune during the stock market crash of 1929. Simultaneously her health and vision failed, hrmging her career to an abrupt end. She spent the last two decades of her life a virtual recluse, bedridden and mostly forgotten. She died at her Hollywood, Calif, cottage, Jan. 11, 1947.

TANISTRY, a custom among various Celtic tribes, by which the king or chief of the clan was chosen from among the heads of the septs and elected by them in full assembly. He held office for life and was required by custom to be of full age, in possession of all his faculties and without any remarkable blemish of mind or body. At the same time and subject to the same conditions, a "tanist" or next heir to the chieftaincy was elected, who, if the king died or became disqualified, at once became king. Usually the king's son became tanist, but not because the system of primogeniture was in any way recognized; indeed, the only principle adopted was that the dignity of chieftainship should descend to the eldest and most worthy of the same blood. Tanistry was abolished by a legal decision in the reign of James I and the English land system substituted. See Bremon Laws.

TANJORE, a city and district of India in the Madras presidency. The city is situated on the right bank of the river Cauvery, and is an important junction on the South Indian railway, 218 mi S. of Madras. Pop. (1941) 68,702. As the last capital of the ancient Hindu dynasty of the Cholas, and in all ages one of the chief political, literary and religious centres of the south, the city is full of interesting associations. It was the scene of the earliest

Italy was readmitted to the committee of control in March labours of Protestant missionaries in India. The modern history of Tanjore begins with its conquest by the Mahrattas in 1674 The British first came into contact with Tanjore by their expedition in 1740 with a view to the restoration of a deposed raja In this they failed, and a subsequent expedition was bought off The Mahrattas practically held Tanjore until 1700, when the district was ceded to the East India company The raja retained only the capital and a small tract of country round. He died in 1833 and was succeeded by his son Sivaji, on whose death in 1855 without an heir the house became extinct. Among buildings may be mentioned the palace within the fort, and the great temple of the 11th century, enclosed in two courts, surmounted by a lofty tower and including the exquisitely decorated shrine of Subrahmanya. The city is famous for its silk brocade, jewellery, carnets, inlaid copperwork, modelling in pith, etc.

The DISTRICT OF TANJORE has an area of 3,738 sq mi. It is irrigated by an elaborate system of dams, cuts and canals and the soil is exceedingly productive The delta of the Cauvery occupies the flat northern part, which is highly cultivated, dotted over with groves of coconut trees and densely populated The staple crop is rice, grown on about five-sevenths of the cultivated area, and rice milling has also developed. Soap and mats are made and fishing carried on The district is traversed by the main line and several branches of the South Indian railway. The chief seaport is Negapatam. The population of the district in 1941 was 2,563,375 See Tanjore District Gazetteer (Madras, 1906).

TANKARD, a type of drinking vessel. The word was formerly used loosely of many sizes, usually large, of vessels for holding liquids; thus, it was applied to such as held two or more gallons and were used to carry water from the conduits in London in the 16th and early 17th centuries The word is now generally applied to a plain, flat-bottomed drinking vessel of silver, pewter or other metal, or of glass or pottery mounted on metal, with a hinged cover and handle, holding from a pint to a quart of liquor (See DRINKING VESSELS ) The derivation is obscure. It appears in O Fr as tanquart It may have been metathesized from Gr. κάνθαρος, Lat cantharus, a large vessel or pot

TANKS are self-propelled combat vehicles embodying the military characteristics of fire power, mobility, crew protection and shock action.

### PREDECESSORS

The modern military tank is a direct outgrowth of World War I. but the idea underlying its development-protected, mobile striking power-had been used throughout the history of warfare The Assyrian war chariots of about 3000 BC, the armoured elephants of Kublai Khan and the Chinese armoured "war carts" of the 12th century BC, represented early exploitations of this idea. A later predecessor of the tank was the mediaeval knight, who with his horse and armour ruled the battlefield from the 5th century to the 15th century AD. The introduction of gunpowder ended the knight's supremacy and spurred the development of various types of battle carts, heavily armed and usually providing protection for the combatants they transported and the men or horses used to propel them Conrad Keyser's horse-drawn battle car (1395) was an early example. Roberto Valturio in 1472 suggested wind as a motive power. Both Leonardo da Vinci (1482) and Holzschuher (1558) described battle vehicles of the period and set forth tactics for their employment which are remarkably prophetic of modern tank tactics.

The modern amphibious tank was presaged in an armed and armoured wooden vessel propelled by hand-rotated paddle wheels, described in 1588 by Agostino Ramelli. By 1599 Simon Stevinus had built two small "land ships"-armed sailing vessels on wheels. During the 17th century the most successful designs utilized horses protected within the structure, while as late as 1755 there was another unsuccessful attempt to use wind propulsion

About 1769 a Frenchman, N. J Cugnot, produced a steampowered road vehicle, and later another to be used as an artillery tractor. Cugnot's vehicle was impractical, but it is credited with turning thinkers of his day, including Napoleon I, toward use of automobiles in war. By 1770 the Englishman R. L. Edgeworth

track so important in the evolution of the tank. With Thomas German's invention in 1801 of the first crude version of the caterpillar track, the tank was brought another long step toward actuality. William Palmer in 1812 and John Barry in 1821 experimented with similar devices, and in 1846 Boydell designed an engine with footed wheels In 1855 James Cowen and James Sweetlong (British patent no 747) evolved a steam-propelled war vehicle, while the American Civil War brought forth in 1861 a steam tractor mounting a cannon and bulletproof cone for the cannoneers' protection, invented by Chailes S. Dickinson

During the remainder of the 10th century there appeared several innovations which were to prove significant in the development of the tank About 1862 a vehicle was built to mount a cannon in a turret capable of all-around traverse, in 1882 the endless track was improved by lengthening the rails to equal the distance between the axles of the vehicle, in 1886 the Applegarth tractor used a track the forward portion of which inclined upward, facilitating climbing and traversing obstacles, and in 1887 the Batter tractor employed a double track like those later used in World Wai I vehicles.

Gottlieb Daimler's invention of the internal-combustion engine in 1886 opened the way for the first really practical self-propelled fighting vehicles While interest in tracklaying vehicles and improvements in their design continued in England and the United States during this period, the perfection of a reasonably efficient internal-combustion engine stimulated experiments in both these countries and in Europe, with various types of armoured automobiles F. R Simms of England is credited with building the first automobile designed for combat purposes, it was a light four-wheeled motorcycle mounting a Maxim machine gun and an armour shield, and appeared in 1898

In the same year a US army officer, R P Davidson, designed a three-wheeled automobile similarly armed and armouned, built by the Duryea company of Peoria, Ili Davidson experimented also with steam-driven combat cars, as did the Russian engineer Lutski and the English during the Boer War. In 1000 the first true English armoured car, gasoline-powered, appeared Called the Pennington, it had a 16-h p. engine and o 25-in. skirt armour, and carried two Maxim guns protected with shields In 1901 the French firm of Charron, Girardot and Voigt built a military automobile with very similar characteristics. In 1904 this firm, on order from the Russian war office, built the first armoured automobile embodying the same general design and appearance as later equipment of this kind. Weighing 3 2 tons, it carried o 23-in armour and a Hotchkiss 79-mm machine gun in a revolving turret; it utilized a 30-h p engine and was pneumatic-tired. In the same year the Austro-Daimler firm in Wiener-Neustadt built an armoured car which interested the German general staff and was demonstrated on manoeuvres in 1905 and 1906. Advanced for its day, this car carried o 12- and o 15-in. armour, weighed 3 3 tons and was powered with a Daimler 35-h.p. engine Its maximum speed was 28 m p h, and its radius of action 155 mi.

About this time Sir W G. Armstrong, Whitworth and Company, Ltd, in England built a semiarmoured car armed with a shielded one-pounder pom-pom Utilizing solid rubber tires, it was powered by a 40-h.p engine and carried a light steel cable to be used with power take-off pulleys on either side of the hull, for pulling itself out of difficult spots. Its designer was the same Walter G Wilson who later was prominent in design and production of English tanks during World War I.

With the attention given the dirigible balloon after the turn of the century, as a reconnaissance instrument, it was only natural that an antiballoon armoured car such as the German Ehrhardtwagen should appear. Though lightly armoured, it weighed 3 5 tons, was powered with a 50- to 60-h p. engine, and had a speed of 20 m p.h. In 1900 and 1910 Davidson in the United States was adapting unarmoured Cadillac automobiles for this same purpose. His "balloon-destroyers" mounted Colt automatic guns.

Meanwhile, the sultan of Turkey had displayed interest in armoured cars and in 1909 had purchased four such cars built by the French Hotchkiss company. These are interesting primarily

had produced the "footed wheel," a foretunner of the caterpillar for their relatively powerful engine (60 hp), their top speed of 60 mph and for the Hotchkiss 79-mm machine gun they mounted In 1910 an amphibious fighting vehicle was designed by a Swiss, Col Schleyer It utilized a 20-hp rear-mounted engine and a screw propeller, and carried a single machine gun. This novel device earned no more encouragement for its creator than did the design of Austrian army officer Gunther Burstyn for an excellent tracklaying combat vehicle, submitted to the Austrian war ministry in 1911 Significant because this vehicle, if adopted, would have given the Austrians and the Germans the first actual tank, Burstyn's proposal was received coolly by both governments

The Burstyn Motorgeschutz was superior in many respects to the early British and French tanks of World War I silhouette vehicle, it used cable-type tracks with spring suspension, mounted a small rapid-fire gun, and was designed for a crew of three or four men It was expected to have a speed of 18 mph on roads and about 5 mph. maximum cross-country. For aid in crossing obstacles, it had four wheels on extension arms which could be raised or lowered, the rear pair being driven while the front pair, which were not, could be used in steering.

In 1912 the first Italian armoured vehicle, built by Isotta Fraschini, appeared This machine carried one rapid-fire gun in a revolving turret, it saw action in Africa during the Italo-Turkish War in 1912 An improved Italian car, the Bianchi, later incoiporated features derived from this experience. The Bianchi weighed 3 4 tons, carried a crew of three or four, and mounted two Fiat machine guns, one in a revolving turret and one in the rear of the hull This car was used considerably during World War I, and later in Italy and Hungary until 1930 In 1913 Russia entered the field with a four-wheeled pneumatic-tired armoured car carrying three Maxim guns.

By 1914 the French were using in their armoured vehicles for the first time a weapon heavier than a machine gun. The Renault car, and two models of the Peugeot car, all built in that year, each mounted 37-mm. guns The Peugeot cars were relatively heavy, weighing 5.5 tons, and carried 0.217-in armour, yet they still were capable of speeds as great as 25 mp h. The Peugeot car included an additional set of controls in the real which permitted driving backward

During the years immediately prior to World War I, the tacticians of the major powers which were to engage in that struggle seem not to have envisioned the part such a combat vehicle could play. The Germans expected a quick victory without the aid of such contrivances. Lieut Fhecz of the French army and Gen (then Capt.) J. F. C. Fuller of the British army, as late as 1913 and 1914, respectively, predicted the machine gun would bring about static trench warfare, and suggested greater emphasis on means for overcoming it. But it was not until the soundness of their ideas was clearly demonstrated along the Aisne in 1914 that serious attention was given to armoured, trench-spanning vehicles.

## WORLD WAR I TANKS

In Oct. 1914 E D. Swinton of the British aimy suggested adapting the American Holt caterpillar system to an armoured car. One month later a fellow British officer, T. G Tulloch, submitted ideas for a "land cruiser" capable of dealing with light enemy fieldpieces. In Jan. 1915 Winston Churchill, then first lord of the admiralty, endorsed these proposals in a now famous letter to Prime Minister H. H. Asquith. By June 1915 trials were held of a 105-h.p. Foster-Daimler tractor designed to bridge trenches, and of a 125-hp. Holt tractor fitted to Tulloch's specifications. Neither was satisfactory. Work had also been done during this period on a pedrail armoured car in which Churchill was interested, but when he left the admiralty this was discontinued and efforts were turned to adaptation of Holt tractors, under Swinton's direction By Sept 1915 the first Foster company model, called "Little Wilhe," was completed but was found unsatisfactory, and its successor, "Big Willie," was begun. About this time the "cr-periments committee" of general headquarters in France submitted these specifications for a suitable "landship:"

1. It must be proof against rifle and machine gun fire (but not artillery),

2 It should carry one small cannon and at least two machine guns

3 The crew should number six, two for the cannon, one for each machine gun and two drivers.
4 It must be able to traverse craters 12 ft wide and 6 ft deep, with sloping sides, to cross barbed-wire entanglements, and to

with sloping sides, to cross barbed-wire entanglements, and to span 4-ft trenches

5 It must maintain a speed of 2½ mph. over bioken ground and carry fuel for six hours' action.

6 Its tractive elements should be either of the pedrall or caterpillar type—whicheve proved better for crossing maishy ground. Since the machines were to be used on wide fronts with infantry, the committee suggested numbers of small "landships" were preferable to a few large ones.

In late Sept 1915 a wooden model of "Big Willie" was accepted It was of it long, It it wise and 81 ft high Detachable sponsass for mounting small cannon or machine guns added three feet to its width I law as to mount two Openuder (5g mm) cannon and two machine guns, and carry a crew of one officer and nine men. Weight of 22 tons, speed of 3g mp), trench-spanning abhity of 8 ft and obstacle climbing abhity of 4g ft were specified. In December of that year the cover name "tank" was adopted to conceal the seal nature of these machines By Feb 8, 1916, the first tank had been completed and approved both by the British war office and general headquarters, and within another month too had been ordered. By mid-August the first detachment of 13 was shipped to France, to be followed by other increments during the remander of that month.

Britan Tanks—On Sept 15, 1016, the tank met its first test in the battle of the Somme, 40 of these new machines were used, apparently taking the Germans by surprise. The German and army chief of staff reported after the action "The nemmy have employed new engines of war as cruel as (they are) effective." Unforseen difficulties were experienced by the British, however, in this first action, 17 tanks bogged down or failed mechanically before reaching the line of departure, another 15 were unable to leave the line of departure at the appointed time; 5 more bogged down during the action and only of carried out their missions.

This first British model, designated the "Mark I." was produced in two types, a "male" weighing 31 tons and mounting two 6pounder and four machine guns, and a "female" weighing 30 tons, mounting six machine guns. They were 26 ft 5 in, long, 13 ft o in wide and 8 ft I in high, powered with a 105-hp Daimler water-cooled engine Maximum speed was 3 7 m p h, with a "fuel distance" of 12 mi. They could traverse obstacles 4½ ft high, span trenches II ft 6 in. wide and climb a 22° slope. They used the rigid-type suspension on rollers, with steel tracks. Armour thickness varied from 0 2 in, to 0 4 in A total of 150 Mark I tanks was built, and they were used in nine engagements, the last on Nov 1, 1917. As early as April 8, 1917, at the battle of Arras. they were reinforced with the improved Mark II, and thereafter the British tank underwent constant development, the last war model being designated the Mark V. In the latter, specific improvements included an increase in speed to 4 6 m p.h., an increase in maximum armour thickness to 0.47 in., and the substitution of a Ricardo 150-h p water-cooled engine, plus a better planetarytype transmission. In addition, the Mark V had twice the fuel distance possessed by the Mark I.

Dunng World War T the British also built a "Medium A" or "Whippet" tank weighing 15.7 tons which used a crew of only three men, and had greater speed and fuel distance than the heavy tanks; and an enlarged version of the Mark V, which was used to transport up to 25 infantrymen into battle.

French Tanks.—Though the Bruish were the first to use tanks in battle, the French had actually preceded them in experimentation in this field. The Schmeider tank was produced in quantity during 1916, about 400 of this model being used in mue actions between April 16, 1917 (Chemin-des-Dames), and Sept 26, 1918 (Argonne forest). An equal number of the St. Chamond tank was built during the same year and saw action in 11 engagements from May 5, 1917 (Laffaux mill), to Sept 26, 1918 (Champagne). During 1917-184 the Renault factory delivered about 500 of a third

type, a light, two-man tank. The Renault, first committed on May 31, 1918, was used in at least 40 battles by the end of Oct

The Schneider and the St Chamond were similar as to armsent (one 3-rmm gun and two machine guns), speed (five mules per hou), suspension (co.l spring-hogie type), and tracks (stellate type). The Schneider was lighter (14,9 tons compacted to 25 3 tons) and smaller in over-all dimensions, the difference being accounted for by the bulkner power-transmission system used in the St Chamond. This consisted of a four-cylinder 9-b p water-cooled engine with a dynamo and two electric metors, plus storage cells. In addition, the Schneider used a six-man crew, while the St Chamond Tengured nine me

The Renault was armed with a 37-mm, gun or a machine gun, possessed a speed of six miles per hour, weighed only 7 4 tons and was smaller in over-all dimensions than either of the other French tanks

German Tanks .- Though the Germans had opportunities before and during World War I to take the lead in development of the tank, their leaders refused to consider the possibility of stalemated trench warfare, and the appearance of the tank on the Allied side marked an advantage Germany was never able to overcome It was not until the capture at Cambiai (Nov 20, 1917) of a number of British tanks, that the Germans possessed any serviceable armoured vehicles of this type. The captured tanks were assembled and repaired at Charleroi, where German experts studied them, but the idea of copying them was soon abandoned Instead, reliance was placed on a model of German design which was already well along. A few of these were delivered in time to participate in the battle of St Quentin on March 21, 1918, and in five additional actions before the Armistice in November. The Germans also used a few captured specimens in various actions. but they never had tanks in numbers at all comparable to those of the Allies

The German model made during 1018 was built by the Daimler company, and was known as the "A7V" It weighed 33 tons, was powered with two Mercedes-Daimler four-cylinder engines of 150 hp. each, carried a crew of 18 men and mounted one 6-pounder gun and six machine guns Perhaps its most interesting feature was the thickness of 1ts armour, which varied from 0 59 in. to 1.18 in., and was desuged to be proof against 37-mm gunfire

U.S. Tanks.—Entry of the United States into the war found it with only a few experimental tank models, and with no definite construction program. It was not until late Dec. 1917 that the first official step was taken to create a U.S. tank force, when Gen. John J. Pershing designated Col. S. D. Rockenbach as chief of tank service for the American expeditionary force. A month later this became the tank corps of the U.S. army, a separate arm, with Col. Rockenbach still at its had. By the summer of 1917 experiments were under way with two U.S. models, one of the wheeled type, the other using caterpliar traction. Both gas-electric and steam power plants were tested in conjunction with these models, neather of which was satisfactory.

By Sept 1917 it was decided to copy British and French designs, and plans were made to build a Maik VIII talk resembling the British Mark I to Mark V tanks, and a U.S. version of the French Remault. About half (1,500) of the projected Mark VIIIs were to be joint Anglo-US, products, with England furnishing hulls, gurs and ammunition, and the United States supplying power plants and other components. An additional 1,450 Mark VIIIs of all-US construction were ordered, but none of this latter group was finished in time to see war service. After some delay in converting the specifications for the Remault tank from the metric to the English system of measurements, contracts were let for 4,400 units, parts for which were made in about 20 different plants, Final assembly for these units was done in three plants, one in Cheveland. O. and two at Daviton. O

By 1918 the U.S. tank program included two more models. One of these was the Ford three-ton tank, using a crew of two, carrying one machine gun and capable of eight-mile-per-hour speeds This tank, costing only \$4,000, was to have been produced in large quantities, but, the program was terminated by the early end of the war,

was an improved version of the Renault. It was to carry both a 37-mm gun and a machine gun and was to use a three-man crew instead of the two-man crew used in the Renault About 1,000 units of the U.S. Mark I were ordered, but none was actually delivered pilor to the armistice. While the US tank building program was attended by mefficiency, confusion and lack of coordination between various interested agencies, most of the difficulties were overcome, and at the war's end, work was completed or in progress on a total of 23,405 tanks of various types Meanwhile, U.S. tank forces had been organized and equipped with such models as were available from the Alhes The 304th US tank brigade, first to see combat action (St Milnel, Sept 12, 1918), was equipped with about 90 Renaults, 36 St Chamonds and 24 Schneiders In this action, only 25 tanks reached Nonsard ahead of the infantry, the remainder being immobilized by terrain difficulties, mechanical failures or enemy mines and gunfire US tank units participated in 7 actions during the St. Mihiel operations and 14 more during the Meuse-Argonne campaign, and in addition assisted British offensives in 7 other actions Aside from the fact that they were equipped with tanks of foreign make, U S units participated on an equal basis with the tank forces of their Allies, once they were organized and committed to action.

#### TANKS BETWEEN WORLD WARS I AND II

The two decades following World War I were a period of continuous development and improvement in the tank as an instrument of war. It became a standard weapon of most armies, and all the major powers conducted experiments with successive new designs, each searching for an ideal balance between the three conflicting requirements of mobility, armament and armoun Neither the giant tank (up to 80 tons) nor the very light tank, or tankette (3 to 8 tons), was entirely neglected, but the general trend was toward tanks of medium weight (18 to 36 tons) yielding the best all-around performance and utility. At the same time it was possible, through development of vastly improved power plants, to build tanks carrying larger and heavier armaments, with gradually increasing armour thicknesses. Speeds increased greatly (up to 45 m p h), horsepower per ton rose materially and fuel distances of 200 mi were achieved. Each of the major components of the tank underwent steady refinements Air-cooled engines were introduced, as were rubber rollers and tank treads, doublecoil springs and volute springs for suspension systems, short-wave radio communication, intercrew communication systems employing throat microphones, oil cooling systems for motors, gas filters and blowers, fans for cooling crew compartments and many other improvements contributing to the tank's reliability and effectiveness, as well as crew comfort and efficiency.

The wastly improved mobility and power of the full-tracked, armoured whiche led to experiments with this chasses for a number of special purposes, such as troop carriers, gun carriages, flame throwing and snoke laying. These were later to result in the development during World War II of a whole family of special-purpose armoured vehicles, all related to the tank, and some so similar in design as well as purpose as to make their differentiation from tanks somewhat arbitrary. The remainder of this article, however, is confined to the true tank—an armoured, self-propelled, tracklaying vehicle, possessing heavy fire power and intended, on suitable occasions, for direct assault and overrunning of defended positions

Great Britain.—The British royal tank corps, though its sensience was in doubt for a penord numediately after World War I, continued as a separate arm. It was required during this penod to operate on limited appropriations, so that through expediency at first, and later as a matter of doctrine, it tended toward the use of very small armoured vehicles, but in sufficient numbers for training. At the same time, the British continued to build more experimental tanks—susually only one specimen of each model than any other country. From 1919 to 1939 the British built more than 75 different full-tracked armoured whicles, all of which could be classified as tanks. Notable among these were the Carden Lloyd serves, light two, and three-man tanks, with several

United States.-For some years after World War I, tank development in the United States was affected even more senously by the same difficulty that retarded the British program-lack of funds Until the early 1930s, the large numbers of Renault-type light tanks and the heavy Mark VIIIs on hand were used for training, and some improvements were attempted upon them Meanwhile, the US program paralleled the British in another respect. single specimens of various experimental types were built by the ordnance department, or were bought from private builders. U.S. models during this period included a 23-ton medium tank (1922); a 75-ton light tank (1928); a 15-ton medium tank (1929); a 11.25-ton medium tank (1930), an 85-ton light tank (1931); a 15-ton medium tank (1933), a 13-ton medium tank (1933); and two light tanks (1935) weighing 9 75 and 3 tons, respectively. As World Wai II approached, the United States possessed a light infantry (or cavalry) tank and a medium infantry tank which were excellent for their day, though they existed in quantities sufficient only for very limited training. The final model of the light tank (which was essentially the same in both cavalry and infantry versions) had a turret of rounded plate with welded construction, mounted a 37-mm gun with coaxial machine gun, a machine gun in the bow and a third machine gun outside the turret as an antiaircraft weapon Fourteen feet 10 in. long, 7 ft 4 in. wide and 7 ft 6 in high, it weighed 14 tons, had a speed of 35 m p h and a crew of four Fifty-four gallons of fuel carned it 100 mi It employed a 250-h p radial air-cooled engine. The US medium tank in 1939 was laiger in each dimension, weighed 23 tons and attained a 30-mph speed with a 400-hp. radial air-cooled engine It travelled 130 mi on 136 gal of fuel Its maximum armour thickness was one inch, and it mounted one 37-mm gun and eight machine guns. Turret and hull were welded

Germany .- Immediately after World War I, the German A7V tanks which had not been destroyed or captured were transferred to Poland Several light tanks and a supertank weighing 165 tons and mounting four 77-mm guns had been completed or nearly completed by 1918. All of these were destroyed under the Armistice terms, but the plans for the LK light tank were transferred to Sweden Here its designer, Vollmer, later supervised the building of a similar Swedish tank in the German-controlled Landskrona factory. For a few years, while relations with the USSR. remained friendly, a number of German-designed armoured cars were built in that country Adolf Hitler's rise to power ended German-soviet co-operation in this field, but led to a similar arrangement with Poland. Prior to 1934 Germany secretly built some experimental tanks and armoured cars and by 1935 when the treaty of Versailles was abrogated, it was ready to show publicly a number of small tanks and other armoured vehicles. Experience gained in the Spanish Civil War led to the building of a number of armoured troop carriers and tanks ranging from 8 to 40 tons in weight. By 1938 Germany was able to freeze designs on four medium tanks, which underwent only minor modifications thereafter. These models employed steel tracks with rubber bogie tires and spring or torsion bar suspensions. Generally well designed, they provided liberal crew space, excellent sighting equipment, low silhouettes and auxiliary escape hatches. Their greatest general weakness was mechanical unreliability.

France—The French tank program after World War I was affected by the large numbers of Renaults in service at the war's end. France could not afford to purchase more modern designs in quantity until 1330. Meanwhile, study and development continued, though not on the scale of British experimentation (be-

while the French produced only 15) During this period work was continued on a huge break-through-type tank which had been started during World War I The French made notable progress in armour production, besides making considerable use of cast armour, they pioneered in work with welded armour. They were successful in combining thick, well-shaped aimour with light suspension systems, thus holding down over-all weights The French were among the first to use controlled differential steering. After the Russian Revolution, M Kegresse, the Russian designer who had developed the half-track vehicle, sought refuge in France where he worked with the Citroen automobile firm to produce a number of tanks and half-track armoured cars employing flexible rubber track devices As early as 1924-25, a Citroen-built tank used tracks with jubber treads.

French tank strength just prior to its entry into World War II was estimated at about 3,500, including a number of World War I Renault light tanks, three types of medium (12-15 tons), two heavy tanks of 30- and 74-ton weights, respectively, and a minethrowing tank carrying an 81-mm trench mortar

U.S.S.R .- Although the Russians had followed closely the development by other nations of armoured vehicles and had actually built a few such vehicles incorporating elements of original Russian design, they possessed little really serviceable armoured equipment throughout World War I. Even in the years after the Revolution, tanks and other armoured vehicles used by the Red army were either purchased in quantity from other countries or reproduced from foreign designs The most notable Russian contribution to tank development prior to 1920 was Kegresse's half-track design. After the Revolution, a number of British Mark V. Medium A and Medium B tanks and French Renault and Chamond tanks which had been lent to the White Russians were taken over by the soviets Some modifications were made on these, and in 1025 an 80-ton tank was built. In 1926 the soviets purchased some British Vickers medium Mark II tanks, and by 1028 were producing the T-18, the first entirely Russian-designed tank. It was similar to the Renault, using a two-man crew and mounting a 37-mm gun and a machine gun. The T-26, built during this period, was a light infantry accompanying vehicle weighing about 10 tons and mounting a 45-mm gun It continued in service until the summer of 1941 Beginning in 1930 the T-27, a Russian version of the British Carden Lloyd Mark VI tankette, was built in large numbers This was a small two-man vehicle weighing only 1.9 tons and mounting a single machine gun. It was followed by the T-37, a two-man amphibous tank, also patterned after a British model The BT tank was the Russian version of the 1931 U.S. Christie, a fast 10.5-ton vehicle capable of running either on tracks or on wheels (The Russians apparently never operated the BT on wheels.) The T-28, similar to the BT series except for slightly greater weight (11.2 tons) and heavier gun (76 mm.), was produced in quantity and served well on the Finnish front in 1940.

As early as 1935 the German Gen. Heinz Guderian reported that the soviets possessed 10,000 tanks, and praised their organization, tactics and training. By 1941, according to reports published after the war, Russian tank strength was 21,000. Starting in the mid-1020s with almost no tank forces worthy of the name, and limited technical knowledge and productive capacity in this field, the soviets had by 1940 attained a place with respect to armoured strength, training and doctrine at least equal to that of other major European powers.

## WORLD WAR II

Germany's lightning conquest of Poland in Sept. 1939 and its rapid march through France and the Low Countries the following summer were spearheaded by panzer divisions built around the tank models that had been standardized by 1938. Postwar studies indicated that early successes of German armour in World War II were caused more by its bold and skilful employment in a manner not fully anticipated by its opponents, than by superiority in quality or numbers. (According to Guderian, when the west was overrun in 1940 German tank strength was less than 2,800, while

tween 1918 and 1930 the British evolved at least 27 types of tank, the French alone possessed about 3,600 tanks, most of which were superior in armour and fire power to those of the Germans) Among the nations which were to confront German armies early in the war, the Russians alone seem to have sensed correctly the potentialities of armour and to have prepared-at least in numbers. Here again, however, novel German tactics and their boldness and skill of execution were sufficient to match Russian material superiority. In the summer of 1941, 2,000 German medium tanks were sent against the more powerful Russian 31-ton T-34 medium and 48-ton KV heavy tanks, but by September the Russian tank losses exceeded 17,000 compared to only about 500 for the Germans

Allied military leaders in 1940-41 took note of the importance of morale and teamwork, as well as organization, tactics and technique, in the German successes, and revised their own doctrines accordingly Yet, there was a mistaken tendency in some circles to attribute German victories solely to superiority in weapons and equipment. This had a commendable effect on the Allied tank production programs, for no effort was spared to develop combat vehicles capable of coping with the vaunted panzers The Germans, for their part, continued to turn out new models, and in the resulting race for material advantage the tank as a war machine underwent constant and accelerated refinement Differences in tactical concepts were reflected in the designs produced by different armies—the Germans and Russians particularly tending as the war went on to build more heavily armed and armoured monsters. sometimes at the expense of mobility and mechanical reliability The days when strategic surprise with large masses of armour was possible for one or another opponent gave way to fierce encounters between forces more equally matched in armour Numbers, skill and daring were still to prove decisive in many actions, but the tank design race became one essentially between projectile and armour.

Under the stimulus of World War II, many refinements were produced, such as the gyroscopic gun stabilizer to improve accuracy of moving fire, power-operated turrets with integrated fighting compartments, or turret "baskets"; hydramatic transmissions; frequency modulation voice radio with effective ranges of ten miles or more, long-tube high-velocity guns with muzzle brakes to reduce gun flash; waterproof sealing combined with periscopelike air intake trunks for fording or landing operations; and many other technical improvements Before the war ended, the tank had demonstrated its versatility in many types of action in all theatres It had been used in open desert warfare, in jungles, in ice and snow and in landing assaults. On at least one occasion (the British landing in Normandy on June 6, 1944), light tanks participated in an air-borne operation.

The tank served most usefully in World War II when employed in mass on suitable occasions (and withheld on unsuitable ones) by commanders who fully appreciated what it could and could not do. Again, it was most effective when used as a member of an integrated team including all the other ground arms and supported by suitable aircraft,

Germany .- In the campaigns of 1939-40, the 6-ton, two-man PzKw I, mounting two 7.9-mm, machine guns and carrying armour sufficient only for protection against small arms, was one of the two tank types comprising the bulk of German armour. The other was the PzKw II, a three-man, g-ton vehicle with about twice the armour thickness of the PzKw I, and mounting a 20-mm, antiaircraft machine gun. In the early months of the war these were reinforced with the PzKw III and PzKw IV, both medium-weight tanks mounting infantry support weapons adapted for tank use By 1942 German experience in tank-v.-tank actions, especially in Russia and Africa, had clearly demonstrated the need for more powerful guns. Accordingly, the 1943 model of the PzKw mounted a high-velocity 75-mm. gun. By this time the Germans were ready to abandon light tank production and concentrate on models of 20 tons and more, with thicker armour and even more powerful weapons. By April 1942 the first of the famous "Tiger" tanks was delivered, and by the following fall it was available in sufficient numbers to be used on the Leningrad front. Officially designated the PzKw VI (later PzKpfw Tiger), this tank weighed

and companies, and for use in strategic roles.

In early encounters with the Russian T-34 medium tank, the Germans were impressed with the latter's well-sloped armour, and hastened to incorporate a similar hull design in their PzKw V (Panther) which went into production in late 1042. The Panther resembled the Russian T-34 in appearance, and carried 80-mm frontal armour It mounted a high-velocity 75-mm gun with muzzle brake, was manoeuvrable and had a speed of 20 m n h Soon after, a more heavily armoured version of the Tiger appeared Weighing 75 tons, it carried six-inch frontal armour and, though underpowered, it was adequately mobile, being capable of 24-m p h speeds. Its designers had provided tracks 32 5 in. wide, a feature which gave it good mobility over soft or muddy ground This model was known as the Komestiger (Royal or King Tiger).

Although Hitler correctly sensed the psychological value of such seemingly invincible tanks, the haste with which he insisted they be produced seriously affected their mechanical reliability Even the notorious "88" gun, which was for a time the master of the field with its muzzle velocity of 3,340 ft per second which enabled it to penetrate 6 6 in of armour at 2,000 yd, was reduced in effectiveness by the short life of its tapered-bore tube. The firing of several hundred rounds of high-velocity ammunition was sufficient to make it dangerous to its own crew, so that it required replacement-a time-consuming operation.

A combination of factors, including lack of dependability, lack

of strategic mobility, limited numbers, fuel shortages and piecemeal commitments in the later stages of the war, prevented the German Panther and Tiger tanks from being the decisive weapons which Hitler, at least, seems to have expected them to be. Total German tank production from 1030 to 1044 has been estimated

at 23,000

Great Britain .-- In May 1040 when the Germans invaded the Netherlands and Belgium the British had in France about seven mechanized cavalry regiments and two tank battalions plus an armoured car regiment These were armed principally with the Matilda I tank, discussed below. During the last days before the fall of France the British 1st armoured division, equipped with cruiser tanks, landed in France and joined the action at Calais and on the Somme. Although most of these troops were evacuated, their equipment was lost and it was not until early 1941 that armoured units were re-equipped in England New armoured divisions were formed, and soon were in action in Africa and the middle east. By the end of 1941 experience in tank actions in Libya, Greece and Burma had already suggested design features which were to be incorporated in new British models.

The British had entered the war with five standard tank types; the light tank Mark VI B; the infantry tanks Marks I and II; and the cruser tanks Marks I and III. The light tank Mark VI B was a speedy, rehable machine, weighing just over five tons and mounting two machine guns The 12.3-ton infantry tank Mark I was the Matilda I referred to above, and had been designed with crew protection as the primary consideration. The result was that its three inches of armour could withstand a 75-mm. projectile, but it was underpowered and slow, and its single machine gun was no match for the German tank armament of that day

The infantry tank Mark II, known as the "Waltzing Matilda." was a much more efficient tank. With armour up to 3.5 in. and a two-pounder gun, it weighed 26 tons, but was faster than the Matilda I. The crusers Marks I and III had been designed for speed and fire power. Weighing 14 tons, they carried a two-

pounder gun and attained a speed of 18 m.p.h.

As the war progressed, these tanks were modified a number of times and eventually replaced by models reflecting the general trend toward thicker armour and greater gun power. Typical of the British tanks developed by the end of the war were the Valentine X and the Cromwell VII, both cruisers; the Churchill VII, an infantry tank; and the light Tetrarch tank. The Valentine X weighed 17.2 tons, mounted a six-pounder gun, carried a threeman crew and had a speed of 15 m.p.h. Its maximum armour thickness was 2.56 in. The Cromwell VII weighed 28 tons,

about 60 tons and mounted an 88-mm anti-arcraft gun. It was mounted a 75-mm gun, used a crew of five and was capable of mitended for issue not to panzer divisions but to GHQ battalions 31-mph speeds. The Churchill VII was a five-man tank also, weighing 39 5 tons, carrying armour up to six inches and mounting a 75-mm gun Its speed was 13.5 mp.h The light Tetrarch tank was used by the British in the Normandy air-borne operation Very lightly armoured (maximum 62 in ), it mounted a three-inch howitzer, carried a three-man crew and attained a speed of 25 mnh Its weight was 7.6 tons

United States .- By 1939 the United States had begun to rearm, and orders had been placed for added numbers of the light tank M2A4 and the medium tank M2A1, which were then the current standard models It was soon realized that a better gun than the M2A1's 27-mm, would be needed against the Germans Accordingly, the M-3 medium tank was designed and ordered in quantity This tank, which reached Africa in time to play a significant role in the British victories there, was known as the Grant While similar to the M2A1, it mounted a 75-mm gun in the hull The M4 medium tank, known as the Sherman, with added armour and the 75-mm gun placed in the turret, was in production by Oct. 1941, and it also reached Africa in time to influence the action there Undergoing continual development during the war, the M4, or Sherman, became by far the most widely used tank in the war A total of 49,234 were produced Its components featured simplicity and ruggedness. Of particular interest were the volute spring bogie-type suspension, the highly developed V-8 engine and the rubber-block, rubber-jointed tracks used on the Sherman. A life of 3,000 mi, was not unusual for these tracks, compared to about 600 mi for the metal-jointed German tracks Aside from the fact that the numbers of the Sherman tank supplied to Allied armies made possible the massing of superior tank forces in critical areas, its speed, manoeuvrability, and capacity for sustained operation under severe conditions made the Sherman tank a vital factor in Allied victory.

It is interesting to note that one year before the famous German Tiger appeared the U.S. army ordnance department, visualizing a need for such supertanks, had produced the M-6 heavy tank, weighing 65 tons, mounting a high-powered three-inch gun, the most powerful ever placed in a tank to that time (though not the largest calibre). The M-6 had the couvalent of four inches of armour and a nine-cylinder, 1,000-h.p radial air-cooled engine gave it a speed of 22 m.p.h. Its general performance characteristics compared favourably with those of the Sherman tank, with which it had been designed to work as a team. The general staff, however, preferred to use available shipping space to transport two 35-ton medium tanks for every M-6 heavy which could have been shipped, and, in addition, suitable engineer bridges for the M-6 were not available. Therefore, production of the M-6 was

discontinued after about 40 had been built

In Sept, 1942 development was begun of a tank which would have the armour protection and fire power of the M-6 without its great weight. The result was the heavy tank M26 (General Pershing), weighing 45 tons, mounting the 90-mm. gun and having an armour equivalent to nearly seven inches. The Pershing reached Europe in time to participate in the final attack on the Germans in the spring of 1945. Utilizing the 500-h.p. V-8 engine designed earlier for the Sherman series, the Pershing had a speed of 20 mp.h. Like the medium series, it used a five-man crew. A unique feature of the Pershing was its torquematic transmission. which combined the hydramatic transmission with a torque converter. In this model the ordnance department departed from the volute spring suspension in favour of a torsion bar system U.S. light tanks, designed originally as fighting reconnaissance

vehicles, were fast and dependable, though lightly armoured. They also were constantly improved during the war. The M-2 series soon gave way to the M-3 and later the M-5, both mounting the 37-mm gun, and in the M-5 utilizing a hydramatic transmission and dual V-8 Cadillac engines. These tanks, weighing about 16 tons and having a speed of 40 m.p.h., saw sustained action in Africa and Europe as organic equipment of U.S. tank and armoured cavalry units. By 1945 a light tank known as the M-24, designed to employ a light but powerful 75-mm. gun built originally for use in aircraft, was delivered. It was highly sucfor all US light tank units. Weighing slightly more than 19 tons and using Cadillac dual engines, it had a speed of 35 m p h.

and armour equivalent to 2 5 in

Worthy of note as part of U.S. tank development during World War II was the so-called "swimming device," consisting of metal box floats attached to the tank to permit it to disembark from a ship several miles offshore and proceed ashore under its own power A tank thus equipped could move through the water at six miles per hour, firing its weapons while affoat, and jettison the swimming device after landing, without necessity for the crew to dismount. This device was used successfully in the Normandy andings and in the Pacific

U.S.S.R .- After the Finnish "winter war" of 1030-40, which apparently awakened the soviets to the need for greater armout thicknesses, the T-28 was radically modified until, with two-inch armour, its weight reached 34 tons The Russians also had at the war's beginning a relatively thin-skinned heavy tank, the T-35 Weighing 40 tons, it could make 18 m p h, and mounted a 76-mm. gun along with a considerable array of lesser armament, but its

maximum armour was only 1 18 in

It was the models laid down in 1938-39 and produced by 1940 which were really to revolutionize soviet armour The 26-ton T-34 medium was one of these. It was of the Christie type, with wide (24-in.) tracks, a low silhouette and a 30-m p h speed provided by a good 500-h p. hquid-cooled diesel V-12 engine was armed with a 76-mm. gun.

Another 1940 model was the KV heavy (named for Klim Voroshiloff, soviet minister of defense), which weighed 52 tons and mounted a 76-mm gun The KV was much more heavily armoured than the T-34, which accounted for its greater weight, since in other respects it was much like the T-34 With these early wartime models the soviets came into their own as designers, producers and users of fighting tanks. Before the war's end another heavy tank, the Joseph Stahn, was to appear It was a logical step from the T-34 and the KV, in the progression toward thicker armour and more fire power

#### TANKS AFTER WORLD WAR II

Few details about Russian armoured strength or tank models were available after 1945, but the U.S.S.R was believed to have about 40,000 tanks, and organized tank units were estimated unofficially as equalling at least 35 armoured divisions. The JS III, a later model of the Stalin tank, was reputed to have the equivalent of ten inches of armour, to weigh about 56 tons and to be powered with a 600-h.p. engine. It was said to mount a 122-mm. gun and to possess exceptionally well-sloped armour Other reports mentioned another tank, the T-44, but little was known of it except that it was listed as a heavy tank, presumably even more formidable than the Stalin

Great Britain and France also proceeded with tank experi-mentation and development after World War II. Under the Military Assistance program, North Atlantic treaty nations were scheduled to receive some United States equipment. The western democracies individually and collectively were maintaining far less active armoured strength than the Russians, but were attempting to remain abreast of them in design and development of tanks.

Meanwhile, one postwar United States model was a superheavy tank announced in 1947, described as the heaviest vehicle ever built for the ordnance department Weighing nearly 100 tons, it mounted a 105-mm, gun and a 50-calibre machine gun, the whole assembly heavily armoured Another was the M-46 General Patton, weighing about 47 tons and mounting a 90-mm. gun. As a combat vehicle, it was essentially an improved version of the Pershing tank, since its performance characteristics, fire power and armour and the general types of mission for which it was suited appeared to be very similar to those of the Pershing.

No radical changes in tactical doctrine for employment of tanks emerged immediately after the war; the cardinal principle of mass utilization-heavy concentrations in depth on relatively narrow fronts-combined with deep penetrations and rapid ex-

cessful in the spring offensive of that year, and became standard ploitations still was adhered to by most military thinkers. New emphasis on air-borne operations suggested a design requirement for air-transportable tanks (or planes which could carry standard models) It also suggested at least one important mission—that of striking powerfully and rapidly overland to make a ground "link-up" with air-borne troops The effect of the atomic bomb and other related weapons on ground was fare, including armoured operations, remained largely a matter of speculation,

operations, remained argety a matter of specimition, and the control of the contr (Sept-Oct 1949), G Underhill, "The St Armored Cavalry Journal (May-June 1949)

TANNA: see GAON

TANNAHILL, ROBERT (1774-1810), Scottish song writer, son of a Paisley silk weaver, was born on June 3, 1774 He was apprenticed to his father's trade at the age of 12, and, inspired by the poetry of Robert Burns, he wrote verses as he drove the shuttle to and fro He began in 1805 to contribute verses to Glasgow and Paisley periodicals, and published an edition of his poems by subscription in 1807 Three years later, on May 17, 1810, he committed suicide Tannahill wrote some charming songs "Loudon's Bonnie Woods and Braes," "Jessie, the Flower o' Dunblane" and "Gloomy Winter's Noo Awa" are the best.

Tannahil's centenary was celebrated at Passley in 1874 See edition by D Semple (1876) for details of his life, also Brown's Paisley Poets,

ll 1 (1889).

TANNENBERG, BATTLE OF. No portion of the earth's surface has been more fought over than East Prussia It was in 1410, on the field of Tannenberg, that the Teutonic knights were utterly routed by their enemies the Poles and Lithuanians, and the German victory of 500 years later was in some degree the reversal of this defeat.

The Tannenberg of 1914 was the greatest victory achieved by any of the combatants at the beginning of World War I, and its strategic and moral effect upon the struggle were far-reaching France and Russia had been joined by military convention since 1802 and their chiefs of staft had made careful arrangements for concerted action In case of war with the Central Powers it had been agreed that Germany was the main enemy and that the principal military effort must be made against it.

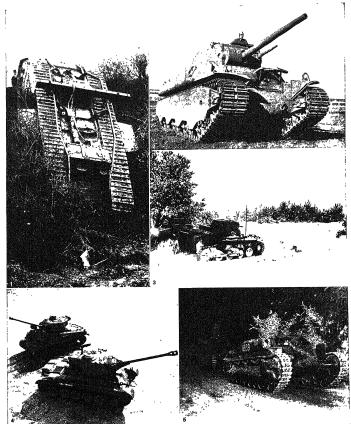

Because of the vastness of its territory and the comparatively undeveloped state of its railways, Russia's rate of concentration was considerably slower than that of France, so much so that there was a danger of the latter's being crushed before the attack on Germany in the east could begin to exert its effect. Unfortunately, under the pressure of French insistence, the good will and optimism of Russia's military leaders exceeded practical possibilities and the outbreak of war found Russian military plans in some disorder. All Russia's initial operations in East Prussia were in fact hasty improvisations.

Geographically, East Prussia points forward into the heart of Slavdom and constituted a difficult problem of defense for Germany. True to its policy of concentration of force at the decisive point. Germany had decided to advance against France with its main forces while maintaining only a minimum of strength in the east. Not wishing to abandon national territory without a blow, the Germans had decided to concentrate this minimum strength in East Prussia, despite the dangers involved in such action. Germany's strength in the east was to consist of 11 divisions, 6 first-line and 5 second-line, with but a single cavalry division.

Taking the East Prussian front as it appeared to the Russians, it can be divided militarily as follows:

1. Königsberg Area - A more or less fortified area extending over the Königsberg peninsula, of a depth of 19 mi. from north to south. In the centre lay the obsolete fortress, strong against anything but heavy artillery. The area could be reinforced by sea through the canal from Pillau It formed a strong flanking position from which to attack any force to the south

2. Insterburg Gap .-- A gap of 43 mi, of open country, down

  Libyan desert in 1942

which ran the main Insterburg-Allenstein railway The River Angerapp running north and south blocks this gap It formed an excellent line of defense with the right flank resting against the impassable Lake Mauer

3 Masurian Lakes -A line of continuous lakes from Angerburg to the Russian frontier at Johannisburg, a distance of 50 mi. The narrow gaps between the lakes could be held with few troops, and the whole line presented an almost impregnable front behind which the Germans could operate to either flank

4 Johannishin g-Dzialdowo (Soldau) Front -A distance of 75 mi running east and west. On the Russian side the country had been left a desert as a defense against Germany

The Russian Plan of Invasion.-The Russian plan for the invasion of East Prussia was to advance with two armies north and south of the line of lakes, with the object of enveloping the German forces supposedly concentrating behind this line northern army under Paul Rennenkampf was to advance first, toward the Insterburg gap, with the object of drawing the Germans as far to the east as possible. The southern army under Alexander Samsonov was to advance to the line Rastenburg-Allenstein, with the object of striking the rear of the Germans opposing Rennenkampf

Rennenkampf's army crossed the frontier on Aug 17 with a strength of six and one-half divisions and five and one-half cavalry divisions On Aug 20 an action was fought with the German 8th army at Gumbinnen Max von Prittwitz und Gaffron, the German commander in the east, had concentrated his main strength to meet Rennenkampf, six divisions and a cavalry division, while leaving about two divisions to face Samsonov's army, which was concentrating on the River Narew

Rennenkampf had moved off without a great portion of his transport and found himself forced to halt on Aug. 20. witz advanced to attack him. There were serious miscalculations in the German movements, with the result that the action was indecisive, both sides suffering heavy losses. That evening the news arrived that Samsonov had not only started to advance, but that two of his corps were already close to the frontier and that he had at least five corps with him The German commander abandoned all hope of defeating Rennenkampf on Aug. 21 and contemplated a withdrawal to the Vistula. On communicating this on the telephone to the supreme command, he and his chief of staff were at once superseded.

The new commander, Paul von Hindenburg, had not yet been employed in the war His chief of staff, Erich Ludendorff, reached supreme headquarters at Coblenz on Aug. 22 and the situation in the east was explained to him He immediately ordered the troops retreating in front of Rennenkampf to halt at once and to prevent him from pursuing, and issued instructions for a concentration against Samsonov. General Hindenburg joined Ludendorff's train at Hanover and took over the command

at Marienburg on Aug. 23.

Luckily for the new command, Max Hoffmann, the chief of the operations section under Prittwitz, had already carried out many steps facilitating the concentration desired by Ludendorff, and the situation, though alarming, had not grown worse since the supersession of Prittwitz. Samsonov's right was indeed well over the frontier near Ortelsburg and his left between Neidenburg and Dzialdowo (Soldau), but the Russian advance appeared to be slowing up. The German 20th corps had taken up a position north of Neidenburg and was awaiting attack. The leading umts of the 1st corps were detraining south of Deutsch Evlau and were moving up on the right of the 20th corps. The 3rd reserve division had detrained at Allenstein and was moving up on the left of the 20th corps: A landwehr division and units from the Vistula garrison troops were also coming up Thus, a strength of about six or seven divisions had been collected to oppose ten divisions and three cavalry divisions of Samsonov's army

No decisive results could be expected from such strength, and decisive operations were the Germans' only hope. The most important feature of the situation, however, was that Rennenkampf had made no forward move since Gumbinnen and had lost all touch with the enemy in front of him. Ludendorff therefore con-

ceived the idea of withdrawing all the troops from Rennenkampf's front, with the exception of the cavalry division, and of directing them against the right flank of Samsonov's army. Another four divisions thus obtained would give him an actual superiority over Samsonov and the direction of their attack might indeed be de-

An Account of The Battle .- Samsonov, who in peacetime was the governor general of Turkistan, had arrived from sick leave in the Caucasus on Aug 12 He had seen neither his subordinate generals nor his staff before, and his immediate superior, Jilinsky, commander of the northwestern front, was urging him forward to cross the frontier on Aug 19 The original concentration areas of his army behind the Bobr and the Narew had been considered to be too far to the east and a general move of all corps to the

west was in progress. By Aug. 20, the right wing (6th and 13th corps) had reached the frontier, with the 4th cavalry division well behind on the right. The left wing (15th and 1st corps) was just short of the frontier, with the 6th and 15th cavalry divisions covering it Of the 23rd corps, one division was two days' march behind the left wing and the other had not yet detrained at Warsaw The troops had been marching for a week across the desert area north of Ostroleka, over execrable roads in very hot weather. Much of the transport had been left behind, the men were tired and unfed and numbers had been much reduced by sickness No contact had been gained with the enemy and the army was already more than 24 hours late in crossing the frontier Reports from Rennenkampf of his victory at Gumbinnen and, during his advance westward on Aug. 24 and 25, of the signs of a hurried retreat on the part of the Germans, brought further urgings from Jilinsky to Samsonov to hurry. Samsonov obeyed to the best of his ability, and by the morning of Aug. 26 his position was as follows:

His centre of two corps (13th and 15th) was advancing northwest and was close on the line Allenstein-Hohenstein. On his right was one corps (6th) and the 4th cavalry division at Rothfliess, at two days' march from the centre On his left was a corps (1st) and the 6th and 15th cavalry divisions near Koschlau, at one day's march from his centre. The 23rd corps troops which were up were moving into the gap between the centre and the left. His forces were thus much dispersed.

Reconnaissance had been bad and Samsonov had little information as to the enemy's dispositions. He seems to have thought that the Germans flying in front of Rennenkampf had already crossed his front in their march to the Vistula and that he was too late to cut them off. He had deviated from his instructions to advance with his left on Allenstein and now had practically the whole of his force to the west of that town. He had no knowledge of the whereabouts of Rennenkampf's army and did not realize that he was increasing the space between the two Russian armies and thereby facilitating the German operations. His supply system had broken down utterly and his men were half famished and worn out with the fatague of excessive marching. The signal service had also broken down and orders had been sent out to corps by wireless. The Russian signals were easily tead by the Germans, who thus had absolutely accurate information as to their

opponents' dispositions and intentions. Germans Attack Samsonov -The new German command had galvanized the dispirited 8th army from the first and hope of success ran high. The attacks on Samsonov's two flanks were to be launched simultaneously on Aug 26 On the right, the German 1st corps, strengthened by the Vistula garrisons, attacked only halfheartedly Hermann von François, the commander of the 1st corps, was short of some of his heavy artillery and he contented himself with driving in some of the Russian outposts On Aug. 27. however, he launched his attack in earnest. At dawn a hurricane bombardment was opened on the Russian 1st corps's positions on either side of Uzdowo. The famished Russians did not wait for the infantry attack but broke and ran By 10 P.M that night there was nothing left of the Russian left wing except a small rear guard just north of Dzialdowo, and that too had disappeared before the next morning

The rear of the Russan centre was now completely exposed and François directed his march on Neidenburg. Opposation there was none, and by the night of Aug 28 his leading troops had reached Muschaken, eight miles east of Neidenburg. By the night of Aug 32 he whole length of the road from Neidenburg to Willenberg was held by a line of entrenched pickets. The Russian retreat to the south was completely blocked. During Aug. 30 François was attacked at Neidenburg by fresh Russan troops coming up from Mlawa and actually lost the town for a time. He held stoutly on to the line of his pickets, however, and on Aug 31 Neidenburg was proccuimed.

On the left, the German 17th and 1st reserve corps, having turned their backs on Rennenkampf and marched due south, had arrived within striking distance of the Russian right at Rothlitiess on the night of Aug. 25. Their attack on the morning of Aug. 26 came as a complete surprise. The Russain oft Lorops withdrew in confusion, Josing 6,000 men and 16 guns. By the night of Aug. 27 the Russian right was 27 mil. So ft Rothlifiess and in a state of hope-

the Russian right was 3 mil. S. of Rathilies and m a rate of hopeless demonstration. The rear of the Russan centre was now exposed on its other flank. The German 17th corps continued its much to the south, while the ist reserve cops moved in closer toward Allenstein. The story of the fighting in the Russian centre is not so inglorious as that on the two flanks. In accordance with Samsonow's plan the centre (15th and 15th corps) continued their advance on Aug. 26 toward the line Allenstein-Holmstein. The 13th corps encountered no opposition, but the 15th had to fight its way steadily forward. For Aug. 27, the advance was 10 be

continued.

Second German Blow — Ludendorff, with his accurate information of the events on either flank, now decided that the German centre had retired enough. The remforced each copps was therefore ordered to attack on Aug 27. The battle which ensued between the Russian 13th corps and the German 20th corps was particularly frect, the Russians holding their own and even advancing a little on their left. The Russian 13th corps rendered no help to its neighbour. On Aug. 28 the Germans renewed their attacks and this time the hardly tred Russian 13th corps commenced to break. The 13th corps, moving down to assist, found itself assilied in the rest by troops arriving from Allenstein and for the second time brought no help.

When night fell the two Russian corps were on a line from Griestienct to Wapilitz and in Cose touch with the Germans. Hoping to escape from pursuit, they began to withdraw during the night. The withdraws soon became a rout, and a mass of troops and transport, both unfed and unwatered, became inextrically mixed in the depth of the Forest of Grinfinless. Determined attempts were made during Aug. 216 break through to the south

whole of his force to the west of that town. He had no knowledge of Muschaken and to the north at Kallenborn, but the German of the whereabouts of Renneimann's army and dd not realize ring held fast. Only about 1,000 men effected there escape. The that he was increasing the space between the two Russian armies greater portion of these two corps surrendered to the German and thereby facilitation; the German nonerators. His sumply was parties clearing the forest during Max 20 and 31

Samsonov himself had moved up to Nedenburg on Aug 27 in order bette to control the battle. He was greeted with the news of the disaster to both his flanks and met streams of stragglers coming into the town. He decided to go to the headquarters of the 15th corps and take personal charge, and left. Neidenburg on the morring of Aug. 28 with a small staff, all mounted on horses. At once he became mixed in the mass of transport in the forest and could exercise no effective command. He then decided to ride to the south, but during the might of Aug 28—29 he became exhausted after having walked for some distance. He drew aside in the darkness and his staff heard a single shot. A careful search brought no result and the staff continued its way, certain that its unfortunate commander had taken his own life in his despair at the turn which events had taken.

Results.—The practical result of the fighting from Aug. 36 to Aug 30 was the total annihilation of two Russaan corps and the reduction of three other corps to half their strength in numbers. The whole Russian and army was so demortalized and was so deficient in essential material, such as artillery and transport, that it was no longer of any fighting value. The Germans claimed 125, coop prisoners and 500 guns. It is certain that their body was very great, for 60 train loads of captured material left Puchallowen after the battle and the captured horses were driven in herds to improvised camps at Neidenburg. Although greatly inferior in the whole eastern theatre, the Germans had yet managed to concentrate a supernority on the field of battle. The Russains and 132 battlahons, 96 squadrons and 630 guns, including 12 heavy, while the Germans had 135 battlahons, 48 squadrons and 818 guns, including 128 heavy.

818 guns, including 128 heavy.

TANNER, HENRY OSSAWA (1850-1937), US ariss, of Negro descent, was born at Pittsburgh, Pa, on June 21, 256, He was the son of Benjamin Tucker Tanner (born 1832), who became bushop of the African Methodset Episcopal Church in 1888 Henry Tanner was a pupil of Thomas Eakuns, in Philadelpina, and of J. P. Laurens and Benjamin Constant in Paris. He first exhibited at the Salon in 1895. Examples of his work are in the gallentes of Luxembourg; Chicago, Illi; Des Monnes, Ia, Los Angeles, Calif., etc. His "The Destruction of Sodom and Gomoriah" (1932) is in the Metropolitan Museum of Art, New York clicky. How was a knight of the Legion of Honour, a member of the Paris Society of American Painters, of the American Art association in Paris and of the National Academy of Design, New York

TANNHÄUSER or TANHUSER, German minnesinger of the 13th century, who lived for a time at the court of Frederick II. duke of Austria. After Duke Frederick's death he was received at the court of Otto II, duke of Bavaria, but he spent much time in wandering about Germany. He also went as a crusader to the Holy Land. His poems belong to the decadence of the minnesong, and combine a didactic display of learning with descriptions of peasant life. His adventurous life led him to be identified, in the popular imagination, with the knight Tannhäuser who, after many wanderings, comes to the Venusberg, or Horselberg, near Eisenach. He enters the cave where the Lady Venus-the Frau Hulda of German folklore-holds her court, and abandons himself to a life of sensual pleasure. By and by he is overcome by remorse, and, invoking the aid of the Virgin Mary, he obtains permission to return for a while to the outer world. He then goes as a pilgrim to Rome, and entreats Pope Urban to secure for him the forgiveness of his sins. The pope declares it is as impossible for him to

hauser departs in despair, and returns to the Venusberg. In three days the staff begins to put forth green leaves, and the pone sends messengers in all directions in search of the penitent, but he is never seen again

This legend was at one time widely known in Cermany, and as late as 1830 it survived in a popular song at Entlebuch in Switzerland, a version of which was given by Ludwig Uhland in his Alten hoch- und mederdeutschen Volksheder (1844) Among the attendants of Hulda was the faithful Eckhart, and in the preface to the Heldenbuch he is said to sit before the Venusbeig, and to warn passers-by of the dangers to which they may be exposed if they linger in the neighbourhood The legend was reproduced by several modern German poets, and by Richard Wagner in the famous music drama

Iamous music curins. The poetry, see F. H. von der Hagen's Mune-Fen Taminauer Blattech, Deutsche Liederfühler des 12 von 14 Jahrhunderts, 3rd ed, no. 47 (1893). See also F. Zandet, De 17 Taminauersag und der Munesager Taminauer (1838), J. G. T. Grasse, Die Soge von Taminauer (1846, and ed, 1861). A Öhlte, Zu. Taminauers. Leben und Dickfen (1890), J. Sebect, Taminauer, Inhalt und Form seiner Gedichte (1894)

TANNIN or TANNIC ACID, the generic name for a widely disseminated group of vegetable products, so named from their property of converting raw hide into leather (av) They are soluble in water, and their solutions, which have an acid reaction and an astringent taste, are coloured dark blue or green by ferrous salts, a property utilized in the manufacture of ink (q v). Some tannins appear to be glycosides of gallic acid, since they yield this acid and a sugar on hydrolysis (eg., oak tannin) while others yield protocatechuic acid and phloroglucinol (e.g., moringa tannin), common tannin, however, is a digallic acid

Common tannin, or tannic acid, C14H10O2 2H2O, occurs to the extent of 50% in gallnuts, and also in tea, sumach and in other plants It may be obtained by extracting powdered gallnuts with a mixture of ether and alcohol. When pure, the acid forms a colourless, amorphous mass, very soluble in water, less so in alcohol and practically insoluble in ether. It may be obtained artificially by heating gallic acid with phosphorus oxychloride or dilute arsenic acid, and conversely on boiling with dilute acids or alkalies it takes up a molecule of water and yields two molecules of gallic acid (HO)aC6H2 CO2H.

The tannin of oak, C19H16O10, which is found, mixed with gallic acid, ellagic acid and quercite, in oak bark, is a red powder; its aqueous solution is coloured dark blue by ferric chloride tannin of coffee, CaoHisOis, found in coffee beans, is not precipitated from its solutions by gelatin. Hydrolysis by alkaline solutions gives a sugar and caffeic acid, while fusion with potassium hydroxide gives protocatechuic acid. Moringa tannin or maclurin, C12H10O6 H2O, found in Chlorophora tinctoria, hydrolyzes on fusion with caustic potash to phloroglucinol and protocatechuic acid, Catechy tannin occurs in the extract of Mimosa catechy, and kino tannin is the chief ingredient of kino  $(q,v_*)$ . Tannic acid is employed either alone or in conjunction with antimony salts as mordant in dveing cotton with basic colouring matter. Medicine.-Tannic acid is officinal in both the British and

United States pharmacopoeias. It is incompatible with mineral acids, alkalies, salts of iron, antimony, lead and silver, alkaloids and gelatin. In the intestine tannic acid controls intestinal bleeding, acting as a powerful astringent and causing constination; it has been recommended to check diarrhoea, and is an antidote in metallic, alkaloidal and glucosidal poisons

Tannic acid is used in the treatment of various ulcers, sores and moist eruptions. The glycerin solution is used in tonsilitis and the lozenges in pharyngitis. For bleeding haemorrhoids tannic acid suppositories are useful, or tannic acid can be dusted on directly. The collodium stypticum is a valuable external remedy. Tannic acid is absorbed as gallic acid into the blood and eliminated

as gallic and pyrogallic acids, darkening the urme.

TANNING, a term describing the conversion of natural skins into leather. The word tan means the bark of the oak, which contains tannin or tannic acid; this has the power to combine with skin fibre and render it imputrescible. Modern tannage may

be pardoned as for the staff he has in his hand to blossom. Tann- be (1) vegetable tanning, i.e., performed with the water extract of barks, woods, nuts, etc., containing tannin, (2) mineral tanning, principally with compounds of chromium or aluminum; (3) combination mineral and vegetable tanning, (4) oil tanning, e, chamois leather (See LEATHER)

TANNU TUVA, part of the Russian Soviet Federal Socialist Republic of the USSR and formerly a region known as Urianghai, mainly of mountain and forest with a small steppe area, lying between the Savansk range on the north and the Tannu Ola range on the south, the former constituting its frontier with Siberia and the latter marking it off from Outer Mongolia has considerable timber resources and some wealth in minerals Its inhabitants, numbering fewer than 100,000, are for the most part primitive nomadic hunters of Turki origin, though there are some pastoral Mongols in the steppe country and a few thousand Russian immigrants in or near town settlements. Since Urianghai under the Manchu dynasty was treated by the Chinese as belonging to Outer Mongolia, and therefore part of the Manchu empire, the Chinese claim to sovereignty over Outer Mongolia had to be taken as applying also to Tannu Tuva

Historically, although tsanst Russia assumed direct control of Urianghai in 1911, it was not annexed to the tsarist Russian empire, and when it was declared an independent state by the Tuva People's Revolutionary party in 1921 it was recognized as such by the USSR. The republic of Tannu Tuva (with its capital at Kyzyl) was proclaimed in 1026, after some clashes with Mongol factions which had endeavoured to include Tannu Tuva in Outer Mongolia The USSR subsequently supported separation both political and cultural between Tannu Tuva and Outer Mongolia, although in 1924 it brought about, in partial settlement of Mongol claims, the cession to Outer Mongolia of a large tract of territory at the eastern end of Tannu Tuva inhabited principally by Mongol and not Turki tribes. In 1026 Tannu Tuva and Outer Mongolia recognized each other's independence In 1944 Tannu Tuva was incorporated into the R.S.F.S.R. (See also MONCOLIA)

TANTA, a town of Lower Egypt, in a central position nearly midway between the two main branches of the Nile, and converging point of several railways traversing the delta in all directions Population (1937) 95,260. It is the capital of the rich province of Gharbia, and is noted for its fairs and Moslem festivals, which are held three times a year and are sometimes attended

by 200,000 pilgrims and traders.

TANTALUM (symbol Ta, atomic number 73, atomic weight 180.88) was discovered by A. G. Ekeberg in 1802 One stable form, Ta181, and radioactive isotopes of mass numbers 180 and 182 are known The electron arrangement in the unfilled outer orbits (O and P) is: 5s2, 5p6, 5d3, 6s2. Tantalum is always found associated with columbium (q.v.) in its ores and this resulted in confusion on the part of the early investigators until J. C. G. de Marignac, in 1866, developed a method for the separation of the two elements, a method which has become classical and which is of great commercial value. The important minerals are tantalite. Fe(TaO<sub>3</sub>)<sub>2</sub>, and columbite, Fe(CbO<sub>3</sub>)<sub>2</sub>, found in commercial puantities in Australia, Brazil, Belgian Congo and South Dakota. Of less importance is the mineral microlite (6CaO.3Ta2Os.CbOFs) found in New Mexico These minerals may carry other elements such as titanium, tin, tungsten and manganese

Separation.—The pulverized ore is fused in iron pots with sodium hydroxide, which converts the tantalum and columbium into sodium tantalate and sodium columbate, compounds which are insoluble in water if some free alkali is present. At the same time compounds of iron, manganese, etc , which are soluble in hydrochloric acid are formed. The fused mass is crushed and treated with water and most of the free alkali is removed by decantation. The black residue is digested with hot hydrochloric acid to dissolve the iron and manganese compounds and to react with the sodium tantalate and columbate to form tantalic and columbic acids. These are washed by decantation and dissolved in hydrofluoric acid. Sufficient potassium fluoride is added to the solution to form the double fluorides K2TaF7 and K2CbOF5.H2O. The concentration of the solution is adjusted so that it is nearly saturated with the tantalum salt when hot (90° C.). On cooling

thus salt crystallizes out in the form of fine needles, leaving the (melting point 211° C, boiling point 241 6° C) columbium and most of the impurities in solution This method carbide, TaC, made by the direct union of the elements or by the of separation was first used by Marignac and its efficiency is the result of the relative solubilities of the potassium double fluorides of tantalum, titanium and columbium. In the order given the solubilities are 5 g, 12 g and 77 g, per litre at room temperature The tantalum salt can be purified further by recrystallization from water containing a small amount of hydrofluoric acid, and this potassium tantalum fluoride is used in the preparation of all other compounds of tantalum and the metal itself

Pure ductile tantalum was made by Werner von Bolton in 1905 The double fluoride was heated with sodium in evacuated tubes to bring about the reaction K2TaF7+5Na=2KF+5NaF+Ta The washed, finely divided metal powder was pressed into sticks which were melted down by drawing an aic between them and a watercooled table within a vacuum furnace The fused buttons were quite limited in size but could be worked into rod and fine wire In 1922 C. W Balke perfected a process whereby tantalum bars weighing up to ten pounds might be produced. The double fluoride is electrolyzed in iron pots provided with graphite anodes The current keeps the bath liquid and deposits the metal in the form of small crystals When the pot is full the electrolytic mass is pulverized and the salt is separated from the heavy tantalum powder with an air blast Final cleaning is done chemically to give a tantalum powder of high purity This is pressed into bars which are sintered in vacuum furnaces at a temperature not far below the melting point of the metal (2,996° C) The bar 15 heated by its own resistance to the passage of an electric current These bars are very ductile and can be worked into sheet, rod and wire This is done at 100m temperature, since the hot metal absorbs large volumes of the common gases and becomes brittle Tantalum resembles but is somewhat darker than platinum in colour and its specific gravity is 166 It is outstanding in its resistance to the action of acids and corrosive chemicals except hydrofluoric acid, concentrated sulphuric and phosphoric acids above 175° C, and solutions of the strong alkalies

Applications.—Tantalum was first used as a filament in electric lamps, but for this purpose it was soon replaced by tungsten Its first extensive use was in the manufacture of electrolytic rectifiers. These (trade name "Balkite") utilize the electrolytic valve action of tantalum, which allows an electric current to pass in one direction only when immersed in acid. It is used in electronic tubes. Large quantities of sheet tantalum are used in the construction of chemical equipment for use in handling corrosive gases and liquids Heat exchangers, evaporators, condensers and acid absorbers are built up from sheet by a special process of electric welding Tantalum produces minimal foreign-body reactions in the human body and is, therefore, used in nerve and

bone surgery with great success

Compounds of Tantalum.—Tantalum is usually pentavalent but in some compounds its valence can be two, three or four. The pentoxide, Ta2O5, is white in colour and is obtained by heating the metal in air or oxygen or by the ignition of tantalic acid, HTaO3,xH2O The latter is precipitated by the addition of ammona to solutions of the alkali double fluorides, by the addition of hydrochloric or nitric acid to solutions of the soluble tantalates or by the action of water on tantalum pentachloride. This acid gives rise to a large number of tantalates such as 4K2O.3Ta2O5 16H2O and 7Cs2O.6Ta2O5 38H2O Tantalates are most easily made by fusion of the oxide with the carbonates or hydroxides of the alkali metals. The addition of hydrogen peroxide to solutions of the tantalates produces pertantalates of which potassium pertantalate, K<sub>2</sub>TaO<sub>8.2</sub>H<sub>2</sub>O, is typical.

Anhydrous tantalum pentafluoride, TaFs, can be made by the direct action of fluorine on tantalum in the form of hydroscopic prisms (melting point 97° C., boiling point 229° C.). The tantalum fluoride, formed by the solution of the metal or acid in hydrofluoric acid, is really the acid H2TaF7, which forms many double fluorides with the fluorides of other metals. Tantalum pentachloride, TaClo, is made by the action of chlorine on heated tantalum or by the action of chlorine and the vapours of sulphur

action of carbon on the oxide, is a very hard yellow crystalline mass which is used in the manufacture of hard carbide tools for the machining of steel (see CARBIDES)

TANTALUS, in Greek legend, son of Zeus or Tmolus and Pluto (Wealth), daughter of Himantes, the father of Pelops and Niobe He was the traditional king of Sipvlus in Lydia (or of Phrygia), and was the intimate friend of Zeus and the other gods, to whose table he was admitted But he abused the divine favour by revealing to mankind the secrets he had learned in heaven (Diod Sic, iv, 74), or by killing his son Pelops (q v) and serving him up to the gods at table, in order to test their power of observation (Ovid, Metam, vi, 401); another story was that he stole nectar and ambrosia from heaven and gave them to men (Pindar, (Ol, 1, 60) According to others, Pandareus stole a golden dog which guarded the temple of Zeus in Crete, and gave it to Tantalus to take care of But, when Pandareus demanded the dog back, Tantalus denied that he had received it Therefore, Zeus turned Pandareus into a stone, and flung down Tantalus with Mt Sipylus on the top of him (Antoninus Liberalis, 36) The punishment of Tantalus in the lower world was famous. He stood up to his neck in water, which flowed from him when he tried to drink of it. and over his head hung fruits which the wind wafted away whenever he tried to grasp them (Odyssey, xi, 582) This myth is the origin of the English word "tantalize" Another story is that a rock hung over his head ready to fall and crush him (Euripides, Orestes, 5) The sins of Tantalus were visited upon his descendants, the Pelopidae. Ancient historical reminiscences and natural phenomena, especially volcanic catastrophes, are at the bottom of the legend. The tomb of Tantalus on Mt. Sipylus was pointed out in antiquity, and has been in modern times identified by C F. Texier with the great cairn beneath Old Magnesia; but Sir W. M Ramsay inclines to a remarkable rock-cut tomb beside Magnesia.

The story of Tantalus is an echo of a semi-Greek kingdom, which had its seat at Sipylus, the oldest and holiest city of Lydia, the remains of which are still visible There was a tradition in antiquity that the city of Tantalus had been swallowed up in a lake on the mountain; but the legend may, as Ramsay thinks, have been suggested by the vast ravine which yawns beneath the acropolis.

J Hylén (De Tantalo [Uppsala, 1896]) considers the story of the thirst of Tantalus in the underworld to be the result of the Orphic interpolator in the Négura of the Odyssey, and the Pandareus story to be an innovation of the Alexandrine poets. The essay contains a copious list of authorities and a history of the legend. According to V. Henry (Revue des Études grecques [1892]). Tantalus is the sun. His betrayal of the secrets of the gods refers to the sun's unveiling the secrets of heaven; the slaving of Pelops denotes the going down of the sun

See PELOPS, PHRYGIA; Sir W. M. Ramsay in Journal of Hellenic Studies, ii., Sir James Frazer, Pausanias's Description of Greece, vol. ii., p. 555, vol. v, p. 392

TANTIA TOPI (c. 1819-1859), rebel leader during the Indian Mutmy, was a Mahratta Brahman in the service of Nana Sahib. He instigated the massacre of Cawnpore, and commanded at the battle of Bithur, where he was defeated by Gen H Havelock. With the aid of the Gwahor contingent he pressed Gen. C. A. Windham hard at Cawnpore on Nov 27-28, 1857, but was defeated by Sir Colin Campbell on Dec. 6. Together with the rani of Jhansi he was besieged by Sir Hugh Rose in the Jhansi fort, but escaped and collected a force of 20,000 men which Sir Hugh defeated without relaxing the siege This was the decisive action of the campaign in central India, and Tantia Topi was monochloride on the heated oxide. It is a white crystalline solid obliged to seek refuge in the jungles of Rajputana and Bundelkhand, where he was taken by Major Meade, condemned and exccuted on April 18, 1859 He was the only rebel leader in the Mutiny who showed any conspicuous military ability. (See INDIAN MUTINY)

TAOISM. The term Taoism has two meanings: (1) the philosophical system attributed to Lao Tzu (b. 604 BC) and Chuang Tzu (b 330 B C), (2) the popular religion of the Chinese

Taoism as a Philosophical System .- The term Tao originally meant the revolution or the way of the heavens about the earth This movement of the heavens was regarded as the cause of the phenomena on earth The Tao was located about the

celestial pole, which was considered to be the seat of power because all revolves about it In the course of time this concrete expression became abstract, and the Tao was viewed as the universal cosmic energy behind the visible order of nature This cosmic energy regarded as being is impersonal, omnipresent and eternal; viewed as becoming it works spontane ously, orderly, unselfishly and continuously for the highest good of all beings.

The Tao produced the vin and the yang, the negative and the positive, female and male principles of nature These by their interaction brought forth heaven and Reas earth Heaven and earth gave birth to all TAOIST PRIEST IN FULL beings The human order is the product of COSTUME. the eternal energy.

Philosophic Aspect .- Taoism has usually been regarded as a mystic religion, but it was also an economic and political philosophy It advocated frugality, simplicity and the joys of the peasant life in contact with the soil. It opposed the educational programme of the Confucianists, and advocated the theory that the people should be kept in innocence (not in ignorance) The Taoist philosophy is responsible for that remarkable trait of the Chinese, namely, their contentment in situations which offer a

minimum of comfort and their prizing of culture above possession. Political Aspect.-In politics Taoism opposed a highly centralized government and favoured the maximum autonomy for the people. Lao Tzu and his successors promoted the small village state which enjoyed full autonomy and lived in harmony with its neighbours. All forms of bondage and legal restraints were opposed. Non-resistance was exalted and militarism was condemned

The ethics of Confucianism met with the strongest opposition on the part of the Taoists. Such virtues as love, justice, reverence, wisdom and sincerity were regarded as the first steps departing from the harmony of the simple life in the Tao, and producing the distracting contraries which marred the purity of life.

The Taoists were mystics, but they were practical mystics, who hoped to realise the best social order through a harmonious relationship with the Tao. Their ideal was "this worldly." Their mysticism had three stages: (1) the purgation, casting out selfishness and self-secking; (2) union with the Tao, by which the individual lost his individuality with the distraction of the contraries; (3) power, which enabled the individual merged with the Tao to escape the limitations of time and space.

Taoism as a Religion.-Taoism as a religion is inherent in Taoism as a philosophy. The early mystics practised breathing and abstaining from food, and sought longevity and a future life in the Taoist paradise. The religious aspect did not become prominent, however, until the Han dynasty (206 B.C -AD 220), when the Taoists occupied themselves in compounding the elixir of life and in making journeys to the Isles of the Immortals. They also developed several sects which practised exorcism and fortunetelling and exercised considerable political power.

The rise of Taoism as a church is attributed to Chang Tao-Ling

(b. AD 34), who developed a high degree of magic power which he transmitted to his heirs, together with the political prestige which reputation for such power brought. These took part in a

successful rebellion in the latter part of the 2nd century, and established a state in Szechuan based on Taoist principles. The descendants of Chang Tao-Ling were recognized by the Government and in 1016 were given a fief at Lung Hu Shan in Kiangsi Their function consisted of a general oversight of the Taoist priests and monks and the rule over the world of the gods The system developed a hierarchy among the gods which corresponded to that of the government of China. At the head was Yu Huang Shangti, the Pearly emperor, who presided over an elaborate

Buddhist Influence.-Through contact with Buddhism in the first six centuries of our era the Taoists appropriated the Buddhis world view, adopted the monastic system and imitated the Bud dhist pantheon Lao Tzu was deified and was associated with Pan Ku and Yu Huang Shangti in the Taoist Trinity patterned after the Three Jewels of Buddhism Present-day Taoism is a

conglomeration of animism, polytheism and magic

alter the lines of minimum, polytheism and magic conglomentation of minimum, polytheism and magic conglomentation—II A Olits, Chung True (London, 1889), James Luge, The Tests of Tooton, pts.; and z. TAORMINA, a town on the east coast of Sicily (ancient Tauromenum), in the province of Messina, from which town it is 30 mi SSW by rail Pop (1936) 4,293 (town), 7,580 (commune) It is a winter resort, chiefly on account of its situation and views It lies on an abrupt hill 650 ft above the railway station, and was occupied at least as early as the 8th cent B.C. (as the discovery of a Sicel cemetery of that period shows) It was refounded by the Carthaginian Himilto in 397 B.C., after the destruction, by Dionysius the Elder of Syracuse, of the neighbouring city of Naxos. In 392 Dionysius occupied it and settled his mercenaries there. In 358 the exiles from Naxos at last found a home there. It was the city at which both Timoleon and Pyrrhus first landed During the First Punic War it belonged to the kingdom of Hiero, and after his death it was allied to Rome. During the first Servile War it was occupied by Eurous and some of his followers, but was at length taken by the consul Publius Rupilius in 132 It was one of the strongholds of Sextus Pompeius, and after defeating him Augustus made it into a colonia In the time of Strabo it was inferior in population to Messana and Catana; its marble, wine and mullets were highly esteemed. In AD. 902 it was taken and burnt by the Saracens; it was retaken in o62, and in 1078 fell to the Normans.

The ancient town perhaps had two citadels; one the hill above the town to the W, now crowned by a mediaeval castle, the other the hill upon which the theatre was afterwards constructed There are some remains of the city walls. The church of San Pancrazio, just outside the modern town, is built into a temple of the 3rd century B C., dedicated to Serapis, the south wall of the cella of which is alone preserved. The other ruins belong in the main to the Roman period. The theatre, largely hewn in the rock, is of Greek origin, but entirely reconstructed. The stage and its adjacent buildings, especially the wall, in two storeys, at the back, are preserved. The view is of exceptional beauty, Mount Etna being seen from the summit to the base or the south-west, while to the north the rugged outlines of the coast and the mountains of Calabria across the sea to the northeast make up one of the most famous views in the world. There are also remains of a much smaller theatre (the so-called Odeum) and some large cisterns; a large bath or tank which was appar ently open, known as the Naumachia, measures 426½ ft. in lengtl and 392 in width. There are remains of houses, tombs, etc., o. the Roman period, and fine specimens of Romanesque and Gothiarchitecture (notably the Palazzo Corvaia) in the modern town See Rizzo, Guida di Taormina e dintorni, Catania, 1902.

TAPACULO, the name given in Chile to a bird (Pteropto chus albicollis) and applied in an extended sense to its allie forms, which constitute a small Passerine family, Pteroptochidae, peculiar to South America About 20 species are known.

The true tapaculo (P albicollis) has a resemblance to the

The true trajection (P. abrocous) and a resembance to the females of some of the smaller shites (Lanuta), but differs in its shortened wings and powerful feet. It rarely files, hops actively on the ground of among bushes with list fail erect, and continually utters various and stiange notes—some, says Darwin, are "like the cooling of dowes, others like the bubbling of water, and many defy all similes". The Turco, Hylactes megapodius, is larger, with greatly developed feet and claws, but is very similar in colour and habits. The Turco is distributed through central and northern Chile.

TAPANULI, a residency on the west coast of Sumatra, Netherlands Indies, area 14,760 sq mi, bounded north by Achin, east by the government of the East Coast of Sumatra, south by the residency of Sumatra's West Coast, and west by the Indian ocean. It is very mountainous, but has flat stretches of alluvial land on the coast between spurs of the great central range of mountains which traverses the length of the residency from north to south and forms a great massit from the centre of the residency to its eastern border which includes the mountain lake Toba. along the eastern shore of which the Tapanuli boundary runs. This lake, regarded as holy, was not seen by a European until 1863 (van der Tuuk). Previous attempts to reach it met with disaster, three Frenchmen and two Americans being murdered on their way to it, in 1835, while, in 1850, Ada Pfeiffer was obliged to turn back on account of native hostility. The lake, which is 3,000 ft above sea level, is 56 mi long, with an area of 23 sq mi and a greatest depth of 1,500 ft It has a large hilly island, Samosir, in the centre, divided from the mainland on the west by a narrow channel It is bordered on all sides by steep rocks, overhung with vegetation, and surrounded by mountains, and affords magnificent views. A good motor road runs to it from the coast, and there is a road around the lake from Balige to Prapat. There is also a motor boat service

The mountains of Tapanulı include Malea, in the south, 6,545 ft , Ulu Darat, in the centre, 7,010 ft., and Sibutan, on the northeastern border, 7,972 ft Small rivers flow westwards from the mountains to the sea, the Gadis, Turu and Sibundong, but they are almost useless for navigation. The coast is either rocky or marshy, but in Tapanuli Bay, which is surrounded by mountains and shut off from the effects of the southwest monsoon by Morsala Island, there is a good harbour with secure anchorage. Cultivation is confined to the valleys and the flat coastal strips, where maize, rice, coco-nuts, coffee, nutmegs and rubber are grown. Gold and silver are known in close association. Pop. (1930) 1,042,583, largely Batak (852 Europeans, 6,349 Chinese and other foreign Asiatics). The inhabitants consist of Mohammedans and Christians, while many remain pagans, with traces of Hinduistic practices mingled with their animism. (See SUMATRA.) They grow rice, coffee, tobacco and maize, also fruit and vegetables, and keep horses, cattle, pigs and buffaloes, build picturesque houses, are patriarchal in society, and are good crattsmen m wood, ivory and copper, while the women weave their own clothes. Cannibalism has been shed, the Bataks have become more amenable to outside influences. They have many languages.

The capital and chief port of Tapanuli is Sibolga, pop. 1co,765, the headquarters of the Resident, which is connected by road with Lake Toba and the interior generally, and, by the road round the southern end of Lake Toba, with Pennatang Siatar, the termines of the Sumatra East Coast railway, giving access to Medan and Belawan on the costs. A road through the Padag High-lands connect Sibolga with Padang, and a branch from this leads to Natal, a small port on the cost, in the south, while there is road connection between Sibolga and Barus, a small port in the north, connected by cable and overhead telegraph with Padang, and, by water between Barus, Sibolga, Natal and Padang, Bencolein and Batavia. Foreign exports of Tapanuli (1939) were 6,00,000 guilders, mainly rubber. Tapanuli was annexed piecemeal by the Dutch during the 19th century. Much of the residency was occupied by Japani March 1942.

TAPE MACHINE; see Ticker.

TAPESTRY. Tapestry is popularly assumed to be almost any land of heavy material, ordinarily wood, hand-sween, machine-woven, or even embroidered, used to cover furniture or walls, and this definition is justified in that it is the older mage, is the definition of the Latin tapes, and is still reflected in the parallel French derivative non lapisser, "uphoblesters" As continue there were specific designations for tapestry in the more immed sense, as Austaclesses or basseliars in French, and when the French therm scenaed to be current in England, "arras" there, from the French town which was for a time a centre of production. But now "tapestry" is more correctly reserved for one type of handwoven fabric, and perhass its machine-made imitation.

## TECHNIQUE

Tapestry differs from other forms of patterned weaving in that no wefts are carried the full width of the web, except by a very rare accident of design. Each unit of the pattern or the background is woron with a weft of the required colour, which is inserted back and forth only over the spot or section where that colour appears in the pattern. The weaving its, typically, in plandioth technique, the weft passing over and under the warps alternately, and on the return shoot, under, where before it was over, and vice versa. The wefts are pressed tightly together with a comb or the point of the bobbin, to cover the warps completely, which appear only as more or less marked parallel ridges in the texture—according to the coarsenses or finences

Where the margin of a colour area is straight and parallel to the warps, a slit is necessarily left, which may be treated in any one of five different ways First, it may simply be left open, as in the Chinese silk tapestries, which are called k'ssu, "cut silk," for that reason Second, it may be left open on the loom, but sewed up afterwards, as in European tapestries from the 14th to the 17th centuries, and also in some later types. Third, the weaver may dovetail his wefts along the colour-area contact, passing the west from one side, and that from the other, in turn over a common warp. This may be either "comb" dovetailing-single wefts alternating—or "saw-tooth" dovetailing—clusters now from one side, now the other. (For diagrams see: A U. Pope, ed., A Survev of Persian Art. 1938, iii, pp 2178-81.) Dovetailing has the double disadvantage of making the fabric heavier at that point and blurring the outline. Persian weavers of the 16th century developed a successful variant in silk tapestry rugs, whereby a black outline weft was dovetailed over two warps-one of each of the adjacent colour areas-effectively hiding the coloured wefts in the compacting of the weave, and providing strong clear drawing. The same device is found several centuries earlier in Peru, but if there was a common source, examples from it have not yet been noted.

The fourth treatment—interlocking—was introduced in the Gobelins factory in the 18th century. Here wefts of juxtaposed colour-segments are looped through each other between the two warps which mark, respectively, the margin of each colour. This gives a continuous surface of even weight and was prized by the French weavers because the resultant effect more closely approximated that of painting.

Finally, one curious variant would, in strictest definition, fall outside tapestry, though it starts with the tapestry conception: between every two rows of tapestry-woven wefts is a cloth-woven, individual shoot which makes the fabric solid. Because of the presence of the intercalated cloth wefts, this type would be rigorously classified as a brocaded cloth, but the idea is that of tapestry, with the cloth structure subordinate and the problem solved being one in tapestry weave. The device, rare everywhere, is found in Japan in the prin and 8th centuries, in east Persä in the roth century (Moore collection, Yale university), and in median-toth control (Moore collection, Yale university), and in median-with diffusion in the two opposite directions, and transmission (as in the case of various other textile techniques such as bark-cloth, feather-work, tre-and-dye, double-cloth) to the western hemisphere.

Haute-lisse and Basse-lisse.—European tapestry may be woven on either of two types of looms, haute-lisse or basse-lisse.

The former is a vertical frame, with heavy uprights (bâti, in French) holding a horizontal roller (ensouble) top and bottom, on which the warps are stretched Each warp passes through a loop of cord (the lisses), and the loops encircling the warps which correspond to uneven numbers are fastened to one slender cylinder. those to the even, to a second cylinder, both being above the weaver but within reach so that he can pull forward with his left hand now one, now the other set of warps (te, form the shed), in order to pass his bobbin (brocke) behind them, this being a short, pointed, slim cylinder of polished wood on which his weft-varn is wound

The basse-ksse loom, on the other hand, has the rollers on the same level at table height so that the warps stretched between them are horizontal, and the lisses are attached to two slats, each of which is connected with a treadle so that the weaver depresses the add-numbered, or even-numbered series of warps to form his shed with movements of his feet, leaving both hands free to manipulate his bobbin Production on this loom is nearly twice as fast as on the vertical loom, reducing cost proportionately The cylinders in both instances serve to roll up the finished portion and unroll a further length of unwoven warps so that the section in process is always in a convenient relation to the weaver. At both types of loom the weaver works from the back side and has a mirror into which he can look through the unwoven warps, and which is placed to reflect the portion in process; but while the haute-lisse weaver can examine his finished work directly by walking round to the other side of his loom, the basse-lisse worker has to tilt up his frame.

The design is rendered first as a drawing on paper, the petit patron: then it is enlarged to the size which the tapestry is to be. and is painted in exactly the correct colours on linen (later often paper) This is called the grand patron. Up into the early 16th century the patron, or cartoon, was sometimes called in French the portrait (or pourtraict). The artist specializing in designing (whether for execution in tapestry, or in other techniques and media such as embroidery, wood-carving and stained glass) was called a portrastist.

The grand patron was sometimes itself hung as a substitute for tanestry; and large-scale paintings similarly rendered on great sheets of heavy but flexible linen, called toiles peintes, or "painted linens," were made expressly for this purpose The most interesting collection of old toiles peintes, dating chiefly from the 16th century, belongs to the cathedral of Reims

The haute-lisse weaver has the grand patron which he is following hung beside him, but the basse-lisse worker has his laid under his warps, so he follows from immediately above his model In both cases the main outlines are drawn on the warps.

The design is executed, in all professional European work, at right angles on the loom so that in the finished hanging the warps run horizontally. This is aesthetically advantageous, since the warp-ribbing tends to create texture lines which are more or less re-enforced by linear shadows, and if vertical, these sever the design, but if horizontal they bind it into continuity. Practically, however, horizontal warps are disadvantageous since they mean horizontal slits, with weight from the heavy wool fabric pulling on them as the tapestry hangs, and thus accelerating deterioration. That the aesthetic consideration should have prevailed over the practical is noteworthy.

The extra weft-ends are left hanging loose on European tapestries, but they can be fixed with an additional twist and cut short. making a reversible fabric. This is a practice especially common in far eastern tapestry weaving. All European tapestries are relatively coarse up to the 18th century with, in general, from 10 to 18 warps to the inch. Transition from shade to shade is effected

with irregular "comb-tooth" hatching,

Twill Tapestries.—Instead of the plain-cloth binding com-monly found in tapestries, a twill can be used, i.e., a weave in which the weft is floated over two or more warps, then under one or more warps, with this underpass shifted always one to the right or left making the diagonal ribbing characteristic of serge. Such a weave, with the wefts over two, then under two warps (which means that the warps also pass over two wefts)

appears in tapestry for the first time, as far as can be determined, in Persia in a unique silk and metal-thread square, the design comprising a royal portrait, figures of angels, animals and plant motives (Pope, ed., Survey of Persian Art, ni, pp 2151, 2199, Pls 1090-91), and from the 17th century on (Moore collection, Yale university, Metropolitan museum) is used in goat's hair or wool, especially for shawls, in Khurasan and Kerman. The type is perpetuated in the well known Kashmir shawls, and was probably introduced into Kashmir from Persia, along with other crafts, in the 16th century

#### HISTORY

Early Examples.-The earliest known specimens of tapestry weaving of linen can be dated between 1483 and 1411 BC, for one bears the cartouche of Thutmose III of Egypt (1483-1451 BC), another of Amenhotep II (1451-1420 BC.); and the two, together with a third fragment carrying hieroglyphics, were found in the tomb of Thutmose IV (d 1411 BC) (see P Ackerman. Tabestry, the Mirror of Civilization, 1933, p. 12 and bib. p 344). The Amenhotep piece has the tablet bearing the king's name and titles upheld by uraes, set in a powdered pattern of lotus and papyrus flowers, with a narrow border on each side, one with lotus flowers and buds, the other with disks. Only the designs-in red, yellow, green, blue and brown-are tapestrywoven, the ground being plain cloth, in the tapestry areas the wefts are not kept straight, but curve to follow the drawing Thus the work is in effect bobbin-darning on warps left bare for the purpose

That these were made for Egyptian royalty does not by any means indicate that the technique was originally or distinctively Egyptian It is already fully evolved in these, the first examples, suggesting that the necessary prior development had been carried on in a region where conditions did not preserve textile fibres, and just at this period numerous Syrian ideas, techniques and undoubtedly also actual craftsmen were entering Egypt. That the craft was not indigenous can be assumed from the fact that, while countless mummy wrappings of the succeeding centuries have been unwound, comprising hundreds of yards of plain linen cloth of widely varying qualities, occasionally bearing some coloured stripes, no further instances of tapestry weaving are known to have been found in Egypt datable between this period and the 4th century AD, a lapse of some 1,800 years.

Fragments of wool tapestries in graves on the Kertch peninsula, datable in the 4th or 3rd centuries BC., carry stagheads and ducks in the Hellenistic style which was widely diffused but especially strong in Syria, and some 200 to 500 years thereafter the technique is represented again in a silk fragment, which though found at Loulan in central Turkistan (A. Stein, Innermost Asia, 1928, 1, pp. 242, 255, no L.C. vo2 a., Pls XXXI-XXXII) has close Sylian connections, This is a band showing in seven colours (three browns, one evidently originally purple, two greens, light blue and crimson) in a central zone, a scrolling stylized tree in the crown of which appears a bird's head; the whole designed to present alternatively a conventional bird (Raptores?) displayed, flanked by confronted griffons composed of a crested bird with deer (or horse?) feet, alternating with a symmetrical scroll. The border motive is a rosebud rendered as a heart in a deep calyx, and some of the multiple guard stripes are in con-tinuously graduated polychromy. The bird nesting atop a cosmological tree, and the double entendre are both west Asiatic. fantastic griffon variations are a persistent feature of Syrian design; the heart-rose is the standard border theme on later Syrian textiles, where also compound borders with variant guard stripes are frequent, while the unusual graduated polychromy appears on approximately contemporary wool tapestries at both Palmyra and Dura-Europos. Thus this tattered strip represents the same cultural linkage between the Mediterranean coast of Asia and its very heart, which accounts likewise for the Buddhist sculpture of northwest India of this same time (the so-called Gandhara style), for that is primarily of Syro-Hellenistic, rather than pure Hellenistic derivation

The wool tapestry with graded polychromy, found at Palmyra

(R Pfaster, Textiles de Palmyre, Paris, 1934, p. 36, no L 26), so onamented only with groups of square dots, but that from Dura (tdem, Rew des Aris Asataguas, vui, p. xxvi) bears stylized lines, and this figure, better drawn, appears also on wool tapestress found at Loulan which likewise may be assigned either to Syria or Persas (Stein, op et 1, pp. 241, 255, 256, nos LC v 03-06, op Pl XXXII) A closely related piece is known from south Russia Ci. Stephan, in Compte Remaid de la Commission Impériale Archéologique, St Petersburg, 1881, p. 143, Pl VI, no 3) Tapestry weaving must, then, have been common in western Asia and probably especially in Syria at the turn of the Christian era, and had climatic conditions been less unfavourable we should probably know a whole phase of the art now irretureably lost

Egypt.-The favourable conditions did exist, on the other hand, in Egypt, and consequently a mass of tapestry fragments has been recovered there, dating from the 5th to about the 10th century AD., and especially numerous from the 5th to the 7th centuries These are mostly garment trimmings, woven into or (in inferior specimens) sewed onto tunics and cloaks. Tunic trimmings (see Dalmatic) when complete consist of stripes over the shoulders (clavi) down front and back, varying in width from about 1 to 6 m., ranging in length from just below the belt to the very bottom, a neck piece, panels on the shoulders and near the knees which may be round (orbiculus) or rectangular (tabtion), and cuffs. Parts of pillows also are quite common, wall hangings far less frequent, and when in solid tapestry weave-in contrast to tapestry motives inwoven in cloth-rare and proportionately important. The last, notably a series of fragments in the Berlin museum representing dancers, in polychromy and silhouette (O Wulff and W. F Volbach, Spatantike und Koptische Stoffe, Berlin, 1926, pp 7-8, nos 9240-44, Pls 4, 5, 44), and sometimes the pillow panels, are naturalistic illustrations in a delayed Hellenistic style or subsequently in the early Byzantine style (best examples, Dumbarton Oaks, Washington, D.C.)

The garment trimmings fall into two main classes, indigenous desagns rendered either in polythromy, or more often in silhouette, most typically in some tone of purple (dyed with madder plus indigo), and designs copied, with more or less distortions, from Syrans shuttle-woven silk patterns (a distinction first established) by Straygowski, and repeatedly noted by Wulff and Volbach). In the former, constantly recurring themes are the vine, or less often ivy, the amphora, frequently with the vine growing out of it; nude women, nude youths or boys, including dancers often armed, and annuls, above all the lonn and the har—all explicable as descended from the Osiris cult and appropriate to burnal robes because of their relevance to revival in a hir after death.

In the patterns copied from Syrian models, the styles of the different great textile-producing cities there can be recognized, and subjects from the local cults, so that, analyzed in their wider relations, they throw considerable light on the history of religion, as well as of art

All types are woven with woollen wefts on linen warps, though a few with silk wefts have appeared, and cotton wefts are occasionally introduced to give a brighter white. Primarily in the 7th, and perhaps also the 8th century, the tapestry technique may be supplemented with embroidery, as in bo der margms, usually in split stitch. In a special variant which is not true tapestry the pattern, characteristically meanders or other geometric repeats, is executed with a free bobbin, "free" because it follows the design without regard to consistency of weft-direction, carrying a linea actually repply ground. The multiplicity of tones in polychrome pieces is noteworthy, especially from the 7th century on, and includes clear, delicate pastely

The Egyptian tapestry weaving deteriorated sharply to a very low level from the rth to about the rith century, when it was somewhat improved, though within a very limited range. Into white (or sometimes dyed dark green) linen garments were woven in tapestry, sometimes in wool, often in silk, occasionally with metal-thread enrichments, trimming bands in varying groups, ranging from a half-inch to a foot and more in width, with pat-

terns of geometric enlacements, frequently enclosing small quadrupeds or hards (ducks) highly stylzed, and inscriptions. Many of these merely simulate writing, but many are legible, in handsome angular ("Kufte") scripts on enlier pieces, in cursive scripts later, giving religious phrases, or the names or titles of rulers, occasionally with the place-name also (trråz) A characteristic colour combination in silk is golden yellow and scarlet

Syria.—Meanwhile from the 6th to 8th centurnes and doubtless from then on, in Syria, striking wood lapestries were being made, corresponding in style to the contemporary shuttle-woven silks, with animals or birds (commonly cocks) in energetic heraldic stylization, framed in roundels, almost always on a red ground (Pfister, in Revine des Arts Assirgiess, 3m). And later, from the 1rth to the 13th centuries, silk and gold-thread tapesries (E. Kumsch, in Zeitschrift µn bildende Kunst, n i 14) were produced in Syria, highly distinctive in style and illustrating one of the great Syrian pagan religious, which were still active in the old Pheomician cities when the Crusaders took them over, and have left a leggacy in west Asia in the so-called devil-worship of

the Yesida (q\*p\*).

Persia—Of the Persian tapestries fewer specimens have sur vived, but one notable fragment (Moore collection at Yale university) bears an bear in the impressive Sassaman style (Pope, ed, op. et.), 1, p. 708), and a single piece from the Seljuk period (rith century) establishes the maintenance of the technique (ibid., m., p. 738). This reappears in the 16th century, intermediate examples having all apparently been destroyed, as the medium for rich silk and metal-thread rugs, and for a very beautiful type of figural designs, of which only three are known still to exist of figural designs, of which only three are known still to exist 1940. The control of th

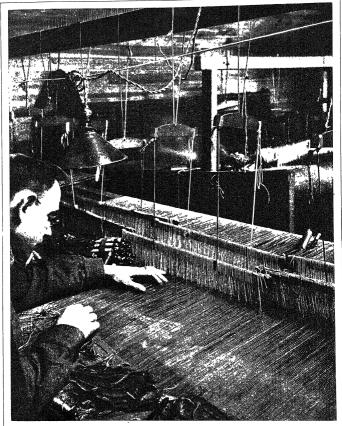

The modern descendants of these, occasionally silk but more often wool, in slit tapestry, with simpler patterns, are the familiar kulims; and the type extends, with variations in decorative style, through the Caucasus and Asia Minor into eastern Europe

Far East.—The technique had long since been in use also still further to the east in China, and there, in the original land of silk, silk was the typical material, in a fine, light texture, the wave finished perfectly on both sides so that the panels are reversible. The warps are vertical in relation to the pattern. The "metal" thread, which is quite common, is the thinnest possible gold-leaf applied to tough paper, cut in narrow strips and spirally wound on a silk core.

The earliest surviving examples, dating from the Tang and early Sung periods (8th to roth centures), show only simple repeating patterns—flowerets, vine elements, ducks, lions—but are probably not representative of the full development of the time since they come only from remote desert stations of central Asia (P. Ackeman, Tapetry, the Mirro of Cruitsation, pp. 237–238, ref. pp. 466–407) Subsequent examples, which are not numerous until the Ch'ing period (fed4–1912) when they are rey abundant, depict the same subjects as contemporary paintings, birds and flowers, landscapes, folktoristic and religious subjects, with the addition of symbolic complexes, notably selections of "Precious Things." Bepecially plentiful are squares from official robes indicating rank (Cammann, in Bull. of the Needle and Bobbin Clab. 26).

The technique travelled from China to Japan in the Ashikagaperied (15th century), where it was used for characteristic libertaritive motives, also in silk as a rule, and with vertical ways, but with a considerably coarser texture than that familiar in Chinese work. The history of the art in Korea remains obscute, but rather coarse wood tapestry-woven rugs from there, with stylized motives, are well-known in western markets (Ackerman, op.cif., pp 231– 233 and refs. p. 407).

Western Hemisphere.—How and when this, and a number of other complex Asiatic textile techniques, were transmitted to the Americas is not known. That they could have been independently re-invented there, as anthropologists have sometimes taken for granted, is hardly credible. But examples of a fully established technique and style appear, perhaps as actify as An 600-700 in

to light from the coastal sites of Peru, datable from about the 8th to the 12th centuries (thid, ch viv, P Kelemen, American Medicual Art, ch vi)

These are found on bodies, buried-characteristically in a squatting posture-fully dressed, indeed often wearing a multiplicity of garments hardly feasible in life, and padded and heavily wrapped into an approximate ovoid. The principal articles are tunics, for men, varying in length and with or without sleeves, for women, full length, or in the Incaic period, a long skiit held under the arms with a sash; for both, enveloping mantles, breechcloths for men and boys, belts, head-bands, bags, curtains and pillow covers (Excellent collections, Lima Museum, Brooklyn Museum, American Museum of Nat Hist, NY, Textile Museum, Washington, DC)

The warps of the tapestries are of undyed cotton (the cotton of the region being naturally either white or brown), the wests of wool-llama, alpaca, or vicuna-with cotton sometimes introduced for bright white The range of available colours-made with natural dyes of all three classes-is large, for the most part in saturated tones, the compositions are usually quite polychrome

and powerful contrasts are preferred

The patterns all derive from the local cults a feline divinity. in some presentations fantastically adorned; an anthropomorphic deity, or more likely several distinct personalities, ordinarily with an elaborate head-dress and trequently carrying a staff, birds, including the eagle and the conder, fish Plant motives are comparatively rare All are angularly conventionalized, with the rectangle and especially the diagonal as substructure, the style showing a marked preference for meanders and reciprocals. The latter range from the most rudimentary, the serration, with its section the Z or its magnification the chevron, to complex developments of overturned interlocking figures of naturalistic origin, notably condor heads, original in this region

In the degeneration of the art in the later middle ages, the characteristic principles appear elimination-as, omission of the mouth; fusion-as, nose and mouth merged into one spot, exaggeration-as, human profile reduced to a huge nose, part-forwhole-as, the feline represented only by its claw; but the application of these devices of deteriorating conventionalization is unusually extreme, so that these inferior phases of the art became very popular in the World War I Paris Decadent school

Though a great advantage of tapestry is its flexibility which makes unnecessary repeating patterns, these strongly predominate in the Peruvian use of the technique in all periods. The organization of the repeats follows in part basic textile forms relevant to shuttle weaving, viz : (i) stripes, (ii) bands, (iii) rectangular checks, implicit or explicit, but schemes unrelated to the fabric structure also are used, eg. (iv) diagonal stripes; (v) chevron stripes, (vi) lozenge checks Within these frameworks, the succession, whether of motives or of colour changes, is often exceptionally complex. The usual unit is three, or its double, six-the latter a peculiarity of textile design in this region throughout its pre-Columbian history-and the permutations thereon are numerous, varied, and not infrequently remarkably ingenious.

After the Spanish conquest, European designs were supplied to highly skilled Inca weavers who executed them with their own modifications, producing an effective hybrid style (good examples,

Boston Museum of Fine Arts).

Probably the technique was also current in the other highly evolved pre-Columbian cultures of Central America and Mexico; but climatic conditions there have been destructive of all textiles

Europe: "Gothic" Period.—Tapestry weaving does not appear in Europe until the middle "Gothic" period.—though the technique was probably used in classical Greece and Rome-the oldest surviving examples dating from the 12th century, of German provenance (Halberstadt cathedral). These show the "History of Abraham," "Christ and the Apostles," and "Charlemagne" amidst four classical scholars, all three in crude but vigorous drawing (B. Kurth, Deutschen Bildeppiche des Mittelalters, pp. 38-53, Pls. 3-11)

From the 14th century the history is continuous, and it is in

the Andean culture, while a vast amount of remains have come this phase, in the Paris shops, that the highest aesthetic level is attained, in a superb series-however maltreated by time and restorers-illustrating the Apocalypse, ordered in 1377 by the Duc d'Anjou from Nicolas Bataille, and based on cartoons by Jean de Bondol of Bruges (Angers Museum, impressive colour plates Demotte, La Tap Gothique, NY, 1921-24, Pls 2-14) A dignified panel shows King Arthur as one of the Seven Heroes (Sept Preux) (formerly Mackay collection, now in the Metropolitan Museum, NY), and a superb related series has been for some years in commercial hands but remains unexhibited and unpublished

From the 14th century tapestry was used not only for wall hangings in the houses of the rich, churches and secular public buildings, but also for covers for cushions, chairs, benches, tables, beds, for canopies, for horse and mule blankets, and sometimes

as rugs

In the 15th century the production centre shifts from Paris to the Low Countries, with major "schools," more or less successive yet overlapping, in Arras, Bruges, Tournai and Brussels No examples are known definitely assignable to Arras, but the town can perhaps be credited with a few damaged panels of the early 15th century, notably a series (in the Musée des Arts Decoratifs, Paris), with small-scale ladies and gentlemen amusing themselves outdoors, against a dark blue ground, strewn (rather sparsely here) with little flowering plants and bushes, a type which, with or without personages, but usually with at least animals and birds, continued for more than a century, and was known as menues verdures ("small verdures"), but is called in the modern market mille fleurs ("thousand flowers") These and scattered related pieces have a childlike charm, but are by no means great, and the same would be true of the contemporary Tournai style, known from remnants of a series illustrating the lives of St Piat and St Eleuthère made for Tournaı cathedral by Pierre Feré in 1402

Within two or three decades, however, a distinguished and energetic style had evolved there, impressively exemplified by the "Passion," of St. Mark's, Venice, which lay for generations disregarded under the basilica's roof (Dedalo, 1925) Tournai production continued important through the century, with variations in style and in divergent qualities, but characterized in general by vigorous silhouette drawing, effective narrative action and the necessary combination of carrying-power with detail-flowers, animals, architectural elements, textile designs and other costume elaborations-to provide surface enrichment and interest for closer examination. The weaving is competent, especially the deliberate exploitation of the technical peculiarity of slits in facial delineation; the colours are substantial to suit the heavy texture but clear and telling, and most of the dyes have held well, save for purples which have usually browned

The dukes of Burgundy, enthusiastic tapestry collectors, were good customers, employing especially the Greniers, but only remnants of these great sets have survived Famous existing sets include: the Beauvais cathedral "Life of St. Peter" (2460), the widely scattered "Trojan Wars" (based not on Homer but on Raoul Lefèvre's Recuyell, 1420, published in translation by Caxton, 1474, which derived from the much-discussed work of Dictys Cretensis); the Saragossa "Esther"; and numerous hunting and peasant scenes, the last very popular as part of the current vogue of pastoral romanticism. When the "school" was first defined (by Dr. Betty Kurth, Götische Bildteppiche, 1923), attributions to it were too sweeping, the then unrecognized Bruges "school," especially, becoming engulfed in it; but even as now reduced, the work of Tournai from the 15th and early 16th centuries remains of primary importance.

The identification of the cartoon painters has been generally neglected, though the possibility of deciphering their "signatures" in decorative inscriptions on the tapestries themselves has now been repeatedly demonstrated (P Ackerman, Rockefeller-McCormick Tapestries, Ap. I), and actually a critical comparative study defines in the four cities (Arras, Bruges, Tournai and Brussels, with Antwerp as a probable fifth) more than 60 masters, of unequal merit and productivity, of whom some 70% are known by name, with information on them available in guild and other documents Outstanding in Tournai are the LeOuien and LeFeire haps, with ribbons. families, and their respective pupils

But the most famous cartoon-painter whose work was executed on Tournaı looms was Beaudoum Bailleul, famous first because he was called on to design perhaps the most important series of the time, the "History of Gideon" provided by Philip the Good, duke of Burgundy, for his new Order of the Golden Fleece; and second because Bailleul had the unique honour of being mentioned by Jean Lemaire in his Couronne Margaritique. No trace of the "History of Gideon" has, as yet (1945), been found, but, contrary to the usual assumption, this does not mean that Bailleul's work has all disappeared, for it can be recognized in the two great panels from the "History of Clovis" in Reims cathedral (C. Loriquet. Tapisseries de la Cathédrale de Reims, Pls I, II), and likewise in several pieces in American collections

The most conspicuous family of weavers at the turn of the 15th century were the Poissoniers of Tournai, who produced some exotic series inspired by Vasco da Gama's trips to the Indies, and a new style of grande verdure suggested by Indian printed (or painted) cottons. An upper border treated as a bell-fringed valance is a striking recurring feature (Annual, Museum of Ait, Providence, R I

Many other Tournai tapestries have been assigned quite arbitrarily, without a shred of evidence, to a fictitious "school of Tours" or "of the Loire valley," and the uncritical repetition of this chance guess seriously impairs the value of most current histories of the art, in respect of this period. Actually, the Tours looms began producing only in the Renaissance, and were never really important.

The Bruges "school" has been completely overlooked, most of its productions being merged with those of Tournai, it displays a tonic uginess of real aesthetic force, typified by the Doria Palace (Rome) "Alexander." More elegant but still characteristic is the "Lady with the Unicorn" series, from the first decade of the 16th century, in the Cluny museum (Paris), widely familiar because various elements from it have been utilized for countless needlepoint patterns. Six allegories of the Virgin are gracefully presented, with the romantic worldliness typical of the period, against menue verdure on a light red ground

Borders are lacking on practically all the earlier tapestries (the "Passion" set in St. Mark's, Venice, is a fine exception), but rouleaux bearing descriptive texts often finish the top, or less often the bottom, while the multiple scenes are divided from each other and thus framed on the sides by slender columns, fre-

quently depicted as embossed gold and jewelled.

At the end of the 15th, and during the first quarter of the 16th centuries, the Brussels looms became very active, relying for cartoons, however, in the first instance on Antwerp painters. The type, markedly standardized, represents precisely the same taste as the funerary monument of Marguerite of Austria and Philippe de Savoie at Bourg-en-Bresse, and indeed the artist, known as Jean van Roome, who designed the tomb sculptures there, was responsible for a number of tapestry patrons. Various other nameable painters, however, used essentially the same manner. Thus a Maître Knoëst, known from a signatory inscription (M. Crick-Kuntziger, Maîts e Kuoëst, Liege, 1927), employed it in its most conventional form, while a long-discussed Maître Philippe, finally identified as Philippe de Mol (Apollo, 1931), was a more talented and finished practitioner.

The compositions in all this stylistic group are crowded with figures, often closely packed, in bouffant costumes but commonly unpatterned, so that the undifferentiated faces seem to be inset in a mass of heavily modelled stuffs. Mediocre examples abound (notably in the Spanish state collection: see Valencia de Don Juan, Tapices de la Corona . . . ; or Tormo y Monza et al., Los Tapices . . .), but a somewhat more distinctive use of the idiom is seen in the numerous, distributed series of the "Redemption," of which several large panels passed from the Hearst collection into the Metropolitan museum. An extensive "History of David" in the Cluny museum (Paris) shows a more elegant phase of the style. Throughout this class the border, only a few inches wide, follows a formula: a garland of roses, daisies, grapes, tied, per-

A modified and revitalized edition of this style, with more sensitive aesthetic imagination, was used by the well-known painter Bernard van Orley (c. 1490-1540) in the set of Hunts illustrating the months, commonly known as the "Hunts of Maximilian," though erroneously since they postdate that emperor. In a related manner, but revealing another personality, are panels illustrating the legend of Notre-Dame de Sabion, quite possibly the work of Bernard's brother, Philippe (Ackerman, Tapestry, the Muror of Civilization, p 371)

Both designers and weavers in all the Low Countries cities were organized in guilds, and especially the latter had careful regulations, carrying effective penalties for violation, to protect on the one hand the workers, and on the other, craft standards

During this period, colours are predominantly dark (20, 30 or as many as 40 shades being used in a composition); the texture tends to be coarse; silk if used at all is, as a rule, limited to highlights, and metal thread is rare

The Renaissance.-The placid quantity production which was bringing prosperity to Brussels guildsmen was suddenly disturbed in 1514 when Raphael executed a series illustrating the "Acts of the Apostles," to be woven by Pieter van Aelst of Brussels for Pope Leo X. The painter, secure in his own medium, made no concession to the unfamiliar medium for which he was working. Air, depth, light, all alien to the conventions for a flat, rough, heavy, woven hanging, envelope large, solidly modelled figures, with little respect either, on the one hand, for the silhouette needs of textile arts, or, on the other, for the detailed elaboration necessary to embellish a woven surface. But the new manner, erroneous though it largely was in this translation, succeeded so well, that it soon supplanted lingering descendants of the old local cartoon styles, and for the next 150 years Brussels turned out one set after another in stereotyped exaggerations of the Raphael innovations Whether it be Jacob from the Old Testament, or Scipio from Roman history, Charlemagne, Cyrus, Venus. or the Virtues and Vices, it is always a cluster of huge, over-dramatic figures rendered with exaggerated highlights in a perfunctory setting. Borders become wide and elaborate, with swags, scrolls, masks, trellises, urns, sculptures.

Shades are higher keyed with a preponderance of tans and yellows, gradations more gradual, strong colours like red are used chiefly for contrast (and have not infrequently faded, leaving the fabric still more weak and flat); silk is lavished on the more expensive qualities, increasing the unsubstantiality; and occasional pieces are heavily brocaded with gold, characteristically "basketwoven" for maximum ostentation.

The characteristic grande verdure of the time, a specialty of Enghien, has the field filled with huge scrolling serrated leaves reminiscent of the acanthus, sometimes with flowering plants, usually with birds and insects.

Among the outstanding Brussels families in the craft were the Pannemakers, Geubels and Leyniers, the last continuing into the 18th century. From 1528 on it was obligatory to weave the Brussels city mark-an escutcheon flanked by B's-in the selvage. and the shop mark also was usually inserted.

Scattered weavers in Paris, working in small ateliers of two or three looms during this period produced similar pieces.

The dominant influence in the Brussels industry in the 17th century was Rubens (1577-1640). His most famous set was the "Triumph of the Church" designed to the order of Archduchess Isabella of Spain (1627-28), but imitations and adaptations of his style were legion. The Renaissance qualities were pushed further: more monumentality, drama, bombast. Heavy, elaborate columns are often substituted for side borders. Additional weaving shops became important, such as those of the Hyckes, and the Raes.

Flemish Weavers Abroad .- The persecution of Flemish Protestants in the first half of the 16th century drove many craftsmen, including tapestry weavers, out of the country, while throughout that century others travelled seeking their fortunes, and such itinerant masters established more or less enduring shops, from England to Italy. Thus the Sheldon looms (E. A. B. Bannard and A J B. Wace, The Sheldon Tapestry Weavers, Oxford, 1928), while founded in the first half of the century by Richard Hyckes, who had learned the craft in Holland, was manned from 1557 on by Flemings and Englishmen, roughly half-and-half. The most individual creation was English county maps; the major output, cushion-covers in a provincial version of the Flemish Renaissance style. The enterprise expired in 1614.

Again, Flemish and French weavers collaborated in the court looms at Fontamebleau, founded by Francis I (c 1535), and carried on by Henri II. Surviving examples are few, but the best show far more delicate grace than contemporary work to the

north

When Gian Giacomo Trivulzio of Vigevano had a set of the Months made after cartoons by Bramantino (d. c. 1536) in 1509 (Sunda, in Bull Needle and Bobbin Club, 27), he employed as head weaver Benedetto da Milano, but the work shows a Flemish touch, so either Benedetto was an emigrant who had so journed in Milan, or was Flemish trained. The house of Este in Ferrara employed Flemish tapestry weavers most of the time from 1436 to 1507, often as repairers but also to execute cartoons by Italian artists (like Cosimo Tura), and the Karcher factory there from 1536 on was quite productive. Outstanding is a gay and elegant series decorated with playing button, made for Cardinal Hercules Gonzaga (1527-1563), after cartoons most likely by Battista Dossi, executed in silk and metal thread (Gulbenkian collection,

The first regular shop in Florence was established by a Brussels worker, Jan Rost, for Cosimo I de Medici (1510-1574), and production continued there, under various auspices and in fluctuating volume, to the middle of the 18th century Bronzino, Bachiacca, and Pontormo were among the noted painters who provided designs. The selvage city-mark was FF. The art never became important in Venice, and efforts elsewhere in Italy, though fairly numerous, were slight and sporadic until much later,

and that is equally true of Spain

Germany and Switzerland.-Meanwhile, from at least the middle of the 14th century, nuns in their cloisters and ladies in their castles scattered over Germany and Switzerland had been busy at their looms weaving illustrations of their legends, both religious and secular. These are for the most part rather smaller -long narrow strips, modest panels or cushion covers, coarse in texture, simple in shading, limited in palette but with clear strong colours effectively contrasted. Doll-like figures, monsters half fairy-tale and half heraldry, undulant banderolles with naive explanations in bold Gothic lettering, scrolling foliation, stiff flowerets, often combined with textile-patterned back-drops, combine to give a toyland charm (excellently presented by Kurth, Deutschen Bildteppiche . . . , with numerous admirable plates).

This domestic type continued into the 17th century, but in addition, various shops were established for longer or shorter periods by wandering Flemings, who achieved usually pseudoprimitive simplifications of their native style. An exception is the looms of Seeger Bombeck in the middle of the century, at Leipzig and Weimar (see also, H Schmitz, Buldteppiche).

Scandinavia. The Scandinavian countries likewise had a well established domestic, semi-amateur tradition of tapestry weaving, and it has proved unusually persistent. Fragments of tapestry were found, showing bits of figures and trees, in the Oseberg ship which had been used for a chieftain's tomb in the first half of the oth century. A section of a narrow horizontal strip in Oslo dating from the end of the 12th century shows two awkward but amusing figures against an arcade, illustrating April and May (see H. Dedekam, Baldesholtaeppet).

Examples assignable to the next five centuries are lacking, but from the 17th century on they are quite numerous, with four subjects often repeated: the "Adoration of the Magi," the "Mar-riage at Cana," "Salome Dancing," and the "Wise and Foolish Virgins." In the 19th century craft movement, systematic and successful efforts were made to revive the art, and serious artist craftsmen have produced sound and attractive work (see The American-Scandinavian Review, xv).

Meanwhile, in Sweden, at Kalmar, a shop was carried on for a

quarter of a century (to 1570) with Flemish weavers under ducal protection, and later Charles IX (1550-1611), as part of his planned economy for national prosperity, established a factory at Eskilstuna, which, however, hardly survived him (see J F. Bottiger, Svenska Statens Samling

French State Shops .- Henry IV of France, another king who planned his nation's economy, included in his program, which emphasized the luxury production that has ever since been industrially important in France, tapestry looms, and made his first step towards these by establishing a shop under Gérard Laurent in the Faubourg St. Antoine, which was later (1608) moved into the large gallery of the Louvre. Here, manned primarily by haute-lisseurs, it continued until 1671, producing, for example, a "History of Psyche" (which was also woven in Brussels and in the Gobelins), the "Lives of St Gervais and St. Protais," and

various other classical subjects Meanwhile at the turn of the 16th-17th centuries, two Flemish weavers had been brought over by government arrangement to establish basse-lisse looms (de la marche) in Paris: François de la Planche (or Franz van den Planken) and Marc Comans. Satisfactory working conditions were found for them in an old dve-factory on the outskirts of the city which had belonged to the Gobelin family, and so began the establishment commonly

known by that name, which has lasted ever since.

One of its first ambitious productions was an allegorical invention lauding Catherine de Medici under the guise of Artemisia (P. Ackerman, Tabestry, the Mirror of Civilization, ch x), the petits patrons chiefly by Antoine Caron (c. 1515-1593), who also collaborated with Laurent Guyot on a "History of Coriolanus" (first known weaving, 1600), and he in turn collaborated with Gaston Dumée on the long-repeated "Pastor Fido" set. Meanwhile the shop had a valuable asset in Rubens' "History of Constantine," and also they had revived a 16th century pastoral romance of enduring popularity, the "History of Gombaut and Macée," a symbolically typical peasant couple.

De la Planche died in 1627 and was succeeded by his son Raphael, who four years later broke with the Comans family and moved his share of the business to the Faubourg St. Germaindes-Près, leaving the Comans at the Gobelins Competition between the two thereafter repeatedly became bitter, but despite this, both continued to produce in considerable quantity, as well as good quality, until they were superseded in 1662 by the royal

Colbert, as usual alert to profitable possibilities, recruited skilled personnel, not only from the de la Planche and Comans shops, but also from the old Louvre enterprise, and thus established ateliers of both horizontal and vertical looms As director, he utilized Charles Le Brun (1610-1600), already experienced with tapestry in a brief-lived undertaking initiated at Maincy (1658-1663) by Colbert's ill-fated predecessor in the finance ministry, Nicolas Fouquet, and the Gobelins shops were chartered as a royal factory in 1667 (see M. Fenaille, Etat Générale . . . des Gobelins . .). Le Brun himself created the most important sets, such as

the "Elements," the "Seasons," and above all, the Louis XIV," supplemented by the "Royal Residences," 37 large panels altogether.

His rather portentous academicism dominated also the work of Antome and Charles Coypel (1661-1722, 1694-1752), and a halfdozen other designers who devoted themselves to classical and Biblical themes; but a lighter spirit was introduced by Claude Audran the Younger, with his talent for decorative inventions.

especially in the grotesque manner.

Louis XV (1710-1774), in his turn, was celebrated in a set of "Hunts" by Jean Baptiste Oudry (1686-1755). But the outstanding artist working for the factory during this reign was François Boucher (1703-1770), whose gay sophistication, presented with childlike charm yet polished elegance in delicious pastels, posed new problems for the weavers. Now indeed they must learn to paint with a bobbin, and to this end hundreds of new dyes were perfected for both wool and silk, until about 10,000 hues were available, to effect almost imperceptible tonal modulations; and interlocking of the wests was introduced to

render the transitions practically invasible, while the finest textures practical were used, from 70 to Occasionally as many as 40 warps to the inch A femmized frividous classicism imbued the "Loves of the Gods" (on which other pantiers also collaborated), the "Elements," the "Metamorphoses" Benard van Orley's "Hunts," revuevd and refutivished, proved popular.

Both Oudry and Boucher worked also for another major statesubsaduzed factory which had been carried on at Beauvas by two Flemmgs, Louis Hihart, for 20 years (1664–1654), and Philippe Behagle for 27 more (1684–1711) see J Badin, La Manufacture. de Beauvan) Oudry was attached to this factory as official painter under the next notable director, de Mérau (1722– 1734), and made for it a seuse of romantic "Hunts," "Pastordi

1734), and made for it a sense of romantic "Hunts," "Pastoral Amusements," four "Comedes of Moliter," and undet the subsequent director, Nicolas Besnier (1734-1753), his famous "Fables de La Fontaine" During this last regime, Boucher began to purvey to the looms (1756), creating the Italian fêtes, Chinese scenes, and vancius politely groomed pastoral scenes with titilating erotic overtones. The factory has always been especially noted for furniture and screen panels.

Meanwhile Charles Coypel produced the great "Don Quixote" set, brilliant decorations But by the end of the century, though technical standards were maintained, artistic deterioration had set in, and in the next 125 years it accelerated disastrously

Two new types of decorative panels appear at the height of production, the architectural composition and the grotesque. The former usually shows a complex arcade with massive balustrade on which stand urns of flowers and perhaps a for or two, as peacock with trailing tail. In the latter a nonstructural architectural tracery defines a complex of varied panels, framing a medley of festoons, scarves, vases, musical instruments, putti, masks, comedy-actors.

A third factory at Alubusson, which had been operated as a modest private undertaking for a century and a half, also was chartered as a royal factory in 1665, but practically all the output here was relatively coates maternal for the open market. The most effective pieces are pseudo-Chinese subjects. Coarse verdures, usually dull in colour, were made in quantities The Alubusson architectural panels either mittate those of the greater attelers, often with more complex elements and the addition of ammals, or depict a damasked wall hung with a painting or cluster of decorative objects, and garlands. The factory was especially successful in its production of carpets, with conventional or floral designs.

In all three shops the idea of tapestry as a woven picture was so predominant that the commonest border was a woven imitation of a carved and gilt frame

Apprentues in these factories, in order to attain the rank of master, had to produce a small specimen of their work with a difficult subject. Sometimes an elaborate vase of flowers was chosen, but often copies were made of paintings in the royal collection, and similar little pieces were made by the weavers in their own time to supplement their income.

their own time to supplement their motions.

Between World Wars I and II an effort at renewal was made in both the factories, but especially at Beauvais, by patronizing painters of the Paris Decadence school. The results were in kind

England.—The enterprise of Henry IV of France inspired James 1 of England to do likewise, and in 160-be set up the Mortlake shops. However, most Mortlake tapestries are "English" only by courtesy, for not alone the weavers, but also the cartoons were imported from Flanders, or the latter were painted by Flemings. The one notable exception as the "Battle of Soley" series in Hampton Court palace. In the 18th century, Flemish weavers in England (totably John Vanderbank in Soho) produced picturesque and distinctive grotesques in the Chinolisein

In 1872 William Morris, as part of his campaign to resuscitate handwork in order to combat the human fills resulting from machine industry, established tapestry-looms which in 1877 were moved to Merton Abbey, the name by which the shop was thereafter known. Cartoons with plant patterns were supplied by Morris himself, in his careful style, while figure pieces by Edwards.

Burne-Jones are typically pre-Raphaelesque Colours are clear but rather heavy, in the late Gothic taste, and nostalgic antiquarianism has hovered over the factory's work almost without alleviation ever since

Spain.—The Santa Barbara factory of Madrid, famous for its panels after Goya designs, was established in 1720, under a Flemmg, Jarob Vandergoten, who dued three years later, but was succeeded by his five sons, the whole family being basse-lisseurs. In the first half-century the work that issued from under their hands was all minature of current foregan syles, first Flemish or French, then Italian Later in the century, however, a local style was introduced by the painter Francesco Bayery v Sabias (1742-1795), whose cartoons present romantic illustrations of Spanish life in a hard but incluresque style

Finally Spain got a great painter who was viridly native in insight and expression, Francesco de Goya (1746-1828), and between 1776 and 1791 he supplied 45 cartonos. Intense, sharply characterized, dramatic without being theatrical, these designs, though they nake no special adjustment to the medium, are of such intrinsic interest that they are self-justifying, as they are self-existent.

The Low Countries.—Brussels continued to be the predomnant weaving centre of the Low Countries and the most characteristic cartoon painters were the two David Temers (1670-1690, 1638-1685), father and son, whose cartoons were repeated and style imitated throughout the 18th century. Their peasants, usually in small scale in a landscape setting, are entertaining, and the total effect is agreeable. Forest scenes treated as illustrative verdures were woven here and in other Flemish cities in great quantities. The industry died in Brussels in 1704.

Holland was never of pumary importance in the history of the industry, though the shop of François Spiennx hd competent work in the 16th century. The most characteristic product of the country is cushion covers with the armorial bearings of cities and city officials.

Other Countries.—Cardinal Barberini in Rome employed several Flemish weavers in 1633 or 1634, and the looms continued to produce almost to the end of the century, fluctuating between French and Flemish styles. Other looms established in 7710 in the Hospital of San Michele by the pope, which endured hinto the 19th century, alternated between woven copies of Italian paintings of the time, and imitations of Flemish verdures A factory founded in Naples in 1740, which continued into the 19th century, imitated contemporary French styles.

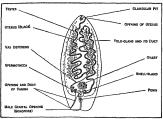

Peter the Great of Russia, as part of his program of modernizing his country in the French taste, established looms in his capital in 1716, with workers from the Gobelins The most striking productions are portraits of Catherine the Great.

In the United States, efforts were feeble In 1893 William Baumgarten, head of a decorating firm, settled Adubusson workers in New York primarily to imitate French tapestries In 1911 the painter, Albert Herter, created a shop to execute original designs and achieved some effective decorations (G. Hunter, Decorative Textlies, pp. 239-245)

Bullionaphily—No satisfactory comprehensive account is withinked and asket tipestime (or mideot textile in general). On Perevisian tappes of Asket tipestime (or mideot textile in general). On Perevisian tappes are the satisfactory and the satisfactory in green in Pereposal Textiles, Metropolitan museum (1930). All published accounts of the art during the 15th century in Europe are unsatisfactory, but for illustrations of "Godhir" pieces see. C. **TAPEWORMS** (cestodes or Cestoda), a class of endoparasitic Platyhelminthes (q v) in which the body is usually flattered and ribbon-like, and may be unisegmental or composed of a chain (strobila) of "segments" (proglotitides). In the latter

arthropod, but is probably to be looked upon as an adaptive device for the multiplication and dissemination of eggs. The number of segments in a complete strobila varies, in different species, from three or four to many hundreds, and the length of the chain from less than a millimetre to several metres. Each segment contains a separate set of reproductive organs, but the nervous and excre-

1-DIAGRAM ILLUSTRATING REPRODUCTIVE SYSTEM OF AMPHI LINA FOLIACEA. A CESTODE WORM, INFESTING THE BODY OF STURGEONS

tory systems are continuous throughout the chain Tapeworms have no mouth or alimentary canal, liquid food being presumably taken in by absorption through the body-wall. The adult worms are, with few exceptions, intestinal parasites of vertebrates. In almost all known cases the life-history involves an intermediate host and a somewhat complex metamorphosis.

General Morphology.-The body of the adult is covered externally by a cuticle, below which there is a cellular subcuticular layer All the internal organs are embedded in loose parenchymatous tissue. In most forms the parenchyma contains numerous "calcareous corpuscles"-small refringent nodules composed mainly of carbonate of lime The function of these is unknown Possibly they are merely stored-up excretory products The musculature consists mainly of longitudinal fibres, often in definite bundles and situated, for the most part, rather deeply in the parenchyma

In the segmented forms there is, at what is usually called the anterior end, a specialized "head" or scolex, serving as an organ of fixation This is generally provided with muscular suckers or variously modified sucker-like organs known as bothria or bothridia, and may, in addition, bear a central proboscis-like structure. the rostellum, which is commonly armed with cuticularized hooks The region nearest to the scolex is the zone of proliferation of new segments, which are, as a rule, continually being formed throughout the life of the worm. As they pass back along the strobila the segments become successively sexually mature and finally gravid, the most posterior usually containing little but a uterus crowded with eggs.

The nervous system consists of an intercrossing system of nerve-fibres and ganglionic cells at the anterior end (in the scolex in strobilate forms), and usually a single pair of main lateral nerve cords which are continuous throughout the body and without segmental ganglia. The excretory or "water-vascular" system is composed typically of two pairs (dorsal and ventral) of main longitudinal canals, continuous throughout the strobila and connected together anteriorly.

The animals are, with rare exceptions, hermaphrodite, each individual, or each segment in strobilate forms, being potentially male and female The male duct and the vagina may have separate apertures or may open side by side into a common atrium. There is considerable variation in the position of these openings In unsegmented forms they may be terminal, subterminal or ventral, while in segmented forms they may be on the ventral surface

case the segmentation is not comparable with that of an annelid or on one of the lateral margins of the segment. The essential organs of the genital apparatus do not differ greatly from those of other groups of Platyhelminthes The oviduct connected with the ovary and its associated glands, and with the inner end of the vagina, leads into a uterus in which the fertilized eggs are accumulated

Classification .- There have been considerable changes during recent years in the systematic arrangement of this group. The older division into unsegmented forms (Monozoa) and segmented forms (Merozoa) has been generally abandoned, since it does not correspond with an arrangement based on internal anatomy It is now customary to divide the Cestoda into two main subclasses, the Cestodana and the Eucestoda or cestodes proper The former group contains two families of unsegmented forms, parasitic in fishes.

- (1) Amphilimdae, with a protiusible proboscis at the anterior end and a very long uterus traversing the body length three times and opening near the anterior end, whereas male and vaginal pores are posterior.
- (2) Gyrocotylidae, with a frilled margin, posterior ruffled rosette, and uterine, male and vaginal pores in the anterior body

The Eucestoda include a large number of the more typical tapeworms, sometimes unsegmented but usually with a long ribbonlike body divided into a few to many segments and with a scolex There are five main orders although others may be necessitated by recent findings of unusual species

I Phyllobothrioidea These are intestinal parasites of elasmobranch fishes and are characterized by the four mobile, often large and leaflike bothridia which may be armed with hooks or subdivided by senta

II. Diphyllidea This order includes only the genus Echino-bothrium, parasitic in elasmobranch fishes These are segmented tapeworms of not more than 20 segments with a scolex having

two bothridia and with a spiny "neck" region behind the scolex III Tetrarhynchoidea These tapeworms, also parasitic in the intestine of elasmobranch fishes, are distinguished by the four protrusible proboscides covered with hooks or spines that can be everted through four openings on the scolex. The scolex in addition has four bothridia or bothria

IV Dibothriocephaloidea This order, inhabiting the intestine of various vertebrates, includes a number of unsegmented tapeworms such as Caryophyllaeus and Archigetus and also many segmented types. The scolex is usually provided with two shallow bothridia Heie belongs Diphyllobothrium latum, a human parasite whose complicated life history is discussed below.

V Taenioidea This is the largest and most important order, including all the more common tapeworms of higher vertebrates The body is always segmented and the scolex bears four true suckers or acetabula, often with the addition of a rostrellum armed with hooks. The life cycle includes a bladder-worm stage (see below).

## LIFE HISTORY

Development.-The eggs of Cestodes are usually enclosed in two membranes, one of which may show cuticularized thickening, forming a hard "shell." In the Bothriocephalidea the shell is provided with an operculum at one pole, like that of a digenetic Trematode The embryo, at the stage when it is ready to hatch. is a spherical or oval mass of cells (called an "onchosphere"), provided at one pole with cuticularized hooks, of which in most species there are three pairs-hence the name "hexacanth embryo." In certain Amphilinoinei, however, the embryo has ten hooks. The embryonic hooks are used as levers, chiefly in burrowing among the tissues of the intermediate host.

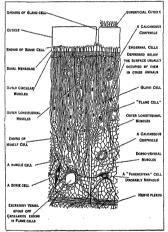

In some of the Dibothriocephaloidea the embryo is provided with an external ciliated envelope and hatches in water, where it swims about by means of its cilia. In the human parasite Diphyllobothrium latum, for example, the ciliated embryo is at first free in fresh water and is then swallowed by a small copepod (Cyclops or Diaptomus). Shedding its ciliated coat, the embryo penetrates into the body-cavity of the copepod, and develops into a more elongate form called the procercoid If the copepod is swallowed by a suitable fish, such as a pike, perch or trout, the procercoid, develops further among its tissues into a pherocercoid, and is then infective for the final host, infection being acquired by eating the fish in a raw or impetfectly cooked state

For the development of this species, therefore, and of others related to it, two successive changes of host are required. The larval forms known as Sparganum, which occur in many land vertebrates, including man, have been shown to be the plerocer-

coids of Diphyllobothrum.

The larval forms of Tetrarhynchoidea, resembling the scolex of the adult, without the strobila, or with only an unsegmented appendage, occur encysted among the ussues of various marine

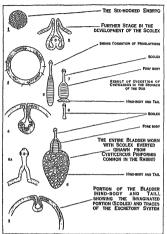

animals, chiefly teleostean fishes
Among the best known of the Taeniidea the developmental Instory is quite different. The human parasite Teema solutum may be taken as typical. If an egg of this worm be swallowed by the proper intermediate host (in this case the pig) the beacanth empty is liberated in the intestine and proceeds to pierce the intestinal wall, wandering about among the tissues and usually coming orest among the muscles. Here it grows into a small bladder, in opposite to the embryonic hooks. At the bottom of this invagination five thickenings appear, destined to become the four sucknown and the median rostellum. Finally the hooks are developed on the rostellum, and the bladder worm, or cystizeress, is fully formed

TROW LANKESTER, "TREATHER OR ZOOLOGY" (BLACK)
Fig. 2.—MICROSCÓPIC STRUCTURE OF A TAPEWORM. A PORTION OF A
TRANSVERSE SECTION THROUGH THE BODY-WALL OF LIGULA INTESTINALIS

Should this be ingested by a human being with raw or imagefactly concept pox; five "beat" is every animated and attaches itself to the limit of the littesthie, and the "neck" joining it to the bladder beignt to from its series of progletides. Another human parasite, Tomis signate, has a similar development, but is without hooks, and makes use of the ora si memerical the lost.

Many modifications occur in the form of the bladder worm, but the essential features of the development are the same throughout the order. In some forms the ougunal bladder worm gives rate to several or many scolices instead of the usual single scoley, a phase of asevual multiplication thus being introduced in the aud-onastic of the sheer (Teamus on Multicest multices).

FROM LANGESTER, "THEATHER ON EGOAGET (BLACE)

TEG. 3.—DEVELOPMENT OF A TAENIID TAPEWORM (TAENIA PISIFORMIS)

1-5, development of the six-hooked embrys, within the intermediate host, and successive stages in the formation of the head, 6-5, weighted the complete of the co

the bladder worm, which occurs in the brain and is often called a Coenurus, gives rise to numerous scolices, each capable of developing into an adult worm if ingested by a dog or other suitable carnivorous host.

In Echmococcus granulosus this phase of multiplication is elaborated still further, the original embryo developing in the intermediate host into a large and relatively thin-walled bladder or cyst ("hydauta"), from the inner surface of which there are budded off a large number of "brood-capsules," each containing from 10 to 30 scolices. Daughter cysts may also be budded off, and these may give rise to further scolices, so that altogether a very large number of potential adult worms may be formed from the original embryo.

This worm occurs, in the hydatid stage, in the liver and other organs of a large number of hosts, including man, sheep, ox and pig The adult is a very small worm with only three or four segments, and occurs in the intestine of the dog, wolf and fox,

As may be noted from the examples already given, the intermediate host is usually an animal likely to be devoured by the final host. Thus the dog harbours severat Taenioid tapeworms whose intermediate hosts are rabbits and sheep. The cysticerus of Taenia taeniaeformis of the cat occurs in rats and mice A number of species of Hymenolepis parasitic, as adults, in ducks and geese make use of small fresh-water Entomostrace such as Cyclops and Cybris as intermediate hosts Houseflies and earthworms are the vehicles of infection for several of the tapeworms of fowls Dipybdum caunum, a common parasite of the dog and cat, passes its cysticercus stage in fleas and in the louse, Trichodectes The louse is capable of swallowing the eggs of the worm, but the adult fles cannot do so Fleas become infected during their larval period, the eggs, when swallowed, hatching in the hinder part of the intesting and the embryo boring through its wall into the bodycavity Here they do not continue their development until the pupal stage has been passed, the cysticerci becoming fully formed only in the adult flea Infection is acquired by dogs and cats, and accidentally by man, through swallowing fleas containing them

The larvae of many of the Phyllobothrioidea, whose adult forms are found in the spiral valve region of the intestine of sharks and rays occur among the tissues of other marine animals. One such larval form (apparently belonging to a species of Tylocephalum) occurs in the pearl-oyster, and is believed to be one of the princinal causes of the production of pearls This, apparently, takes place only in the event of the death of the parasite from some unknown cause

Economic Importance.-From the fact that taneworms often occur in enormous numbers in the intestine of an apparently perfectly healthy animal, it is clear that they are not always definitely injurious to their hosts. As parasites of man and of domestic animals, however, they have considerable importance. As a rule their ill effects are most manifest in young animals, and they are sometimes responsible for serious digestive and nervous disturbances, and even for severe losses among stock and poultry. The adult worms, besides depriving the host of a certain amount of nutrient material, secrete substances which have been shown to be definitely toxic in many instances, when injected into the blood or body-cavity of experimental animals. The same is true of the larval forms, and certain changes take place in the blood cells of infested animals which indicate that some of these poisons are normally absorbed into the system. It is probable, however, by the migrations of the laivae within the body, and the secondary invasions by pathogenic organisms for which they prepare the way, that the most serious harm is

Only in exceptional cases, such as the invasion of the brain by the hydatid of Echinococcus, are tapeworms really dangerous (H A B.: L H H)

TAPIOCA (a native Brazilian word), a farinaceous food substance prepared from cassava starch, the product of the large tuberous roots of the cassava or manioc plant, (See Cassava) Cassava starch, separated from the fibrous and nitrogenous constituents of the roots, is spread, while in a moist condition, upon iron plates, and with constant stirring exposed to such heat as causes a partial rupture of the starch granules, which agglomerate into irregular pellets, becoming hard and translucent when cooled. In this condition the starch forms the tapioca of commerce, a light, pleasant and digestible food, much used in puddings and as a thickener for soups.

TAPIR, the name for large woodland mammals, forming the family Tapiridae of the order Perissodactyla (q.v), with four front and three hind toes, massively built and with the nose and upper lip produced to form a short flexible trunk. Four species

inhabit South and Central America, and one, Tapirus indicus, the Malay region. The latter is the largest, and is readily recognized by its black fore- and hindquarters and white body. It may stand 3 ft. 6 in at the shoulder and is solitary, shy, nocturnal and inoffensive, frequenting deep forests in the neighbourhood of THE BRAZILIAN TAPIR (TAPIRUS water. Its diet is exclusively vegetarian. The American spe- TRAL AND SOUTH AMERICA cies are all nearly uniform dark brown when adult, but the young,

TERRESTRIS) FOUND ONLY IN CEN-

like those of T. indicus, are spotted and striped with white. The best-known new world form is T, terrestris of Brazil and Para-

guay. In habits it and the other three species resemble the Asiatic The peculial distribution of the tapirs is explained by the form presence of fossil forms in Europe, China and the U.S.A. in Miocene, Phocene and, in the two latter localities, Pleistocene forma-

TAPPAN, ARTHUR (1786-1865), U.S. philanthropist and abolitionist, was born on May 22, 1786, at Northampton, Mass He was of a stem and pious nature and often championed humanitarian and religious causes Among those organizations to which he contributed were the American Bible society, the American Missionary society and the American Tract society. He donated money to establish Kenyon college, Gambier, O, and Oberlin college, Oberlin, O

Tappan was an active supporter of various antislave movements. He joined the American Colonization society, later withdrawing in order to work for the abolition of slavery in the U.S. In 1840 he became president of the American and Foreign Anti-Slavery society and founded the American and Foreign Anti-Slavery Reporter He advocated the abolition of slavery through political means within the constitution, and in 1840 and 1844 he supported the Liberty party's candidate for president, James G Birney. He died in New Haven, Conn , on July 23, 1865.

TAPPAN, EVA MARCH (1854-1930), U.S. teacher and author, was born on Dec 26 in Blackstone, Mass She was only six years old when her father, Rev Edmund March Tappan, died. From that time she received her early education in several seminaries where her mother was a member of the faculty. After graduation from Vassar college, Poughkeepsie, NY, in 1875 Miss Tappan went to Wheaton seminary, Norton, Mass, where she taught from 1875 to 1880 Between 1884 and 1894 she was associate principal of Raymond academy, Camden, N J The University of Pennsylvania awarded her an AM, degree in 1895 and a Ph D the following year From 1897 to 1904 she taught English at the English high school, Worcester, Mass In 1904 she retired from active teaching and, until her death, devoted herself exclusively to writing

Miss Tappan's dedication to the education of young people can be seen reflected in the nature and scope of her writing book, published in 1896, was entitled Charles Lamb, the Man and the Author. In 1900 and 1901 she published In the Days of Alfred the Great. In the Days of William the Conqueror, Old Ballads an Prose and England's Story Among her books on history, many of which were used as textbooks in grade schools and high schools, may be recounted Our Country's Story (1902). In the Days of Queen Victoria (1903), The Story of the Greek People (1908). Our European Ancestors (1918) and The Story of Our Constitution (1922). The story of her own early life was recorded in Ella. a Little Schoolgerl of the Sixties (1923). Her stories were written and organized so that children could

easily understand them; her style was clear and concise.

After 1911, when her mother died, she seldom left her home and continued writing until her death on Jan. 29, 1930, at Worcester, Mass.

TAPPET is an intermediary fitment which converts the action of a rotary cam or lifter into a linear motion, with a return movement by gravity or spring pressure. The largest tapnets are those in the one stamp batteries, which raise a weight of sometimes as much as a ton. The tappets in internal-combustion engines require nice regulation to ensure obtaining the full power of the engine and to maintain silence in the valve operation. (See INTERNAL COMBUSTION ENGINES: MOTOR CAR.)

TAPS AND DIES: see Machine Tools

TAPTI, a river of western India. It rises in Betul district of Madhya Pradesh, flows westward between two spurs of the Satpura hills, across the plateau of Khandesh, and thence through the plain of Surat to the Arabian sea. It has a total length of 450 mi. and drains an area of 30,000 sq mi For the last 32 mi. it is tidal, but is only navigable by small vessels; the port of Swally at its mouth, famous in Angle-Portuguese history, is now deserted because of silting.

TAR: see CAMPHOR; COAL TAR; GAS MANUFACTURE; NAVAL STORES; TARS, LOW-TEMPERATURE,

TARA, a village of Co Meath, Ireland It is celebrated for the hill of Tara, which was for many centuries a royal residence and the scene of great meetings of the people. The soliated hill, upon which five highroads converged, is about 510 ft. in height. On it are ax raths or incular earthworks, the largest of which, the king's 18th (rath-na-riogh), encloses other works, including the formath or meeting place, a flat-topped mound. On this (but not in its original position) stands a pillar stone, said to be the stone of destury on which the Irish kings were crowned. An oblong enclosure, 750 ft. in length by 46 ft in breadth, formed of earthworks, with entrances at intervals on each side, represents the banqueting hall. Extensive excavations were begun in 1953 with the assistance of the Irish woverment.

In the middle of the 3rd century AD King Cormac Mac Art is said to have founded there schools of military science, law and literature In the time of St Patrick, Tara was a great centre of pre-Christian religious rites, and about 560 it was abandoned as a roval residence.

There the Danes were defeated in 980, and in 1843 the hill of Tara was the scene of one of Daniel O'Connell's mass meetings to demand repeal of the legislative union (Aug 15)

TARAFA ('Amr shu ul- 'Ahd ul-Bakrī), 'Arahan poet of the dift century, who, after a wall dan dissapated youth spent in Barran, left his native land after peace had been established between the tribes of Bakr and Taghib and went with his uncle Matlamis, who was also a poet, to the court of the king of Hira, 'Amr ibn Hind (d. 568-569), and there became companion to the king's brother Haiving reduciled the king in some verses, he was sent with a letter to the rule of 8 hären; and in accordance with instructions contained in the letter was buried alive. One of his neems is contained in the Modelbat.

His collected works were published in W. Ahlwardt's The Diwans of the Six Ancient Arabic Poets (London, 1870) Some of his poems were translated into Latin by B Vandenhoff

(Berlin, 1895).

TARAI (TERAI) (i.e., "moist land"), the name of the submontane stip of marshy jungle stretching beneath the lower ranges of the Humalayas in northern India. This strip may be said to extend roughly from the Juman raver on the west to the Brahmaputra on the east, and a large portion of it lies within Nepal. The term, however, is now officially confined to a subdivision of Naim Tal district in Uttar Fradesh. At its northern edge, where the waterless forest tract of the binder (coarse graved deposits) ends, a least of the coarse of the coarse of the coarse of the coarse such as the coarse of the coarse of the coarse of the coarse set the Tain. The Gogra is the great traver of the Taia proper and is novigable from the Himalayan foothills. Elephants, tigers, bears, loopards and other wild animals are found

Everywhere it is most unhealthful, inhabited only by tribes who seem immune to malaria, though large tracts were drained for cultivation and settled with agriculturists from the plains.

TARANCHI. The Taranchi or Ili-Tatars, numbering about too, ooo are a branch of the Iranna Turks, and hve in Semirechie and in Transcaspia, whither they migrated when Kulja passed under Chinese rule. They are closely related to the Sart is religion, culture and language, differing from them principally in allowing their women more freedom.

anowing inter women more freecom.

TARANTELLA, Italian dame of a rapid whirling character, popularly believed to be a cure for the supposed posonous sting of the threat and the properties of the words and the properties of the control of the cont

TARANTO (anc. Tarentum, q.v.), a seaport of Apulla, Italy, and the capital of the province of Taranto 50 mi. from Lecce W. by N. by road, and 68 mi. by rail (44 mi. W. by S. from Brindis)

Pop (1951) 167,166 (commune) The city propes is situated on a rocky sidead 5f ft above sea level, which, in ancient thick, in accent they was a pennsula, the isthmus on the west having been cut through by Ferdmand I of Aragon. This island separates the Gulf of Taranto (Mar Grande) from the deep inlet of the Mar Piccolo, and is sheltered by two other flat islands, San Pietro and

The Strada Garibaldi along the Mar Piccolo is inhabited by fishermen whose language retains traces of Greek The cathedral dedicated to San Cataldo, an Irish bishop, has externally some remains of Saraceauc Gothic, internally it has been completely modernized (retaining however 16 ancient columns in the nave) and the shrine of the patron saint has been termed "an orgy of coccoo" (1657). It has a crypt of the 6th or 7th century There is a museum in the former convent of San Pasquale, with an especially fine collection of vases, terra cottas, and silverware, jewellery, Greek statuary, mosaics, etc., from Taranto and other sites in Anolias.

Adjacent is the Palazzo degli Uffizi, containing various public offices To the east, across the swing bridge over the channel connecting the Mar Grande with the Mar Piccolo is the new part of the town, on the site of the main part of the ancient city, extending as far as the arsenal and even beyond while the Boyo, with the railway station, lies to the west of the island There, too. is the commercial harbour. The chief industry is the cultivation of oysters in the Mar Piccolo, besides oysters Taranto carries on a large trade in cozze, a species of large black mussel, which is packed in barrels with a special sauce. Excellent fish abound in the Mar Piccolo, 93 different species being found. The ebb and flow of the tide is distinctly visible there. Taranto being one of the few places in the Mediterranean where it is perceptible. In 1861 the strategic importance of Taranto was recognized, and the arsenal is the most important in Italy after Spezia. It extends for a mile and a half along the southern coast of the Mar Piccolo, its chief basin

At Taranto the Italians suffered their first major naval losses of World War II. On the night of Nov. 11—12, 1940, British torpedo planes attacked a group of ships there, damaging two crusers, two or three battleships and two fleet auxiliary vessels In the fall of 1943 the city was occupied by British troops

In the rate of 1933 use 15 west complete of printial toppe 1 no 1972. Taranto was entirely destroyed by the Saraces, of the 1972 of the 19

1577. The tarantula (see below), inhabits the neighbourhood of Taranto. The wild dance, called tarantella~(q~v.), was supposed, by causing perspiration, to drive out the poison of the bite.

TARANTULA, strictly speaking, a large spader (Locosa treartula), which takes its name from the town of Taranto (Tarentum) in Apulia, near which it occurs and where it was formerly believed to be the cause of the malady known as "tarantism." This spider belongs to the family Lycosidae, and has numerous allies in various parts of the world. The tarantula, hike all its allies, spins no web as a snare but catches its prey by speed of foot. It lives on dry, well-drained ground, and digs a deep burrow lined with slik to prevent its falling in. In the winter it covers the orfice with slik, and hiberantes in a dormant condition It also guards its occoon and young in the burrow. It lives for several years.

The sexes are approximately the same size but do not surpass I in. in length of body. Like all spiders, the tarantula possesses poison glands in its jaws, but a particle of the secretion of these

Tarantula is often applied indiscriminately to many large spiders not related to Lycosa tarantula, and to at least one Arachmid belonging to a distinct order, Galeodes luscasu of the Egyptian desert In English-speaking parts of the American continent, the Avicularidae, oi "bird-eating" spiders, much larger than any Lycosidae, are called tarantulas Most of them are not poisonous to man

TARAPACÁ, the northernmost province of Chile, bounded N. by Peru, E by Bolivia, S by Antofagasta and W by the Pacific Area 21,346 sq mi. Pop. (1952) 102,789 It is part of the rainless desert region of the Pacific coast of South America and is without water except at the base of the Andes, where streams flow down into the sands and are lost. In some of these places there is vegetation and water enough to support small settlemente

The wealth of Tarapacá is in its immense deposits of nitrate of soda (found on the Pampa de Tamarugal, a broad desert plateau between the coast range and the Andes, which has an elevation of about 3,000 ft ) The mining and preparation of nitrate of soda for export has provided an uncertain livelihood for the population of this province Silver is mined near Iquique, the capital Unfavourable world markets for nitrate caused a decline in population The principal ports of the province are Pisagua, Iquique and Arica, from the first two of which "nitrate railways' tun inland to the deposits.

Tarapacá was ceded to Chile by Peru after the war of 1879-83 and was organized as a province in 1884

TARARE, a town of east-central France, in the department of Rhône, on the Turdine, 28 mi W N W, of Lyons by rail Pop. (1946) 10,142. It is the centre of a region engaged in the production of muslins, tarletans, embroidery and silk plush, and in printing, bleaching and other subsidiary processes The manufacture of muslins was introduced from Switzerland in 1756 The manufacture of Swiss cotton varns and crochet embroidenes was introduced at the end of the 18th century; at the beginning of the 10th figured stuffs, openworks and zephyrs were first produced

The manufacture of silk plush for hats and machine-made velvets was set up toward the end of the 19th century.

TARASCANS, the principal native people of the southwest Mexican state of Michoacan, who term themselves and their language Purépecha. An expanding independent nation at the time of the Spanish conquest, most of the Tarascans by the 20th century were confined to the pine and oak clad highlands dotted with volcanic cones and lakes west from Morelia and Lake Pátzcuaro and north from Uruapan and Paricutin volcano Despite a culture that is more old world than native, there is a marked retention of racial identity; and as of 1050 there were approximately 60,000 persons of Purépecha speech, of which perhaps one-quarter were monolingual This language constitutes a linguistic family with no known relatives Tarascan archaeology and history have been little studied, but artifacts and colonial accounts indicate that this group was the equal or superior of their Mexican contemporaries m the working of feathers, shell, wood, metal and stone, and in military prowess, and only in architectonics were they greatly inferior.

The Tarascans have no special tribal organization, but participate in much the same political, economic and religious organizations as do their mestizo neighbours. Agriculture is dominant: maize and wheat occupy most of the acreage, followed by pulses, cucurbits, barley, cabbage and chile pepper. Livestock includes chickens, oxen, pigs, sheep, beehives, burros and turkeys. Probably the turkey was domesticated by the Tarascans. In the mountain or sierra region forest products are quite important, and there . the wooden house or troje prevails. Among the leading cottage handicrafts are woodworking, pottery making, and weaving. Many Tarascans go as braceros to the United States, and most of the nearly 120 communities have at least one man who has lived in the United States.

Among the leading communities are the Sierra "capital"

glands is not more virulent than that of other spiders of the same Paracho, strongly Indian Cherán and Santa Fe, and the sentimentally important former capitals Tzintzuntzan, Ihuatzio and Patzcuaro

BIRLIOGARTIY — J. A. Mason, "The Native Languages of Middle America," in The Mays and Their Neighbor, (1904), and endete at Miller et al., Lot Tarascoi (Mascon, 1904), in Transaci Region, New Sketch of Geography and pp. 197-108. (June 1944); Smithsonian Institution, Publications of the Institute of Social Astropology, no. 1, 3, 6, 7, 11 (1944-1951), M. Sterm, Englying Uraspare (Marcio, 1945), and D. Goldon, Our Son Miller (1946), and D. Goldon, Our Son Miller (1947), and D. Goldon, catebec (Mexico, 1952).

TARASCON, a town of southeastern France, in the department of Bouches-du-Rhône, 62 mi. N.W. of Marseilles by rail. Pop (1946) 5,813 Tarascon stands on the left bank of the Rhône opposite Beaucaire, with which it is connected by a railway bridge and a suspension bridge The church of St Martha, built in 1187-97 on the ruins of a Roman temple and rebuilt in 1379-1449, has a Gothic spire and interesting tombs in the crypt. Of the original building there remain a porch and a side portal flanked by marble columns with capitals like those of St Trophimus at Arles. The former leads to the crypt, where are the tombs of St. Martha (1658), Jean de Gossa, governor of Provence under King René, and Louis II, king of Provence. The castle, built on a rock, was begun by Count Louis II in the 14th century and finished by King René in the 15th. It contains a turret stair and a chapel entrance, both 15th-century, and fine wooden ceilings The building is now used as a prison. The hôtel de ville dates from the 17th century.

The civil court of the arrondissement of Arles is situated at Tarascon, which also possesses a commercial court, and fine cavalry barracks. The so-called Arles sausages are made here, and there is trade in fruit and early vegetables. In Tartarin de Tarascon Alphonse Daudet has satirized the provincial life of Tarascon, which has a tribunal of commerce and the fair of Beaucaire. It formerly had the two fêtes of La Tarasque, the latter in celebration of St. Martha's deliverance of the town from a legendary monster of that name King René presided in 1469, and grand exhibitions of costume and strange ceremonies take place during the two days of the festival. Tarascon was originally a settlement of the Massahots, built on an island of the Rhône The mediaeval castle, where Pope Urban II lived in 1096, was built on the ruins of a Roman camp Tarascon preserved the municipal institutions granted it by the Romans, and of the absolute power claimed by the counts of Provence only recognized the rights of sovereignty.

TARASP-SCHULS, a Swiss railway station in the lower Engadine, giving its name to a group of villages of which Schuls, the capital of the lower Engadine, situated about 160 ft, above the Inn river, is the chief. Tarasp is famed for its springs, which have been known since the middle ages, but it lies low in the valley and many visitors live at Vulpera, above the south bank of the Inn river.

Above the village of Taiasp is the early mediaeval castle of that name, heavily restored as in 17th century style in recent years. The neighbourhood is famed for its beauty, TARAXACUM: see DANDELION.

TARBELL, EDMUND C. (1862-1938), American artist, was born at West Groton, Mass., on April 26, 1862. He was a pupil of the schools of the Boston Museum of Fine Arts and of Boulanger and Lefebvre, Paris, and became a distinguished painter of the landscape, of the figure, and of portrait. He won the gold medal of the National Academy of Design in 1908, the bronze, silver and gold medals of the Carnegie International exhibition at Pittsburgh, Pa., and various other important prizes and medals. He is represented in the museums of many American cities. In 1906 he was elected a National Academician, besides being a member of the Ten American Painters. He was instructor of painting in the Boston Museum of Fine Arts, and was later principal of the Corcoran School of Art, Washington, D.C., and chairman of the council of the school of the Museum of Fine Arts. Boston, Massachusetts.

See F W Coburn, "Edmund C. Tarbell," International Studio, vol xxxii, pp 75-77 (1907), and J. E D Trask, "About Tarbell," Amer. Mag of Art, vol 1x, pp 217-228 (1918).

TARBERT, fishing village at the head of East Loch Tarbert, an arm of the sea on the west show of the mouth of Lock Fync. Argyllshire, Scotland. Pop. (1931) 1,184. The harbour, though it has a narrow entrance, so shoulted yafe and can shelter the whole Loch Fyne fishing fleet. The pier for the passenger steamers that call there is about 4 m from the village. The herring fishery—including a large tade in curing—forms the only industry Overlooking the harbour are the uilus of a castle built by Robert Bruce in 1326. The ishtmus connecting the districts of Knapdale and Knityre is little more than one mile wide, and boats used to be dragged across to the head of West Loch Tarbert, a narrow sea loch hearly ten miles long.

TARBES, a town of southwestern France, capital of the department of Hautes-Pyrénées, 98 mi WSW of Toulouse on the Southern railway. Pop (1936) 34,749. Under the Roman dominion Turba, which was about 11 mi SE of the present town of Tarbes, was the capital of the Bigerriones, one of the states of Novempopulania The bishopric of Tarbes dates from the 5th century, and in feudal times its bishops held the chief temporal authority, that of the counts of Bigorre, of which Tarbes was the capital, being limited to the quarter of the town where their castle was built. The English held the town from 1360 to 1406. In 1569-70 Tarbes was twice taken by Gabriel, count of Montgomery, and the inhabitants driven out, but in August 1570 the peace of St. Germain allowed them to return. Subsequently Tarbes was several times taken and retaken, and a number of the inhabitants of Bigorre were forced to take refuge in Spain, but in 1504 the members of the League were finally expelled. The English, under Wellington, gained a victory over the French near Tarbes in 1814. Tarbes stands in a fertile plain, stretching to the Pyrenees, on the left bank of the Adour, streams from which are conducted through the town. The lines of the Southern railway from Morcenx to Bagnères-de-Bigorre and Lourdes and from Toulouse to Bayonne cross there. Chief among the many open spaces is the Jardin Massey (35 acres), given to his native town by a director of the gardens of Versailles and containing a museum of paintings and antiquities. Near a small lake stands a cloister (15th century) brought from the abbey of St Sever-de-Rustan, 14 mi. N.E. of Tarbes. The architecture of the cathedral, Notre-Dame-de-la-Sède, is heavy, but the cupola of the transept (14th century), and a rose window of the 13th century, in the north transept, are interesting. There is also a modernized Carmelite church of the 13th century.

Tarbes is the seat of a bishoptic under the archbishop of Auch, of a prefecture, tribunals of first instance and of commerce, a chamber of commerce and a board of trade-arbitrators. Tarbes has an important stud for the breeding of Anglo-Arabian hospis, much used by light cavalry. The industrial establishments include transners, potteries, saw-mills and turners' shops. There are immediately and the statements are included that the statements and the statements are included that the statements are included to the statement of the

portant fairs and markets.

TARBUSH, the close-fitting, flat-topped and brimless cap, in shape like a truncated cone, made of felt or cloth, worn by Mohammedan men throughout the east either as separate headgear of forming the inner part of the turban. It used to be worn as the badge of a Turkish subject in Turkey and Egypt, where it was red in colour with a black or blue silk tassel. It is the same as the "fee." In September 1928, Turkish citizens were forbidden to wear the fee, under severe re-natites. by President Kemal Pashs

the "Res." In September 1925, 1ursish cutzens were romoned of wear the feet, under severe penalties, by President Kernal Pashs TARDE, GABRIEL (1843-1094), French sociologist. He was professor of modern philosophy at the College de France, Paris, and an official of the ministry of justice. For a bibliography of his many important works see M. M. Davis, Psychological Interpretations of Society (1909). His Psychologic économique (1909) was remained in the English as Social Large.

TARDIEU, ANDRÉ PIERRE GABRIEL AMÉDÉE (1876-1945), French politician and writer, was born in Paris on Sept. 22, 2876. Educated at the École Normale Supérieure, he was châf de cabinet to Waldeck-Rousseau from 1899 to 1902. From 1902 to 1014 he Jectured at the École des Sciences Politiques and

the École Supérieure de la Guerre, and was foreign news editro Le Tembe. Entering the chamber of deputies in 194 he acted as special commissioner in the United States (1947–18), member of the Peace conference (1958–19), and minister of the liberated regions (1919–20). As captain of Chasseuris between 1944 and 1916, he was wounded and three times mentioned in dispatches. At the Peace conference (1949) he had a considerable share in darfring the political and territorial clauses. He presided over the Committee of Five which drafted the Allied reply to the German observations on the draft terms of the peace treaty Tardieu also presided over the Alsace-Lorraine committee, the Committee tee of the Saar and that of the execution of the treaty

Tardicu's political attitude was characterized by his inflexible attachment to the policy of Clemenceau, with whom he was associated in the closest collaboration for war and for peace. Three times in succession, between 1919 and 1924, he refused to enter the government, in order to maintain his independent defense of this policy. As director of the Echo National, the dialy paper founded by Clemenceau and himself, he waged a facree war, in foreign affairs, against the steps which paved the way for the victory of the cartel des gauches. Between 1924 and 1926 he had no seat in the chamber, but was again a member from 1926 to 1936. He was premier, 1929–30, and again in 1932 Tardieu died Sept. 17, 1945, 44 Menton, France.

Taroneu men Sept. 17, 1943, sit zermon, France.
Tardeu was the author of the following hastorical works. Questions
Diplomatiques (1965), France and its deliances (1968), La conference
(1970); La France et les eliances (1970); Le mylère d'étadir (1912),

Pais (1921); La Elexuy et le Pais (1921); El Pais (1921); El Elexuy et le Pais (1921); El Pais (1921); El Elexuy et le Pais (1921); El Pais (1921); El Elexuy et le Pais (1921); El Pais (1921); El Pais (1921); El Elexuy et le Pais (1921); El

TARDIGRADA, a class of animals of uncertain affiliation. The Bear-animalucies, as these animals were formetly called, are all of small size, the largest being not much more than r mm, in length, while most of them are very much smaller. They are not parasitic but are found in variable habitats, in damp moss, on flowering plants, in sand, fresh water and even in the sea; and in adaptation to this wide range of external conditions a very large number of genera and species have been evolved.

The organism consists of a well-developed head region in front and of a short body composed of four fused segments, each represented externally by a pair of short, stout, unjointed limbs generally terminated by sharp claws, which seem to range in number from four to mne, but sometimes, as in Batillipea, ending in three pairs of racquet-shaped, digitform outgrowths. The limbs of the last pair project backward from the posterior end of the body on each side of the amus. The cutticle, which is not chithrized, may be smooth or sculptured in various ways and is sometimes strengthened with segmentally arranged plates (Echimizeau) and

sometimes provided with long paired hair-like cirri.

No special organs of circulation or respiration are known The alimentary canal traverses the body from end to end. Within

Style the country of

PERMISSION OF THE MACHILLAN COMPANY, PUBLISHERS ECHINISCUS SPINULOSUS, AFTER

the mouth is a pair of protrusible stylets, large glands open into the oesophagus, there is a muscular pharynx and large median and lateral glands open into the intestine posteriorly. The nervous system, which is remarkably well-developed, consists of a bridblobed cerebral ganglion, frequently provided with a pair of eye-spots, and of a ventral chain

of five large gangha connected by lateral commissures. The sexes are not distinct and the generative products are discharged either into the posterior end of the alimentary canal or directly to the exterior through a median pore in front of the anus. The eggs are large and in some cases at least are enclosed, when laid, in the cuticle of the parent which is cast to form a case for them. The young when hatched are about one-third the size of the parent which they closely resemble apart from the occasional absence of one pair of limbs which is subsequently developed

The Tardigrada are divided into two orders (1) The Hetero-

Batilispes, etc.) in which the head is provided with two pairs of cirri in front, a pair of lateral cirri, and a so-called clava or spatulate process, one on each side, and (2) the Eutardigrada containing two families and three genera (Macrobiotus, Hypsibius and Milnessum) in which cephalic cirri are wanting Macrobiotus is the oldest known tardigrade, first observed in the last quarter of the 18th century The most remarkable feature of the tardigrades is their ability to withstand desiccation and low temperature, a phenomenon known as anabiosis Specimens kept for eight days in a vacuum, transferred for three days into helium gas at room temperature, then exposed for several hours to a temperature of -272° C. came to life again with the raising of the temperature to normal room temperature, 60% of specimens kept for 21 months in liquid air at a temperature of -190° C came to life Specimens allowed to dry at room temperature and kept dry for 18 months returned to life in about two hours after having been transferred into water An interesting feature of the structure of Tardigrada is the more or less fixed number of cells of which their body is composed Thus the median dorsal strip of epidermis is composed of only 24 pairs of cells.

The Tardigrada cannot be assigned with complete confidence to the Arthropoda, or Gnathopoda, until it be proved that their oral stylets are modified appendages. Assuming that they belong to the Arthropoda, they must rank as a class by themselves They have been generally relegated to the Arachnida on the supposition of their kinship with the Acari, but their internal and external anatomy make such an affiliation unlikely. They have also been compared to Perspatus mainly on account of the structure of their limbs; but there seem to be no good reasons for regarding the

two types as related

(The best treatise on Tardigrada is Ernst Marcus, "Tardigrada," published in Bronn's Klassen und Ordnungen, 1929)

TARDIVEAU, RENÉ: see Boylesve, René

TARENTUM, a Greek city of southern Italy (Gr Τάρας), (mod Taranto, q.v), situated on the north coast of the gulf of the same name, on a rocky peninsula at the entrance to the only secure harbour in it. The entrance was defended by the two islands called the Choerades (now S Pietro and S. Paolo) It was a Spartan colony, founded by Phalanthus about 708 B.C. (See SPARTA.) Taras was a mythical hero, son of Neptune. Situated in a fertile district, especially famous for olives and sheep, with an admirable harbour, great fisheries and prosperous manufactures of wool, purple and pottery, Tarentum grew in power and wealth and extended its domain inland. A great defeat by the natives in 473 BC., led to a change of government from aristocracy to democracy. A feud with the Thurians about the district of the Siris was settled in 432 by the joint foundation of Heraclea

In the 4th century Tarentum was the first city of Magna Graecia, and its wealth and artistic culture at that time are amply attested by its coins. (See NUMISMATICS.) In the second half of the century Tarentum was at constant war with the Lucanians, and did not hold its ground without the aid of Spartan and Epirote condottieri Then followed war with Rome (281), the expedition of Pyrrhus, whom Tarentum summoned to its aid, and at length, in 272, the surrender of the city by its Epirote garrison. Tarentum retained nominal liberty as an ally of Rome. In the Second Punic War it went over to Hannibal in 212, and suffered severely when it was retaken and plundered by Fabius (209), who sold 30,000 citizens as slaves. It revived after receiving a colony in 123 B.C., which received the name of Neptunia. In the time of Augustus it was essentially Greek and a favourite place of resort (Horace, Od., iii, 5, 53). Belisarius ordered it to be refortified, but it was soon taken by Totila, who made it his treasure store. After his defeat by Narses, it was sold to the Byzantine empire by its Gothic governor.

One of the most interesting discoveries of recent years has been that of a terramara on the so-called Scoglio del Tonno on the northwest of the town, which in its type and in the character of the objects found there, is exactly identical with the terremare of the Po valley. It seems, however, to be an isolated colony, and not to prove a parallel development in north and south Italy. The

tardigrada containing two families with nine genera (Eclusiscus, only relic of any building of the Greek city is a part of a Doric temple on the island-two fluted columns, with a lower diameter of 61 ft, and a height of 28 ft, and some fragments of the entablature, belonging probably to the beginning of the 6th century BC The rock occupied by the modern town was the citadel, but was connected with the land to the west by an isthmus, which was only cut through by Ferdinand I of Aragon. The line of the walls which defended the city on the east (land) side has been traced, and a few remains of well cut blocks, with Greek masons' marks, have been found. In the centre of the Agora was the huge bronze Zeus by Lysippus, and facing on to it the Ποικιλή, or painted portico, with pictorial representations of the life of Phalanthus, and the foundation of the city, and the museum There was also a fine gymnasium and other buildings mentioned by classical writers. Strabo's description of the site (vi, 3, 1) is a good one. The Roman amphitheatre, on the other hand, and remains of Roman baths by the seashore, have been found; the former perhaps occupies the site of the ancient theatre, in which the Roman ambassador was received in 281 B.C. Tarentum was the birthplace of Archytas and Aristoxenus (qq.v.).

TARENTUM, a borough of Allegheny county, Pennsylvania, USA, 17 mi. NE of Pittsburgh, on the Allegheny river and the Pennsylvania railroad Pop (1950) 9,540; (1940) 9,846 It has large industrial plants (glass, stainless steel, aluminum, paper, castings, etc.) and there are several coal mines in the vicinity. Tarentum was settled in 1796, laid out in 1829 and incorporated as a borough in 1842. The first glass factory was established in

TÂRGOVISTE, the capital of the department of Dimbovita, Rumania; situated at the foot of the Carpathians. on the right bank of the river Jalomita, 48 mi. N N.W of Bucharest. Pop. (1948) 26,038 A branch line connects Târgoviște with the main Walachian system, and is prolonged northwards into the hills, where there are rich deposits of petroleum, salt and lignite. Coal is also found but not worked Apart from the scanty runs of a 14th-century palace, the most interesting building in the town is the Metropolitan church, still one of the finest in the country, with its nine towers and monuments of the princely house of Cantacuzino. It was founded in 1515 by Neagoe Basarab, builder of the famous cathedral of Curtea de Arges. Târgoviște is a garrison town, with a cavalry training school and an artillery depot and repairing arsenal

Târgoviște was the capital of Walachia from 1383-1698 In the 15th century it was sacked by the Szeklers Michael the Brave defeated the Turks under its walls in 1507 In the 16th century it had a population of 60,000 and contained 70 churches and 40 convents. Its importance and population decreased when

the capital was moved to Bucharest.

TÂRGU-JIU, a large garrison town and capital of the department of Gorj, Rumania; situated among the lower slopes of the Carpathians, on the left bank of the river Jiu, and at the terminus of a branch railway which joins the main Walachian line between Turnu Severin and Craiova. Pop (1948) 17,698. The town has a considerable trade in timber, petroleum and farm produce. Anthracite coal is found in the neighbourhood. In the neighbouring hills are the monasteries of Tismana, Lairnici and Polovraci, much frequented as summer resorts.

TARGUM. The Targums are the Aramaic translations-or rather paraphrases-of the books of the Old Testament, and, in their earliest form, date from the time when Aramaic superseded Hebrew as the spoken language of the Jews. (See HEBREW LANGUAGE ) In their origin they were designed to meet the needs of the unlearned among the people who had ceased to understand the Hebrew of the Old Testament. In the absence of any precise evidence on the point it is impossible to give more than a rough estimate as to the period at which Hebrew, as a spoken language, was finally displaced by Aramaic. It is, however, certain that the latter language was firmly established in Palestine in the 1st century A.D. By that time, as we know from many sources, Aramaic was not only the language in common use, but had also received official recognition despite the fact that Hebrew still remained the learned and sacred tongue. Hence we may reasonably infer that the mass of the people had adopted Aramaic at a considerably earlier period, probably, as early as the 2nd century BC, and that the need of Aiamaic translations of the sacred text made itself felt but little later.

The Talmudic tradition, however, is, doubtless, correct in connecting the origin of Targums with the custom of reading sections from the Law at the weekly services in the synagogues, since the need for a translation into the vernacular must first have arisen on such occasions. As we know from the New Testament, the custom of reading in the synagogues both from the Law (Acts xv, 21) and from the Prophets (Luke IV, 16 f , Acts XIII, 14, 27) was well established in the 1st century AD 1ts introduction therefore, will date from a much earlier period. The practice of accompanying these readings with a translation into Aramaic 18, further, so generally recognized by the 2nd century AD. that the Mishna takes it for granted, and merely inculcates certain regulations to be observed by the Meturgeman (translator), who had by this time acquired a definite status. From it we learn that the Meturgeman, who was distinct from the reader, translated each verse of the Law into Aramaic as soon as it had been read in Hebrew: in the readings from "the Prophets" three verses

might be read at a time. Judging by the contents of our existing Targums, and the Targumic renderings given in Tewish literature, it is improbable that any definite system of interpretation was ever formally adopted, the rendering into the vernacular being left to the discretion of the individual Meturgeman. At first, no doubt, the translator endeavoured to reproduce the original as closely as possible, but, masmuch as his object was to give an intelligible rendering, a merely literal rendering would soon be found to be insufficient, and he would be forced, especially in the more difficult passages, to take a more elastic view of his obligations. To prevent misconception he must expand and explain what was obscure, adjust the incidents of the past to the ideas of later times, emphasize the moral lessons to be learned from the national history, and, finally, adapt the rules and regulations of the Old Covenant to the conditions and requirements of his own age. As time went on the practice of introducing additional matter of an edifying character grew in popular favour, and was gradually extended Thus, by degrees, the reproduction of the original text became of secondary importance, and merely served as a pretext for the discussion of topics that had little or no bearing on the context. The method, by which the text was thus utilized as a vehicle for conveying homiletic discourses, traditional sayings, legends and allegories, is abundantly illustrated by the Palestinian and later Targums, as opposed to the more sober translations of Onkelos and the Targum to the Prophets.

It would, however, he incorrect to suppose that the translation of the text was left entrety to the individual taste of the translator. The latter is rather to be regarded as the representative of the age in which he lived, and his interpretation is to be taken as reflecting the exegess of that period. That there were certain limits beyond which the translator might not venture, without incurring the censure of the authorities, may be inferred from the few instances of irranslation which are mentioned with disapproval in the Mishna and elsewhere. A definite rule for guidance in translating is apparently preserved in the Tosefta where it is stated that "the who translates quite literally is a lar, while lar

who adds anything is a blasphemer."

There can be little doubt that the Targums existed for a long time in oral form. They belonged' to the class of traditional literature which it was forbidden to write down, and, so long at least as the Targum tradition remained active, there would be little temptation to commit it to writing. But it is lightly probable that this problibition, in the case of the Targums, was mainly enforced with respect to those parts of the Old Testament which were treatful this synangous servers; g.g., the Law and the Prophets, and that it was jess fragilly observed in relard to the other portions of Sciphuter; a written frimbation of the latter would be of special value for the purpose of givrate study. Hence there is no need to reject the tradition is to the extencte of a written Targum on Job in the time of Canadite I (1st century A.D.).

especially as references to Targum mss occur in the Mishna and elsewhere But, as Dalman has pointed out, it was not these manuscripts, but the living tradition of the learned which was recognized as authoritative throughout the period which closes with the compilation of the Talmud . The official recognition of a written Targum, and therefore the final fixing of its text, belongs to the post-Talmudic period, and is not to be placed earlier than the official results.

I. Targums on the Pentateuch.-(1) The so-called Targum of Onkelos admittedly owes its name to a mistaken reference in the Babylonian Talmud In its original context, that of the Jerusalem Talmud, the passage refers to the Greek translation of Aquila With the exception of this one reference, the Targum is always introduced in the Babylonian Talmud by the phrase "as we translate" or "our Targum" it is probable, therefore, that the name of the author, or authors, was unknown to the Babylonian Jews It is first quoted under the title of the Targum of Onkelos by Gaon Sar Shalom (d AD 859). On the linguistic side we may regard Onkelos "as a faithful representative of a Taigum which had its rise in Judaea, the old seat of Palestinian literary activity " (Grammatik des judisch-palastinischen Aramatsch, p 12 f) It is to be regarded as an official translation of the Law, in the Judaean dialect, which was carried out in Babylon, probably about the 4th century AD. in its final form it cannot be earlier than the 5th century The translation, as a whole, is good, and adheres very closely to the Hebrew text, which has not been

without its influence on the Aramaic idiom

Of all the extant Targums that of Onkelos affords perhaps the most characteristic and consistent example of the exercical methods employed in these works. Two principles may be said to have guided the translators. On the one hand, they had, as their primary object, to produce a faithful rendering of the original which at the same time would be intelligible to the people, for this purpose a purely literal translation would be insufficient. On the other hand, they regarded it as necessary to present the sacred text in such a manner as best to convey the particular form of interpretation then current But later Jewish exegesis was especially concerned to eliminate everything in the sacred writings that might give rise to misconception with respect to God on the part of the unlearned Hence we find various expedients adopted in the Targums for avoiding any reference to the Deity which might be misunderstood by the people, or which involved apparent irreverence Examples of this peculiarly Targumic method are: (1) the insertion of "word," "glory," "presence" before the divine name, when God is referred to in his dealings with men, (2) the insertion of the preposition "before" when God is the object of any action; (3) the use of the passive for the active voice; (4) the use of periphrasis for the more pronounced anthropomorphisms, such as "to smell," "to taste"; (5) the use of different expressions, or the insertion of a preposition before the divine name, when God is compared to man, or the same action is predicated of God and man; (6) the use of " for mm and and the rendering מעוא or אלחים when אלחים denotes heathen gods. Instances of this endeavour to maintain, as it were, a respectful distance in speaking of God occur on every page of the Targums, but cases also occur, by no means infrequently, where human actions and passions are ascribed to God.

(2) In addition to the Targum of Onkelos two other Targums to the Pentatech are cited by Jewish authorities, under the titles of the Targum Jerushalmi and the Targum of Jonathan ben Uzsiel. Of these the former contains only portions of the Pentatuch and is therefore usually designated the Fragmentary (Jerusalem) Targum. Its fragmentary character arises from the fact that it is simply a collection of variae lectiones and additions to the version of Onkelos, intended possibly for use at public services.

The second Jerusalem Targum admittedly owes its ascription to Jonathan ben Juzziel to the incorrect solution of the abbreviated form by which it was frequently cited, viz., "no Targian Jerushalmi. This Targum represents a later and more successful attempt to correct and supplement the Targum of Onkelos by the aid of varients derived from another source. It is not, 'however, a revision of the Fragmentary Targum—for it is clearly independent of that version—but is rather a parallel, if some what later, production, in which the text of Onkelos is already combined with a number of variants and additions. It exhibits, to a marked deeper, that tendency to expand the text by additions of every land, which has been already noted as charactersiste of the later stages of Targumic composition. Homiles, legends, tadditional sayings and explanations, in fact every form of Haggadic expansion, are utilized by the Targumist, so that at times his works convey the impression more of a late Midrash than of a translation

In regard to the source of the two Palestinian Taigums to the Pentateuch, we must accept the conclusion of Bassfreund (MGWJ, xl) that they both derived their variants from a complete Targum Jerushalms But though the existence of an older Targum Jerushalmi cannot be denied it cannot be of an early date, for many of the latest elements in the Fragmentary and pseudo-Jonathan Targums were undoubtedly derived from their common source Moreover, the existence of a written Palestinian Targum at an early date is expressly excluded by the evidence at our disposal In the middle of the 2nd century AD R Simon ben Gamaliel forbade the translation of the Pentateuch in any language but Greek, and this command was upheld by R. Johanan in the 3rd century Even in the time of the later Amoraim there is no mention of a written Palestinian Targum, though the official Babylonian Targum is repeatedly referred to in the Babylonian Talmud, in the Midrashim, and at times also by Palestımıan Amoraim

Yet it is impossible to hold that the Targum of Onkelos was the only representative of Targum tradition that existed among the Jews down to the 7th century AD., the period to which the internal evidence compels us to assign the Targum Jerushalms as used by the Fragmentary Targum and the pseudo-Jonathan We must rather assume that a tolerably fixed Targum tradition existed in Palestine from quite early times. The language employed in the Targum of Onkelos is, admittedly, Palestinian or Judaean, and we may conjecture that the current Judaean exegesis, which, in part at least, must go back to the 2nd century AD., was not without its influence on the Babylonian translation. This old Targum tradition, however, never received official recogmtion in Palestine, and was unable, therefore, to hold its own when the new Babylonian version was introduced. We may infer that, as time went on, a reaction in favour of the older renderings made itself felt, with the result that these were collected in the form of variants and appended to Onkelos. But the authority enjoyed by the latter rendered it secure against anv encroachments, hence any later expansions, especially those of a popular Haggadic character, naturally found their way into the less stereotyped Targum Jerushalmi

II. Targums on the Prophets.—The official Targum on the Prophets is stated by the Babylonian Talmud to have been "said" by Ionathan ben Uzziel, the disciple of Hillel, and is usually known, therefore, as the Targum Jonathan. Elsewhere in the Talmud, however, the quotations from this Targum are given under the name of Joseph bar Chijah, head of the school at Pumbeditha in the 4th century AD. Both in language and style it closely resembles the Targum of Onkelos, and appears to have been modelled on that translation m certain passages, indeed, it appears to have made use of it Probably, like Onkelos, it did not assume its final form in Babylon before the 5th century AD. It naturally follows from the character of the original that the rendering of this Targum is less literal than that of Onkelos, especially in the prophetic books, but, when due allowance is made for the difficulty of the Hebrew, it may be described on the whole as a faithful reproduction of the original text. Its peculiarities of rendering are due to the same principles which were noted as underlying the translation of the Pentateuch. Anthropomorphisms, as a rule, are avoided by means of the same expedients as those employed by Onkelos, expressions derogatory to the dignity of God, or of the heroes of the nation, are softened down, while figurative language is either boldly transposed, or its character clearly shown by the introduction of the particle "as" or

"like." There is, further, a tendency to narrow down the scope of the prophetic utterances, and to limit their application to Israel and its immediate enemies Lastly, in the obscurer passages the Haggadic method of interpretation is employed to its fullest extent, while the translation throughout shows a marked tendency to explanatory additions.

Of a Targum Jerushalm to the Prophets but little is known, though 1 is hardly dubtful that such a Targum eisted, if only m oral form Traces of this versus have been discovered by Bacher in the variants attached to be margin of the Codes Reudinemum, and printed by Jagarde in his edition of Propheta Cheldines (1871). The quotations in Artik from Engs, Exchange Proverbs and Lamentations point to the existence of a Targum

III Targums to the Hagiographa.—These Targums possess but little interest for the student of Jewish literature as they are almost entirely the work of individuals, made in imitation of the older Targums

(1) Targums to the Psalms and Job—These Targums present certain features in common and may therefore be treated under the same heading. Like all the later Targums they exhibit a large amount of explanatory addition, chiefly Haggadic in character At the same time the tanslation of the original is not neglected, and, when separated from the later accretions, this is found to follow the Hebrew tolerably closely. Peculiar to these Targums are the double translations, which they give to many verses, one of which is usually Haggadic in character, while the other is more literal They cannot be earlier than the 7th century AD, and possibly are of a considerably later date.

(a) The Tangum to the Proverbs stands apart owing to the peculiarity of the language in which it is written The influence of the Peshitta version is so clearly marked, that Dalman describes it as a Jewish revision of that version. But setting aside the Syrisams due to the use of the Peshitta, the Targum shows affinity to the Targums to the Psalms and Job. The translation is literal and almost entirely free from Hagagadac additions.

(3) The Targums to the Megulloth -The chief characteristic of these Targums is their exaggerated use of paraphrase. They mark the final stage in the development of Haggadic interpretation, in which the translation of the text has practically disappeared in a mass of fantastic and irrelevant matter The Targum of Esther is known to us in three recensions (1) that of the Antwerp Polyglot, almost a literal translation, (2) that of the London Polyglot, which gives practically the same text with many additions of a Haggadic character; (3) the so-called second (shem) Targum, a much larger work, containing a collection of later Midrashim to this book, According to Zunz this "second" Targum is quoted by Rashi (to Deut 111, 4) as a Jerusalem Targum, and also (I Kings x, 10) as the "Haggada" of the Megilloth Esther The Targum to Canticles is of a similar character to that of the "second" Esther Dalman assigns these Targums to a date halfway between the Babylonian Taigums (Onkelos and that to the Prophets) and the Jerusalem Targums to the Pentateuch and those to the greater Hagiographa. The British museum possesses three important Yemen manuscripts for the five Megilloth and the "second" Esther Targum in mss. Or. 1302, 1476 and 2375.

(a) The Targum to the Chronicles was first edited from an Erintr manuscript by M. F. Bock, 1680-3; A more complete and accurate edition from a Cambridge manuscript was edited by D. Wilkins in 2715. In the translation, which at times is fairly literal, use appears to have been made of the Jerusalem Targums to the Pentateuch, and of the Targums to the books of Samuel and Kings. The text represented by the Eritur manuscript is assigned to the 8th, that of the Cambridge manuscript to the 9th century AD.

No Targums have so far been discovered to Daniel and Ezra and Nehemiah.

TÂRGU-MURES, a town of Transylvania, ceded in 1940 by Rumania to Hungary, 79 mi. E. of Cluj by rail. Population (1948) 47,043. It is situated on the left bank of the Mures, and is a well-bunk town, once the capital of the territory of the Szeklers On a hill dommating the town stands the old fortress, which contains a beautiful clurch in Gother style bult about 14,46, where in 1571 the diet was held which proclaimed the equality of the Unitarian Church with the Roman Catholic, the Lutheran and Calvinistic Churches. The Teleki palace contains and several valuable manuscripts (e.g., the Teleki codes), as collection of old Hungarian pomes, and a manuscript of Tactius. Target Murey has site on interesting Szekler Industrial miseum. The trade is cheep in timber, gran, was, tobacco, fruit and other products of the neighboushood. There are manufactures of sugar, spirits and beer.

TÂRGU-NEAMTU, a town in the department of Neamtu, Rumanna, situated among the lower slopes of the Carpsthians, and on the left bank of the Neamtu, an affluent of the Moldova. Pop. (1943) 8,948, 737 beng Jews. A branch railway runs to Jassy Near by is the ruined fortress of Neamtu, constructed early in the 13th century by the Teutonic Knights against the Cumans (q v), and the monastery of Neamtu, founded in the 14th century and containing two churches and many ancent and interesting relies. Before the seculiarisation of the monastic lands in 1864 at was one of the nchest and most important of the Rumanan monasteries.

Baltatesti, 10 mi. W by S. of Neamtu, is locally famous for its mineral springs and baths.

TÂRGU-OCNA, a town of Rumania, on the left bank of the river Trotos, an affluent of the Sereth, and on a branch railway which crosses the Ghimes pass into Transylvania Pop (1948) 9,796

9,796
Tärgue-Ocas is built among the Carpathian mountams, on bare hills formed of rock salt Outside the town stands the largest pisson in Rumanus; beyond this are the mmes, worked, since 1870, by converts, who receive a small wage. The estimated total of the salt deposits is 264,000,000 tons, about 11,000 tons being extracted annually.

TARIFA, a seaport of Spain, in the province of Caida, at the extreme south point of the pennasula, 2 mi, by rail W.S.W. of Gibraltar Pop. (1940) 6,959 (mum, 14,815). Tarifa is the Haula tone of Strabo, between Gades and Belon. According to that writer, it was colonized by Romans and the removed inhabitants of Zelis in Mauretaina Tingitian. The Intel Transductor or Traductor of coins and of Polemy appears to be the same place. Its present name, daing from early in the 8th century, is derived from Tarif. (See Spain History.) In 1292 Tarifa was taken by Sancho IV of Castile from the Moors. In the defense of Tarifa Alphonso XI gained the battle of Salado, a short distance to the westward, in 1340. In 1812 a French force under Claude Victor-Perrin and Laval vainly endeavoured to capture Tarifa, then held by Gen. Hugh Gough.

The town is nearly quadrangular, with narrow, crooked streets, and is still surrounded by its old Moorish walls The rocky island in front of the town, connected with the mainland by a causeway, is for field.

TARIPFS. From the middle of the 19th century to the period of the great depression of the 1930s, tainfis, in the sense of lists of the taxes required to be paid upon various classes of goods when mowing across national frontiers, constituted the principal official condition upon the conduct of commercial transactions between persons in different countries. With the 1930s, other forms of control over foreign trade came into wide use. In some countries, the right of the duties prescribed by the tariff schedule to munor importance. This had been the situation even before the exigencies of World War II and of the unsettled early post-war years made official licences and other dracet governmental decisions the prime determinants of the movements of goods between countries for the time being. The above applies to controls of exports as well as of imports, although not as markedly or as extensively. Controls upon imports are by far the more imports are the first me or the more imports are by far the more imports are the price the more imports.

tant, and this discussion deals principally with them.

Customs Duties and Their Functions.—Tariffs may be distinguished from customs, although the two are often used interchangeably Tariffs, a term found in many languages, denotes the lists or schedules of commodities with the particular duties or charges upon each noted, whereas customs is the English term which originally denoted all "customary" tolls or dues paid by merchants upon commodities on their way to or from market, not necessarily differentiated by the class of goods, for the benefit of the king, lord, local government or other authority. In the course of time, as the national state became the dominant economic as well as political unit, the complex structure of multiple local and provincial tolls on trade was substantially replaced by those levied only upon crossing the frontier of the country The term then came to be restricted, in most countries by the late 18th or early 10th century, to taxes on the importation or exportation of commodities across national boundaries By the middle of the 19th century, most industrial countries had curtailed or abolished their taxes on exports Internal taxes, where now levied on production

or trade, are most commonly termed excise duties or sales taxes. In their original character, as internal levies or tolls, customs sometimes had the character of fees for services sendered to traders, such as the use of market places, roads, bridges, habbours, etc, or assurance of protection for persons and goods. By the time they became purely frontier taxes, then primary function was to raise revenue, to help cover the costs of the national government or the personal expenditures of the king. In time, as international trade in competitive products expanded, customs duties, especially on imports, came to serve also in a protective way. In fact, many governments have from time to time revised their schedules of customs duties for that very purpose, in accordance with the current concept as to how far foreign commerce should be regulated in favour of domorties for the production or trade in particular lines. (See Free Trade; Pro-TECTION.)

The revenue and protective functions of import duties shifted in relative importance from time to time after the middle of the 10th century and varied considerably with the different countries. as will appear from the historical discussions which follow When duties are levied almost entirely for revenue, as they were in Great Britain for a great many years until after World War I, the regime is referred to as free trade The two principal functions of customs duties are, however, seldom mutually exclusive. Revenue duties may be with or without incidental protection, while protective duties, unless they prove entirely prohibitive of imports, usually yield revenue incidentally and often in substantial amounts. In most industrialized and economically diversified countries, the protective function became predominant Among the countries pumarily producers of natural products, notably those of Latin America, the import duties continued to serve almost exclusively as yielders of revenue. As local manufacturing developed in particular lines, however, especially under the stimulus of import shortages during wars, some of the import duties of traditionally raw-material producing countries also assumed a protective character and indeed were often selectively revised for that purpose.

Customs duties have long been employed also as preferential deveces, to divert trade to particular sources or directions. This use has been found mainly, but not exclusively, in the trade relations between certain countries and their dependencies Differential scales of import duties have frequently been employed also for bargaming purposes, to obtain improved conditions of admission for a country's export products into foreign markets, or to penalize the trade of countries whose tariff practices were regarded as unfair. Duties were most actively used for trade barganning after the 1860s by the countries of continental Europe and since 1934 also by the United States.

(H. CHA.)

## TARIFF HISTORY OF THE PRINCIPAL TRADING COUNTRIES UP TO 1930

The United States.—The tariff history of the United States, like that of European countries, divides itself into two great

periods, before and after the year 1860. The period before 1860 may again be divided into three sub-periods, the first extending from 1789 to 1816, the second from 1816 to about 1846, the third from 1846 to 1860.

- If (a) The Tariff Act of 1.780 was the first legislative measure passed by the United States The protectionsts have pointed to it as showing the disposition of the first congress to adopt at once a policy of protection, the free traders have pointed to a similarly as showing a predilection for their policy Each has some ground for the claim The duties of the act of 1.789 were very modestate, and, as compared with those which the United States has had under any subsequent legislation, may be described as free trade duties On the other hand, the spirit of the act of 1.789 was protective Such in the main remained the situation until 1816, duties being indeed raised from time to time norde to secure more revenue, but the spirit and the general rate of the duties not being sensibly modified
- (b) After the close of the War of 1812, however, a new spirit and a new policy developed. A demand arose for two closely connected measures protection to domestic manufactures and internal improvements. Protection was demanded as a means both of aiding young industries and of fostering a home market for agricultural products; it was a part of the "American system." Some movement in the direction of higher duties was manifested as early as 1816 Still greater changes were made in 1824. 1828 and 1832. The tariff of 1828 was affected by some political manipulation, which caused it to contain objectionable provisions, and to be dubbed "the tariff of abominations" The so-called abominations were removed in 1832, when the protective system was deliberately and carefully rearranged By this time, however, the opposition to it in the south had reached a pitch so intense that concessions had to be made. The nullification movement led in 1833 to the well known compromise, by which the rates of duty as established by the act of 1832 were to be gradually reduced, reaching in 1842 a general level of 20%. But the reductions of duty made under it proved ephemeral In 1842, when the final 20% rate was to have gone into effect, the protectionists again had control of congress, and after a brief period of two months. during which this 20% rate was in force, passed the Tariff act of 1842, which once more restored the protective system in a form not much less extreme than that of 1832.
- (c) Four years later, however, 1846, a very considerable change was secured by the south, and a new era was entered on. The Democratic party now was in control of legislation, and in the Tariff act of 1846 established a system of moderate and purely ad valorem duties, in which the protected articles were subjected, as rule, to a rate of 3.0%, is some cases to rates of 3.5 and 2.0%. The system, often spoken of as one of free trade, was in reality only one of moderated protection. In 1847, duties were all further reduced, the rate on most protected commodities going down to 3.4%.
- II The second great period in the tariff history of the United States opens with the Civil War. In the session of 1860-61, immediately preceding the outbreak of the conflict, the Morrill Tariff act was passed by the Republican party, then in control because the defection of southern members of congress had already begun. The advances then made were of little importance as compared with the far-reaching increases of duty during the Civil War. Duties were steadly raised, partly by way of offset to the internal taxes, partly to get additional revenue and largely because of a disposition to protect domestic industries. The close of the war thus left the United States with a complicated system of very high taxes both on imported and on domestic products.

The main features of the tariff history of the United States in the years after the Civil War were that the internal taxes were almost entirely swept away and the import duties on purely revenue articles similarly abolished, while those import duties that operated to protect domestic industries were mulntained, and in many cases increased. Efforts were indeed made to reduce the tariff duties, but met with strong opposition, and in the end were almost completely frustrated. The decade immediately following the war brought about the gradual transformation of the high war brought about the gradual transformation of the taxes levied on all commodities for revenue purposes into a system of high dutues almost wholly on protected commodities. This transformation met with much opposition, not less in the Republican party than in the Democratic pairy. The opposition led to a general revision in 1883, which, on the whole, served rather to put things in order than to make any change of policy

The tariff system as revised and codified in 1883 would probably have remained unchanged for many years had it not been for an unexpected turn taken by political and financial history In the second half of the decade 1880-00, a continuous large surplus in the treasury directed attention to the state of the revenue, and gave strength to the protests against excessive taxation. In addition, the Democratic party, which had long been committed, though in a half-hearted way, against the policy of high protection, was brought to a vigorous and uncompromising attack on it through the leadership of President Cleveland In his presidential message of Dec 1887 he attacked the system in unqualified terms. The Republicans, as is almost inevitable under a party system, championed the policy opposed by the other side, and declared themselves in favour of the consistent and unqualified further application of protection. The protective question thus became the main issue in the presidential election of 1888, which resulted in the defeat of the Democrats In the next ensuing session of congress, the Republicans passed the McKinley Tariff act It advanced duties materially on a considerable number of commodities, both raw materials and manufactured articles. A further step towards consolidating the protective system was taken by abolishing the duty on sugar, mainly a revenue duty For consistency in maintaining the protective principle a direct bounty was given to the domestic producers of sugar in Louisiana Another turn in the political wheel brought an abrupt change four years later, in 1804. President Cleveland. defeated four years before, was now again elected, and the Democratic party came into power, pledged to change the tariff system Accordingly the tariff act of 1804 was passed, known as the Wilson Tariff, bringing about considerable reductions of duty The measure, however, was less incisive than its chief sponsors had planned, because of the narrow majority commanded by the Democrats in the senate. The most radical change was that the duty on wool, typical among the duties on raw materials, was completely abolished, and with this came a great reduction in the duties upon woollen goods. A duty was reimposed on sugar, chiefly as a means of securing needed revenue, but at a less rate than had existed before 1800; the bounty of 1800 was abolished. The next election in 1896 brought still another turn, the Republicans being once more brought into power under the leadership of President McKinley. At the extra session which President Mc-Kinley called in 1897, almost the sole measure considered was the tariff act, known as the Dingley act. This reimposed the duties upon wool, on most qualities at the precise rates of 1800. on some qualities at even higher rates. Necessarily the duties on woollens were correspondingly raised, and here again made even higher than they had been in 1890. The tariff act of 1900, amending that of 1897, did not appreciably change the situation. It made certain reductions in duties, such as the rates on hides, wool tops and various iron and steel products; but except in the case of hides, the reductions were in most cases more nominal than real. The net result was to leave the general height of the tariff at much the same level as had previously ruled. At the next presidential election in 1912 the Democrats, for the first time since 1802-04, gained control of both the executive and legislative branches of the government Immediately the Democratic leaders began the revision of the tariff law. In the act of 1913 most raw materials, including raw wool, were placed upon the free list; the complicated schedules that had grown up in the Republican tariffs were largely scrapped; and the effective protection upon semi-manufactured and wholly manufactured articles was markedly decreased. Sugar was to be admitted free. But the abolition of the sugar duty was not to take effect till 1917; by that time World War I had set in; and under the war conditions, the duty was retained, though at a lower rate than that of 1900. The act of 1913, however, proved to be of little practical significance. The outbreak of World War I in 1014 made impossible all competition from abroad with United States industries. This situation endured for a year or two after the close of the war, and it was not until the collapse of 1920-21 that serious consideration was again given to the tariff problem. By that time the Republicans were again in power, and were so firmly entrenched, after their decisive victory at the polls in 1920, that they did not hesitate to restore the protection of prewar days and even increase it. The agricultural regions of the central west were hardest hit by the great decline in prices, and clamoured for some remedy The Republicans followed their traditional policy of holding forth a high tariff as the remedy for all ills, and at once enacted the Emergency Tariff act of 1921, which provisionally reimposed the duty on wool, and raised those on sugar, wheat, corn, meat. In 1922 a general revision was made, and a new complete tariff act was passed. The duties on agricultural products were still further increased, and those on manufactured goods, such as woollens, cottons, silks, pottery, hardware, were either put at the level of the tariff act of 1900 (the last preceding high tariff act) or raised above that level. Some articles previously admitted at low rates were now subjected to high ones, such as dvestuffs and chemicals. All in all, the protective policy was carried higher than ever before. At the same time a new administrative policy was introduced, by giving the tariff commission certain powers as regards modification and adjustment of

Great Britain .- England emerged from the mercantilist policies of the 17th and 18th centuries with a tariff system that not only imposed high rates but was extraordinarily complicated and confused The first steps toward the radical change which was to come in the 19th century were taken by Pitt. In 1787 he caused the Consolidation act to be passed, which codified the previous intricate mass of scattered, inconsistent and cumulative duties. In 1786 he also arranged a commercial treaty with France providing for substantial reciprocal reductions of duties; but this measure, unlike that for consolidation, was swept away by the French Revolution. After 1815 English tariff history is marked by two great changes: on the one hand the modification and finally the repeal of the "corn laws", on the other, the steady succession of acts which gradually cut down the duties on all other goods and led eventually to the complete adoption of free trade. The corn laws, it is true, were first strengthened, then experiments were made with sliding scale duties, designed to keep the price of grain stable, and finally they were suddenly wiped out at the time of the Irish famine of 1846. They had political support because of the predominance of the gentry and the landed interests in both houses of parliament. But industrially as well as politically they were vulnerable, and inevitably collapsed in a crisis like that of the famine. The other series of events began with Huskisson's measures of 1824, which reduced duties, especially on raw materials such as wool, and went on with a succession of measures until the last remnant of protection disappeared in 1860. The notable steps were Peel's act of 1842, an important and far reaching measure; Peel's second important act, in 1846, contemporaneous with the corn law repeal; Gladstone's famous budget of 1853; and finally in 1860 the removal of the silk duties, the last of the protective duties which had been retained. This final step of 1860 was taken in connection with the Cobden-Chevalier treaty with France, noted below. For half a century thereafter, England was on a free trade basis and was the stronghold of free trade. The system was suited to her industrial development during the period, enabling her manufactures to develop at an extraordinary rate, while foodstuffs and raw materials were imported in ever increasing volume. The system seemed entrenched beyond attack, and this notwithstanding the fact that the landed interest was hard hit by the decline in agricultural prices from 1873 to the dose of the century. It was not until World War I that a change took place, and it then took place to an extent which could not have been expected and indeed, was not expected when the initial steps were taken. Very shortly after the outbreak of the war, in 1915, certain duties were imposed upon lixuries, the so-called McKenna duties; being at the rate of

334% on watches, motor cars and parts, cinema films and the like. Immediately after the war some further changes were made in the same direction, yet still susceptible of interpretation on other grounds than that of a return to protection pure and simple. In 1919 imperial preference to the colonial products, long urged by the colonies themselves, was granted on tea, coffee, cocoa, sugar, the most important being the preference on sugar. In 1920, again, the imports of dvestuffs and coal-tar dyes were completely prohibited, this being in the nature of a war measure, designed to ensure the domestic production of military explosives, and also that of dvestuffs whose importance to textile industries was deemed cardinal. In 1921 came the Safeguarding of Industries act, which went a step further, imposing a duty of 331% on the product of the so-called key industries, such as optical instruments, barometers, wireless apparatus In the same year came the anti-dumping act, imposing a 331% duty on goods sold in England below cost or sold at particularly low prices because of depreciated currency elsewhere Some of these duties were repealed by the MacDonald Labour government in 1924. But all were re-enacted in 1925, and then at last the Baldwin government took steps which clearly were not explicable on political or military grounds, or as means for meeting special emergencies. In 1925 not only were the McKenna duties restored, but, what was more important, the safeguarding of industries' provisions were given a wide scope. In advocacy of them, most was said about the desirability of preventing unemployment through the protection of established industries. The board of trade was made a sort of tariff commission which should investigate particular cases and recommend to parliament advances in duties; not merely for key industries or because of special circumstances, but as part of a general industrial policy While the import duties to which this measure led were not, as compared with the entire volume of Britain's trade, of great substantive consequence, they marked unmistakably a departure from the principles of the free trade regime as it existed before 1914

France.-The tariff history of France during the 19th century, like that of England, is divided into two parts, one running to the year 1860, and the other beginning after 1860. France emerged from the revolutionary wars with a cumbrous system, resting partly upon the highly complicated measures left over from the mercantilism of the 18th century, and for a part upon complete prohibition of importation (directed primarily against England) which had been adopted during the war period and was left in force, largely through inertia, for almost half a century thereafter. The tariff system of France, in other words, from 1815 until 1860, was rigidly protectionist. In 1860 the Cobden-Chevalier treaty made an abrupt change, to which the Emperor Napoleon III was led in some part by intellectual conviction, but much more by the desire to get on good terms with Great Britain. The treaty provided for great reductions on manufactured goods imported from England, while England in her turn not only conceded the free admission of silks, but also reduced duties on French wines. After 1860 France virtually universalized these lower duties, extending them by a series of commercial treaties to almost all the countries of the continent. These treaties commonly contained the most-favoured-nation clause, and were in turn fortified by treaties which the various countries concluded between themselves as well as with France. The result was an interlacing network of commercial engagements which covered almost the whole of Europe, and brought about not a system of free trade, but one of nearer approach to free trade than had ever before been widely practised Such, at all events, was the situation for two decades from 1860. The French people, however, had always been restive under the treaty system imposed upon them by the will of Napoleon III. The English treaty, which was terminable after the lapse of ten years, was at first renewed with reluctance, and finally terminated for good in 1891 The protectionist revival culminated in the great Méline act of 1892. By that France established a double system: maximum duties which were not to be exceeded, and specified minimum duties which the government might concede to other countries in return for concessions supposed to be equivalent. The maximum duties, however, were in no case to be reduced on agricultural products; for in France, as in England, agricultural producers were hard hit by the decline in prices. One important purpose of the act was to deprive the immistry of discretionary power as regards reductions through commercial negotiation, the minimum duties which might be conceded to other countries were specified by the legislature. The system was mantaned in essentials, though not without some modification, until the outbreak of the war in 1914. The revival of high protection in France did not run its course without serious difficulties, especially in the way of controversy on rates with other countries. There was a tarif war with Italy in 1888–90 and one in 1892–95 with Switzerland. In 1910 there was again a revision upward, which, however, left the general system intact.

One further factor in French tariff policy during this period was the treaty of Frankfurt (1871) terminating the war of 1870-71. By that treaty France and Germany had guaranteed each other most-favoured-nation treatment-not complete, but almost complete, in that they guaranteed to each other the same rates as they conceded to the important neighbouring countries of central Europe Being incorporated in the general treaty, these provisions, unlike the special commercial treaty of 1860 with England, could not be denounced; and they were felt by both countries to hamper their commercial negotiations, being the more unwelcome because of the constantly growing national antagonism. When all treaties and engagements with Germany, and practically those with other countries also, were swept away with World War I, France was able to proceed untrammelled with a new course of policy. It rested upon the maintenance of a high protective system, susceptible of some liberalization through special bargains with other countries, by which these were to be induced to admit French goods at lowered rates in exchange for specified concessions in the French duties, varying from country to country. In 1920 the maximum and minimum system was virtually given up and the government given free hand in commercial negotiations. The result was a highly complicated series of engagements, which brought into vivid contrast two essentially different lines of policy. that of special bargaining, and that of equal treatment under a most-favoured-nation clause. The second policy was unpopular in France, partly because of its association with the treaty of Frankfurt, but partly for other reasons connected with peculiarities of French foreign trade. Not only as regards France, but as regards Europe at large, the alignment was marked by one or the other of these two ways of procedure. Those in favour of closer commercial relations preferred the most-favoured-nation method. while high protectionists looked to the policy of specific bargainings. On the whole France was not successful in securing what it wished by bargaining, even though it had political advantages in dealing with states like Czechoslovakia, Hungary, Yugoslavia, and even Belgium. In 1927 it was compelled to arrange with Germany a treaty virtually upon most-favoured-nation basis, a change which marked a halt in the other policy, and perhaps the beginning of a general trend the other way.

Germany.-The tariff history of Germany, like that of German history in general, is closely connected with Prussia. Prussia took the lead in the creation of the German customs union (Zollversin). It arranged a partial union in 1819 which was followed by the Zollverein of 1834, including practically the whole of the later empire. Prussia was then a grain exporting country, and favoured a liberal tariff system. As time went on, manufacturing industries developed, especially in the west and south of Germany, and contests arose within the Zollverein between the free trade and protectionist parties. In these, upon the whole, the anti-protectionists were victorious until after the establishment of the empire. A commercial treaty with France in 1862, a sequel of the Anglo-French treaty of 1860, confirmed the liberal tendency. But after 1871 Germany, like France, and at about the same time, turned the other way. Under Bismarck's lead, and in consequence of an alliance between the industrialists of the west and south and the agricultural interests of the east (now threatened by imports), Germany returned in 1879 to protection. Grain duties were imposed, and proved an important source of revenue, because imports continued on a large scale; at the same time the

continuing imports made the landed interest firmly protectionist. At the beginning of 1802 Germany entered upon a policy of commercial treaties which were based upon special negotiation with each particular country; though they were prevented by the treaty of Frankfurt from having as much effect in the way of discriminations between countries as might otherwise have been the case This policy of specialization was continued in the legislation of 1902, when rates were further increased and further commercial treaties were mitiated As in the case of France, the policy of specialized commercial negotiations led to quarrels and retaliations, there being tariff wars with Russia, Spain and Canada. After World War I, Germany for a while was restricted by certain provisions of the Versailles treaty. These required her for five years from the date of the treaty (that is, during 1919-24) to give most-favoured-nation treatment to the Allies, while at the same time leaving the Allies free. With the termination of this arrangement in 1924 Germany proceeded more freely, and in 1925 adopted a new tariff A protectionist regime was established both for agricultural products and for manufactured goods, with an expectation, however, that the duties might be reduced through bargaining for lower duties by other countries on German goods. Success in this direction was achieved in 1927 by the commercial treaty with France, which provided for certain reductions upon French goods, and also secured for German goods imported into France treatment virtually on a most-favoured-nation basis. Other treaties contained similar provisions, and emphasized the acceptance by Germany of the most-favoured-nation policy and disposition to moderate the protectionist regime. This attitude prevailed until the depression of the 1930s.

Other Countries.-The same trend in tariff legislation appeared in other countries during the years succeeding 1860. In almost all, the protectionist movement gathered strength again after 1880. Austria, Russia and Italy turned to high tariffs, sometimes mitigated by commercial agreements, sometimes aggravated by the failure of commercial negotiations The greatest extreme was reached in Russia, which under the leadership of Count Witte developed a system of protection more extreme than that of any other country, not excepting the United States After World War I, when the financial and treaty arrangements had all to be remodelled, there was the same resurgence and accentuation of protective tariffs. The main cause lay in the strengthening of national feeling and in the persistence of nationalist antagonisms engendered by the war. The new states which arose after the war or were greatly enlarged by it, such as Poland, Czechoslovakia, Yugoslavia, Greece and Rumania, turned to protective measures. In good part, they were influenced by imitation of the larger powers, and not least by mitation of the United States

GENERAL SURVEY OF THE SITUATION PRIOR TO WORLD WAR II

Prior to World War I .- Viewing the situation generally, two broad periods can be distinguished in the development of import tariffs and the related conditions upon international trading after 1900. The first period, running up to the outbreak of World War I in 1914, was marked by three outstanding characteristics: (1) the levying of import duties was practically the only form of official control generally used by governments to regulate the importations of foreign goods; (2) in height, the duties of most countries were moderate compared with those which have prevailed during more recent years, and they were marked by considerable stability, with material changes made only at long intervals; and (3) equality of competitive opportunity for the products from all foreign sources was the rule in most markets, with preferences favouring the products of some countries over those of others the exception and found mainly in the trade relations between a few countries and certain of their colonies or dependencies.

Decades of the 1920s and 1930s.—The second period, comprising the two decades between 1919 and 1939, was characterized by more frequent changes, by a trend toward higher duties, and by the development of other methods of regulating imports

and of special arrangements between many countries regarding their trade. These practices became particularly marked during the great depression, after a decade of shifting tendencies

As political and economic conditions gradually improved and became fairly well stabilized toward the middle of the 1920s, many governments felt they could cleax the seventry of the increased tarifis and emergency controls upon foreign tade, resorted to, especially on the continent of Europe, during World War I and the disturbed period immediately following. This gave courageous tone to the recommendations of the first World Economic conference, held at Geneva in 1927 Indeed, for a number of years pinch to 10 sept. Here was a great for the continuous commercial treaties were negotiated in the latter 1920s in which governments exchanged reductions in their respective duties on the distinctive products of the other.

With few exceptions, these treates carried the most-favourednation clause, i.e., each confuacting country promised to accord to imports from the other as good treatment as the best that was then—or might later be—granted to the same products from the

nation most favoured.

Developments During the Depression.—Shortly after the onest of the general economic depression late in 1929, however, this liberal movement lost impetus. It gave way to a tightemic of import controls, which soon developed into a distinct movement toward restrictive economic nationalism, and an increasing degree of governmental inner vention into foreign trade operations. The upward revision of the import duties of the United States adopted m June 1930 was the first important step in this direction and was quickly followed by similar trade-estrictive measures on the part of other countries. The adoption by Great Britain of a general tariff early in 1932, which made most imports from nonempire sources subject to duty, after almost a century of practically free trade, was another of the outstanding developments.

Added to the usual pressures during a period of declining economic activity and shrinking markets, to maintain employment and support prices, the problem of many governments was agenvated by the practical stoppage of new international lend ings, and by the succession of depreciations of various important currencies, starting with the British pound sterling in Sept. 1931. To the resulting dislocations of existing competitive relationships and the distortions of national trade balances and budgets, there are the starting of the starting control of the st

The increases in import duties resorted to by many countries during the early days of the depression were soon followed by measures for controlling directly the importation of foreign goods or the transfer of funds to pay for them. In the fall of 1931, there began to be revived the practice of limiting to specified quotas the quantities of particular classes of goods permitted to be imported, as a whole or from particular countries, or of making foreign commercial transactions generally subject to official licence. Initiated by France, the practice spread within a few years to almost all countries of Europe and, in lesser degree, to certain extra-European areas (see QUOTA). Centralized control on the transfer of funds abroad, precipitated by the financial difficulties of certain central European banks in 1931, was soon resorted to by one government after another, spreading from Europe to Latin America and other outlying regions, as another means of regulating the volume and direction of a country's foreign trade, and of adjusting adverse trade balance situations. Originally temporary and defensive measures, both import quotas and exchange controls soon came to be widely used as aggressive means, by which the operating government bargained for assurance of the admission of larger quantities of its national products into the territories of others, for release of funds due its citizens or for other special advantages. The relative allocations of imports or of exchange to different countries were, in some cases, put on a frankly preferential basis.

The Ottawa agreements of 1932, whereby the various parts of

the British empire undettook to supply their import needs as far as possible from within the empire, constituted an outstanding development of another type but in the same trade-diversonary direction. That objective was sought either through enlarged duty preferences among the British countries, or through additional tariff or quota handcaps on the competing products of outsiders, chiefly the latter. The Ottawa agreements had wide repercussions

A world economic conference was convened at London in 1933, with the hope of finding solutions for the general economic depression through concerted action. Apparently, however, it came too late to supersede the various national recovery programs, conceived from a purely domestic or regional viewpoint, which had already developed momentum in many of the important countries. With little prospect, then, of early relief through material expansion of their exports, many governments fell back upon the further restriction of imports by various methods, or upon special arrangements for the official direction of their reduced purchases to selected countries Bilateral agreements, frequently revised, came to be an important method whereby pairs of governments endeavoured to provide specifically regarding the volume or the make-up of the trade between their nationals, or the total balance of payments between their countries Almost inevitably, these arrangements tended to become exclusive in the character of their favours, and discriminatory against the commercial interests of other countries. The basic import duties were often overshadowed as the prime regulators of trade movements, and existing obligations to accord treaty countries equality of tariff treatment were progressively nullified

Several of the major countries of Europe, notably Germany, who happened to need large quantities of foods or raw materials from other European and certain overseas countries, beyond the value of their exports to them, used that fact as a barganing weapon. They insisted upon arrangements whereby the foreign exchange resulting from their imports was to be reserved by their exploying countries—primarily, if not exclusively—for the purchase of their own export products, for preferential debt payments, thawing of frozon credits, etc. Thus, there spread the idea that the trade or total payments between each pair of countries should approximate an annual balance. The result was some diversion of tade, but mainly a shrinkage of the total volume, with the balance usually struck closer to the level of the lower of the two currents of

Meanwhile, the sharp drop in the export trade of the United States, involving serious domestic readjustments, prompted the government of that country to obtain congressional authorization, in June 1934, for initiating a program of trade agreements intended to differ from the narrowly bilateral type then prevalent Over the subsequent decade, agreements were concluded with 28 foreign countries for the reciprocal reduction of excessive tariffs and other trade barriers on each other's distinctive products. Through these, the United States sought to revive progressively the freer flow of international trade generally, and to give a new turn to the commercial policy of the nations. A distinctive feature was the reassertion of the most-favoured-nation or equality-oftreatment principle, and its application to all forms of trade barriers, including quotas and exchange controls as well as tariffs In all cases but Cuba, the benefit of the concessions made by the United States were extended to the like products of all other countries, except those materially discriminating against the commerce of the United States.

Despite the moderating influence of the United States trade agreements program, the dominant trend in the trade policies of most countries during the 1330s continued in the other direction. The observed cumulative results of the trade restrictive and diversionary measures before long led various officials and business leaders of the 'very countries pursuing those practices to recognize that, in overlooking the essentially multilateral character of world commerce and financial relations, the measures by which particular countries or pairs of them sought to improve their own position too often only aggravated the position of others and provoked counteraction which rebounded to their own disadvantage.

for checking the growing deterioration of the general economic relations between nations which came to mark the 1930s

Partial explanation probably lay in the fact that, in addition to the continuing economic uncertainties, political considerations and pressures were becoming increasingly important factors in the commercial policies of various countries. The lengthening shadows of the impending war, which finally broke out in 1939. were frequently impalpable factors in the restrictive measures or unusual trade-control arrangements of many peacefully intentioned governments during the latter 1930s. As later became too clear, they were the obvious explanations for the actions of certain other governments, such as deliberately curtailing imports of certain essential products, either in order to foster selfsupply even at high cost, or to divert their limited exchange resources to increased importations which advanced the country's "rearmament program," or enlarged its national reserves of strategic commodities

## INTERNATIONAL TRADE CONTROLS DURING WORLD WAR II

Outside of the two secluded axis-controlled regions in Europe and in the far east most international trade routes were kept substantially open during the war by the British and American navies. despite heavy sinkings However, the enlargement of the war to almost global dimensions, and the intensification of the war production programs of the Allies, called for the drastic diversion to war purposes of all available resources. The consequent shortage of many types of goods for ordinary civilian use, and of the shipping to carry them, limited during the war the volume of ordinary commercial interchanges of goods within the nonaxis world Under the circumstances, the usual tariffs and other trade controls of the importing countries became subordinate to the governmental decisions of the exporting countries, as to whether the particular goods could be spared, as to the particular destination and as to current availability of transport.

To a large extent, governments themselves participated in the procurement and distribution of many classes of commodities These took the form either of direct bulk purchasing by official agencies or of governmental over-all contracts or arrangements regarding supplies, shipping and exceptional risks, with the actual transactions consummated through private trading channels Such government-to-government or governmentally arranged transactions were often found the only way of ensuring adequate supplies of essential foreign materials or products at noninflated prices, and of effecting such disposition of the limited resources of goods and ships among competing claimants as would best serve the national interests and support the Allied war program.

As the war progressed, the enlarged production programs of the Allies and of the countries friendly to them resulted in huge international movements of special supplies and equipment, either for direct use in connection with military operations or for the support of the basic economies of the combatant nations. These exceptional movements were facilitated by the introduction of two new forms of commercial policy,

A series of combined boards was established in 1942 for the most effective utilization of the joint economic resources of the United Nations toward the prosecution of the war, covering the fields of raw materials, foods and industrial production, as well as munitions and shipping. Imitated by the United States and the United Kingdom, with the participation of Canada and certain other British dominions in particular fields, the combined boards encompassed their own resources and those of other accessible areas in the procurement of materials and products. In the allocation of the aggregate supplies thus made available, they envisaged the needs of all the United Nations engaged in the war, in accordance with their relative essentiality and urgency. The Anglo-American governments also undertook a measure of responsibility toward supplying the other United Nations with their essential civilian import requirements, so far as the naturally prior claims of the military programs allowed. While the two governments operated jointly in programs for meeting the essential needs of

No effective methods of collective action were found, however, the peoples in certain regions, notably the near and middle east, the United Kingdom was especially concerned with the British empire and with the overseas colonies of friendly European countries, while the United States undertook to share, between its own population and those of Canada and Latin America, the goods

in short supply available for civilian consumption

In the matter of payment for these exceptional movements of goods between the various active belligerent allies, another new principle of commercial policy was introduced. Early in 1941, when the ability of Great Britain to pay in dollars for the huge quantities of munitions and supplies needed to continue the war was rapidly diminishing, the United States Lend-Lease act authorized the president to make available to the government of any country whose defense be deemed "vital to the defense of the United States," any articles, service or information, without regard to current compensation In return for such aid, "the benefit to the United States may be payment or repayment in kind or property, or any other direct or indirect benefit which the President deems satisfactory," This new policy of sharing one country's production and facilities with other countries engaged in a common struggle, without regard to their precise ability to make repayment-sometimes referred to as "mutual aid"-was soon adopted and put into wide practice also by various of the other United Nations, in accordance with their capacity to contribute goods or services By the end of 1944, the cumulative measurable value of the goods, facilities and services contributed under this principle by the various United Nations (chiefly the United States, the United Kingdom, Canada, Australia, New Zealand and India), for use by other United Nations in the common effort, had exceeded in magnitude the highest value recorded for the entire international trade between all countries during any prewar year A significant feature of the agreements with regard to the ultimate settlement of lend-lease, which were concluded by the United States with more than 30 of the United Nations, was the uniform pledge of all the contracting countries to collaborate after the war in a program designed to promote more liberal conditions for international trading and a more prosperous, expanding world economy.

## INTERNATIONAL TRADE CONTROLS AFTER WORLD WAR II

Transition from War to Peace .- The termination of hostilities in 1945 put an end to the forced commercial seclusion of most of Europe and of the far east, as well as to the arbitrary diversion of the resources within those regions to Germany and Japan. However, the war had left in its wake widespread destruction and disorganization. Drastic changes had taken place in the economic and often even in the political position of many countries and colonies, and there were more to come It was evident that the process of restoring a satisfactory and stable structure of world commerce would be long and difficult, and that for many countries the pattern of trade and of the measures for its control that would emerge might be quite different from those of the prewar period.

As goods and shipping again became available primarily for civilian use, the various joint programs under British-American auspices, through which many commodities in short world supply had during the war been procured in bulk and then centrally allocated among the Allies and friendly neutrals, soon tapered off. By the close of 1946, only the allocation of tin, coal, fertilizer and certain scarce farm products were still subject to international review. With termination of lend-lease and other mutual aid programs in the fall of 1945, the financing of most international shipments had promptly reverted to its usual cash or credit basis.

To facilitate the resumption of normal trade, the United States and Canada, upon whose supplies the Allied nations had come to rely heavily, relaxed their licence controls upon exportations The needs of the war-ravaged countries, especially in Europe, for supplies of foreign products for replenishment and rehabilitation were exceptionally large, and their current ability to pay for them with their exports or cash exceptionally low. To help finance this mutually beneficial flow of goods, several of the countries which had been outside the area of active conflict—notably the United States and Canada in the western hemisphere, and Switzerland and Sweden in Europe—extended sizable loans or established substantial official credits

Even in the formerly war-involved countries of western Europe, where there were the fewest political obstacles to the revival of foreign commerce, a large measure of governmental control and even official intervention in the conduct of foreign trade seemed unavoidable for a time Each government felt that its immediate responsibility for economic rehabilitation included planning for the country's essential import requirements. This involved direct supervision over the utilization of the limited amounts of foreign goods obtainable and of the means to pay for them, in order to ensure that the most vital needs of the nation were given priority. In fact, to reduce the cost of acquiring essential products needed from abroad, governments often suspended the collection of import duties on broad ranges of commodities. Official management of imports was all the more necessary because the revival of the exports of these countries' products, the principal means of paying for foreign goods, was retarded by the extreme domestic shortage of supplies and the serious derangement of internal production and distribution facilities

Soon after the end of the war, the liberated countries of western Europe became very active in the negotiation of trade agreements with each other and with other European countries, in order to facilitate the resumption of the traditionally large intra-European exchanges of distinctive products Unlike the prewar type of trade agreements, however, these did not deal with changes in the structure of their tariffs and other basic foreign trade controls. The negotiations centred rather upon the lists of goods which each country was especially desirous of obtaining from the other, and the delivery of which the other government agreed to facilitate through the granting of export licences, usually up to specified maximum quantities for each scheduled class of goods Since the reserve funds of the liberated countries were very limited and exchange values of their currencies uncertain, these agreements usually aimed at a balanced value for their over-all bilateral exchanges during the year, although some provision was usually embodied for reciprocal credits to cover limited overdrafts either

In most of the countries of eastern Europe, there was the handicap of political unsettlement in addition to economic disorder and meagre finances. That hampered the resumption of their foreign trade long after the close of the war. Aude from some goods obtained through exchanges with neighbouring areas on a barter basis, their principal early myorits were the relief shipments supplied by U N R.R.A. (United Nations Relief and Rehabilitation administration), the greater part of which came from the United States. The experimentation with state control of the domestic Corner German stellites, the heavy doliveners to the invaded eastern areas called for as reparations operated further to limit any stable trade with western Europe or with overease countries.

In most of the areas of the far east overrun by Japan, the process of liberation and of restoring something like a stable processor gime, often under new political auspices, moved very slowly. Excepting the Philippinas, such foreign trade as was possible for several years after the war was handled by governmental agencies or by officially designated organizations.

To ease the transition for the United Kingdom and the group of countries for which it is the financial centre, the United States extended to Britain a long-term loan of \$83,750,000,000. Even with that, however, the shrunken foreign exchange resources of the sterling area countries after the heavy war losses allowed little unital relaxation of their wartime restrictions on trade with outside countries.

With the passing of the special arrangements by which the Latin American countries had regulated their import requests to conform to the export controls of the United States, their principal wartine sources of simply, most of the governments of South America and certain of Middle America replaced them with stronger local import controls; 'However, in viewof, their improved financial position after the profitable wartime sales, few felt it necessary to apply these controls very restrictively

Trade Difficulties of the Early Postwar Years.-Even after the immediate transitional period following World War II, the course of international trade continued to be determined only to a small degree either by the height of the tariffs or by the export or import licensing systems, which came into common use in most countries outside of North America More determining were the acute needs of the war-involved areas for products essential to the rehabilitation of their economies and the unprecedented pent-up demand everywhere for goods that had not been freely available for a number of years The prime limitations upon meeting these exceptionally high demands for goods were two, the general world shortages of many essential commodities, especially foodstuffs and coal, and often of the means for transporting them, and the limited ability of many countries to pay for such foreign goods as were obtainable. Insofar as official trade controls were important, the decisions in the exporting country as to how much of particular commodities could be spared and where they should go were on the whole more influential than were the duties or other official conditions set by the governments of the importing countries upon their admission.

During 1946, as domestic production in various countries increased and supplies became generally more ample, restrictions on exportations were gradually relaxed. On the import side, direct exportations were gradually relaxed. On the import side, direct field licence, at least over the greater part of watern and souther field licence, at least over the greater part of watern and souther m Europe. Drawing upon their exchange reserves, and in the case of the countries of the sterling area and of western Europe upon the sizable extensions of credits earlier mentioned, most foreign countries expanded their purchasing eagerly. By 1947, the aggregate movements of goods in world commerce had recovered to above the prewar volume, and in terms of the higher prices the value was very much larger.

The very eagerness of the peoples of many countries to acquire large quantities of foreign goods, however, brought a sharp reaction in the way of official restrictions upon imports In the case of Europe, this was caused partly by the disappointingly slow recovery on the part of most countries in the production of essential commodities and in financial stabilization. Apparently the degree of disorganization in their internal economies had been underestimated, and their progress was further held back by severe weather, crop failures and strikes. The continued unsettled conditions in Germany, in the Danubian countries, and in the far east, which had been important sources of supply as well as markets for western Europe, was an additional retarding influence. This intensified the demand for substitute supplies from the western hemisphere, principally the United States. Moreover, the earnings from foreign investments, shipping and other sources, by which various European countries used to pay for much of their prewar excess of imports over exports, had shrunken during the war. In quite a number of countries, notably those of Latin America, the high rate at which their peoples had been buying foreign products since the war was well beyond the value of their current export earnings, and was itself responsible for their governments' resorting to stricter import controls as a safeguard for the nation's financial position.

By the close of 1947, new or tightened restrictions upon imports had been brought into operation in the great majority of countries in both hemispheres. By that time, both the accumulated foreign exchange reserves and the new credits obtained to tide over the transition had been seriously drained. To readjust their countries buying programs closer to the ability to pay, many governments curtailed the admission of various classes of goods regarded as not strictly essential. The cuts were applied with special severity to purchases from the follar countries, in order to conserve the limited dollar resources for the most essential produced by the conserved of the c

Particularly acute was the crisis that developed in the balance of payments of the sterling area. In July 1947, Gesta Butan had offered to make current sterling earnings freely convertible mot oblars, as agreed to in connection with the loan from the United States, with a view to starting the return toward the multilateral settlement of international balances. That offer brought so heavy a call upon Bartish dollar holdings as to force its suspension in a month. The effort to meet this crisis, through shap curtailment of imports into all the sterling area countries, exceted against a considerable number of other countries by materially shrinking their export markets

The Marshall Plan—It became clear that the war-disrupted countries of Europe needed further assistance to help rebuild their productive and trading strength and to ude them over until their own recuperative efforts, individually and jointly, had had time to bring results. Under stimulus from Secy of State George C. Marshall's offer of possible aid from the United States, the European countries met in the summer of 1947 to develop a cooperative program for common recovery. When the Soviet Union withdrew, along with the satellite countries of eastern Europe, it became the program of the 16 countries of seistern Europe, it

The large funds voted by the United States congress early in togs, and in each of several years thereafter, in support of this European Recovery program, the "Marshall plan," brought gratifying results in several ways in the expanded production and general reconstruction of the patiticipating European countries, in the more confident attitude is bred, and in its stimulus to close collaboration among themselves. Moreover, in increasing the putation of the program of the program of the program of the program, the side extended by the United States also busistered interational trade generally.

Despite this assistance, many countries were still unable to afford all the imported good desired, and selective restrictions continued. The purchases from dollar countries in particular were concentrated upon the most essential products. The inconvertibility of most currences, and often their unreal official exchange rates, hundered even such freet exchange of goods between counties as their recovering production might otherwise have allowed As a corrective to this situation, many countries tried what amounted to partial or selective depreciation of their currencies, by such devices as multiple exchange rates and exchange certaincates. The man objectives were to stimulate the foreign sales of their export products and to discourage or make mose costly the importation of classes of goods considered of secondary importance.

The type of trade agreement earlier described, which provided for reciprocal exchanges of supplies and anned at a bilateral annual balance of values, became the common pattern over a large part of the world. Although metapable so long as currencies were unconvertible and exchange reserves low, they came to have a distinctly constricting effect upon the potential expansion of foreign trade. The general resistance to the inclusion of nonessentals in the schedule of products that each country would admit from the other states of the control of

To ease the settlement of uneven balances in the trade among the European countries themselves, a special intra-European payments plan was inaugurated in 1948. Under this arrangement portions of the dollar aid allocated by the United States to respective ERP countries were made conditional upon their setting up special accounts of equivalent value in their own currencies, against which members with whom they had an export surplus could draw to finance their deficits. This was later replaced by a flexible system for clearing balances, the European Payments union,

The first broad efforts to loosen the "log jam" of governmental

restrictions upon the normal flow of goods and of payments, which had been building up since World War II, came in 1949. For, despite the vanous measures taken earlier, few countries yet felt able to relax materially their restrictive foreign trade controls For most countries of western Europe, the problem continued to be particularly acute and took two forms how to reduce their trade deficits with the dollar countries and how to open the way for larger trade exchanges with each other and their associated overseast territories.

In Sept 1949, Great Britain announced a 30% devaluation of its currency in terms of the dollar. This action was soon followed by all the sterling areas except Pakistan, and by all of the western European countries except Switzerland. Before long, many contress in Latin America and elsewhere made sharp cuts in the official exchange rates for their currencies as a whole or for transactions in particular categories of commodities. These moves were expected to reduce the overly high export prices that had developed under the inflationary conditions which, varying only in degree, had characterized the domestic economes in most countries since the war Along with the more realistic official realignment of currency values, commercial programs were initiated for more organized and infensive marketing of goods in dollar countries

On the problem of bringing about a freer flow of goods among themselves, the countries participating in the European Recovery program agreed in 1949 simultaneously to lift quota limitations upon their importations from the others in the group to the extent of at least 50% of past private trade in each major category of products. Early in 1950 they agreed upon a sense of steps for the progressive further liberalization of such quotas, with the hope of the trade among themselves ultimately becoming free of all hence restrictions. That program suffered several sebacks in the next few years, and by the close of 1953 had made only limited and uneven progress.

In the meantime, smaller groups of Buropean countries were actively considering various plans for a greater degree of trude beeralization among themselves, both for their own value and as possible intermediate steps toward for their own value and as possible intermediates steps toward for their own value and as general customs umon or economic mitegration of all western Europe. The only substantial progress actually made was the abolition of import duties on the movement of goods between Belgium, the Netherlands and Luxenbourg, which thus formed the Benelux Customs umon. However, other obstacles to the effective operation of this enlarged free market still persisted into the 1958. And its development into a full economic umon seemed remote.

In the major Assatic areas, progress toward resumption of nonmal commerce was still largely dependent upon political developments. Operating to hamper and even further to restrict trade operating were the following: (i) the spread of communist control over continental Chna, (2) the continued civil werfare in Indochans; (3) the internal disturbances in Burma; and (4) the disputes on both political and economic issues between India and Pakistan, which in Aug 1947 became independent countries.

On the favourable side was the setting up of an independent republic of the United States of Indonessa by the close of 1949. This promised to bring about the more stable condutions necessary to make available to world markets the various raw materials for which these islands had long been an important source. At about the same time the stabilization of the Japanese yean and the transfer from the Allied powers to the Japanese government of the authority to regulate the foreign trade of that country allowed its commerce to return rapidly to private channels.

Similar progress was concurrently being made in the principal other area occupied by the Allied powers, namely, western Germany. The adoption of a uniform conversion rate for the mark in 1948 and shortly thereafter the merging of the British, French and American zones for trade purposes greatly stimulated the revival of the German economy and facilitated direct private trade with foreigners.

Viewed broadly, the progressive improvement in production, monetary stability and trade balance which many countries were making gave promise, by the beginning of 1950, of early trade normalization. In fact, a number of governments began to liberalize their licence and exchange restrictions. The most pronounced steps were those taken by the countries of western Europe, earlier mentoned, to facilitate their exchanges of goods with each other Moderate relaxations were put into effect by Canada and several of the South American countries

An important contributory development at about this time was the substantial easing of the world shortage of dollars, which had for many countries been the prime problem in their trade imbalance. Their growing ability to supply themselves and each other with essential commodities, their improved export position pricewise as a result of the devaluations of 1948-49, joined with the strict selective curbs upon imports of less essential products especially from dollar sources, altogether resulted by the middle of 1950 in a marked narrowing of the dollar gap.

It is important to note, however, that this near closure of the dollar gap was the result more of the sharp decline in foreign purchases of United States goods from their earlier exceptional height, than of increases in the quantities of foreign goods sold in the

American market.

Trade Boom and Reaction After the Korean Outbreak.—
The sudden invasion of South Korean mid-1yop introduced we forces into the trade current. The resulting emergency pressures and the reactions to them oversladowed the normal recuperative forces for several years in determining the course of international trade and the character of the measures for regulating it.

The Pixt Phase—The threatened worsening of the international political situation led the United States and the other members of the North Atlantic Treaty organization (NA T.O.) to rebuild their defensive strength and stimulated a wide movement to acquire larger supplies of foreign products. At first, demand centred on basic raw materials for the enlarged midustrial production that was now anticipated and for military and commercial stock-pling. Before long the demand from many countries spread to broad ranges of commodities, in the aggregate well beyond the quantities readily available. Consequently, prices quickly rose to unusual heights, especially for primary products.

The widespread eagerness to stock up, in fear of later shortages and possibly higher purces, came at a time when—as carlier noted—most countries had greatly improved their financial position. This enabled a considerable number of governments in various parts of the world, especially in the western hemisphere, to take bold steps toward relaxing the operation of their import control of the world.

systems

On the other hand, as the intensified demand in international markets mounted, many governments imposed or tightened restrictions upon the exportation of their national products. This was done cheefly by enlarging the lists for which individual licences were required and by closer scrutiny of export applications as to quantity, destination and often price. The man objectives were commonly twofold: to ensure the retention of sufficient supplies for domestic consumption or processing without undue price rises; and to provide for some fair allocation of the products in exceptionally high demand.

In an increasing number of countries, national security considerations became an important factor in determining the destinations for which certain products would be licensed. The object was to prevent, or at least limit, shipments of commodities of strategic or other potential military value to countries with possible aggressive intentions. This program of tightening export centrols on such shipments and transhipments to the Soviet blow was most pronounced on the part of the United States, Canada, the western European countries, Japan and the Philippines.

The extraordinary itse in the market prices of various primary commodities led the governments of many countries to increase sharply the taxes upon their exportation or to impose new ones. The usual purposes were to divert part of the windfall gains to governmental use and to check the domestic inflation being engeldered. Certain countries also aimed to build up stabilisation funds to support the particular exporting industries during the investible lean years to follow.

An interesting experiment in joint action by the nations of the

free world for dealing with the problems of supplies of certain scarce basic materials, and their equitable allocation, was initiated early in 1951 under Anglo-Franco-American auspices. While all measures taken by the 28 participating countries were the result of voluntary agreements, the series of standing commodity committees making up the International Materials conference had a steadying effect upon the general raw materials situation, reducing the intense initial competitive bidding for supplies and the sharp fluctuations in market prices. Within less than three years they were able to go on a "stand-by" basis

The Second Phase —Beginning in the spring of 1951, there set

The Second Phase—Beginning in the spring of 1951, there set in a distinct slowing down in the volume of purchases of many base materials This brought a decline in their prices from the earlier peaks, although both demand and price for most primary commodities continued well above pre-Korean war level for another year or so. Joined with the gradual subsidence of the fears of extreme shortages was the growing resistance by government and merchants to what they considered excessive prices, notably

for rubber, tin, wool, jute and wood pulp

To the countries of Asia, Latin America and the overseas sterling areas, whose principal exports are primary products, the trade developments of 1050-51 usually brought distinct gains in their financial postion, though often at the cost of sharp domestic inflation. This condition continued even after the recession from the initial high demand and prices. For the mudustrial countries of western Europe and North America, on the other hand, the sharper rise in prices of raw-material imports than of their typical manufactured exports, combined with the need for greatly increased quantities of imported materials for industrial expansion in support of the rearmament programs, often created difficult veloped into acute balance-of-payments cries in France and Britain, and along with Britain in many of the other sterling-currency countries.

In fact, the sharpness of the fluctuations in international demand and prices brought on by the Korean conflict created problems for a great many countries. Even the primary producing countries of South America and Asia found before long that their high rates of importation were depleting their newly replenshed foreign exchange reserves and bringing back the earlier trade axis-times. Some governments sought to redress the situation through greater domestic austerity and intensified efforts to increase exports, but most often the immediate corrective adopted was renewed restriction of imports as a whole or from particular currency areas

The Third Phase.—During 1952 and 1953, the majority of the countries made substantal progress toward the restoration of balance in their external trade and financial position. In this they were aided by good harvests in most regions, the large inventories of foreign goods on hand from earlier purchases, and the general return to more stable market prices. Most of the improvement, however, was achieved through reducing the volume of their foreign trade by cutting back the country's imports to the level of earnings from current exports.

The recession in raw-material prices eased the problem of the industrial countries through improving their terms of trade. Obversely, for the primary producing countries, the sharp shrinkage in mome from their export staples had an adverse effect upon their external financial positions. This held back any appreciable relaxation of the import restrictions to which they had reveted after the period of overbuying. Even among the countries which succeeded in working back toward a more balanced position in their international payments, only a few had by the close of 193 fest warranted in doing much toward leaking the restrictions on their international payments, only a few had by the close of 193 fest warranted in doing much toward leaking the restrictions on their of Europe and of the sterling area apparently preferred to rebuild their foreign exchange reserves to a higher level, so as to be in a stronger position to withstand possible renewed strain upon their balance of payments.

On the export side, this third or readjustment phase of the trade shifts following the Korean outbreak did bring an appreciable relaxation of the licensing and rationing controls adopted during the scramble for supplies after mid-1950. Those controls that were still maintained had as their prime objects the implementation of reciprocal supply agreements and the checking of the shipment of strategic products to areas under Soviet domination At the same time, the wide resort to high export taxes on the part of the primary producers during the price upsurge of 1950-51 was reversed. Most of the extra levies were reduced or abolished to make the products more readily salable in world markets.

General Agreement on Tariffs and Trade.-While the majority of countries after World War II depended for the regulation of their foreign trade primarily upon administrative controls on the quantities of goods entering or leaving their territories and on the conditions of paying for them, most of the noncommunist governments regarded them as essentially short-run measures They declared themselves as looking forward to the time when improved conditions would enable them to liberalize or abandon most of these controls and to rely again primarily upon moderate and nondiscriminatory tariffs

The most important concrete expression of the desire of the nations to move toward that long-term objective has been the General Agreement on Tairifs and Trade (GATT), originally concluded at Geneva in 1947, and amplified at Annecy in 1949 and at Torquay in 1951.

in 1947, and amplined at Annecy in 1949 and at Torquay in 1951. By 1953, 33 countries were contracting parties, and accounted in the aggregate for about 80% of total world commerce

The GATT grew out of the proposal by the United States shortly after the close of World War II that the nations collaborate in a broad program, as envisaged in the lend-lease settlement agreements, to promote more liberal conditions for international trading and a prosperous expanding world economy. It consisted essentially of two parts. Specifically, there was the series of agreements that were negotiated specifically, to ever was the series of agreements that were rigidinate simultaneously by various pairs of governments for the reduction of existing import duties of each on selected products of particular nerst to the other party, or their binding against increase The aggregate concessions in the bilateral negotiations were then generalized to the same products from all of the participants Of a more general character was the code of principles regarding quantitative restrictions and other measures affecting foreign trade by which the contracting governments undertook to be guided, as soon as certain specified limitagovernments undertook to be guated, as soon as certain specified neutra-rements found themselves able to relax, if not to terminate, the various quantitative controls and other nonconforming practices that had been so promoment in the unsettled posture decade, the more liberal progressively to exert their beneficial influence.

In the meantime, the collective tainff agreements were regarded jin-

portant, both as an advanced concept of the desirable pattern of in-ternational trade arrangements and, at the least, as effecting a sub-stantial tariff truce through the stabilization of a large part of the import duties of the world Despite some withdrawals of specific duty concessions by a number of countries—a flexibility for which the duty concessions by a number of countries—a nexibility not which that the member governments agreed in Oct. 1953 to a second extension of their tariff undertakings as a whole to run to the middle of 1955.

Trading With and Within the Soviet Sphere.—As earlier

indicated, almost all of the countries of eastern Europe began to move toward centralized control of their economies as soon as World Wai II ended. Thereafter, their foreign as well as their domestic trade came

to be conducted almost entirely through agencies of the state or those authorized by it Moreover, as these countries had been remoulded along the lines of the Soviet Union, and—with the exception of along the lines of the Soviet Union, and—with the exception of Vigoslavia—had come increasingly under its direction, their commercial political programs of the Soviet bloc. They were, therefore, less responsive than the open-trading countries to the general shifts in world

sponave than the open-training countries to the general sunties in worst counteries after 95. U.S.S.R. and five of the countries in the Soviet sphere set up a Council for Economic Mutual Assistance as an offset to the ERP which was manugarated the preedding year by the countries of western and southern Europe and which those of the east had refused to join, While agreements for closer trade relations and in certain es also for industrial collaboration were concluded between various

cases also for industrial collaboration were concluded between various pairs of these countries, the only co-ordinated economic planning for the region as a whole was evidently that stemming from Moscow The strong mituence of the USSR was exacted toward making the Soviet bloc as nearly self-sufficient as possible. The ambituous production programs amonunced by the various satellities seemed designed primarily for meeting Russia's import requirements and sendarily their own needs or those of other mort culcuments and sendarily their own needs or those of other mort culcuments and sendarily their own needs or those of other mort culcuments and sendarily their own needs or those of other mort culcuments and sendarily their own needs or those of other mort fearmants and the save manufacturing facilities of the Soviet zone of Germany and the law materials of communist China were, likewise, increasingly integrated into the governmentally planned trading system of the Soviet Union and its European satellites.

Despite the long-term objective to reduce their dependence upon the west for supplies and markets, the countries in the Soviet sphere intermittently sought arrangements for trading with outside countries

to meet their immediate needs for raw materials and capital equipment to meet their immediate needs for raw materials and capital equipment not available from each other. Since credit was seldom obtainable, such trade exchanges were usually planned on a closely balanced basis. In part, the volume of this trade was limited by the restrictions imin part, the volume of this trade was inmited by the restrictions in proceed by various countries of the few world upon the restrictions. The Soviet blue of products that would be recommended by the restriction of the rest USSR and the other communist countries

No. 30 K and the other communist countries
After repeated attempts at collective trade, negotiations between
east and west at Geneva under the auspices of the Economic Commusion for Europe had yielded hitte result, Russia mivted the nations to
a Moscow Economic conference in the spring of 1952

There the Soviet spokesmen put forward vigorously the beneficial possibilities of larger exchanges with the communist countries, if only outside countries exchanges with the communist countries, it only outside countries would lift their export restrictions Only small-scale bilaterial transactions were known to have resulted, however, partly because of the inability of the Soviet bloc to supply many of the products sought by the others, and partly because of communist insistence on including in the proposed exchanges various products which the western govern-

ny use outsers, and party occases or communist measures on anadomic in the proposed exchanges vanues products which the western governments would not hence for algorithm of the proposed of the proposed of the community of the U.S. 8th of New York and London, 1931). TARIJA, a department and town of southeastern Bolivia The department lies on the northern frontier of Argentina, and is bounded west by Potosí, north by Chuquisaca, and east by Paraguay. Pop. (1950 census) 126,752. A1ea 11,979 sq mi The eastern part of the department belongs to the great Chaco lowland region. The Chaco districts are inhabited by small nomadic tribes of Indians, and the grassy Llanes de Manzo by the Chiriguanos, many of whom live in permanent villages, breed horses, cattle and sheep, and till the soil. In the mountains are remnants of the Quéchua, once masters of an empire. There are oil wells at Río Bermejo and Sanandita

The capital, SAN BERNARDO DE TARITA (DOD. census 1950. 16,869) is the only town of importance in the department. It is situated on the Río Tarija, about 85 mi. E. of Tupiza. It is about 6,500 ft. above sea level and its climate is mild. (J W. Mw)

TARIM, the river which gives its name to the great basin between the Tien Shan and Kunlun mountain systems of central Asia. The area of the basm is over 350,000 sq mi, and the length of the river may be said to be about 1,000 mi. The mountain frame dies away to the northeast in the arid Gobi, so that beneath the slopes of the Kunlun lies the Kansu highway from China, The river is formed by the confluence of the Kashgar and the Yarkand; it then flows for about 230 mi. northeastward between high banks, bordered by poplars and reeds, and joins the Aksu, a swift and powerful stream from the north; 20 mi, farther on the Khotan river flows in from the south, and after another 150 mi. it begins to come into direct conflict with the sand dunes of the great desert and to form lateral lakes in the hollows between the great dunes, which the Khotan river has had to fight in the lower part of its course Numerous streams flow in from the Kunlun northward parallel to and east of the Khotan river, but lose themselves in the desert, and the Khotan reaches the Tarim only about 40 days in a year. Farther to the east the Tarim breaks up in deltaic fashion and swings north and south Here it skirts the northeast front of the great dunes and has a number of long lakes on its course, stretching mostly north to south or northwest to southeast. The lakes act as filters and the river emerges from them bright and clear. A little north of lat. 40, at Airylgan, it receives the Koncheh river, which issues from the lake called Bagrach-Köl. This river has poplars on its left bank which hinder the spread of the desert from the north-east. Below Airylgan the remains of the river, which has diminished practically all the way down from its confluence with the Aksu, enter the dwindling lakes of Kara-Buran, a sort of ante-room to the real terminal basin of the river, the Kara-Koshum (Lop-Nor, q v ) at an altitude of 2.675 ft. above sea-level. In 1990-01 Dr Syen Hedin discovered several fresh desert lakes forming to the north of Kara-Koshun, and branches of the deltaic arms of the Tarım, or overflows of such branches, straining out in the same direction, facts which he interpreted as showing a tendency of the river to revert to its former more northerly terminal basin of the old (Chinese) Lop-

The lower part of the course of the river is, on the whole, moving south-westward into lower ground. Its course is so sluggish that sediment is deposited in its bed, which is thus raised above the surrounding country The river is usually frozen during December, January and February. The thaw in March causes a flood, followed by a greater one, due to the melting of snows on the mountains, and the high water can be traced down

the river during the summer

The basin is often divided into four main regions:-(a) The Takla-Makan desert (qv) or central area of bare drift-sand desert. Its borders on the west, north and east are determined by the belts of vegetation accompanying the Tisnaf, Yarkand and Tarim rivers respectively. The area has outliers beyond these riverine borders (b) The oasis belts south of the Tien-shan, east of the Pamir and north of the Karakorum and Kunlun 'The oases on the south he between the gravel glacis of the Kunlun and the sands of Takla-Makan. The best known are Karghalik. Khotan, Keriya, Niya, Cherchen and Charkhlik, Those on the north include Uchturfan, Aksu, Bas-Kuche, Kuerhlei, Karashar, Turfan, Pichan and Hami To the west the two chief ones are Kashgar and Yarkand The cultivable areas are usually greater in the west and the north than in the south (c) The terminal depression of Lop and the Turfan basin The Lop basin contains the terminal marshes of the Tarim river, the salt-encrusted bed of the former extension of Lop-Nor beyond the marshes, and the dune-covered area east of the final course of the Tarim river between it and the north-western shore of the old lake. The Turfan depression is enclosed on the north by a portion of the Tienshan; on the west by an outlying range of the same, and on the east and south by the barren hills of the Kuruk Tagh Within these boundaries there are belts of glacis, desert, oasis-cultivation and dune-covered desert, exactly as one finds them in the Taxim basin. (d) The Sulo-Ho basin, and the cultivated area along the route north of the Nan-shan, leading into Kansu from the eastern Tarm. The basin is covered with bare gravel, except for a narrow belt of vegetation accompanying the lower course of the river, and the limited area capable of cultivation by means of irrigation around the oasis of Tun-huang South of Tun-huang accumulations of drift-sand, approach or overlie the foothills of the Nan-shan.

Problems of Climatic History .- The present-day climate of the Tarim basin is discussed in the article on Sinkiang (q v.), but the problems of its possible changes of climate in the past have been the subject of much investigation during recent years. The expeditions into the Tarim basin which have been undertaken by Sir Aurel Stein and Dr. Sven Hedin have resulted in a great mass of evidence bearing on the problem. This evidence has been interpreted by various authorities, who have each put forward a theory to explain the facts reported by the explorers. The problem is connected with the supposed "desicca-tion" of Central Asia. (See Asia: Exploration.)

Great changes have come about in the Tarim basin during the last two thousand years. Settlements have been abandoned and fresh ones made; some regions, once prosperous, are now deserted and are quite uninhabitable; rivers have forsaken their old beds, and other rivers do not extend as far as they once did, while the lakes in the centre of the basin appear to be shrinking in size.

Historical Geography. The Tarim basin lies on a highway

Tien-shan and the southern one along the northern foot of the Kunlun. Both unite at Kashgar, whence the route leads over the Pamirs to the trans-Caspian lowlands

The region has always been one having an essentially "corridor" nature There is not, and never has been, sufficient atmospheric moisture or subterranean water supplies to support a large agricultural population The narrow belts of riverine jungle could never, within historic times, have afforded the possibility of nomadic existence to any but quite insignificant communities, such as the present Dolans on the Yarkand river. This point is very important, for it explains why the great nomadic tribes of the Wu-sun. Sakas, Yueh-chih, Huns, Turks and Mongols were always ready to raid, or to make tributary, the oases of the Tarim, but never crossed the Tien-shan, permanently to occupy the basin Nature has denied grazing grounds to the Tarim, and has thus protected it against ever becoming the scene of great migratory movements and the upheavals which accompany them Within the basin itself, the only basis of life was painstaking agriculture, possible only by means of irrigation. This mode of life did not appeal to the neighbouring nomads; the plateaux of the Tien-shan or the Mongolian steppes were more suitable for them. Because of these conditions, we find each great wave of Central Asian migration moving along the northern foot of the Tien-shan, or even further north

Modern Economic Conditions in the Tarim Basin.-The potential wealth of the Tarim basin is as yet untouched by modern developments. Hitherto its commercial importance as a highway has benefited those people who used the highway. Beyond the protection afforded at times by Chinese troops, and the benefits of an effective administration, which the region enjoyed when Chinese authority was sufficiently strong to assert itself, the native oasis dwellers have not prospered overmuch from the advantages which their land offers to neighbouring peoples as

an easy trade route between East and West.

The fertile "loess" which composes much of the western part of the basin is eminently suitable for cultivation. The total amount of land under cultivation could be increased if a scientific system of irrigation were developed by the Chinese administrators. The chief obstacle to wider cultivation of the oases as found in the people themselves They are mostly Turki, engaged in either agriculture or commerce, and, although they do not resent foreign interference, they show no desire to enlarge their commercial and agricultural enterprises. The attitude of the Chinese in the matter of foreign exploitation of the Tarim basin is very discouraging Foreign capital is needed to develop the resources of the country, and the Chinese are not anxious to admit this, owing to their dread of alien domination

The products are chiefly grain of all kinds, wool, cotton and silk. Khotan is the centre of the silk industry, and also the centre of valuable jade deposits Agriculture is the most im-portant and widespread industry. The natives depend on it for their existence, as foodstuffs are not imported from the neigh-bouring States. The cotton and jute industries could be turned into a flourishing trade if properly exploited, both products being of excellent quality. Soil, labour and material are there to cooperate in the development of these industries.

The political disturbances in the Tarim basin during the last century and the recent upheavals in China itself have been responsible to a large extent for the commercial apathy prevailing in East Turkistan. (See also Sinkiang, Kashgar, Khotan, Yarkand, Lop-Nor, and for bibliography see Asia.)

TARKANRÍ or TARKILANRI, a Pathan tribe inhabiting the valleys of Bajour, on the border of the North West Frontier Province of India.

TARKINGTON, NEWTON BOOTH (1869-1946), U.S author, was born in Indianapolis (Ind.), July 29, 1869 After studying at Phillips academy, Exeter (N. H.), he entered Purdue university, Lafayette (Ind.), but later transferred to Princeton, whence he graduated in 1893. He was a member of the Indiana House of Representatives in 1902-03 One of the most of the nations; the main routes through it being in an east-west versatile of American writers of fiction, Tarkington won early direction, the northern route along the southern foot of the recognition with his novel, The Gentleman from Indiana (1800).

Among his outstanding successes were the charming romance Mon- buttress of the Plateau Central, with the Montagne Noire (3,970 siem Beaucaire (1900), which was later presented on the films and on the legitimate stage, the humorous portravals of boyhood and adolescence, Penrod (1914) and Seventeen (1916), his delineations of the modern industrial city, The Turmoil (1915); The Magnificent Ambersons (1918), and The Midlander (1924), combined as Growth (1927); and The Plutocrat (1927) Perhaps his most finished novel was Alice Adams (1921), which, like The Magnificent Ambersons, was awarded a Pulitzer prize Tarkington was also the author of a number of plays including Beauty and the Jacobin (1912), Mister Antonio (1916), The Man from Home (1906), and Up from Nowhere (1919), the latter two with Harry Leon Wilson, Penrod Jashber (1929) He died on May 19, 1946

TARLAC, a municipality (with administrative centre and 42 barrios or districts) and capital of the rich province of Tarlac, Luzon, Republic of the Philippines It is located on the central plain of Luzon in the region drained by the Agno river Pop. (1939) 55,682, of whom 29,038 were males and 114 were white The region produces two crops of palay (rice) annually, one by means of irrigation. Other agricultural products are sugar, tobacco, corn, beans, sweet potatoes, coconuts and pineapples Pampango is the principal vernacular, but Tagalog, Ilocano and Pangansman are spoken in the municipality and elsewhere in the province Of the inhabitants aged 6 to 10 inclusive, 33 1% attended school in 1939, and 58 8% of the population 10 years old and over was literate. The number of parcels of private land declared for taxation in 1938 was 5,113 and the number of owners 3,030 Tarlac was founded in 1686 (C. S L)

TARLETON, SIR BANASTRE (1754-1833), English soldier, the son of John Tarleton (1719-1773), a Liverpool merchant, was born in Liverpool on Aug 21, 1754. Educated at Oxford, he entered the army and in Dec 1775 he sailed as a volunteer to America with Earl, afterward Marquess, Cornwalls. His services during the American War of Independence in 1776 gained him the position of a brigade-major of cavalry. In 1780, as commander of the British legion, a mixed force of cavalry and light infantry, he went to South Carolina, supporting Sir Henry Clinton in the operations which culminated in the capture of Charleston. After taking part in many successful engagements, he marched with Cornwallis into Virginia and was instructed to hold Gloucester This post, however, was surrendered to the Americans with Yorktown in Oct. 1781, and Tarleton returned to England on parole From 1790 to 1812, with the exception of one year, he sat as M P for Liverpool. In 1794 he was promoted to major-general, and in 1812 general; he held a military command in Ireland and another in England. In 1815 he was made a baronet. He died without issue at Leintwardine, Shropshire, on Jan. 25, 1833.

He wrote a History of the Campaigns of 1780 and 1781 in the Southern Provinces of North America (1781) which was criticized by Col. Roderick Mackenzie in his Strictures on Lieutenantcolonel Tarleton's History (1781), and in the Cornwallis Correspondence.

TARLTON, RICHARD (d 1588), English actor, according to Fuller (Worthies m, 139) was born at Condover, Shropshire. He was probably at one time an inn-keeper. In 1583 he is mentioned as one of the original company of queen's players and he had become an experienced actor; he was their chief comedian and remained with them until his death. He was Elizabeth's favourite clown, and his talent for impromptu doggerel on subjects suggested by his audience has given his name to that form of verse. For the queen's men he wrote The Seven Deadly Sins. Many songs and witticisms of the day were attributed to him, and after his death Tarlton's Jests, many of them older than he, made several volumes. He is said to have been the Yorick of Hamlet's soliloguy.

TARN, a department of France, formed in 1790 of the three dioceses of Albi, Castres and Lavaur, belonging to the province of Languedoc. Pop. (1946) 298,117. Area, 2,232 sq.mi. Tarn is bounded north and east by Aveyron, southeast by Herault, south by Aude, southwest and west by Haute-Garonne, northwest by Tarn-et-Garonne. The department forms the southern

ft ) near its southern border The general slope is from east to west, and in the east the Monts de Lacaune reach 4,154 ft at the Pic de Montalet The greater part of the department is floored by ancient rocks with some granite, especially in the north, and the general level is from 1,500 to 2,000 ft The Aveyron runs along the northern boundary, the Tarn across the middle of the department, and the Agout across the south, and they join one another west of the boundary on their way to Garonne The Aude receives the streams from a part of the Montagne Noire

The limestone and sandstone foothills are clothed with vines and fruit trees, and are broken by deep alluvial valleys of extraordnary fertility. The eastern portion of the department has the climate of Auvergne, the severest in France, but that of the plain is Girondin The winter average temperature reduced to sea level is 41° and the summer average temperature is 70°, but the great elevation often reduces these figures by 15° to 20°. The rainfall, 29 or 30 in at that place, exceeds 40 in on the Lacaune and Montagne Noire

The west and centre produces cereals, wheat, oats, maize and vines; the valleys around Castres provide natural pasture for cattle, market-gardening is carried on in the west. There are mines of coal and iron, and quarries of lime The industries include the manufacture of textiles, hosiery, brushes, morocco leather, hats, metal foundries, dve works and glassworks department is famous for its sparkling wines The department is divided into two arrondissements (Albi and Castres) and there are 36 cantons and 325 communes. The department is in the 16th military region, and the académie (educational division) of Toulouse, where is its court of appeal,

The chief towns are Albi (the capital and seat of an archbishop, with suffragan hishops at Rodez, Cahors, Mende and Perpignan). Castres, Gaillac, Lavaur, Mazamet and Cordes (qq v). Burlats has ruins of an old church and château; Lisle d'Albi, a bastide with a 14th-century church, and Penne has ruins of a mediaeval châtean

TARN, a river of southern France, 234 mr long, a tributary to the Garonne. It rises at 5,249 ft on the Hercynian gneisses of Mt. Lozère, flows westward and, having received the Tainon, enters a goige in the Jurassic limestones, which separates the Causse de Sauveterre from the Causse Méian. It receives the Ionte (left) and passes between the Causse Noir, the Larzac plateau and the Causse de St. Affrique (left) and the Lévezou range and the Plateau of Ségala (right). At Millau it receives the Dourble (left) and lower down the Dourdou (left) and from there to the cascade of Sabo, above Albi, the river crosses Permian and Sılurian rocks Having entered the plain, the river has cut out a deep bed in the Tertiary strata, passes Gaillac, and, after receiving the Agoût (left), it turns northwest, receiving the Tescou (right) at Montauban and the Aveyron (right). After passing Moissac it joins the Garonne on its right bank.

TARN-ET-GARONNE, a department of southwestern France, formed in 1808 of districts formerly belonging to Guienne and Gascony (Quercy, Lomagne, Armagnac, Rouergue, Agenais), with the addition of a small piece of Languedoc From 1700 to 1808 its territory was divided between the departments of Lot. Haute-Garonne, Tarn, Aveyron, Gers and Lot-et-Garonne It is bounded north by Lot, east by Aveyron, south by Tarn and Haute-Garonne, and west by Gers and Lot-et-Garonne. Area, 1,440 sq mi. Pop. (1946) 167,664. The department is the region focusing upon Montauban and includes the junction of the Aveyron and the Tarn and their union with the Garonne. These rivers separate hills of Pliocene strata, and in the extreme northeast stands out the edge of the Plateau Central and the limestone Causse de Quercy (1,634 ft.). The climate is mild and agreeable; the mean annual temperature being about 56° F. Rain falls seldom, but heavily, especially in spring, the annual rainfall being 28 or 30 in.

The wide alluvial valleys of the three large rivers are most productive. Cereals, especially wheat, maize and oats, occupy more than two-thirds of the arable land of the department. The vine is grown everywhere and large quantities of grapes are exported as table fruit. Potatoes are also grown Plums and apricots are abundant. The breeding of horses, especially for cavalry purposes, is actively carried on, and the rearing of horned cattle, both for draught and for fattening, is also important. Sheep, pigs, poultry, and silk-worms are also sources of profit. There are metal-founderse, various kinds of silk-mills, and manufactories of straw-hats, wool, paper and brooms. The principal exports are fruit, wine, flour, truffles from the Rouergue, and early vegetables. The canal of the Garonne traverses the department or 48 m and the Garonne and the Tarn furnish 82 m of navygable waterway. The department is served by the Orléans and the Southern railways. The department forms the diocese of Montauban under the archbishop of Toulouse, and belongs to the académic (educational division) of Toulouse, where is its court of appeal, and to the district of the XVII. corps d'armée (Tou-Careller, and the control of the Arthur and Careller, and the Careller, and th

Castelarrasin), 24 cantons and 195 communes

TARNOPOL, a province of Poland, bounded on the north
by the province of Volhyma, on the west by Lemberg (Lwow), on the south by Stanislawów provinces, and on the east by Russia Area 6,268 sq miles. Pop. (1931) 1,604,000 In 1931 49 3% were Poles, 45.5% Ruthenians and the rest mostly Jews thenians belong to the same race and religion as those in Stanislawów province (q v.), but the Poles are more numerous in Tarnopol, since they had been colonizing the Podolian plateau since the 14th century. Tarnopol is part of the plateau of Podolia joining up with the Lublin uplands, having the appearance of hills where the land slopes down to the Volhynian plain, especially in the Gologory. The south is bounded by the Dniester, with its lower valley, the tributaries of which drain the bulk of the province except in the north, where the Bug and Styr have their sources. These tributaries all flow from north to south and from the deep savines which are a feature of Podolia The plateau is sometimes flat, sometimes hilly and wooded, as on the Miodobory along the eastern border. The Strypa and the Lipa were scenes of stubborn Russian defense during World War I. Tarnopol is a fertile agricultural province, densely populated with small peasant proprietors. It is famous for its horses and cattle The chief towns are Tarnopol (pop 35,831), Zloczów and Barezany. The province was occupied by Soviet troops at the start of World War II and was conquered by the axis in 1941.

TARNOPOL, a town of Poland, in the province of the same name, 87 ml. E.S E of Lemberg (Lwow) Pop. (1931) 35,831, half of whom were Jews. The town was founded in 1540 by Jan Tamowald. It became a fortress and received many privileges from the Polsh kings. The ancient synagogue of the reign of Casimir the Great remains. Industry consists in com milling and the preparation of wax and honey. The chief trade is in horses, agricultural produce and spirits. Soviet troops occupied Tamopol in 1030, and it was captured by asis forces in 1040.

TARNÓW, town of Poland, in the province of Cracow. Pop. (1931) 45,235, of whom about 40% were Jews. It is situated on the river Bials, not far from its junction with the Dunajce, and is the seat of a Roman Catholic bishop. It possesses a cathedral in Gothic style, built in the 15th century, with monuments of the Tannowski and Ostrogski families, to which the town formerly belonged, another church, built in 1454, and a diocesan museum with Polish paintings of the 15th and 15th centuries. On a hill mear the town stand the ruins of an old castle of the Tannowski family and a small church over 800 years old. The town hall is an old and interesting building. Agricultural implements jass and chroory are manufactured. Tarnów was occupied by German forces in World War II.

TARNOWSKI, JAN (called Macuvus) (1488-1562). Pollah general. Aftèr a careful education at the palace of Matthew Drzewicki, bishop of Przemysl, he occupied a conspicuous position at court in the reigns of John Albert, Alexander and Sighsmud I. In izoo Tarnowski distinguished himself in Moldavin, taking part in the victories of Wisniowicc (1512) and Orssa (1514). He their travelled in the Near East, and northern and western Europe. While in Portugal he received from King Emanuel the chief command in the war against the Moors, and was pro-

moted by Charles V to a count of the Empire. On the death of Nicholas Fillei in 1526 Tarnowski became grand hetman of the crown, or Polish commander-in-chief, and won his greatest victory at Obertyn (August 22, 1531) over the Moldavians, Turks and Tatars. Tarnowski took the royal side during the "Poultry War" of 1537; and also in 1548 when the szlachta tried to annul by force the marriage of Sussmund Augustus (see Sigismund II) with Barbara Radziwill In 1553, indeed, he was in opposition to the young king; yet he remained emphatically an aristocrat, in-tensely opposed to the democratic tendencies of the szlachta. and working for a firm alliance between the king and the magnates. Though a devout Catholic, he was opposed to the exclusive jurisdiction of the bishops and would have limited the au-thority of Rome in Poland Tarnowski invented a new system of tactics to increase the mobility and security of the armed camps within which the Poles had so often to encounter the Tatars. His principles are set forth in his Consilium Rationis Bellicae (best edition, Posen, 1879) As an administrator he did much to populate the vast south-eastern steppes of Poland.

TARO (Colocasa antiquorum), a coarse herbaceous plant of the arum family (Araceae, q v), called also eddo, probably native to the Pacific islands, where it is extensively cultivated for its large, spherical, underground tubers, which form an important article of food, especially in Hawaii

It is closely alhed to the dasheen (C esculenta), native to the East Indies, a stately ornamental plant, with large shield-shaped leaves, various cultivated forms of which are known as elephant's-

TAROK, a game of cards very popular in central Europe and to some extent in France (tarot) and flally (tarotchi). It is the oldest surviving card game (see Carsos, FlaxInso). The modern game uses 54 cards, comprising 33 sult cards, 21 taroks (permanent trumps) and a joker. Each suit includes four court cards, instead of three as in the 32-card French pack. The taroks, origan-layl illuminated with indivulual designs of sectore significance, now are usually printed only with the Roman numerals from I to XXII.

The play of the game centres upon the manipulation of the taroks, each of which is privileged to win any suit card. Tarok includes many features that were borrowed by other games—competitive bidding, a seat or widow, melding of honour combinations, the sequence of matadors, the suttless or wild joker, the effort to capture specific counting cards in tricks and extra score for the last trick.

TARPAULING (as if tarpalling, from tar, and palling, a covering, Lat., palla, a mantle), is a heavy well-made, double warp plain fabric, of various materials, used chiefly in the manufacture of covers for weather protection. It is usually made from cotton duck, single filled, double filled, or Army construction. Certain tarpaulins are made from drill and flax. To render 1 proof against ram and other atmospheric influences, it is generally treated with waxes, petrolatums, and other waterproofing agents. Some tarpaulins are also made from jute (qw), most are equipped with grommets or eyelets in the corners, spaced around the cover. The fabric is fastened over the object to be protected.

TARPEIA, in Roman legend, daughter of the commander of the Capitol during the war with the Sabines caused by the rape of the Sabine women. According to the story, she offered to betray the citadel, if the Sabines would give her what they were on their left arms, meaning their bracelets, instead of this, keeping to the letter of their promise, they threw their shields upon her and crushed her to death Simylus, a Greek eleganc poet, makes Tarpeia betray the Capitol to a king of the Gaulis The story may be an attempt to account for the Tarpeian rock being chosen as the place of execution of trattors. According to S. Reinach, however, in Revue archéologique, xi. (1908), the story had its origin heaped up on consecrated ground that they might not be touched Tarpeia herself is a local divinity, the manner of whose death was suggested by the tumulus or shields devoted to her cult, a crime being invented to account for the supposed punishment.

II. 38-40; Plutarch, Romulus, 17; Propertius, iv 4, Ovid. Fasti, i. 261; assassinated at the instigation of the sons of Ancus Marcius C. W. Muller, Frag. Hist. Grace, iv. p. 367

TARPON (Tarpon atlanticus), a fish allied to the herrings, but with a large mouth and very large, thick, silvery scales It occurs in the warmer parts of the western Atlantic, and is an active fish, preving on the fry of other fishes It reaches a length of 7 ft , and a weight of more than 200 lb

TARQUINIA (anc. TARQUINII), a town of Italy, in the province of Viterbo, 62 mi. northwest by rail from the city of Viterbo, 490 ft above sea level Pop (1936) 6,368 (town), 8,118 (commune). It is picturesquely situated, and commands a fine view of the sea It possesses mediaeval fortifications, and no less than 25 towers are still standing in various parts of the town. which thus has a remarkably mediaeval appearance. The castle, on the north, contains the Romanesque church of S Maria in Castello, begun in 1121, with a fine portal of 1143, a caborium of 1166 and a pulpit of 1208, both in "cosmatesque" work, the pavement in marble mosaic also is fine There are several other Romanesque and Gothic churches and other buildings. The Gothic Palazzo Vitelleschi (1439) with remarkably rich windows, contains the fine Government museum, now including the Bruschi collection, of Etruscan antiquities from the tombs of the Etruscan city, which probably occupied the site of the Roman town, now deserted, its last remains having been destroyed by the inhabitants of Corneto (the mediaeval name by which the town was till lately known) in 1307 Scanty remains of walling and of

buildings of the Roman period exist above ground. The importance of Tarquinia to archaeologists lies mainly in its necropolis, situated to the south-east of the mediaeval town, on the hill which, from the tumuli raised above the tombs, bears the name of Monterozzi. The tombs themselves are of various kinds The oldest are tombe a pozzo, or shaft graves, containing the ashes of the dead in an urn, of the Villanova period, the earliest belonging to the stage known as First Benacci (see ETRUSCANS) and the latest to the middle or end of the oth century B.C. immediately after the coming of the Etruscans, a few contemporary graves of whom, containing Egyptianizing scarabs and some gold and silver, have also been found. In some of these tombs hut urns, like those of Latium, are found Next come the various kinds of inhumation graves, the earliest of which, the so-called warnor's grave, belongs to the early "Vetulonian" period, and the Bocchoris tomb to 730-690 BC. (MacIver, Villanovans and Early Etruscans, 1924, 40-56; 158-166): the most important are rock-hewn chambers, many of which contain well-preserved paintings of various periods

Tarquinia was the chief of the 12 cities of Etruria, and appears in the early history of Rome as the home of Tarquinius Priscus and Tarquinius Superbus. The people of Tarquinia and Veii attempted to restore Tarquinius Superbus after his expulsion In 358 BC, the citizens of Tarquinia captured and put to death 307 Roman soldiers; the resulting war ended in 351 with a 40 years truce, renewed for a similar period in 308 When Tarquinia came under Roman domination is uncertain, as is also the date at which it became a municipality; in 181 B.C its port, Graviscae (mod Porto Clementino), with Government salt-works 4 m S.W., in an unhealthy position on the low coast, became a Roman colony. It

exported wine and carried on coral fisheries.

TARQUINIUS PRISCUS, LUCIUS, fifth legendary king of Rome (616-578 B.C.). He is represented as the son of a Greek refugee, who removed from Tarquinii in Etruria to Rome, by the advice of his wife, the prophetess Tanaquil. Appointed guardian to the sons of Ancus Marcius, he supplanted them on their father's death He laid out the Circus Maximus, instituted the "great" games, built the great sewers (cloacae), and began the construction of the temple of Jupiter on the Capitol. He carried on war successfully against the Sabines and subjugated Latium, He is said to have raised the number of the senators to 300, and to have doubled the number of the knights.

The introduction of many of the insignia of war and of civil office is assigned to his reign, and he was the first to celebrate a Roman triumph, after the Etruscan fashion, in a robe of purple and gold, and borne on a chariot drawn by four horses. He was

The legend of Tarquinius Priscus is in the main a reproduction of those of Romulus and Tulius Hostilius There seems to have been originally only one Tarquinius; later, when a connected story of the legendary period was constructed, two (distinguished as the "Elder" and the "Proud") were introduced, separated by the reign of Servius Tullius, and the name of both was connected with the same events.

with the same events.
For the constitutional reforms attributed to Tarquinius, see Rome.
Ancient History, for a critical examination of the story, Schweegler,
Remunich Geschichte, lix xv. Sir George Cornewall Lewis, Credibity
of early Roman History, ch. 11; W line, History of Rome, 1, E Pais,
Sterned Roma, 1 (1893), who thentines Tarquinus with Tarpellus, the

Don, Hali, in, 45–75, Oc. de Repub, n. 200

TARQUINIUS SUPERBUS, LUCIUS, son of Lucius Tarquinius Priscus and son-in-law of Servius Tullius, the seventh and last legendary king of Rome (534-510 BC) On his accession he proceeded at once to repeal the recent reforms in the constitution, and attempted to set up a pure despotism. Many senators were put to death, and their places remained unfilled; the lower classes were deprived of their arms and the completion of the fortress-temple on the Capitoline confirmed his authority over the city The outrage of his son Sextus upon Lucretia (av.) precipitated a revolt, which led to the expulsion of the entire family. All Tarquinius's efforts to force his way back to the throne were vain (see Porsena, Lars), and he died in evile at Cumae. In the story certain Greek elements, probably later additions, may easily be distinguished Tarquinius appears as a Greek "tyrant" of the ordinary kind; on the other hand, an older tradition represents him as more like Romulus This twofold aspect of his character perhaps accounts for the making of two Tarquinu out of one (see Tarquinius Priscus) The well-known story of Tarquinius' repeated refusal and final consent to purchase the Sibylline books has its origin in the fact that the building of the temple of Jupiter Capitolinus, in which they were kept, was ascribed to him

For a critical examination of the story see Schwegler, Romische Geschichte, bk. xviii.; Str. G. Concewall Lewis, Credibility of early Roman History, ch. 11, B + Pais, Storia di Roma, 1. (1898); and, for the political character of his reign, ROME: Ancent History. Ancient authorities—Luyy 1. 21; Dion. Hal v. 1-vi 2x.

TARRAGON (Artemisia dracunculus), a smooth green herb of the family Compositae, called also estragon, native to Europe and closely allied botanically to the mugwort and wormwood (qqv). It is widely grown in gardens for its slightly bitter aromatic foliage used in flavouring vinegar, pickles, salads and other dishes.

TARRAGONA, a maritime province in the northeast of Spain, formed in 1833 from the southern part of the province Spain, formed in 1833 from the southern part of the province of Catalonia, and bounded S.E. by the Mediterranean, N.E. by Barcelona, N. by Lérida, W by Saragossa and Teruel, and S.W. by Castellon de la Plana Pop. (1940) 339,299; area 2,426 sq mi. The Ebro flows through the southern portion of the province, and below Tortosa forms a conspicuous maishy delta, but elsewhere the coast-line is unbroken. The hills are clothed with vineyards, which produce excellent wines, and in the valleys are cultivated all kinds of grain, vegetables, rice, hemp, flax and

silk. Olive, orange, filbert and almond trees reach great perfection, and the mountains yield rich pastures and timber. Manufactures are well advanced, and comprise silk, cotton, linen and woollen fabrics, velvet, felt, soap, leather and spirits. There are also many potteries and cooperages and flour, paper and oil mills. Silver, copper, lead and other minerals have been found, and quarries of marble and jasper are worked in the hills.

TARRAGONA, the capital of the Spanish province of Tarragona, a flourishing seaport, and the seat of an archbishop; at the mouth of the river Francoli, 63 mi. by rail W.S W. of Barcelona. Pop. (1940) 33,708 (mum., 35,648).

Tarraco, the capital of the Iberian Cessetani, many of whose

coins are extant, was one of the earliest Roman strongholds in Spain. It was captured in 218 B.C. by Gnaeus and Publius Cornelius Scipio, who improved its harbours and enlarged its walls. A Roman monument on a hill 3 mi. E. is known as the Sepulcro de los Escipiones, and locally believed to be the tomb of the Scipios, who were defeated and slain by the Carthaginians under Hasdrubal Barca in 212 BC, but there is no good reason to believe that the monument is older than the 1st century AD As the Colonia Triumphalis, so called to commemorate the victories of Julius Caesar, Tarraco was made the seat of one of the four assize courts (conventus juridici) established in Hispania Citerior. Augustus spent the winter of 26 B C, here, and made Tarraco the capital of the whole province, which received the name of Hispania Tarraconensis. A temple was built in his honour It was afterwards restored by Hadrian (A.D. 117-138), and the city became the Spanish headquarters of the worship of the goddess Roma and the deified emperors. Its flax trade and other industries made it one of the richest seaports of the empire.

To the Romans the Visigoths under Euric succeeded in 467, but on their expulsion by the Moors in 711 the city was plundeted and hurned. In 1080 the Moors were driven out by Raymond IV. of Barcelona, and in 1118 a grant of the fief was made to the Norman Robert Burdet, who made it a frontier fortress against the Moors. The British took the city in 1705; the French captured it in 1811. In the civil war of 1936-39, Tarragona re-

mained in Loyalist possession until Jan. 15, 1939.

Tarraxona is on the coast railway from Barcelona to Valencia, and is connected with the Ebro Valley Railway by a branch line to Reus. The old town, with its dark and steep alleys, occupies a rugged hill which rises abruptly from the sea to an altitude of about 550 ft. Many of the houses in this quarter are very old, and are built partly of Roman masonry; one such fragment, immured in the palace wall, is inscribed with the epitaph of a charioteer (auriga) Massive ruined walls encircle the old town. Their lowest course is "Cyclopean," consisting of unhewn blocks about 12 ft long and 6 ft wide: Roman masonry of the Augustan age is superimposed. The six gates and the square towers are also, to a great extent, "Cyclopean." Tarragona cathedral is one of the noblest examples of early Spanish art. The main body of the building dates from the end of the 12th century and the first half of the 13th, and is of transitional character. On the north-east side is a cloister contemporary with the church, with which it communicates by a very fine doorway. The cloister contains much remarkable work, and the tracery of the windows bears interesting marks of Moorish influence. Two other noteworthy churches in the city are San Pablo and Santa Tecla la Vieia, both of the 12th century.

There is a fine Roman aqueduct; the Roman amphitheatre was dismantled in 1401 to furnish stone for the eastern mole, though a few rows of seats are left near the sea-shore; and the museum contains a large collection of Roman antiquities. The Torreón de Pilatos is said to have been the palace of the Emperor Augustus. When the monks of the Grande Chartreuse were compelled to leave France, they settled at Tarragona in 1903, and established a liqueur factory. A characteristic feature of Tarragona is the number of its underground storehouses for wine (bodegas); wine is exported in large quantities. Chocolate, soap, flour, ironware, paper, pipes and salted fish are also manufactured.

Control State Control

See G. W. Edwards, Spain (1926).
TARRASA, a town of Spain, in the province of Barcelona, 6 mi. W.N.W. of Sabadell on the Barcelona-Lérida railway. Pop.

(1940) 43,930 (mun., 45,081). Tarrasa was a Roman municipality, and a bishopric from the 5th century to the Moorish invasion in the 8th. Tarrasa is now mostly a modern industrial town.

the Stn. Latriasa is now mosty a mooten more and the TARRYTOWNS (Tarrytown and North Tarrytown, exBeekmantown), Westchester county, New York, U.S.A., on east bank of Hudson river, 25 mi. N. of New York city, opposite Nyack; served by New York Central railroad, motorbus lines and a ferry to Nyack, Pop. Tarrytown, 8.810; North Tarrytown, 8,833, 1950 federal census. Irvington adjoins on the south. The 8,833, 1950 federat census. Irvington adjoins on the south. Are main street, Broadway (Albany Post road), is part of the old King's highway, New York to Albany, laid out in 1723. In Tarry-town, at the junction, with Irvington, is "Sunnyside," Washington

capture of Major André, Sept. 24, 1780. In North Tarrytown, on the Post road, 1s the "Philipse Castle Restoration, with the Old Mill " The original buildings were erected in 1683 by Frederick Philipse, the wealthiest and most influential New Yorker of his time and associated with the West India company and Peter Stuyvesant, and their outstanding fort, house and church builder, The Old Dutch church, across the Post road, was also erected by him about that time. He and his wife are buried there After the revolution, the property was bought by Gerard G. Beekman, whose wife, a Van Cortlandt, became "Widow Beekman," the local traditional historical "little old lady." Around the Old Dutch church in Sleepy Hollow cemetery rest Washington Irving and other immortals. "Kijkuut," the estate and home of John D. Rockefeller, Tr., is at Pocantico Hills. Other modern estates include the Gould estate, and "Hillholm" of the late Worcester R. Warner, whose family have continued his local philanthropy and who joined the Rockefeller family and others in making possible the Philipse Castle Restoration of the Historical Society of the Tarrytowns, Inc. (founded in 1902). The Hokohongus (Washington Irving) treaty tree was long there The villages are partly residential Industries include automobile accessory plants. Tarrytown was incorporated as a village in 1870. Irvington in 1870 and North Tarrytown in 1875 The name is probably a corruption of the Dutch Tarwen Dorn (wheat town)

TARS, LOW-TEMPERATURE, the primary condensation products resulting from the carbonization of coal and such other organic substances as wood, peat, and lignite at temperatures not exceeding 700° C. The term "low-temperature tar" usually

refers to a low-temperature coal tar

Wood Tar is a by-product of the carbonization of wood. Two distinct types of wood tar are recognized. (1) hardwood tar and (2) resinous wood tar, the former derived from woods such as oak, beech, etc., and the latter from resmous stools and roots and particularly from pine wood.

Hardwood Tars The condensed volatile product of wood distillation is known as crude pyroligneous acid, which has the average composition. water 81%, methyl alcohol 3%-4%, acetic acid 6%-8%, tar 7%. After settling, the major portion of the tar separates from the aqueous acid although the latter always retains some tar in solution. The chemical constituents of wood tar form a complex mixture comprising the "fatty" acids, esters, ketones, alcohols, phenols (usually polyhydric) and their methyl ethers, together with waxes. The most important representatives of these groups present in the tar are formic and acetic acids, with their methyl esters, acetone, methyl and allyl alcohol, guaiacol, catechol, and esters of pyrogallol,

Beechwood tar is practically the only wood tar subjected to a complete straight distillation. Three fractions are usually collected, first the light oils and water containing acetic acid and methyl alcohol up to 180° C., then the heavy oils up to 240° C. and finally the pitch. The important fraction is the "heavy oil" from which beechwood creosote is obtained (see CREOSOTE).

The oils from wood tar are used as gum inhibitors in gasoline and as flotation oils; the pitch is used in briquetting.

Resinous Wood Tars are almost wholly represented by pinewood tar, which is commonly termed "Stockholm" or "Archangel" tar and is made extensively in the forests of the U S.S.R , Finland and Sweden It is an important commercial product and differs from hard wood tar in containing the pleasant smelling mixture of terpenes known as turpentine. Pine-wood tar is the residue left after the turpentine has been distilled, usually with the aid of steam. It is used widely in the manufacture of cordage, eg, tarred ropes and twine, and for impregnation of hemp fibre for oakum It is used to a slight extent in pharmacy as a component of some cintments and antiseptics. Distillates of pine-wood tar, particularly the creosote fraction, are used in froth flotation processes.

Peat Tar, a jet black, semisolid oil, lighter than water, which can be dehydrated by heating at 100° C. On distillation up to 360° C. a hard pitch is obtained along with an oily distillate, the Irving's home. Christ church, where Irving worshipped, is on 360° C. a hard pitch is obtained along with an oily distillate, the he Post road in Tarrytown. At the line between Tarrytown and latter consisting of a neutral fraction, containing the solid waxes, North Tarrytown, on Albany Post, road, is a memorial of the phenols and only traces of basic compounds. The most striking TARS 821

characteristic of the neutral oils is their high degree of unsaturation as manifested by absorption of atmospheric oxygen. The waxes, which resemble the montan wax of lignite, melt at about 40° C. The acidic (phenolic) constituents of the tar consist of phenol and its homologues, the cresols and vylenols in small quantity, mixed with tar acids boiling at 250°-360° C. The latter show a carbolic acid coefficient of 31, 10, they are 31 times more powerful than phenol as bactericides Among the phenolic constituents of peat tar, guaracol, methylguaracol and a methyl ether of pyrogallol have been identified These ethers are absent from coal tar, but are found in wood-tar creosote, of which they form the major portion. Peat tar may therefore be looked on as one of the transition steps from wood tar to coal tar. Although the products which can be isolated from neat tar are of undoubted value, the difficulty of winning and drying peat militates against the carbonization of this fuel on an industrial scale

Lignite and Brown Coal Tars resemble peat tar in many respects They are usually black oils of a buttery consistency owing to the presence of parafin wax. Of an average density of 0.95, they retain a high percentage of water but solidity completely at 6°-8° C. In contradistinction to tars from bituminous coal they are aimost completely solibile in herfol. a residue of

about 5% only being usually left.

They are parafinoid in nature, the wax content being as high as 10%. The crude wax melts at about 40° C but from it a series of waxes with meltung points from 46° to 73° C. has been obtained. The phenolec constituents resemble those of peat tar and are efficient bactericides. The basic components belong to the pyridine and quonoline series and are chiefly methylated derivatives. A distinctive characteristic of lightile tars is the presence of keoines in the neutral oils—a resemblance to the oils of wood iar. Lightile tars are of increasing morphorance as a source of fruits of the combustion engines, burning and lubriciting oils and

Low-temperature Coal Tars—r Vacuum Tar has only been produced experimentally with the object of elucating the composition of coal and the effect of heat upon this material. It is obtained when coal is actionamed at temperatures up to 450° C under a pressure of 5-40 mm and the average yield is 14 gal. (6 5% by weight) per ton of coal. It is usually lighter than water (0.99 spg r) and is especially interesting in that some of its constituents are identical with substances found in perforded in Cartesian of the Cartesian of 18 medical water of the composition of the control of the composition of th

Amongst the more interesting constituents of vacuum tar are the naphthene, CasHac called melene which is also found in Galician petroleum and in the distillate of bees' wax, and the hydrogenated phenols (dicohols) such as hexahydro-p-cresol and its homologues.

2. Low-Temperature Tor is produced by the carbonization of bitummous coals, containing 38%—35% solidle matter, at temperatures not exceeding 700° C, which is an optimum temperature for the production of gas, tar and smokeless fuel (see Low-Temperatures Carbon/Latron). It is essentially a mixture of these volatile products of coal which are lugid at ordinary temperatures and which have not been subjected to the secondary-termal decomposition incidental to high-temperature carbonaryation in horizontal retorts. It is therefore regarded as a "primary" tar. Many factors affecting the yield, composition and other than-acteristics of low-temperature tars have been varied in experimental plants with the result that there have been produced many types of tars to which it has been impossible to assign a common composation. Certain well defined characteristics may be shortly summarized of primary tars obtained by low-temperature carbonization processes which have been commercially established.

Low-temperature tar is usually a brownish black oil, much less viscous than the tar made from the same coal at high temperatures. It is obtained in an average yield of 16-18 gal, per ton of coal carbonized, or 8%-9% by weight. This is approximately double the weight obtained by distilling the coal at 905-1, 200° C. Its specific gravity is 10-1-07, and fing to the low temperature at which it is formed, it allowed a radinfield in character, where at which it is formed, it allowed which yaromatic. The most distinctive characteristics of low temperature tar are the almost entire absence of benzene and its homologues, naphthalene, anthrace can and plenoj; the unsaturated nature of the neutral oils, from which can be isolated solid parafims, and the presence of solid, amorphous compounds, of either basic or phenolic nature.

The crude tains a most unstable product and begins to decompose at about 200° C., finally yielding, when sattlied to 360° C, an average of 65% oily distillate and 35% pitch. The amount of pitch formed on distilling low-temperature tar is therefore only half that obtained in a smillar operation with high-temperature tar. The former, too, contains much less "free carbon" (\*s\*, materiasoluble in benzene) than the latter, the average amount being 2%—4%. By modified extractions with caustic soda and sulphuric add (see Coal Tark) the crude distillate can be divided into (\*s\*).

neutral oils, (2) phenols, and (3) bases

a. Neutral oils consist almost wholly of paraffins, naphthenes and olefines, with comparatively small amounts of methylated derivatives of naphthalene and anthracene On treatment with concentrated sulphuric acid, the neutral oils are absorbed with the exception of some 12% consisting mainly of paraffins Crude solid wax representing over 1% of the tar is obtained on cooling an acetone solution of the neutral oils In the paraffin series, all the lower members have been identified, and in the higher ranges, the solid members from C26H14 to C26H60 The latter melt at 62° C a- and β-methylnaphthalenes have been isolated, but no naphthalene Similarly &-methylanthracene occurs in a complex mixture of hydrocarbons crystallizing on cooling the high fractions of the distillates, but anthracene is absent Neither fluorene, nor carbazole has been identified in low-temperature tar: in addition to the hydrocarbons acenaphthene and diphenyl, there occur the fully hydrogenated products, perhydrofluorene, perhydroacenaphthene and dodecahydrodiphenyl

b. Phenols The extraction of the phenolic constituents of the tar or its distillates is complicated by the fact that resmous and asphalic substances accompany the phenols in solution in the al-lah. These impuritues, however, can be climinated by agitation of the alkaline solution with organic solvents or by saturation with salt. The crude phenols (10%—20% of the tar) obtained oaddification as a black oil, can be further purfied by extraction with light petroleum, followed by precupitation of the residue from an ethereal solution by fresh petroleum. The petroleum for the properties of the properti

colour from pale yellow to black

c. Basss The crude bases, representing s%p-4% of the tar, are also composed of a low mobile fraction and a higher viscous fraction containing solid, amorphous substances of unknown constitution. The lower bases consist of pyridne and quinoiline with their mono-, di- and tri- methyl derivatives Only traces of privary bases are present in the tar. There have been dendified pyridne, 2-methylpyridine, 3-methylpyridine, 4-methylpyridine, 2-dimethylpyridine, 2-distributylpyridine, 
Ultimation of Low-Temperature Tar Products.—The commercial possibilities of low-temperature tar have not yet been fully developed, but its application in various directions has been demonstrated. The low-boiling distillates, owing to their "insaturated" nature, form sustafactory fuel possessing certain anti-detonating qualities. It has been claimed that the higher fractions of the neutral oils form an exceptionally good lubricant, whist the "middle" or "dead" oils are suitable for combustion in the diesel engine. Special characteristics are also claimed for

low-temperature tar pitch, which can be used along with or in place of high-temperature tar pitch.

Hill the raids, which were made in Asia Minor regularly, place of high-temperature tar pitch.

TARSIER, a small arboreal mammal, Torsus, byflying a suborder of Pinnates (q.w.) Its name refers to the great length of the anklebones or tarsus, but an equally distinctive character of this animal is its enormous, goglelke eyes. The head in which these are set is rounded, the muzzle short and pointed, while the ears are large. Rather smaller than a squirrel, it has a slender body and long, thin tail which terminates in a truft of hair and serves as a rudder and halance. The fingers and toes end in diskike pads, which assist the animal to adhere to branches and other smooth surfaces. While it is doubtful if more than a single species exists, numerous races have been described on the various islands Sumaira, Borneo, Celebes and some of the Philippins. The tarsier feeds on insects and hands, sleeps during which the structure of its limit days is well adapted. It is a rev, not more than two being found together, and brings forth only one young at a time.

Woolkard, "Monograph on Trassus," Froc Zool Soc. London (1915), W. E. Le Gros Clark, Froc. Zool. Soc. London (1944); F. Wood Jones, Man's Place among the Mammals (New York, London, 1936)

TARSUS (mod. Tersons), an ancient city in the fertile plain of Citica. The small Cydnus river flowed through the centre of the town, and its cool swift waters were the boast of the city. The city is first mentioned on the Black Obeliak, as captured by the Assyrians c \$50 s.C. It was probably an old Ionian colony, settled (like Mallus) under the direction of Claran Apollo. Its importance was the result of: (1) its occellent and safe harbour; (2) its possesson of a fertile terrorry; and (3) its command of the first wagouroad made across Mt. Tarura, which was cut originally only wide enough to carry the waters of a small affluent of the Cydnus. The greatness of Tarus rested therefore mainly on the two great engineering works, the habour and the road.

Tarsus is most accessible from the sea or from the east. Even after the Cihcian Gates were cut, the crossing of Taurus was a difficult operation for an invading army (as Xenophon and Arrian show). Hence Tarsian history (where not determined by Greek maritime relations) has been strongly affected by Semitic influence, and Dion Chrysostom, about AD. 112, says it was more like a Phoenician than a Hellenic city (which it claimed to be). After the Assyrian power decayed, princes, several of whom bore the name or title Syennesis, ruled Tarsus before and under Persian power. Persian satraps governed it in the 4th century B C.; and struck coins with Aramaic legends there. The Seleucid kings of Syria for a time kept it in a state of servitude; but it was made an autonomous city with additional citizens (probably Argive Greeks and Jews) by Antiochus IV Epiphanes in 171 B.C., and then it began to strike its own coms. It became one of the richest and greatest cities of the east under the Romans after 104 BC., and was favoured by both Antony and Augustus: the reception there by the former of Cleopatra, who sailed up to the city in a magnificent vessel, was a striking historic event. In spite of its oriental character, it maintained a university where Greek philosophy was taught by a series of famous Tarsians, who influenced Roman history, Chief among them was Athenodorus Cananites (q v.), teacher and friend of Augustus. St. Paul, a native of Tarsus, proudly describes himself as "a citizen of no mean city."

Taxus depended for its greatness on commerce, peace and orderly government. It was not a strong fortress and could not be defended during the decay of the empire against harian invasion. The Arabs captured the whole of Clificia shortly after An. 560, and Taxus seems to have been a ruin for more than a century after the conquest. But Harun al-Rashid rebuilt its walls in 787, and made it the northwestern capital of the Anto power in the long wars against the Byzantine

year by year, sometimes twice in one year, through the Cilician Gates and past the fortress Loulon, issued through the north gate of Tarsus, which was called the Gate of the Holy War The western gate remained standing, and was misnamed St. Paul's Gate The caliph Mamun died on such a foray in AD 833, havmg caught a chill at a great spring north of the Cilician Gates beside Ak-Keupreu. He was brought to Tarsus where (like the emperor Tacitus) he died and (like the emperor Julian) was buried. His illness recalls the fever which Alexander the Great contracted from bathing in the Cydnus Nicephorus Phocas reconquered Tarsus and all Cilicia for the empire in A.D 965 In the first crusade Baldwin and Tancred captured Tarsus, AD 1000, and there the two leaders had a serious quarrel. It formed part of the kingdom of Lesser Armenia for great part of the three centuries after AD 1180, and it was fortified by Leo II and Hethoum I. But Turkoman and Egyptian invaders disputed its possession with the Greek emperors and Armenian kings and with one another. Finally it passed into Ottoman hands about the beginning of the 16th century

The ruins of the ancient city are very extensive, but they are deeply buried, and make little or no appearance above the surface except in the Dunuk Tash (popularly identified as the tomb of Sardanapalus, a monument which, however, was at Anchiale, not at Tarsus). This shapeless mass of concrete was probably the substructure of a Giaeco-Roman temple, from which the marble coating was removed. The modern town has considerable bazaars and trade, but the climate is very oppressive, because of the proximity of vast marshes which occupy the site of the harbour and the lower part of the original Cydnus course. The river was diverted from its former course by Justinian in the 6th century The emperor's intention was only to carry off the surplus waters in time of flood and prevent mundations in the city, not to deprive Tarsus of what was its chief pride and boast, but gradually the neglect of subsequent centuries allowed the channel in the city to become blocked by accumulation of soil, and now the whole body of water flows in the new channel east of the city, except what is drawn off by an artificial irrigation course to water the gardens on the western side of the city. The population in 1050 was 33.822.

1950 Was 33,3822.

Brazconsaryur—The hierature regarding Tarsus is scanty, and few ancaret macroptions have been published. See W. B. Barker, Lores and ancaret macroptions have been published. See W. B. Barker, Lores and Six in Numinator Chronicle, pp. 195 fl. (1884), pp. 376 fl. (1864), E. Babelon, "Berses Achémendes," Cetalogue Bibl. Nat., the numinants works of B. V. Head, F. Inholo Bitmer, etc. Waddington in Salletin pp. 83–435 (Barden, City, N.Y., 1997), and "Chica, Tarsus and the pp. 83–435 (Barden, City, N.Y., 1997), and "Chica, Tarsus and the Great Tatuus Pars' in Geographical Journal, pp. 137–340 (1994). R. Heberdey and A. Wilhelm, "Escen in Killiden" in the Denkschriften Chieffen, V. Langlois and Macfondal Kinnel: Calladier in Journal of Hellene Studies, pp. 58 fl. (1994), studied Dion Chrysostom's two Tarsus Orations.

TARTAGLIA or TARTALEA, NICCOLO [Nicola Fontana] (c. 1506–1559), Italian mathematician, was born at Bresca. His childhood was passed in dire poverty. During the sack of Brescia in 1712 he was horribly mutiated by some French soldiers. From these injunes he slowly recovered, but he long continued to stammer in his speech, whence the nickname "Tartaglia" He was self-tauglia, but we find him at Verona in 1731 an esteemed teacher of mathematics. In 1534 he went to Venice For Tartaglia's solution of cubic equations, which he derived from his master Sciptone Ferro (d. 1525), see Browntons, Turcon or In 1548 Tartaglia accepted a stutation as professor of Euclid at Brescia, but returned to Venice at the end of 18 months. He ded at Venice in 1550.

Tartaglia's first punted work, entitled Nuova scienzio (Venice, 15,37), della Whit the theory and practice of gunnery. He found the elevation giving the greatest range to be 45°, but failed to demonstrate the correctness of his nutution. His Questii et invensioni diverse (1546), a collection of the author's replies to questions addressed to him, was dedicated to Henry VIII of England. Problems in artillery occupy two out of nine books; of the solution of cubic equations He published in 1551 Regola generale per sollevare ogni affondata nave, intitolata la Travagliata Innenzione (an allusion to his personal troubles at Brescia), setting forth a method for raising sunken ships, and describing the diving-bell, then little known in western Europe. His largest work, Trattato generale di numcri e misure, is a comprehensive mathematical treatise (Venice, 1556, 1560). He published the first Italian translation of Euclid (1543), and the earliest version of some of the works of Archimedes (1543), including De insidentibus aquae, of which his Latin now holds the place of the lost Greek text. Tartaglia claimed the invention of the gunner's quadrant

Tartaglia's own account of his early life is contained in his Quesiti, Tartagnas own account of me early me is contained in its Quesni,
bb. vi, p. 74. See also Buoncompagni, Intorno ad un testamento
inedito di N. Tartaglia (Milan, 1881), Ross, Elogi di Brescani illustri,
p. 386. Tartaglia's writings on gunnery were translated into English
by Lucar in 1588, and into French by Ruefiel in 1845

TARTAN, a worsted cloth woven with alternate strines or bands of coloured warp and weft, so as to form a chequeted pattern in which the colours alternate in "sets" of definite width and sequence The weaving of particoloured and striped cloth cannot be claimed as peculiar to any special race or country, for such checks are the simplest ornamental form into which dyed varns can be combined in the loom. But the term tartan is specially applied to the variegated cloth used for the principal portions of the distinctive costume of the Highlanders of Scotland. For this costume, and the tartan of which it is composed. great antiquity is claimed, and it is asserted that the numerous clans into which the Highland population were divided had each from time to time a special tartan by which it was distinguished. After the rebellion of 1745 various acts of parliament were passed for disarming the Scottish Highlanders and for prohibiting the use of the Highland dress in Scotland, under severe penalties. These acts remained nominally in force till 1782, when they were formally repealed, and since that time clan tartan has, with varying fluctuations of fashion, been a popular article of dress, by no means confined in its use to Scotland alone; and many new and imaginary "sets" have been invented by manufacturers, with the result of introducing confusion in the heraldry of tartans, and of throwing doubt on the reality of the distinctive "sets" which at one time undoubtedly were more or less recognized as the badge of various clans

Undoubtedly the term tartan was known, and the material was woven, "of one or two colours for the poor and more varied for the rich," as early as the middle of the 15th century. In the accounts of John, bishop of Glasgow, treasurer to King James III, in 1471, there occurs, with other mention of the material, the following:-"Ane elne and ane halve of blue Tartane to lyne his gowne of cloth of Gold." It is here obvious that the term is not restricted to particoloured chequered textures. In 1538 accounts were incurred for a Highland dress for King James V on the occasion of a hunting excursion in the Highlands, in which there are charges for "variant cullorit velvet," for "ane schort Heland coit." and for "Heland tartane to be hose to the kinge's grace." Bishop John Lesley, in his De origme, moribus, et rebus gestis Scotorum, published in 1578, says of the ancient and stillused dress of the Highlanders and Islanders, "all, both noble and common people, wore mantles of one sort (except that the nobles preferred those of several colours)" A hint of clan tartan distinctions is given by Martin Martin in his Western Isles of Scotland (1703), which work also contains a minute description of the dress of the Highlanders and the manufacture of tartan.

The following lines give a brief description of the colours of the tartans of the principal clans. The kilt-tartan colour is given in each case; the plaid-tartans vary in slight particulars.

Campbell of Breadalbane, green ground with black and blue half-inch wide crossings and double yellow overcheck Campbell of Argyll, green ground with wide blue and black crossings, narrow black crossings and alternate yellow and white overcheck. TARTAR, in chemical technology, a name applied to crude acid potassium tartrate (bitartrate of potash) deposited in wine casks or vats during the process of vinous fermentation as a crystalline crust of "argol," containing about 75% of potassium bitartrate. This argol when partly purified by recrystallization is known as "tartar," and when further purified and freed from colouring matter it becomes "cream of tartar" Cream of tartar is used medicinally as a diuretic and purgative.

The term "tartar" was formerly employed in a wider generic sense by the iatrochemists who included under this heading both the above tartarus vnn and various substances obtained from it and even salts such as salt of sorrel (potassium oxalate) which resembled it. Thus sal fixim tartan was dry potassium carbonate which on exposure to air deliquesced to oleum tartari per debouium. Neutral potassium tartrate was termed tartarus tartarısatus because it was prepared by neutralizing ordinary tartar with the sal fixum (K2CO2). Spiritus tartari employed by Paracelsus was prepared by dry distillation of tartar. This iatrochemist also used the term in a still wider sense to signify abnormal sediments deposited from animal secretions such as the concretionary masses separating in the liver, kidney or bladder, and usually referred to as "stone '

Wine "Lees" and Argol .- Tartanc acid occurs in the juices of various fruits, particularly the grape and tamarınd. grape this acid passes into the expressed juice and during fermentation of a deposit of sparingly soluble acid potassium tartrate is thrown down which forms the "lees" of wine. During the process of maturing, a further quantity of this tartrate is precipitated and the deposit of "argol" constitutes the main source of commercial tartaric acid.

Cream of Tartar .- Granulated argol is dissolved to saturation in boiling water and the clear solution allowed to crystallize. The coloured crystals are redissolved in hot water and decolorized by means of pipe clay or egg albumen. On subsequent crystallization, small, hard, colourless, transparent, rhombic prisms of cream of tartar are obtained. This salt dissolves in 15 parts of hot water but requires for solution 416 parts of water at o° C. It dissolves freely in solutions of boric acid or borax giving soluble cream of tartar, a white powder, permanent in air when made with bonc acid but deliquescent when prepared with borax. Ignition of the salt produces inflammable gases leaving a residue of potassium carbonate and carbon. Rochelle salt or potassium sodium tartrate, KNa(C4H4O6), a purgative drug, is made by dissolving cream of tartar in aqueous sodium carbonate.

Tartar Emetic (polassium antimony) tartinto), a long-known drug, being mentioned by Basil Valentine, is prepared by warming three parts of antimony oxide or powder of algaroth (q v) with four paits of cream of lartar in presence of water. It separates from the filtered solution in colouries octabedra which gradually lose their combined water, becoming opaque. It is soluble in 145 parts of cold and 1 y parts of howater. It has a nauesous metallic taste and produces womiting when taken internally. In large dooses it is possionous. Besides its medicinal use as an emetic and in the treatment of certain tropical diseases, it is employed as a mordant in dyeing and calloo printing. (G T M. X.)

TARTARIC ACID is one of the most important of the organic acids and probably one of the first to be recognized, for its sparingly solible acid potassium sait (see TARTAR) was known to the Greeks and Romans in the form of a deposit from fermented grape juece K W Scheele first isolated tataric acid in 1769 by boiling tartar with chalk and decomposing the product with sulphure acid. Ordnary startaric acid crystallizes from water in large colourless hemshedral monochine prisms containing no water of crystallization. It melts at 168–170° C and at higher temperatures decomposes into a variety of products; its formula is CAHQO, (See Prayuro Acid).

Manufacture.—The stating material, argol or wine less, is rousted in the dry site, suspended in water and neutralized with calcum hydroxide or calcum carbonate. The precipitated calcum tartne is filtered and treated with dulte subplume and, sparning soluble calcum subplate remains largely undissolved, whereas the tartaric acid passes into solution. The dilute thought so concentrated in vacuum pans to the crystallizing point and cooled. The crude product is redissolved in water, treated with chemical switch remove impurities and decolorized by heating the solution with charcoal. The filtered colourless solution is concentrated and allowed to crystallize. After the granular material is removed by centrulygation and dried in a rotary drier, the pure tartaric acid meets the requirements specified in the Pharmacopoen of the United States of America.

Applications,-Tartaric acid is used as a mordant in wool dyeing It is employed by the calico printer in conjunction with bleaching powder for the liberation of chlorine, as a resist for alumina and other basic mordants and in the discharge colours for Turkey red By successive nitration and oxidation, tartanc acid is converted into dinitrotartaric acid and dihydroxytartaric acid. the latter being an intermediate in the manufacture of the wool dye, tartrazine Tartaric acid also serves in certain photographic processes for printing and developing; ferric tartrate is used in blue-printing It is employed for the production of baking pow-ders, Seidlitz powders, sherbet and similar effervescent drinks Medicinally it is used to make effervescent saline draughts and cooling drinks for febrile and diabetic patients If unneutralized it must be taken in a largely diluted solution, otherwise severe gastroenteritis may result. It is used mostly in the form of potassium bitartrate (cream of tartar) and other salts the actions of which vary. Lime water, magnesia and alkalies are antidotes.

Chemical Properties.—Tartaric and is oudised by hydrogen peroxide in presence of ierrous salts to dhydroymaleic and (H. J. H. Fenton, 1894) and reduced by hydriodic and and phosphorus to make and suscine acids Tartaric acid prevents the precipitation by alkalis of many metallic hydroxides (e.g., copper and iron). Calcium chloride gives a white calcium tartate in neutral solution, the precipitate being soluble in cold aqueous potash but reprecipitated no boiling. Added to concentrated subhuric acid contaming 1% of resortion), tartaric acid develops a violei red contention. With warm ammountant silver intract in furnishes a

Steensomeric Tartaric Acids.—Tour varieties of tartaric acid after recognized: (1) The ordinary dextroorbary tartaric acid found either free or as potassum and calcium tartarics in the judices of tamarida, mulberries, pineapples, unripe, beetroot and especially in grapes; (2) laevarotatory tartaric acid, which occurs naturally in the fruit and leaves of Bauhinie steindate, a native tree of the French Sudan, but which originally was obtained by the resolution of the salts of nacemia acid. Except as regards its

interactions with other optically active substances, its chemical properties are identical with those of the dextro-scal and mall its physical properties it resembles thus and except that it turns the plane of polarization of high to the left and its crystaline sails show hemisherial faces like those of the devito-scal the opposity situated, as object to mixro mags. (3) reaction and the opposity of the normal carde, (Gafbol), 2HLO, which is obtained from the by the oxidation of fumance acid or by mixing molecular proportions of the n- and t-acids, (4) mesotiatatic acid, melting at 150°-160° C, is obtained when cunchonne tatitate is heated for some time at 170° C, to obtained when cunchonne tatitate is heated for some time at 170° C, and also by the oxidation of malece acid, it is marker bike is accemic acid, but unlike the lattic is not resolvable into optically active varieties by L. Pasture forms the foundation of modern conceptions of standard by L. Pasture forms the foundation of modern conceptions of standards of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the conception of the co

TARTARUS, in Greek mythology, the son of Aether and Ge, father of Typhoeus and the gants In the lited the word denotes an underground prison, as far below Hades as earth is below heaven, in which those who rebelled against the will of Zeus were confined In later commentaries Taitarius is the place of punishment of the wicked after death (See Abviss)

TARTINI, GIUSEPPE (1692-1770), Italian violinist, composer and musical theorist, was born at Pirano, Istiia, on April 8. 1692 In early life he studied, with equal want of success, for the church, the law courts and the profession of arms As a young man he was wild and irregular, and he crowned his improprieties by clandestinely marrying the niece (or the daughter of a dependent) of Cardinal Cornaro, archbishop of Padua The cardinal resented the marriage and Tartini, thinking his life in danger, fled for safety to a monastery at Assisi, where his character underwent a complete change He studied the theory of music under Padre Boemo, the organist of the monastery, and learned to play the violin in so masterly a style that his performances in the church became the wonder of the neighbourhood For more than two years his identity remained undiscovered, but one day the wind blew aside a curtain behind which he was playing. His retreat was betrayed to the cardinal, who, hearing of his changed character, readmitted him to favour and restored him to his wife

Tartini next removed to Venice, where he repaired, by the aid of good instruction, the shortcomings of his own self-staught method. After a period of study at Ancona, he returned to Padua, where he was appointed solo violinist at the church of San Antonio From 1733 to 1735 he acted as conductor of Count Kinsky's private band in Prague In 1728 he founded a school for the violin in Padua The date of his presence in Rome does not seem to be clearly established, but he was in Bologna in 1739. Afterward he returned to Padua, where he duel Feb 16, 1737.

Tartim's numerous compositions illustrate his passonate and masterly style of execution, in which he surpassed all his contemponaries. He frequently beaded his pieces with an explanatory poetical motto, such as "Ombra cara," or "Volgete il riso in punto o me pupille." He told Lalande in 1766 that the sonata known as II Trillo del Diavolto, or The Dewit's Sonata, was the fruit of a dream, in which the devil played an exquisite sonata Tratin's first book of sonatas was published at Amsterdam in 1734, the second at Rome in 1745, and many chamber works appeared during his lifetime.

Tartini contributed to the science of acoustics by his discovery (independently of Sorge, 1740, to whom the purmary credit is now given) of what are still called "Tartini's tones" (see SOUND and Hasams), or differential tones. When any two notes are produced steadily and with great intensity, a third note is heard, whose vibration number is the difference of those of the two primary notes. It follows from this that any two consecutive members of a harmonic series have the fundamental of that series for their difference tone—thus, \$\frac{E}{E}\$, the fourth and fifth

harmonic, produce C, the prime or generator, at the interval of two octaves under the lower of those two notes;  $\frac{E}{G}$ ; the third and fifth harmonic, produce C, the second harmonic, at the interval of a fifth under the lower of those two notes. The discoverer was wont to tell his pupils that their double-stopping was not in tune

1872) gave the same admonition Tartini made his observations the basis of a theoretical system which he set forth in his Trattato di Musica, secondo la vera scienzia dell' Armonia (Padua, 1754) and Dei Principi; dell' Armonia Musicale (Padua, 1767, Eng trans 1771). He also wrote a Trattato delle Appogiature, post-

trans 1/11.

Interest the state of the state 60,100. The name, Tartu, adopted after Estonian independence m 1918, means lowland of Tar or Taara, a god of Estonian mythology probably related to the Scandinavian Thor The principal part of the town lies south of the river, and the more important buildings are clustered around the two eminences known as the Domberg (cathedral hill) and the Schlossberg (castle hill), which in the middle ages were occupied by the citadel, the cathedral and episcopal palace. Following a great fire in 1777, the town was almost entirely rebuilt, and its fortifications were transformed into tree-lined promenades. In addition to the 13th century church of St. John, one of the finest and greatest brick buildings in mediaeval Livland, Tartu possesses a university, with an observatory, an art museum, a botanical garden, and a library of 250,000 volumes housed in a restored portion of the cathedral The Estonian National museum in its dome-shaped building is located just outside the town.

The university, chartered by Gustavus Adolphus of Sweden in 1632, moved to Parnu on the advance of the Russians in 1699 and again moved during the occupation by Peter the Great. Not until 1802, under the patronage of Alexander I, was the university restored. German influence predominated until the Russification of 1895. In 1919 the institution was reopened as the Estonian university. Although the technical school was moved to Tallinn, the university still had 3,219 students in 1938. The astronomy department became famous, owing partly to the labours of F. G. W von Struve (1820-39) and partly to Fraunhofer's great refracting telescope, presented by Alexander I

The foundation of Dorpat is ascribed to Yaroslav, prince of Kiev, and is dated 1030 In 1224 the town was seized by the Teutonic Knights, and in the following year Bishop Hermann erected a cathedral on the Domberg. From that date till about, 1558 the town enjoyed great prosperity, and the population reached 50,000. In 1558 it was captured by the Russians, but in 1582 was yielded to Stephen Bathori, king of Poland. In 1600 it fell into the hands of the Swedes, in 1603 reverted to the Poles, and in 1625 was seized by Gustavus Adolphus of Sweden The Russians again obtained temporary possession in 1666, but did not effect a permanent occupation till 1704. In 1708 the bulk of the population was removed to the interior of Russia. The town passed from Russian to Estonian rule in 1918, but suf-Bolshevists. In 1940 the town again fell under soviet and in 1941 under German occupation.

TARWEED, the name given in the United States to various plants of the tribe Madieae of the family Compositae (q,v), natives chiefly of the Pacific coast of North America. They are mostly annuals, with showy yellow or white flowers. Some 25 species occur in California, Oregon and Washington. Several of these, as the yellow tarweed (Hemizonia virgata), the coast tarweed (H. corymbosa) and the clustered tarweed (H. fasciculata), are valuable honey plants The most widely known species is the Chile tarweed (Madsa sativa), native to Chile and naturalized in California and Oregon, a useful forage plant, the seeds of which yield a pleasant, edible oil.

TASCHEREAU, SIR HENRI ELZEAR (1836-1911), chief justice of Canada, was born at St. Mary's in Beauce county (Quebec), on Oct. 7, 1836, the son of P. E. Taschereau. He was educated at the Seminary of Quebec, and was called to the bar there in 1857, becoming a Q.C. in 1867. He entered parliament, and was elected conservative member for Beauce county in the Legislative assembly (1861-67). He gained a reputation in 1874-75 with his work on Criminal Law Consolidation and Amendment

unless they could hear the third note, and Henry Blagrove (1811- Acts of 1869 for the Dominson of Canada with Notes, Commentaries, etc (vol 1 Montreal, 1874; vol in Toronto, 1875, and later editions), and soon afterwards published Le Code de Procédure Civile du Bas-Canada (Quebec, 1876) He became successively puisne judge of the superior court of Quebec (1871), judge of the supreme court of Canada (1878), and chief justice of Canada (1902-06), being knighted in 1902 In 1895 he had become dean of the faculty of law at Ottawa university, where he had previously held a chair Taschereau became a member of the judicial committee of the privy council in 1904. He died at Ottawa on April 14, 1911.

TAS-DE-CHARGE, m architecture, a French term for which there is no English equivalent, given to the lower courses of a Gothic vault, which are laid in horizontal courses and bonded into the wall; they generally rise about one-third of the height of the vault, and as each course projects beyond the course below, following the curve of the vault, they lessen the span to be vaulted.

TASHI LHÜNPO: see Shigatse.

TASHI LHUNKU: 388 SHIGATSE.

TASHKENT, a city of Asiatic Russia, and the capital of the Uzbek SSR, in 41° 30′ N, 69° 20′ E, situated in a loess oasis, watered by the interlocking Chirchik and Keles tributaries of the Syr-Darya Irrigation cultivation is very ancient in the oasis, the town itself dates back at least to the seventh century A.D In 582 the Turks of Transoxiana divided into two khanates, the western one having two headquarters, one at Urumchi and one north of Tashkent, and it is recorded that the Chinese in 659 claimed the territory of the western Turks, including Tashkent It was captured in 1865 by the Russians and was made the administrative centre of the former Government of Russian Turkestan The Russians then built a new town nearly 8 m long and 4 m, broad, considerably to the north-east of Eski-tashkent (old Tashkent), which is now practically deserted

The houses are low because of frequent earthquakes, and are almost hidden by the poplar, willow and fruit trees which surround them and line the broad streets. Its population in 1939 was

585,005.

Tashkent has cotton-cleaning factories, makhorka-tobacco factories, a leather, machinery and cellulose industry, and sawmills; there is a municipal electricity, water and tram service. Much fruit and agricultural produce are grown in the oasis. The population is mixed, Russians, Sarts and Uzbeks predominating Under the postrevolutionary régime efforts were made to raise the status of women. The town has a good library, a museum which includes a collection of Graeco-Bactrian coins, and a Teachers' training col-

TASHKURGHAN or KHULM, a khanate and town of Afghan Turkestan. The khanate hes between Kunduz and Balkh. The ancient town of Khulm stood in the Oxus plain, surrounded by orchards of famous productiveness; but it was destroyed by fered during German occupation and the later struggle with the Ahmad Shah Abdall, who founded Tashkurghan in the middle of the 18th century, and took all the inhabitants away from Khulm to populate it. Ancient Khulm is now only a mass of ruins; but Tashkurghan, lying two or three miles to the south of it, has become the great trade-mart of Afghan Turkestan, At Tashkurghan the caravans from India and Bokhara meet, and

from here the merchandise is distributed.

TASMAN, ABEL JANSZOON (c. 1603-1059), the greatest of Dutch navigators, the discoverer of Tasmania, New Zealand, the Tonga and the Fiji Islands, and the first circumnavigator of Australia, was born at Lutjegast in Groningen, about 1603 In 1634 we first meet with him in the East Indies, sailing from Batavia (Feb. 18) to Amboyna. After a short visit to Holland he was again in Batavia in 1638. On June 2, 1639 Tasman, with Matthew Quast, was despatched by Antony Van Diemen, governor-general of the Dutch East Indies, on a voyage to the north-western Pacific, in quest of certain "islands of gold and silver," supposed to lie in the ocean east of Japan On this voyage Tasman and Quast visited the Philippines and improved Dutch knowledge of the east coast of Luzon; they also discovered and mapped various islands to the north, apparently the Bonin archipelago, Sailing on to N. and E. in search of the isles of precious metals, they ranged about fruitlessly in the northern Pacific. In October the awagators decided to return, and, after touching at Japan, anchored at the Dutch fortress-station of Zeelandia in Formosa on Nov. 24, 1639. After this Tawam was engaged in operations in the Indian seas (easiling to Formosa, Japan, Cambodia, Palembang, etc., as a merchant captain in the service of the Dutch East India. Company) until 1649, when he set out on his first great "South Land" expedition Several Dutch navigators had already discovered various portions of the north and west coasts of Australia (as In 1605–66, 1616, 1618–19, 1622, 1627–28, etc.), but Taman now first showed that this great South Land was an

Van Diemen's Land and New Zealand .- Sailing from Batavia on Aug 14, 1642 with two vessels, the "Heemskerk" and "Zeehaen," and calling at Mauritius (Sept. 5 to Oct 8), Tasman sailed first S, then E., almost seven weeks, and on Nov 24 sighted (in 42° 25' S, as he made 1t) the land which he named Anthoonii van Diemen's landt after Van Diemen, now called Tasmania He coasted its southern shores, and, running up Storm Bay, anchored on Dec. 1, in Frederick Henry's Bay, on the east coast of Tasmania. There he hoisted the Dutch flag. Tasman then steered E for the Solomon Islands, and on Dec. 13 discovered a "high mountainous country," which he called Staten landt ("Land of the States," ie, of Holland, now New Zealand). Tasman believed the newly discovered land to form part of the same great antarctic continent as the other Staten land; which Schouten and Lemaire had sighted and named to the east of Tierra del Fuego He anchored on Dec. 18 in 40° 50' S., at the entrance of a "wide opening," which he took to be a "fine bay" (Cook's Strait). He gave the name of Moordenaars (now Massacre) Bay to this spot, where several of his men were killed by the natives (Dec. 10). He then sailed along the south shore of Cook's Strait, but without discovering the full extent of the strait here dividing New Zealand into two main islands. Returning westward he then coasted the west side of the North Island, till, on Jan. 4, 1643, he reached the northern extremity of New Zealand.

Thence he bone away to N N.E and on Jan 19-25 he discovered various Islands of the Tonga or Friendly group. Here the ships provisioned, for the first time since leaving Mauritius Thence Tasman steered N. and W. reaching on Feb. 6 the eastern part of the Fijs archipelago, which he called Prince William's Islands and Heenskerk's Shouls. He reached the western extremity of New Guinea on May 18. He arrived at Batavia on June 15, 1643 after a ten months' voyage.

Second Voyage.-The materials for an account of Tasman's important second voyage in 1644 are scanty. He was instructed to obtain a thorough knowledge of Staten Land and Van Diemen's Land, and to find out "whether New Guinea is a continent with the great Zuidland, or separated by channels and islands," and also whether the new Van Diemen's Land is the same continent with these two great countries or with one of them." In this voyage Tasman had three ships under his command, the "Limmen,"
"Zeemeeuw" (or "Meeuw"), and "Brak" (or "Bracq"). He
coasted the south-west coast of New Guinea; he mistook the western opening of Torres Straits for a bay, but explored (and perhaps named) the Gulf of Carpentaria: for the first time the coast-line of this great bay was mapped with fair accuracy. Though pre-ceded by Jansz (1606) and Carstensz (1623) on the east shore of the gulf as far as 17° S., Tasman first made known the south, and most of the west, coast. Beyond this he explored the north and west coasts of Australia as far as 22° S., and established the absolute continuity of all this shore-line of the "Great Known South Continent"; his chart gives soundings for the whole of this coast. Tasman's achievements were coldly received by the Dutch colonial authorities; but on Oct. 4, 1644 they rewarded him with the rank of commander (he had frequently enjoyed the use of the title already). He was also made a member of the Council of Justice of Batavia. He was a member of the committee appointed on April 18, 1645 to declare a truce between the Dutch East India Company and the vicercy of Portuguese India. In 1647 he commanded a trading fleet to Siam, and in 1648 a warfleet sent against the Spaniards of the Philippines (May 15, 1648,

345

to January 1649). By 1653 he had quitted the company's service He died probably before Oct. 22, 1659, and certainly before Feb 5, 1661

5, 1661

TASMANIA, a State of the Commonwealth of Australia consisting of one large and numerous smaller islands, the largest of which, King, Flinders and Cape Barren Islands, lie in Bass Strait (total area, 26,215 miles-roughly that of Scotland-forming 0-88% of the area of the Commonwealth). The island of Tasmania extends from about lat 40° 40' S, to lat, 43° 40' S, is of a maximum length (N-S.) of 180 m and breadth (E.-W) of 190 miles, and has a shield-shaped general outline tapering southwards It lies upon the main continental platform and at various periods formed part of the continent to its north Bass Strait, though some 140-150 miles wide, is relatively shallow so that Tasmania is linked to the mainland by a submarine ridge carrying only 30-40 fathoms from which rise the groups of islands mentioned above. The latest severance of Tasmania is probably geologically recent and a rise of c, 200 ft .-- or a corresponding fall in sea-levelwould reunite it to the mainland It is, in fact, essentially a portion of the eastern highland belt of Australia (see Australia. Geomorphology) and has the same general physiographic character modified, to some extent, by climate. Subjected to repeated strains and stresses, and also to active denudation, throughout its history, the island-mass has assumed the character of an extremely irregular upland block, or group of blocks, with generally flattened tops but steep, and often precipitous (step-faulted) sides—cf. the term "tiers"—and possessing several coastal, and also some inland, lowlands in which crustal oscillations have produced features of both emergence and of submergence. The nearness in time of some of the most influential of these movements is proved by the freshness and sharpness of many of the forms (eg, "drowned" coastal features, valley gorges, waterfalls and generally ungraded stream courses), by the signs of dislocated drainage, and by the general irregularity, and even wildness, of the topography. The extensive and varied igneous intrusions-Palaeozoic granites and serpentine, Cretaceous diabase, Tertiary basalts, etc —evidence the intensity of the move-ments, while weathering has flattened, but also in part, by means of differential erosion, diversified the surface.

Physiography.-Several divisions may be distinguished. (i.) The south and west are occupied by a broad belt of highlands presenting abrupt irregular fronts to the west and north. They are composed mainly of very ancient sedimentary rocks (Pre-Cambrian-Palaeozoic schists, quartzites, slates, sandstones and limestones) much intruded by granite and other igneous formations. The general surface level rises to some 4,000 ft with many summits approaching 5,000 ft, (Cradle Mountain, 5,069 ft ), but the incision of streams and the cutting of deep valleys and gorges (King River, 3,000 ft. deep, and of the valleys of the Arthur, Pieman, Gordon Rivers) has given rise to a wild, inaccessible, and little known landscape, with some lakes and forests, much poor and sterile rock and soil, but possessing great actual and potential mineral wealth. (ii.) The Central (Lake) Plateau, only partly dissevered from the above, consists mainly of Mesozoic rocks (Permo-Carboniferous) and slopes down from a general level of 3,500 ft. in the northwest to lower levels in the southeast, in which direction it is drained by the streams of the Derwent system. To the north and northeast it presents a towering es-

carped front ("tiers") with individual elevations of over 4,000 ft. potentially, the most valuable in the Commonwealth though its fashioned mainly out of igneous (diabase) intrusions. The rocks contain some oil shale and coal, but for the rest supply only grasslands The heights which flank the central east coast are a portion of this formation, being severed only by the Macquarie-Coal River depression (elevation 660 ft. near Tunbridge) (iii) The northeast highlands, though detached from the central massif by the broad Tamar-Esk depression, resembles it in being a plateau with levels rising to 3,000-4,000 ft. The Palaeozoic sediments have been penetrated by igneous intrusions of various dates and composition (granite, diabase, basalt), the harder of which form great bosses (Ben Lomond, highest elevation in the island, 5,760 ft) They constitute a group of wild and mineralised mountainblocks towering above the adjoining lowlands (iv ) The northern lowlands a down-faulted area fronting Bass Strait and broadest in the northwest, consist substantially of the same rocks as the highlands behind (pre-Cambrian schists, Palaeozoic slates, sandstones, etc ) and, besides rich deposits of metallic ores, include valuable limestones, oil-shales and coal Many of these rocks yield infertile soils, but the great basalt (Tertiary) flows which characterise this area redeem this quality, and these lowlands, with their irregular terrain and diversified potentialities form one of the richest regions. (v.) The east and southeast lowlands are even more irregular, and are worked out mainly in Mesozoic (Triassic-Jurassic) strata which contain coal. Diabase and older rocks form irregular, rough and infertile ranges, spurs and platforms over considerable areas, but the later strata yield soils useful for pasturage and cultivation

Lakes are an especial feature of the Tasmanian highlands, and especially of the central plateau Here, at an elevation of about 2,500 ft., the heavy ramfall is held up in impervious (diabase, etc ) rock-basins, and elsewhere (eg, in the west) are lakes of glacial origin. Great Lake (alt 3,800 ft.) is 15 miles long and its natural depth was only 20 ft. It has importance in connection with a great hydro-electric supply scheme.

The coast-line (900 miles) receives its special character from recent subsidence, though there has been a still later but smaller elevation. Where the coast runs parallel to the grain of the highlands it is mostly closed (e.g., on the west) and presents few good openings. On the northeast and southeast, on the other hand, are many curious features of submergence (e.g., Freycinet and Tasman's peninsulas) and also some fine "drowned valley" harbours (Tamar, Derwent, see Launceston, Hobart) (v. inf).

Climate.-Tasmania lies in the southern temperate zone in the track of the east-moving cyclonic systems ("lows"), while no part is far removed from the sea. Hence its climate is cool. equable and moist, somewhat resembling that of southwest England and Ireland. Like these, too, its weather conditions are exceedingly variable-hardly four consecutive days showing the same conditions-but in its case there is added to this variability an extraordinary local diversity due to the irregular and sharp-cut topographical features. Thus there is strictly no general climate of Tasmania, but, within limits, temperatures, and particularly rainfall, show remarkable ranges (eg., 130 in at Lake Margaret on the west coast, 18 in. at Antill Ponds in the east midlands). Broadly speaking temperatures range from 65° F in summer to 45-50° F in winter, the east coast having temperatures in general c. 4° above those of the west coast owing to the influence of warm (north) and cool (south) sea-currents respectively. Rainfall is greatest in the west, where the highlands force precipitation from the moist westerly winds (40 in av. ann. along the coast, rising to 60 in., and to 140 in. in the central northwest, with a late-winter maximum (e.g., Queenstown: 100 in.; Aug., 10 in.; Feb., 4 in.). The northeast highlands also receive 40-80 in., but the eastern and central lowlands are in the "rain-shadow" of the western heights and receive some 20 in. more or less with a maximum in spring and summer when southeast winds blow in with rain. (See also LAUNCESTON.) It is the cool and moist climate of Tasmania which lends it that relatively verdant and garden-like character which is such an attraction to Australians from hotter and drier latitudes.

Vegetation .- The natural vegetation was one of the finest and

natural riches have been largely dissipated The chief controlling factor appears to be rainfall-or rather, availability of moisture. Thus the beech forests-so-called "myrtle"-which are peculiar to Tasmania are found in various separate areas but always where the av. ann. rainfall is over 50 in Eucalypts form the bulk of the forests in areas of intermediate rainfall and range from swamp and blue "gums" in the lower river-flats to the "snow" or "mountain" gum on higher slopes. Some of the "pines" (Huon, "celery-top," etc) are also denizens of the lower and wetter "celery-top," etc) are also denizens of the lower and wetter valleys, eg, in the southwest. The "wetter" forests have also often a dense and almost impenetrable undergrowth (tree-ferns, laurels, etc ). In the drier "rain-shadow" lowlands of the east and centie the forests become thinner-though the trees tend to become individually finer—and a type of wooded "park" or grass-land prevails. The wind-swept plateau-tops carry little but stunted scrub, grasses, and bog and moorland vegetation merging in places into "alpine," and the lower hills which lie along and immediately behind the west coast, with their relatively light nainfall (20-40 m) are matted over with the strange and impassible "horizontal" (bauera) scrub. The western mountains and valleys still contain fairly large forest patches (eg., the fine eucalypt forest of the Huon Valley), and the northeast also is well clad In the lowlands and on the more accessible slopes the forests have been largely destroyed or wastefully depleted for their valuable contents Commercially useful timber is supplied by many of the gums—blue, yellow (cider), swamp and stringy gums, peppermint, etc—by the soft-wood pines, the beech, the blackwood of the northern basaltic slopes and valleys and also by the acacias (eg, the "black wattle" supplying tanning bark). Tasmania has a relatively large extent of forested land (1,500,000)acres, nearly 9% of total area) But, from the scientific forester's point of view, the forests are not as valuable as might appear. There were (1940) only 1,593,000 ac. of reserved forests, or, with timber and fuel reserves, 2,544,000 ac.

General Economic Aspects.-The extraordinary diversity of soil, climate, and of topographical feature within even a quite restricted area has given to Tasmanian land development a sporadic and somewhat "patchy" nature. This, and the very large extent (about 3) of broken and uncultivable terrain, has prevented the growth of large and simple types or areas, such as, e.g., the wheat belt in Australia, and has rendered difficult any large-scale unified economic organization.

Mining and Metallurgy.-If Tasmania's mineral output is not relatively large it is large in proportion to the area of the State. The island contains some notable individual deposits and its reserves are also probably considerable, much of the country being as yet inadequately prospected. The minerals fall into two main classes. (a) metallic minerals occur chiefly in the older rocks of the western highlands where the extensive igneous activty has led to mineral concentrations. In the central west the Oueenstown-Gormanston area was developed, under conditions of extraordinary physical difficulty, upon a large scale, outlet being chiefly by Macquarie Harbour (Strahan, Pillinger). Northwards from this are the Zeehan-Dundas, Read-Rosebery, Waratah, Mt. Bischoff and other areas.

Many of these mines produce varying quantities of silver, lead, copper and gold, partly as a by-product, e.g., in copper refining. The copper is produced almost entirely by the Mount Lyell Mining and Railway Company which owns extensive workings, railway lines, electric (power and light) supply schemes (Lake Margaret). The output of this Company's mines in 1938 was 12,720 tons copper, 67,176 oz. silver, 7,919 oz. gold; the year's profits amounted to more than £803,000. Mount Bischoff is still noted for tin, while the Read-Rosebery zinc reserves are estimated at over 2,500,000 tons. In addition valuable osmiridium alluvial deposits occur along the west coast, The similar rock formations of the north, north-east and east contain gold (Bea-consfield, Lefroy, Lisle, Mathinna, Mangana) but more impor-tant is tin, the bulk of the Tasmanian output coming from the north-eastern fields (Gladstone, Derby, Branxholm, Ringarooma) and also from the east (St. Helen's, etc.), while a rich deposit

has also been discovered on King Island, Tasmanian iron reserves are estimated at 100,000,000 tons, the ore occurs in the ancient rocks of the west and north, notable deposits being at Rio Tinto (Savage River on the west coast. about 50,000,000 tons) and at Burme where the Blythe uver has cut through a deposit of 17-30,000,000 tons The iron ores are as yet little exploited (b) Non-metallic minerals consist chiefly of coal, oil shales, limestones and pottery clays Coal (actual and probable reserves, 244,000,-000 tons) occurs in the Permo-Carboniferous, Trias-Jura and Tertiary strata along the north and east coastal areas and is increasingly mined around St Mary's, in the Mersey valley, etc. In the northern coastal areas occur large deposits of oil shales, while limestones and clays in great quantity occur there and elsewhere The shales are as yet little worked, but the limestones and clays form the basis of the potentially important cement industry of Maria Island, etc , the limestones of Melrose are exported through Devonport for fluxing purposes to New South Wales (see BROKEN HILL), those near Hobart (q v ) are used for the carbide industry (1942-43 £190,803), and the clays are also used for tile, etc , manufacturing (eg, near Launceston) Metal concentrating and refining is conducted on a large scale on the Zeehan and Mount Lyell areas, but Mount Bischoff ores are smelted at Launceston (q.v). The important Electrolytic Zinc Company's works at Risdon (see Hobart and Broken Hill) recovered (1938) 47,370 tons zinc (£915,617) and cadmium valued at £60,760 from Bioken Hill ores (exclusive of Tasmanian concentrates treated). The Mount Lyell Mining and Railway Co. has also engaged in the production of superphosphates, sulphuric acid, etc As elsewhere in Tasmania the growing success of mining, metallurgical, etc , industries is due to hydroelectric power.

Timber, Fruit, etc.—Tasmania's sawmill output (1939-40) was 79,330,000 super ft , of which about 80% is exported Recent discovery of the high value of Australian hardwoods for making paper-pulp has led to the establishment of a promising new industry which, able to absorb poorer timbers and "offal" formerly wasted, has, allowing for re-growth, unlimited reserves. The cultivation of imported soft-wood species also holds out promise. Fruit-growing in Tasmania has progressed as over-sea markets have become available. The apple crop in 1937 was worth £989,-000, and was much more important than potatoes, hay or wheat.

Agriculture and Dairying .- The products of arable agriculture are characteristically wheat, oats, potatoes and fodders. Tasmania was once the granary of Australia, but the uncertainty and dampness of the native climate, together with the competition of the later-developed and more suitable continental wheat-lands, have discouraged home production. A little is grown near Launceston and Hobart under the influence of the milling industry there (1924-25: 13,000 ac., 231,000 bu.; 1927-28. 28,000 ac., 672,000 bu.; 1935-36 19,500 ac., 570,895 bu.), but Tasmania tends to import wheat and similar products. Her position opposite the port and market of Melbourne-and more remotely and occasionally, that of Sydney-greatly aids this process of specialization. Oats, barley (malting), hay (chaff), pulses, potatoes -and also dairying with its associated pig-rearing, bacon-curing, cheese and butter making-have in fact a distribution influenced by climate, soils and commercial position. The central northern lowlands-from Deloraine, through Westbury, Longford, Evandale, to Lilydale-centre on Launceston which is a market and exporting centre. The 15-mi.-wide strip of fertile coastal lowlands which stretches northwest to Stanley, backed by a similar belt of pastoral country and, beyond this, by timber areas, finds an outlet in such ports as Ulverstone, Penguin, Burney,

Pastoral Industries. As more intensive forms of land utilization have progressed; the pastoral industries have tended to decline, especially as in Tasmania there is small room to move away as settlement advances. To some extent, however, this tendency has been checked by specialization, "meat" cattle, for example, being replaced by dairy herds, while in the case of sleep, careful lotal adaptation has led to survival, e.g., of "utility" (meat-wool) types as elements in a mixed farming regime. Notable, also, is the achievement of several long-established sheep-breeding families in rearing high-class strains.

Sheep .- The whole of the west of the island is too wet, or too wild, for sheep, and these are confined mainly to the areas with 30 in or less av ann rainfall which comprise the southeast + of the island, relatively few being scattered along the north coastlands The greatest concentrations are in the upper and central Macquarie River basin and in the northern hill lands of the Derwent-Coal basin ("The Midlands"). The Longford, Evandale and Oatlands districts show densities of 300 per sq mi, and here the sheep fit into the farming rotation and are mainly marketed as meat, fresh (Launceston, Hobart) or refrigerated (export) In the north other cultivations (v sup) are more profitable. In the poorer and rougher eastern hill and coast lands fewer are kept. but the central highlands provide good summer grazing grounds for sheep from the adjoining districts to the east Cattle, apart from dairy cattle (v. sup), are decreasingly important, but they are found in the rougher lands around the borders of, and between, the better farming areas along the north and east and more particularly in "the midlands" (se, northern Derwent-Coal River hill lands) and here tanning assumes local importance

Manufacturing Industries; Power Supply.-These have grown up upon the basis of the primary producing industries and are still often locally associated with them extraction and refining of metals, sawmilling, making of jams and preserves, dairy products, bricks, tiles and pottery; tanning, etc (v sup) Secondary are the chemical, cement, carbide and electrode industries, making of furniture, agricultural implements, etc. A new tendency, however, has now appeared, namely for industries of a larger and more derivative type to concentrate in Launceston and Hobart (qq.v.) As this tendency develops greater strength, the manufacture of chemical products, cement, iron, paper, artificial silk, woollen and other textiles may be expected to assume considerable proportions. The reasons lie partly in the presence of raw materials, partly in the favourable position of Tasmania with relation to (chiefly) Victoria, New South Wales and South Australia, but mainly in the fact that Tasmania, along with a cool climate, possesses reserves of water power The water power resources are the property of the state which develops them and sells power in bulk to large consumers and municipalities, though it also retails power to consumers in Hobart. The total power in Tasmanian hydroelectrical plants was 143,000 hp in 1940-41. This was made up mainly by plants at Waddamanna, as well as at Tarraleah on the upper Derwent River. A new dam at Miena has increased the supply of the Waddamanna water The Great Lake scheme (63,000 hp) was completed. Advantage has been taken here of the Great Lake, whose area was increased to 60 sq mi and depth to 55 ft by means of a dam, and also of a difference in level of 1,250 ft between the parallel valleys of the Shannon and the Ouse The Shannon scheme, adjacent (13,000 hp), was being extended Launceston (qv) and its district. as well as Hobart, is supplied from the Great Lake system, other systems being the Lake Margaret-Zeehan, Zeehan-Rosebery (under construction), Country District and North-west Coast Service. So far only 52,000 h p has been utilized, the Electrolytic Zinc Works (Risdon) consuming 35,000 h.p.; the Carbide works. 3,500; Hobart, 8,500; Launceston, 3,000. The further reserves of Tasmania are estimated at over 500,000 continuous h.p. Besides the State schemes the Mount Lyell Mining and Railway Co. can supply 8,000 continuous h.p., and there are numerous smaller mining and municipal supplies. The coasts abound in good natural harbours-though some are exposed and not very usefulbut the main sea traffic centres on Hobart, Launceston, on the north coast ports and on those of Macquarie Harbour.

See G. L. Wood, The Tasmanian Environment (1923); A. Lowndes and W. Maze, Land Utilisation, Tasmania (Sydney, 1937); G. Taylor, Australia (1943).

Statistical Summary\*: Area and Occupation -26,215 sq mi. (16,778,000 ac) = 0.88% of the Commonwealth, wholly in temperate zone Coast-line: 900 mi = 1 mi. per 29 sq mi. of land surface. Of the total area 6,325,889 ac. had been alienated or were in process of alienation in 1939; 7,791,189 ac were occupied by the crown or unoccupied, 297,481 ac, were leased for timber:

\*The Australian governments have largely postponed publication of later data (1944).

Chief Resources of Tesmania

31.347 were for mining purposes, and the rest were for pastoral or agricultural purposes or for closer or soldier settlement Average iuial holding (1939) 586 ac

Pobulation (1933) 227,599, of which 115,097 were males and 112,502 were females The State contains 3 42% of the population of the Commonwealth and has a density of 8 68 per sq mile. Its natural increase (1936-40) was 12,614 although in the same period it lost 793 more persons through emigration than it gained through immigration Metropolitan Hobart and suburbs (54,890 ac), 60,406 (1933) = 26 5% of total population

Production (net value) (1939-40). total, £14,438,000; agricultural and pastoral, £4,236,000; manufacturing, £6,253,000, min-

ing, £2,144,000

Mining (gross value of metal contents of ores produced, 1938): Total, £1,953,000 copper, £580,000; tin, £244,000, lead, £163,-000, zinc, £356,000, silver, £104,000, coal, £62,000 (83,000 tons), in 1030 £74,000 (99,000 tons), osmiridium, £3,000, limestone flux (1939), £79,000, gold, £195,000. In the case of copper, lead and tin, the 1938 figure fairly represents the general level of annual production Zinc production from Tasmanian-mined ores was only resumed in 1936 after a five year suspension, the value of the year's output dropped slightly in 1938 from the 1937 figure. Production of coal decreased steadily for some years, but in 1939 production was increased by almost 16,000 tons and value increased more than £12,000 over 1938 Silver, osmiridium and wolfram fluctuate widely from year to year

Trade, Commerce, Communications — Trade. Total (1937-38) £22,900,000 (£94 0 per caput). Exports: £11,136,000. Metals: c £2,500,000; fruits, £1,500,000; jams and other prepared foods, £390,000; potatoes, £521,000, dany produce, £452,000; wool, £817,000; hides, etc, £347,000, timber, £541,000

Imports: £11.800.000. Food and drink £2.657,000; metals and

machinery, £3,681,000, clothing, etc., £1,708.000.

Shipping (entered and cleared): 2,000-2,500 vessels, 1,500,000-2,750,000 tons (net) Railways: Government lines (1939-40) 644 42 miles (of this, all is 3'6" gauge). Private (1939-40) 116 34 miles. Gross revenue (government railways) (1939-40) £536,000; working expenses, £688,000, loss after payment of working expenses and interest, £245,000

Social Conditions .- Education. (1939) State schools, 448; teachers, 1,264; average weekly enrolment, 30,865; average daily attendance, 28,189; expenditure exclusive of buildings, £320,616. Private schools, 63; teachers, 330, enrolment, 7,003; average attendance, 5,324. (O. H. T R; X)

History.- Tasmania, or, as it was originally called, Van Diemen's Land, was discovered in 1642 by the Dutch navigator Tasman (q.v.), who named the territory after his patron, Van Diemen In the 18th century the island was visited by French and English explorers, including Capt Cook in 1777. The news that the French explorer, Baudin, had surveyed the south of the island in 1800 stimulated the British to forestall the French. In 1802 the "Cumberland," a small schooner, landed at King's island in Bass strait, and in 1803 Lieut, Bowen was sent by Governor King of New South Wales to form a settlement on the south coast of Van Diemen's Land. In 1807, Col. Paterson occupied Port Dalrymple on the north side of the island, During the same year Col, Collins, who had failed in an attempt to colonize the shores of Port Phillip, transferred his soldiers, convicts and officials to the neighbourhood of Hobart, and was appointed commandant of the infant settlement. The difficulties of the settlers

were increased by the hostility of the blacks The first collision took place at Risdon, a few days after the landing of Lieut Bowen's expedition, and for this the white settlers were entirely responsible Hostilities between the races were incessant from 1802 till 1830 In 1831 George Robinson induced the remnant of the blacks to leave the mainland and take refuge first in South Brum and subsequently in Flinders island, their numbers having then diminished from 5,000, the original estimate of the aboriginal population, to 203 The last pure-blooded Tasmanian died in 1876, at the age of 76

The growth of population was extremely slow, and in 1808 a census showed that there were only 3,240 people on the island, all told Soon settlers began to arrive, and as their number in the colony increased, an agitation arose for more political freedom and improved administration, in consequence of which, in 1822, courts-martial were replaced by courts of justice, and in 1825 the colony was made independent of New South Wales, Col. At thur being appointed governor. In 1828 the Van Diemen's Land company commenced sheep farming on a large scale in the northwest district of the island under a charter granted three years before, and in 1829 the Van Diemen's Land establishment obtained a grant of 40,000 ac at Norfolk Plans for agriculture and grazing grant of so,000 ac at Norfolk Plans for agriculture and grang In 1834 Foultand bay, on the mainland of Austriala, was occupied by settlers from Van Diemei's Land, and in 1835 there was a migration, large when compared with the population of the island; to the shores of Port Philip, now Victoria. At that date the population was 40,171, a large proportion being convects, for in four years 5,000 proson were not all satisfied with the system of government, and an agitation commenced m Van Diemei's Land, as well as in New South Wales, for the introduction of representative mistitutions and the abolition of transportation. This system was abolished in New South Wales in 1849, and in the siland, which is the intermit had been the receptacle for convokes from the United Kington, India and the colognist, in 1853. In the same year representative institutions were introduced and the colony was renamed Tasmania, three years later responsible government was granted. The discovery of gold in Victoria caused the value of exports to that colony to rise from £665,760 in 185z to the value of exports to that colony to rus from £65,2700 m 185; to 1,175,5310 m 185,5 while the population dimnaished through magration fundamental through magration and the state of the

TASMANIAN DEVIL (Sarcophilus ursinus), is a large, heavily built relative of the dasyures. In size it may be compared to a badger. The general colour of the fur is black tinged with brown, with white patches on the neck, shoulders, rump and chest It is a burrowing animal, nocturnal and carnivorous, and commits great depredations on the sheep yards and poultry lofts of the inhabitants. (See Marsupialia)

TASMANIANS. The Tasmanians, who are now extinct, were of medium height, had black to dark brown skins; woolly hair, heavy brows; longish, oval or pentagonal, flattish and small sized (cranial content) heads; short broad noses and large teeth.

Culture .- They were food gatherers, expert hunters and trackers of game, nomads, moving in small groups of the family type. with very little government but recognizing the areas belonging to other groups as reserved and not to be interfered with except on risk of war. Hereditary or permanent chiefs do not seem to have been found. No marriage ceremony is recorded and there seems ground for holding that they were polygynous. They are typical representatives of the Early Stone and Wood Age. The stone implements are very crude in form and finish (akin to Mousterian products) and were made of phthanite, a fine grained sandstone. Fire was made with the groove and saw or with the drill Stones with black and red bands were used for tallies or mnemonics for absent friends. All have been lost and their exact significance is not quite clear. They made rough drawings on bark, with charcoal, ornamented themselves, using red othre for the hair and wore shell necklaces, fillets of gay flowers, or festoons of showy berries. Huts and wind-breaks were used as shelters. Skins were thrown over the back against rain but otherwise they were naked. Scarification was practised and they

rubbed themselves with powdered charcoal and red ochre They greased their bodies against rain. They made rafts generally of the bark of some species of Eucalyptus, which was rolled up into cigar shaped bundles, three going to a raft, broad in the middle and tapering to a point at each end These were good fair weather craft but dangerous in storms They used their spears for fishing but had neither bow and arrow nor boomerang

Language.-There were five dialects, classified on a geographical basis in two main groups as eastern and western Enough remains to show that they were all related and were dialectical variations from a common archetype The language is said to have been musical and soft, vowels being peculiarly full and round They had no d, f, v, s, or z Words began generally with a consonant, cr, pr and tr being common, other combinations being rare Words end with a vowel as a rule. Distinct forms were used for singular and for plural.

TASSIE, JAMES (1735-1799), Scottish gem-engraver and modeller, was born at Pollokshaws, near Glasgow, on July 15, 1735, and died in London on June 1, 1799. During his earlier years he worked as a stonemason until he removed to Glasgow to attend the academy established by the brothers Foulis, the printers, and became one of its most distinguished pupils Subsequently he visited Dublin and became acquainted with Dr. Quin, who had been experimenting in imitating antique engraved gems in coloured pastes. He engaged Tassie as an assistant, and together they perfected the discovery of an "enamel," admirably adapted by its hardness and beauty of texture for the formation of gems and medalhons Tassie went to London in 1766. After a hard struggle the beauty and artistic character of his productions came to be known. The empress of Russia commissioned a collection of about 15.000 examples; all the richest cabinets in Europe were thrown open to him for study and reproduction; and his copies were frequently sold by fraudulent dealers as the origmal gems He exhibited in the Royal Academy from 1769 to 1791, In 1775 he published the first catalogue of his works, followed in 1791 by two volumes quarto, enumerating nearly 16,000 pieces.

Tassie also executed many large profile medalhon portraits of his contemporaries. They were modelled in wax and were then cast in white enamel paste, the whole medallion being sometimes executed in this material; while in others the head only appeared in enamel, against a background of ground-glass tinted by paper placed behind. At his death, in 1799, Tassie's works numbered

about 20,000 pieces.

21.38 g G

His nephew, William Tassie (1777-1860), also a gem-engraver and modeller, succeeded to the business. His portrait of Pitt, in particular, was very popular, and circulated widely. He bequeathed to the Board of Manufactures, Edinburgh, a valuable collection of casts and medallions by his uncle and himself.

See Gray's James and William Tassie, 1895.

TASSO, BERNARDO (1493-1569), Italian poet, father of Torquato Tasso (q.v.), was born at Venice on Nov. 11, 1493, of a noble family of Bergamo. He was attached to the service of the prince of Salerno, and married a Neapolitan lady, Porzia de' Rossi. When his patron came into conflict with the Spanish Government of Naples Bernardo was proclaimed a rebel and his property sequestrated. In 1556 his wife Porzia died under mysterious circumstances Next year he entered the service of the duke of Urbino, and became a considerable figure in the literary circle of his court. He wrote a long, complicated and dull roman-

tic poem in octave stanzas, entitled Amadigi (Venice, 1560). Bernardo died at Ostiglia on Sept. 4, 1569.

TASSO, TORQUATO (1544-1595), Italian poet, son of the preceding, was born at Sorrento on March 11, 1544. He was brought up at Naples, where he lived with his mother and his

handsome and brilliant lad, now became the companion in sports and studies of the young heir, Duke Francesco Maria della Rovere He met there many of the most famous scholars of the day, including Aldus Manutius and the critic Speroni At Venice, whither his father went to superintend the printing of the Amadigi (1560), he found himself the pet and prodigy of a distinguished literary circle He was then sent to study law at Padua, but his distaste for the subject led Bernardo to allow his son to exchange the study of law for that of philosophy and poetry at Padua, and then at Bologna In 1561 he published some poems, and before the end of 1562 produced a narrative poem, Rmaldo, in twelve cantos which proposed to combine the regularity of the Virgilian with the attractions of the romantic epic Tasso, who was still only 18 years old, sought to give the adventures of Roland a classic form He was now famous In 1565 he became attached to the learned court of Ferrara, at first in the service of the Cardinal Luigi d'Este

The years between 1565 and 1570 seem to have been the hap-piest of Tasso's life, although his father's death in 1569 caused him profound pain. He was the idol of the most brilliant court in Italy. The princesses Lucrezia and Leonora d'Este took him under their protection. He was admitted to their familiarity, and there is some reason to think that neither of them was indifferent to him personally. In 1570 he travelled to Paris with the cardinal. Frankness of speech and a certain habitual want of tact caused a disagreement He left France next year, and took service under Duke Alfonso II. of Ferrara The most important events in Duke Attonso 11. Of Ferrara The most important cross in Tasso's biography during the following four years are the publication of the Aminta in 1573, and the completion of the Gerusalemme Liberata in 1574. The Aminta is a pastoral drama of very simple plot, but of exquisite lyrical charm. It was represented at Ferrara in the summer of 1573, at the critical moment when modern music, under Palestrina's impulse, was becoming the main art of Italy.

The Gerusalemme Liberata occupies a larger space in the history of European literature, and is a more considerable work. Yet the commanding qualities of this epic poem, those which revealed Tasso's individuality and which made it a classic, beloved by the people no less than by persons of culture, are akin to the lyrical graces of Aminta. It was finished in Tasso's 31st year, and was read to the duke and to Princess Lucrezia in the summer of 1575

As in the Rinaldo, so also in the Jerusalem Delivered, he aimed at ennobling the Italian epic style by preserving strict unity of plot and heightening poetic diction. He chose Virgil for his model, took the first crusade for subject, infused the fervour of religion into his conception of the hero Godfrey. But his own natural bias was for romance. Godfrey, a mixture of pious Aeneas and Tridentine Catholicism, is not the real hero of the Gerusalemme. Fiery Rinaldo, Ruggiero, impulsive Tancredi, and the chivalrous Saracens with whom they clash in love and war, divide our interest and divert it from Goffredo. The action of the epic turns on Armida, the beautiful witch, sent forth by the infernal senate to sow discord in the Christian camp She is converted to the true faith by her adoration for a crusading knight, and quits the scene with a phrase of the Virgin Mary on her lips. Brave Clorinda, donning armour like Marfisa, fighting in duel with her devoted lover, and receiving baptism from his hands in her pathetic death, Erminia seeking refuge in the shepherd's hut-these lovely pagan women, so touching in their sorrows, so romantic in their adventures, so tender in their emotions, rivet our attention, while we skip the battles, religious ceremonies, conclaves and stratagems

Tasso's self-chosen critics suggested every course but the right one, which was to publish the Gerusalemme without further dispute. Tasso, already overworked by his precocious studies, by exciting court-life and exhausting literary industry, now grew almost mad with worry. His health began to fail him. He complained of headache, suffered from malarial fevers, and wished to leave Ferrara. The Gerusalemme was laid aside in manuscript for only sister Cornella, and was educated by the Jesuits. He was a a time. He opened negotiations with the court of Florence for an precocious child and famous in Naples for his learning when, at exchange of service. This irritated the duke of Ferrara, who feared ten years old, he joined his father in exile in Rome. In 1537 he that the Medici might get the coveted dedication of that already accompanied his father to the court of Urbino. Torquato, a famous epic. Therefore he bore with the poet's humours. MeanTATA 831

while Tasso became the subject of delusions-thought that his servants betrayed his confidence, fancied he had been denounced to the Inquisition, expected daily to be poisoned. In 1576 he quarrelled with a Ferrarese gentleman, Maddalo, who had talked too freely about some love affair, in the summer of 1577 he was relating his sorrows once more to the princess Lucrezia, when he magined a servant was listening and rushed on him, knife in hand He was shut up in a room in the palace, and the duke then took him to his country seat of Belriguardo The often told story, immortalized by Goethe, that a compromising haison with Leonora d'Este came to light, and that Tasso agreed to feign madness in order to cover her honour, must be dismissed. The poet's own temperament and the critics of his Gerusalemme Liberata had aggravated his ill-health He was now placed in a Franciscan convent at Ferrara He escaped at the end of July, disguised himself as a peasant and went on foot to his sister Cornelia at Sorrento

He seems to have found peace and healing with his sister, but after a time missed the court cucle, and asked to return to Ferrara There his old irritability returned. In the summer of 1578 he ran away again; travelled through Mantua, Padua, Venice, Urbmo, Lombardy. In September he reached Turm on foot, and was courteously entertained by the duke of Savoy. Wherever he went, "wandering like the world's rejected guest," he met with the honour due to his illustrious name But life was intolerable to him outside Ferrara In February 1579 he returned at an ill-chosen moment. Alfonso was about to contract his third marriage, this time with a princess of the house of Mantua. The princesses did not want to see him The duke was engaged Tasso broke into terms of open abuse, and was sent off without ceremony to the madhouse of St. Anna There he remained for seven years until July 1586. After the first few months of his incarceration, during which he was treated with the harshness then usual towards the insane, he obtained spacious apartments, received his friends, and went abroad attended by friends Except for occasional odes or sonnets-some written at request and only rhetorically interesting, a few, like the famous canzone asking for the intercession of Luciezia and Leonora, inspired by his keen sense of suffering and therefore poignant-he neglected poetry.

Long ago his papers had been sequiestrated. Now, in 1580, he heard that part of the Gerusdamen was being published without his permission and without his corrections. Next year the whole poem was given to the world, and in the following six months seven editions appeared. The prisoner had no control over his editors; and from the masterpiece which placed him on the level of Petrarch and Ariosto he never derived one penny of pecuniary profit. The fame of the poem rangely spread throughout Europe, within twenty years of its publication it was translated into English in the well-known version, stelf a masterplece, of Siz Edward in the well-known version, stelf a masterplece, of Siz Edward in the well-known version, stelf a masterplece, of Siz Edward (1600). A rival poet as the court of Ferrara, Battesta Guardi, undertook to revise and re-edit his blyrics in 1582 In 1585, two Florentine pedants of the Della Crusca academy declared war against the Geracalemme.

In 156 Tasso left. St. Anna at the solicitation of Vincenzo Gonzaga, prince of Mantua. He followed his young deliverer to the city by the Mincio, basked awhile in liberty and courty pleasures, enjoyed a splendid reception from his paternal town of Bergamo, and produced a tragedy called Torrissonado, the first sketch of which dates from 1574. But in the autumn of 1587 we find him wandering once more, through Bologna and Loreto to Rome, where he stayed in the house of an old friend, Schjöne Gonzaga, now patriarch of Jerusalem. Next year he wandered off to Naples, where he wrote his unfinished poem on Monte Oliveto. In 1589 he returned to Rome, but fell ill The patriarch in 1590 gain received him. But Tasses 'deless spirit over 'Rome' Rome of the Patria of the State of the Stat

His health grew feebler and his genius dimmer. In 1502 he

gave to the public a revised version of the Gerusalemme, called the Gerusalemme Conquistata. All that made the poem of his early manhood charming he rigidly erased The versification was degraded; the heavier elements of the plot underwent a dull rhetorical development. During the same year a poem on the Creation in blank verse, called Le sette Giornate, saw the Light

In 1394 Clement VIII and his nephew, Cardinal Aldobrandin of St Giorgo, nivited Tasso to Rome There he was to assume the crown of buys, as Peturato Bassumed it, on the Capitol. Worn out with illness, Tasso reached Rome in November. The ceremony of his coronation was open easigned him a penson; of the control of the Capitol Common of the Capitol Commo

He passed away on April 25, 1595, and the cell he occupied became a place of pilgrimage for his admirers. The last twenty years of his existence had been meffectual. At the age of thirty-one the Gerusalemme, as we have it, was accomplished. The work, too, was already runging with the music of Aminta. More than this Tasso had not to give to literature. But those succeeding years of derangement, exile, imprisonment, poverty and hope de-

this Tasso had not to give to literature But those succeeding years of derangement, each; improsument, poverty and hope deferred endear the man to us

(J. A. S; X.)

BIRLINGBARY—The best edition of Tasso's works is that of Rosmi 33 vols (Psa, 1871-29); C. Guasti has othred the prose works a vols florence, 1879) and the letters y vols. (Florence, 1853). English translations of Gerusalemme include the often reprinted translation by Redward Fauritax (stoos) and that by J. K., James (1884). One of the prose work of the prose work of the prosent

TATA, SIR DORABJI JAMSETJI (1859–1932), Indian capitalist, was born at Bombay on Aug 27, 1859, being the elder son of the famous Parsee industrial pioneer, Jamseijt Masaruji Tata. Upon leaving Cambridge, he entered his father's business and pursued his father's great conceptions until they culminated in striking advances in Indian industrial development and also in the establishment in 1905 of the Indian institute of scientific research at Banquiore. See TATA SONS, LIMITED.

TATA, JAMNSETJI NASARWANJI (1839-1904), Parsee merchant and philanthropist, was born at Nosari, in the state
of Baroda, in 1839, and went as a boy to Bombay, where he was
educated at the Elphinstone College. In 1838 he entered his
father's office, and began a commercial career of the highest emnence, beginning with cotton mills at Bombay and also at Nagpur,
and ending with the formation of a company to work the iron
ores of the Central Provinces on modern principles. He also introduced a slik industry after Japanese methods into Mysore. But
his greatest benefaction is the endowment of a research institute
at Bangalore. He dide at Nauheim, in Germany, on May 19, 1904.

TATA, SIR RATAN (1871-1018). Parsee financier and philanthropis, was born at Bombay on Jan. 20, 1871, the son of the famous Parsee merchant Jamsetji Nasatwanji Tata (2.2.). He was educated at St. Xavier's college, Bombay, and entered his father's firm. On the death of the elder Tata in 2004 Ratan Tata and his brother, Dorabij Jamsetji Tata (b. 1859), inherited a very large fortune, much of which they devoted to philanthropy and to the establishment of industrial enterprises. See Tata Sons, Limited.

In England he founded (1912) the Ratan Tata department of social science and administration at the London School of Eco-

nomics, and in the same year established a Ratan Tata fund at the University of London for studying the conditions of the poorer classes. He died at St. Ives, Cornwall, on Sept. 5, 1918

TATAR REPUBLIC, an Autonomous Soviet Socialist Republic, created in 1920, in the Russian SFSR, and bounded on the south by the regions of Kuibyshev and Chkalov, on the west by the Chuvash ASSR and the Marii Autonomous Area, on the north by Kirov region and the Udmurt ASSR, and on the east by the Bashkirian ASSR Area 25,907 sq mi Pop (1939) 2,919,423 (urban 621,859, rural 2,297,564). The republic is drained by the Volga and Kama and their tributaries, the Vvatka, joining the Kama in the east, and the Svyaga flowing northward to the Volga in the west. Forest-pine, fir and jumper in the north, and birch, ash, lime, alder, willow and elm in the southoccupies about 17% of the republic, and in the north there is some marsh land. Of the land favourable to cultivation, 78% is tilled, agriculture being the main occupation of the people Black earth is found in the southwest, along the valley of the Svyaga and in a few other places, the remaining soils being gray forest, clays and sands. The climate is continental, five months of the year having an average temperature below 32° F, and the rainfall averages 16 in per annum in good years, but may fail periodically, resulting in such famines as those of 1911 and 1921, these being caused by insufficient spring rain; summer and autumn rains are more reliable. The prevailing winds are from the southwest and often bring dust storms that cover the crops. In June and July thunderstorms with destructive hall are a source of damage

Agriculture and Industries .- These difficult conditions, giving harvests for export in some years and reducing the region to famine in others, are an indication of the need for more intensive forms of agriculture. Up to 1920 there was no many-field system and the peasants mainly used old-fashioned instruments The tragic holocaust of the famine year was specially severe in the Tatar area, and after that time about 5% of the fields were tilled on more intensive lines, and there was greater care in the choice of seeds and crops. Attempts were made to encourage maize, potato and beet cultivation, and to diminish the sowing of buckwheat, which gives a very unreliable harvest. Better instruments gradually replaced the traditional ones. In 1937 there were about 40,000 tractors used by the agricultural population of the republic, and the crops increased considerably. Rye (48 8%), and oats (19 2%) are the chief crops Others are buckwheat, millet, grasses, lentils, flax and hemp. The mineral wealth is not great

Factory industries are mainly centred on Kazan (q v.), which was the only town in 1939 with a population of over 16,000 The chief future for factory industry lies in food production. Condensed milk plants have been established in the region. The leather industry dates back to the Bolgar empire, and the Morocco and Russia leather of the Tatar republic finds a ready market even beyond the U.S.S.R. Nearly half the pelts obtained in the soviet forests are dressed in Kazan. There is some flour milling, two factories produce agricultural machinery, three work in hemp and jute and one in linen goods. A synthetic rubber plant has recently been erected. Glass, bricks, lime, alabaster and silicate are produced A typewriter factory produces a large part of the typewriters used in the soviet east. There are four printing presses producing Tatar magazines, papers and books. There is also a large cinema film factory, Before World War I the koustar or peasant industries of the region flourished. The government subsequently took measures to restore these industries, since they are a means of giving the peasant sufficient income to prevent his wandering in search of employment, and they also provide for the workless and landless peasant. Among the varied peasant products, sleighs, tarantasses and carts are famous, and are in demand in Siberia. Tatar guitars, dulcimers and violins are noted.

Tanguage and Education.—A great problem of the republic is its low rate of literacy. The position is difficult; partity because the budget of the republic at present shows a mixted deficiency and school premises and materials are not available. The greatest difficulty, however, is the 'wirety of languages. The Tatar population numbers 48,3%; Great Riskissian 43,1%; Chruscht 49,%

941.11.

Mordva 14%, and various other nationalities 23% Assimilation has hardly existed in the past and it is quite common for a village to have a group of Tatars in one section, of Finns in another and of Great Russians in another, each using its own language and following its own customs 'Under the Issarst regime education was mainly Russian. After the foundation of the republic, Tatar became the official language of the administration and by 1925 there were many more Tatar schools than before the revolution, but the training of teachers is a difficulty Moreover the Tatar population is rural, and the greater proportion of the town population is Russian, and as there is a possibility of education in rural districts for about 30% of the children and in towns for about 70%, the problem is complex

History—From the 5th century on there was a strong immigration of Bulgaranas muto the region, they formed an important history of Bulgaranas muto the region, they formed an important fishante—Bolgaran or Bolgary, 50 mm. S of Kazan, being the centre, its runs are to be seen. This kingdom reached its zenth in the roth century, but was ruined by the Mongoli unvision of the 13th century. Intermixture between the Bolgars and the Mongolis and between local Finnish tribes has given the Volga. Tatars a distinctive character. After the fall of the Golden Horde, these morthern Tatars formed a khanate with Kazan as its centre, and there began the immigration into the region of refugee tribes, Mordva, Chuvash, Meschyeraks and Bashkirs. After the capture of Kazan in 1552, a policy of colonal Russian settlements on the Volga, with lines of forts to protect them from attacks by the natives, was pursued. The problem facing the Tatar ASSR is the establishment of co-operation among these elements.

(R M F;X)

TATARS (the common form Tartars is less correct), a name given to nearly 3,000,000 mhabitants of the Russian empire, chiefly Moslem and of Turkish origin. The majority-in European Russia-are remnants of the Mongol invasion of the 13th century (see Mongols), while those who inhabit Siberia are survivals of the once much more numerous Turkish population of the Ural-Altaic region, mixed to some extent with Finnish and Samoyedic stems, as also with Mongols. The name is derived from that of the Ta-ta Mongols, who in the 5th century inhabited the northeastern Gobi, and, after subjugation in the 9th century by the Khitans, migrated southward, there founding the Mongol empire Under the leadership of Batu they moved westward, driving with them many stems of the Turkish Ural-Altaians toward the plains of Russia. The present Tatar inhabitants of European Russia contain very little admixture of Mongolian blood, but belong to the Turkish branch of the Ural-Altaic stock, only Batu, his warriors, and a limited number of his followers being Mongols. while the bulk of the 13th-century invaders were Turks On the Volga they mingled with remnants of the old Bulgarian empire. elsewhere with Finnish stems, and with remnants of the ancient Italian and Greek colonies in Crimea, and Caucasians in Caucasus The name of Tatars, or Tartars, given to the invaders, was afterward extended to different stems of the same Turkish branch in Siberia, and even the bulk of the mhabitants of the high plateau of Asia and its N.W. slopes, described under the name of Tartary The Tatar inhabitants of the Russian empire formed three

large groups-those of European Russia and Poland, those of Caucasus, and those of Siberia. (1) The Kazan Tatars, descendants of the Kipchaks settled on the Volga in the 13th century, where they mingled with survivors of the old Bulgarians and partly with Finnish stems. They speak a pure Turkish dialect: they are middle-sized, broad-shouldered and strong, and mostly have black eyes, a straight nose and salient cheek bones. They are Mohammedans; polygamy is practised only by the wealthier classes. They are excellent agriculturists and gardeners, very laborious, and have a good reputation for honesty. (2) The Bashkirs who live between the Kama, Ural and Volga are possibly of Finnish origin, but now speak a Tatar language and have become Mohammedans (3) The Astrakhan Tatars are agriculturists and gardeners The Kundrovsk Tatars still continue the nomadic life of their ancestors, (4) The Crimean Tatars who occupied the Crimea in the 13th century, have preserved the name of their leader, Nogai The mountain Tatars closely resemble those of Caucasus, while those of the steppes—the Nogais—are plates, hoops, strips, bars, sheet-bars, tin-bar, sheets—black and deudedly of a mixed origin from Turks and Mongols.

galyanized—rails, fish-plates, sleepers, light and heavy structural

(a) The Tatus of Caucasia, who inhabit the upper Kubun, the steppes of the lower Kuma and the Kura, and the Aras, of these the Nogais on the Kuma show traces of an intimate mixture with Kalmucks. They are nomads, supporting themselves by cattle-breeding and fishing, few are agriculturists. The Karachais in the upper valleys about Elbura live by agaicaliture (6) The mountain Tatais, divided into many tribes, are scattered throughout the provinces of Baklu, Elivian, Tiffis, Kutus, Daghestian, and partly also of Batum. They are certainly of a mixed origin, and pursent a variety of ethnological types All who an entire Amenians nor Russans, nor members of any distinct Caucasian tribe, are often called Tatais. Although most fevent Shi-ties, they are on very good terms with their Sunnite neighbours. Polygamy is airse and their women go to work unveight.

The Siberian Tatars occupy three distinct regions-a strip running west to east from Tobolsk to Tomsk, the Altar and its spurs. and South Yeniseisk They originated in the agglomerations of Turkish stems which in the region north of the Altai reached some degree of culture between the 4th and the 8th centuries, but were subdued and enslaved by the Mongols They are difficult to classify, for they are the result of somewhat recent minglings of races and customs (7) The Baraba Tatars take their name from one of their stems (Barama), live in Tobolsk, a few in Tomsk, by agriculture, either in separate villages or along with Russians (8) The Cholym or Chulym Tatais on the Cholym and both the rivers Yus speak a Turkish language with many Mongol and Yakut words, and are more like Mongols than Turks (9) The Abakan or Minusinsk Tatars occupied the steppes on the Abakan and Yus in the 17th century, after the withdrawal of the Kirghizes, and represent a mixture with Kaibals (whom Castrén considers as partly of Ostiak and partly Samoyedic origin) and Beltirsalso of Finnish origin. Their language is also mixed. They are known under the name of Sagais (10) The Tatars of the northern slopes of the Altai are of Finnish origin They comprise some hundreds of Kumandintses, the Lebed Tatars, the Chernevyie or Black-Forest Tatars and the Shors, descendants of the Kuznetsk or Iron-Smith Tatars They are chiefly hunters and have maintained their Shaman religion and tribal organization into suoks They live partly also on cedar-nuts and honey collected in the forests Their dress is that of their former rulers, the Kalmucks, and their language contains many Mongol words, (17) The Altai Tatars, or "Altaians," comprise-(a) the Mountain Kalmucks who have nothing in common with the Kalmucks except their dress and mode of life, while they speak a Turkish dialect, and (b) the Teleutes, or Telenghites, a remainder of a formerly numerous and warlike nation who have migrated from the mountams to the lowlands, where they now live along with Russian peasants.

TATA SONS, LIMITED. A private limited company owned by members of the house of Tata, and founded in 1887 by Jamseth N Tata, Indua's greatest pioneer industrialist. It has, since its inception, launched several concerns and today it manages and controls directly or through associated ouganizations a network of national undertakings in India with an aggregate capital of about \$\frac{1}{2}\sigma\_0\

persons. Its principal industrial undertakings are iron and steel, a hydro-electric system and textiles.

The Tata Iron and Steel Co. Ltd. is the largest industrial concern in India; it owns and operates the biggest steel plant in the British Empire with an annual capacity of a million tons of steel. It produces over three quarters of India's requirements of billets, 21–260

plates, hoops, strips, bars, sheet-bars, tin-bar, sheets—black unid aglvunized—rails, fish-plates, sleepers, light and heavy structural sections in ordinary and high-tensile steel. It is known for the high standard of its wages and for the supenor working and living conditions of its employees A unique feature is the creation by the company of its own town, well-planned and now housing over 100,000 persons, out of what was a jumgle but a few years ago

The hydro-electric undertakings cost approximately £12,000,000, and consist of three companies, the Tata Hydro-Electric, the Andhra Valley and the Tata Power Supply Companies The three power stations are fed by separate lake-systems and have a total capacity of 25,0000 hp. The Tata Gnd transmits energy for

industrialized Bombay and its hinterland

The textile interests of the firm are represented by four companies, the Central India Sg. Way & Milg., the Ahmedabad Advance, the Svidesin Mills and the Tata Mills, representing a total investment of over \$2,00,000 The mills have over \$900,000 spindles, \$7,000 looms and bleaching, dyeing, printing and finishing plants

The Nagpur mills of the Central India Mill Company made history technically by being the first in the world to spin cotton

twist commercially on ring frames.

In addition to these three main undertakings, the firm controls a large soap and oil manufacturing industry, aur transport services for mais and passengers which operate a network of 3,700 routernless covering the Indian pennsula, and a hotel company which owns and operates the Taj Mahal Hotel in Bombay Amongst its most recent activities is the founding of another key industry, the Tata Chemicals Company, with the object of making Indian industries independent of essential chemical supplies from abroad.

Among other concerns launched by the firm, from time to time, a ret the New India Assurance Company, the largest composite Indian insurance house, two cement factories—now merged in the combine known as the Associated Cement Companies, and an investment corporation recently promoted, principally to under-

write and finance new industrial projects

The founders of the firm bequeathed their entire fortunes, over £3 million, to charity. Scientific research, medical relief and social service form the three major channels for Tata benefactions.

TATE, SIR HENRY, 181 BARY, ct. 1898 (1819-1899), Eng-

lish merchant and founder of the National Gallery of British Art, was born at Chorley, Lancashire, in 1819 He became a prosperous sugar-broker in Liverpool, and about 1874 removed to London, where he greatly increased the operations of his firm and made "Tate's Cube Sugar" known all over the world He gave £42,000 to the Liverpool University College, founded in 1881, and a still larger sum to the Liverpool hospitals When he came to London, he presented four free public libraries to the parish of Lambeth He owned one of the best private collections of modern pictures in England. This he offered to the Nation with £80,000 for a building if the government would provide the ground; and in 1892 this offer was accepted. A new gallery, controlled by the Trustees of the National Gallery, was built on the site of Millbank Prison. The gallery was opened on July 21, 1897, and a large addition to it was completed just before the donor died. Tate died at Streatham on Dec. 5, 1899

TATE, NAHUM (1652-1715), English poet laureate and

TATE, NAHUM (165s-2715), English poet laureate and playwright, was born in Dublin in 165s. He was the son of Faithful Teate (as the name was spell), who wrote a quain poem on the Trinity entitled Ter 7tie. Nahum Tate was educated at Trinity college, Dublin, graduating S.A. in 167s. He wrote at Trinity college, Dublin, graduating S.A. in 167s. He wrote at Trinity college, Dublin, graduating S.A. in 167s. He wrote the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of David (1666), in which he collaborated with Nicholas Brady. A supplement was licensed in 17cg. Some of these hymns, notably "While Shepherds watched," and "As pants the hart," rise above the general dull level, and are said to be Tatte's work.

Tate was commissioned by Dryden to write the Second Part of Absalom and Achitophel. The portraits of Elkanah Settle and Thomas Shadwell, however, are attributed to Dryden, who probably also put the finishing touches to the poem. Of ins numerous poems the most original is Pouncea, Power on Tea (1700). In spite of his consistent Toryism, he succeeded Thomas Shadwell as poet laureate in 169. He died within the precented of the Missouthwark, London, where he had taken refuge from his creditors, on Aug. 12, 1715.

TATI, a district of the Bechuanaland protectorate. Area about 2,500 sq mi The railway from Capetown to Bulawayo crosses the territory with a station at Francistown, pop. (1936) 15,864, the principal settlement. Francistown stands 3,254 ft above the

sea and 18 126 mi SW of Bulawayo by rail

The town of Tatı, on the river of that name, is 18 mi. S E of Shashı rıver railway station Tati owes its importance to the presence of gold, first discovered by the German traveller Karl Mauch in 1867 Mining began in 1868, but it was not until 1895 that woik on a large scale was undertaken The imming right are vested in a company, called the Tati Company, Ltd. (See BECHANALAIDA, RRODESIA).

TATIAN (and cent. An ), Christian apologist, mussionary and heretic. Such knowledge as we have of his life is derived from (1) his own Oratio ad Graecos (see § 3), (2) Irenaeus, Adv. Heareste, i, 38, i, (3) Rhodon, quoted in Eusebius's Hist Eccl. V, 13, 1, (4) Clement of Alexandria, Strom., 1, 1, 13, (5) Eusebius, Chronicon somo An V 17, (6) Eiphanus, Paenrom, 1, 3, 46. Convenent collections of these passages may be found in E Schwart's Tations Oratio ad Graecos, Teste und Intervachungen, iv, 1, 51–55, and in A Harnack's Geschethe der altebruitlichen Literatur, 1, 485–66 From these data the following outline of his hie can be reconstructed. He was a Syrian' (Clem Alexand Epiphanis) born in Mesopolama (Or., 43) and educated in Greek learning, in which he became proficient (Or., 1 and 42). He was initiated unto the Mysteries, though into which is not stated (Or., 20), but after this became acquainted with the Old Testament and was converted to Christianny.

Tatian then went to Rome, where he was a hearer of Justin, and together with the latter incurred the enmity of a certain philosopher Crescens Since this fact is mentioned both in Justin's Apology and in Tatian's Oratio ad Graecos, and the Apology can be dated with fair security about AD 152 (see JUSTIN MARTYR), the conversion of Tatian must have been before this date After the death of Justin he became a heretic-according to Eusebius's Chronicon in 173 Among his pupils were Rhodon, and, perhaps Apelles (see Victorinus Reat schol 44, in Ep Hieronymi ad Avitum, ep 124) and Clement of Alexandria (Storm, 1, 1, 11). He made a missionary journey to the east and worked in Cilicia and Pisidia, using the Syrian Antioch as the centre of his efforts (Epiphan ) The heresy which Tatian either founded or adopted was that of the Encratites. Their main doctrines were the evil nature of matter, an absolute forbidding of marriage, abstinence from wine and perhaps from meat. It would also seem that Tatian beheved in the existence of acons, one of whom was the Demiurge of the world. He denied the salvation of Adam It is also stated that in his celebration of the Mysteries (s.e., the Euchanst), he used only water. (See Tertullian, De Jejun, 15; Hippolytus, Philos., 8, 4, 16 and 10, 18; Jerome in Amos, ii, 12 and Iren., Adv. Haer, i, 28, iii, 23.)

Writings—According to Euschius (Hist. Eccl., iv. 20) Tatian wrote many books; of these the names of the following have survived: (1) On Anneals (mentioned in Or., \$5); (2) On Demons (mentioned in Or., \$6); (3) Address to the Greeks (4) Book of Problems (Eus., v. 15, 1—2 quotation from Rhodon) an attempt to deal with the contradictions to be found in the Bible; (2) Aganust Those Who Have Discussed Drivine Things (mentioned in Or., 40 as a book which Tatian intended to write, but there is no evidence that he carried has plan into effect); (6) On Perfection According to the Saviour (Clem Alex, Strom., in 12, 80.); (7) The Distinssuron; (78) a recension of the Pauline epistles. Of these books only two—the Distensaron and the Address to the

'Tatian describes himself as an "Assyrian," and though the terms "Assyrian" and "Syrian" are used very loosely by ancient writers, it is probable that he was born E. of the Tigris; i.e., not in Syria as we understand it. Epiphanius, in another passage, calls him an Assyrian.

Greeks-are extant.

The Address to the Greeks (Oratio ad Graecos) (see edition by J C 70 tion, in Corp apole div sace, Jena, 1851) belongs to Tatan's Catholic period. He has the double purpose in view of exposing the weakness of the pagan view of the universe and of commending the Christian explanation. The omissions in the Oratio are even more remarkable than its statements. There is at the most not more than an allusion to Christ, who is never mentioned by name, and though there are frequent allusions to the regaining of life, which is accomplished by union with the Logos, there is no reference to the doctrines of the incarnation or of the atonement. The Oratio was probably written in Greece about AD 150.

TATRA MOUNTAINS, a name usually reserved for the highest group of the central Carpathans (va., the Vysoké Tatry), which rises abruptly as an isolated igneous group, partly in Slondvaika and partly in Poland, from a high plateau of about 2,600 ft to altitudes exceeding 8,400 ft, and extends between the rivers Vth, Poprad, Dunajee and Arva The mountains have a westeast length of about 20 mi and a width varying from 9-15 mi, notable peaks being Gerlachowka (8,737 ft), the highest in the Carpathians, Lomincký (8,642 ft.) and Kriván (8,190 ft.) In everything except glacures the range bears the Aipine imprint Small spas, well-cumpped and the range bears the Aipine imprint Small spas, well-cumpped controlled, summer controlled and the state of

South of the valley of the Váh runs a lower parallel range of similar structure, the Nízské Tatry, reaching its maximum heights in the peaks of Dumbier (6,707 ft ) and Králová Hola (6,373 ft )

(W S L)

TATSIEN-LU (TACHENLU, KANGTINO), a town in the territory of Sikang, west of China, situated more than 8,000 ft. above sea level. It is a great mart for Thete, and from Tatsien-In the two trade routes, the Ayalam and the Janglam, diverge, the former making for Ladakh and the latter for Kashgar Pop est. 20,000

TATTA or Thuro, an ancent town of India, in Sind province, 7 mi. from the right bank of the main channel of the Indius and 13 mi from a station on the North-Western railway, the population (1941) was 8,262. That was the capital of the Samma dynasty in Lower Said in the 16th century, and long continued to be the centre of trade in the country, to which it sometimes gave its name in early European travels. Its former importance reflected its location at the apex of the India delta. An Reclifi factors was catabliched these as each but can obtain the second of the country and the second of the country are catabliched these as each but can obtain the second of the country are catabliched these as each but can obtain the second of the country are catabliched these as each of the country in the country are catabliched these as each of the country are catabliched these as each of the country are catabliched.

English factory was established there in 7,758, but soon withdrawn. TATTERSALL'S, London horse auction mat, founded in 1766 by Richard Tattersall (1,744—95), who had been stud groom to the second duke of Emgston. The first premises occupied were near Hyde Park corner, in what were then the outskirts of London Two "Subscription rooms" were reserved for members of the Jockey club, and they became the rendezvous for sporting and betting men. "Tattersall's Committee" and "Tattersall's Sing" are the descendants of these subscription rooms but are not in any way connected with the horse mart. The former is a strong, but unofficial, organization that looks after the purity of the turf from the point of view of the bookmaker and bettor althe; and the latter is the name given to the principal betting enclosure on any racecourse on which meetings are held under Jockey club or National Hunt rules. By a house of lords decision Tattersall's Ring is not a "place" within the meaning of the Betting act, 1853.

Ring is not a "place" within the meaning of the Betting act, 1853.

TATTLER, a North American wading but (Heteractitis in-canus), about 11 in. long, slaty gray above and white barred with gray below. It breeds on the Pacific coast north from British Columbia, wintering in the Hawanian Islands and the Caliboagos.

TATTOOING: see MUTILATIONS AND DEFORMATIONS.

TAUCHNITZ, the name of a family of German printers and publishers. Karl Christoph Traugott Tauchnitz (176:-1836), born at Grossbardau near Grimma, Saxony, established a printing busness in Lelpiagi in 1796 and a publishing house in 1798. He specialized on the publication of dictionaries, Bibles and steroetyped editions of the Greek and Roman classics. The busness of the Greek and Roman classics. The busness

(1798-1884), until 1865, when the business was sold to O Holtze. He left large sums to the city of Leipzig for philanthropic purposes Christian Bernhard, Freiherr von Tauchnitz (1816-95), the founder of the firm of Bennhard Tauchnitz, was the nephew of the first-mentioned His printing and publishing firm was started at Leipzig in 1837. The Library of British and American Authors, begun in 1841, was taken over in 1934 by Oskar Brandstetter of Leipzig In 1929 the collection numbered more than 4,800 vol In 1868 Tauchnitz began the Collection of German Authors, followed in 1886 by the Students' Tauchnitz editions

TAULANTII, in ancient geography, an Illyrian people in the neighbourhood of Epidamnus (Thuc i, 24). They were originally powerful and independent, under their own kings. One of these was Glaucias, who fought against Alexander the Great, and placed Pyrrhus (q v ), the infant king of Epirus, whom he had refused to surrender to Cassander, upon the throne (Plutarch, Pyrrhus, 3). Later the Taulantii fell under the sway of the kings of Illyna.

TAULER, JOHANN (c 1300-1361), German mystic, was born about the year 1300 in Strasbourg, and was educated at the Dominican convent in that city From Strasbourg he went to the Dominican college of Cologne, and perhaps to St. James's college, Paris, ultimately returning to Strasbourg In 1338-39 Tauler was in Basel, then the headquarters of the "Friends of God" (see Mysticism), and was brought into intimate relations with the members of that pious mystical fellowship He died on June 16, 1361

Tauler's sermons were printed first at Leipzig in 1498, and re-Tauler's sermons were printed into at Leipzig in 1498, and re-printed with additions from Meister Eckhart and others at Basel (1522) and at Cologne (1543) There is a modern edition by Julus Hamberger (Frankfurt, 1864), and A W Hutton edited Tauler's Ser-mons for Festivals under the title of The Inner Way See H Dennile, mons for neutrus under the tute of Lee Inster way See I Dennie Das Buck vow gestlicker Armist (Stresburg, 1877), Carl Schmidt, Dan Buck vow Gestlicker Armist (Stresburg, 1877), Carl Schmidt, Tauker Life and Sermont (1857); R. A. Vanghan, Hours with the Mystics, and ed., vol. 1, pp 134-907; Peeger's Gestle der deutschen Mystic um Mittelalter, vol m. W. R. Inge, Christian Mysticasm; R. M. Jones, Studiest in Mystical Religion (1903).

TAUNG-GYI: SEE SHAN STATES

TAUNTON, a municipal borough and market town of Somer-setshire, England, on the river Tone, 44\frac{2}{3} mi S W. of Bristol by the Western region railway route. Pop. (1951) 33,613. Area 3.8 sq mi. The town is chiefly built on the south side of the river in Taunton Deane valley. Taunton is the county town of Somerset, and is in the Taunton parliamentary division.

There is evidence of an early settlement near the suburb of Holway, and Taunton (Tantun, Tantone, Tauntone) was a place of considerable importance in Saxon times King Inc erected an earthen castle here about 700, and a monastery was founded before 904. The bishops of Winchester owned the manor, and obtained the first charter for their "men of Taunton" from King Edward in 904, freeing them from all royal and county tribute. Before Domesday Taunton had become a borough with very considerable privileges, governed by a portreeve appointed by the bishops. Two members were returned to parliament from 1299 bishops. Two members were returned to parliament from 1885. The Saturday market dates from before the Conquest.

Its main streets converge upon a triangular space, where there is a market cross. The parish church of St. Mary Magdalene is a fine Perpendicular building. Remnants of Norman work are preserved in the chancel arch, and of Early English work in the north aisles and transepts. The tower is also a notable feature. Little is left of an Austin priory established in the reign of Henry I by William Giffard, bishop of Winchester, who also built the castle, now a museum for prehistoric, Roman and mediaeval antiquities. At the Restoration it was dismantled and its moat filled in. Among the schools is a grammar school founded in 1522 by Richard Fox, bishop of Winchester. The town was incorporated in 1627.

TAUNTON, a city of Massachusetts, U.S., one of the county seats of Bristol county, 35 mi. S of Boston, at the head of ocean navigation on the Taunton river, 14 mi. above Fall river. It is on federal highway 34 and is served by the New York, New Haven and Hartford railroad.

The population of Taunton was 40,100 in 1950 and was 37,395 in 1940 by the federal census. Within the corporate limits of the

was carried on by his son, Karl Christian Phillipp Tauchnitz city (which has an area of 44 25 sq mi ) are several villages. The old "common," fringed with lofty elms, is the centre of the business section of the modern city, and about a mile from "the Weir," at the harbour Its manufacturing industries are extensive and varied, including large cotton mills, and plants producing aluminum, chemicals, silverware, stoves and ranges, soap, plastics, drills, gears and a number of other products Taunton was founded in 1638 and became the frontier town of Plymouth colony.

Miles Standish was engaged on the original survey. The town was incorporated in 1639, taking the name of the English home of many of the settlers. It was a base of operations during King Philip's Wai. In 1686 it refused to comply with the demands of Sir Edmund Andros for a tax levy In 1774, after the passage of the Boston Port bill, a red flag inscribed "Liberty and Union" was raised on the common in token of sympathy with Boston During the Shays' rebellion the courthouse was twice besieged by insurgents who were dispersed on both occasions by one of the judges, Gen David Cobb Industrial development began with the establishment of ironworks in 1656 Brickmaking and shipbuilding were important early industries, and for some time Thomas Coram, founder of the London Foundling hospital, was one of those engaged in the latter In the adjoining town of Berkley is the famous Dighton rock, with inscriptions long attributed to the Norsemen, but believed by some to be the work of Indians or of a Portuguese explorer. Taunton was chartered as a city in 1864. It was one of the first cities in the United States to operate its own electric-lighting plant, which it acquired in 1897

TAUNUS, a wooded mountain range of Germany in the province of Hesse-Nassau It lies between the Rhine and the Main on the south and the Lahn on the north, and is about 55 mi Its southern edge stands 5 to 10 mi. back from the Main but slopes steeply to the Rhine, and from Bingen downward forms precipitous crags, many of which are crowned with picturesque ruins. It has an average elevation of 1,500 ft, but the loftiest peaks occur in the east, where the Grosser Feldberg (2,887 ft ) Kleiner Feldberg (2,714 ft.) and Altkonig (2,618 ft.) dominate the Wetterau and the valley of the Main Above the Rheingau (the slopes to the Rhine between Biebrich and Bingen). the altitude averages 1,500 to 1,700 ft. The geological core of the system consists of (?Archean) argulaceous schists, capped by quartaite (Devonian) and broken through in places by basalt. On the northern side, which sinks on the whole gently toward the Lahn, the higher greywacke formation (Devonian) attains a considerable development. The hills are generally well-wooded, with firs and beeches. The lower slopes are, where possible, planted with vineyards, orchards and chestnut and almond groves The vineyards of the Rheingau are specially famous, and yield many famous brands of wine. The Taunus is also famous for its mineral springs and health resorts.

There are ruins of the castle of Kuno (above Falkenstein); of a fortress at Konigstein; a Cistercian abbey at Eberbach; and two concentric lines of pre-Roman fortifications at Altkonig, The chief historical monument, however, is the Saalburg, a Roman fort serving as a centre of communications along the limes or fortified frontier line drawn from Rhine to Main by Domitian (see LIMES GERMANICUS).

At Niederwald (q.v.) is the gigantic "Germania" statue in commemoration of the 1870 war. The steep crags of the western end of the Taunus, where they abut upon the Rhine, are rich in the romantic associations of the great river. Here are the rock of the siren Lorelei; the old castles of Stahleck and Pfalz; and the quaint mediaeval towns of Kaub and St Goarshausen.

TAURI, the earliest known inhabitants of the mountainous south coast of the Crimea (Herodotus iv, 103). Nothing is certain as to their affinities. They probably represent an old population perhaps connected with some Caucasus stock. They are not likely to be Celts. They were famous in the ancient world for their maiden goddess, identified by the Greeks with Artemis Tauropolos or Iphigeneia (q.v.), whom the goddess was said to have brought to her shrine at the moment when she was to have been sacrificed at Aulis. Orestes sought his sister, and almost fell a victim to the Tauric custom of sacrificing to the maiden shipwrecked strangers. a real custom which was the ground of the whole myth His adventures were the subject of plays by Euripides and Goethe Towards the end of the 2nd century B C we find the Tauri dependent allies of the Scythian king Scilurus, who from their harbour of Symbolon Portus or Palacium (Balaclava) harassed Chersonese (q v) Their later history is unknown. (E, H M)

TAURINI (tou-re'në), an ancient Ligurian people, although the name may be of Celtic origin, who occupied the upper valley of the Padus (Po) In 218 B.C. they were attacked by Hannibal with whose friends, the Insubres, they had a long-standing feud They later became subject to the Romans, and the colony of Augusta Taurinorum (Torino, Turin) was founded in their territory (probably by Augustus after the battle of Actium) Both Livy (v. 34) and Strabo (iv. p. 200) speak of the country of the Taurini as including one of the passes of the Alps, probably the Mont Genèvre or Col d'Argentière

TAUROBOLIUM, properly the shooting of a bull, hence a rite of baptism by bull's blood, usually in connection with the worship of Cybele (q v ), though not limited to it Of oriental origin, its first known performance in Italy was in AD 134 Prudentius describes it in Peristephanon (x, 1066 et seq ) the person undergoing the ceremony, clad in a toga worn cinctu Gabino, with golden crown and fillets on his head, takes his place in a trench covered by a grating, on which a bull is slain.

The taurobolium was often performed as a measure for the welfare of the emperor, empire or community, its date frequently being March 24, the Dies Sanguins of the annual festival of the Great Mother and Attis (qq.v). But its usual motive was the purification or regeneration of an individual, who was occasionally spoken of as renatus in aeternum, reborn for eternity, in consequence of the ceremony (Corb Insc Lat vi. 510-512), more commonly the effect was considered to endure for 20 years

TAURUS ("the Bull"), in astronomy, the second sign of the zodiac denoted by the symbol & It is a constellation of very great antiquity, the Pleiades and Hyades (qq v) two of its constituent star clusters, being possibly referred to in the Old Testament; while Aldebaran, its brightest star, is mentioned by Hesiod and Homer The Greeks fabled this constellation to be the bull which hore Europa across the seas to Crete, and was afterward raised to the heavens by Jupiter. Aldebaran is the principal object in the Hyades, named after the seven daughters of Atlas and Aethra. Many of the Hyades (but not including Aldebaran) form an associated group of stars with a common motion. The measurement of the motions of these stars permits an accurate determination of their distance; they are situated at approximately 130 light years from the sun. Aldebaran itself is a reddish giant star, located at a distance of about 80 light years from the sun constellation contains the "crab nebula," a gaseous mass which has been shown fairly conclusively to have originated in the outburst of the new star, or nova, of A.D. 1054. Photographs indicate that the nebula is expanding in size from year to year The structure of the Milky Way in Taurus is complex, with dark, almost starless lanes and bright nebulosity.

TAUSEN, HANS (1494-1561), the protagonist of the Danish Reformation, was born at Birkende in Funen in 1494. The quickwitted peasant lad ran away from the plough at an early age, finally settling down as a friar in the Johannite cloister of Antvorskov near Slagelse. After teaching for a time at Rostock and Copenhagen, he was again sent abroad by his prior, visiting the newly founded University of Leyden and making the acquaintance of the Dutch humanists. He was already a good linguist, understanding both Latin and Hebrew. Later he translated the books of Moses from the original. In May 1523 Tausen went to Wittenberg, where he studied for a year and a half, when he was recalled to Antvorskov. In consequence of his adherence to Lutheran doctrines he was first imprisoned in the dungeons of Antvorskov and thence transferred, in 1525, to the Grey Friars' closter at Viborg in Jutland, where he preached from his prison to the people assembled outside, till his prior, whom he won over to his views, lent him the pulpit of the priory church, Several young men in Viborg had studied at Wittenberg, and

the burghers had already expelled their youthful bishop Jorgen Friis Tausen no longer felt safe among the Franciscans, he discarded his monastic habit, and placed himself under the protection of the burgesses of Viborg At first he preached in the parish church of St John, then in the market-place from the church When the Franciscans refused to allow him to preach in their large church, the mob broke in by force A compromise was at last arranged, whereby the friars were to preach in the forenoon and Tausen in the afternoon. The bishop sent armed men to the church to arrest Tausen, but the burghers drove them back In Oct 1526 King Frederick I made Hans Tausen one of his chaplains, and charged him to continue "to preach the holy Gosto the citizens of Viborg, who were to be responsible for his safety Tausen found a fellow worker in Jorgen Viberg, better known as Sadolin, whose sister, Dorothea, he married. He was the first Danish puest to marry He was also the first to use Danish instead of Latin in the church services.

On the death of King Frederick, Tausen, at the instance of Ronne, was, at the Herredag of 1533, convicted of blasphemy and condemned to expulsion from the diocese of Sjaelland, whereupon the mob rose in arms against the bishop, who would have been murdered but for Tausen's intervention. Ronne then permitted Tausen to preach in all his churches on condition that he moderate his tone On the final triumph of the Reformation Tausen was appointed bishop of Ribe (1542), an office which he held for 20 years

See Suhr, Tausens Levnet (Ribe, 1836); Danmarks Riges Historie, vol ii (Copenhagen, 1807-1005).

TAUSSIG, FRANK WILLIAM (1859-1940), American economist, was born at St Louis, Mo, on Dec 28, 1859. He was educated at Harvard university (A.B., 1870, Ph.D., 1883), where he started teaching in 1882, becoming professor of political economy ten years later He made a particular study of finance and was during 1917-19 chairman of the U.S. tariff commission March 1919 he was called to Paris to advise in the adjustment of commercial treaties He was in 1904-05 president of the American Economic association and from 1896 to 1937 edited the Quarterly Journal of Economics He wrote Wages and Capital (1896); The Tariff History of the United States (1888); Principles of Economics (1911), Some Phases of the Tariff Question (1915), Inventors and Money Makers (1915); and Social Origins of American Business Leaders (1932).

TAUTOMERISM: see Isomerism.

TAVERNER, JOHN (c. 1495-1548?), English composer, was born in Lincolnshire, possibly at Tattershall, and according to some accounts became organist of Boston church. In Nov. 1526 he was made master of the children at Cardinal college, Oxford (now Christ Church), and also acted as organist During this period he wrote his church music. Taverner was then convicted of heresy but it appears that he was not sent to prison because his offence was slight Taverner resigned his post at Cardinal college in April 1530 and some time during this year contributed three songs to Wynkyn de Worde's Song Book ("My Harte, my Minde," "Love wyll I" for three voices, and "The bella" for four voices), published in Oct. 1530 Having secured a lucrative post from Thomas Cromwell, he was concerned in the suppression of four friaries at Boston in Aug. 1538, later being given two of them. He died and was bursed at Boston, probably in 1548

A two-part song, "In Women no Season is Rest or Patience," is in the British museum, but, apart from this and the Wynkyn de Worde the British museum, but, spart from this and the Wynkyn de Worde specimens, only Tweneris's church music has been preserved. Of this there is a complete collection, with blographical notes, in the Carnege (come moromplet); 3 Magnificats and a Te Deum; a Kyrie known as the "Levoy", and shorter pieces.

See "Taverne" by E. H. Fellowes in Grove's Dictionary, and education, 1925 and W. H. Grattan Flood, Early Tudor Company of the Carnege (Cardon, 1925) and W. H. Grattan Flood, Early Tudor Company of the Cardon, 1925 and W. H. Grattan Flood, Early Tudor Company of the Cardon, 1925 and W. H. Grattan Flood, Early Tudor Company of the Cardon, 1925 and W. H. Grattan Flood, Early Tudor Company of the Cardon Company of the Cardon C

TAVERNIER, JEAN BAPTISTE (1605-1689), Freiten traveller and pioneer of trade with India, was born in 1605 at Paris, where his father Gabriel and uncle Melchior, Protestants from Antwerp, pursued the profession of geographers and engravers He had already travelled much in Europe and was well acquainted with the principal European courts, when he started

from Regensburg with two French fathers, M de Chapes and M de St Liebau, for the Levant In their company he reached Constantinople early in 1631, where he spent 11 mo, and then proceeded by Tokat, Erzerum and Erivan to Persia His farthest point in this first journey was Isfahan, he returned by Baghdad, Aleppo, Alexandretta, Malta and Italy, and was again in Paris in 1633 In Sept 1638 he began a second journey (1638-43) by Aleppo to Persia, and thence to India as far as Agra and Golconda His visit to the court of the Great Mogul and to the diamond mines was connected with the plans realized more fully in his later voyages, in which Tavernier traded in costly jewels and other precious wares, among the greatest princes of the east. The second journey was followed by four others. In his third (1643-40) he went as far as Java and returned by the cape, in his last three journeys (1651-55, 1657-62, 1664-68) he did not proceed beyond In 1669 he received letters of nobility and in 1670 purchased the barony of Aubonne, near Geneva

Tavernier's narratives of his travels are Nouvelle relation de l'intérieur du sérail du Grand Seigneur (4to, Paris, 1675), based on two visits to Constantinople in his first and sixth journeys; Les six voyages de J B. Tavermer (2 vol , 4to, Paris, 1676) and Recueil de plusieurs relations (4to, Paris, 1679).

The closing years of Tavernier's life are obscure. He left Paris for Switzerland in 1687, in 1689 he passed through Copenhagen on his way to Persia through Muscovy, and in that year he died at Moscow.

See Chailes Joret, Jean Baptiste Tavermer d'après des documents nouveaux (1886, bibliography), and an English translation of his account of his travels in India, by V Ball (1889).

TAVISTOCK, a market town and agricultural centre in the Tavistock parliamentary division of Devon, England, 15 mi. N. of Plymouth by road. Pop. of urban district (1951) 5,889 Area 3 3 sq mi. It lies in a deep valley below the western edge of Dartmoor where one of the main routes into Cornwall crosses the Tavy. It was once the centre of an important mining district for tin and copper and is one of the four stannary towns of Devon. Its mediaeval importance owes much to the magnificent Benedictine abbey of St Mary and St. Rumon founded in 961 by Orgar, earl of Devon. After destruction by the Danes in 997 it was rebuilt, and among its famous abbots were Lyfing, friend of Canute, and Aldred, who crowned Harold II and William and died archbishop of York. At the time of the Conquest it ranked as the wealthiest house in Devon, including the hundred and manor of Tavistock among its possessions. Most of the abbey was demolished at the dissolution and the lands given to the dukes of Bedford; in 1912 the council acquired some of this land from the duke. Remains of the abbey include the gateway which now houses the Tavistock library The church of St. Eustachius dates from 1318 and possesses a lofty tower supported on four open arches; the "clothworkers' aisle" (1445) witnesses to the importance of the town as a wool centre. Kelly college, near the town, founded by Adm, B. M. Kelly and opened in 1877, is now a public school for boys.

Henry I granted the abbots a market in 1105 and the famous Tavistock goosey fair in 1106. This takes place annually on the second Wednesday in October. In 1513 the abbots were granted a seat in the house of lords. Tavistock is a borough by prescription and returned two members to parliament from 1295 until 1867; in 1885 it was disfranchised.

TAVOY, a town and district in the Tenasserim division of Burma. The town is on the left bank of the river of the same name, 30 mi, from the sea. Pop. (1931) 29,018. It carries on a considerable coasting trade with other ports of Burma, and with the Straits Settlements whither is sent the bulk of the tin ore for which the district is important, as well as much of the rubber. The chief industry is salk weaving, but there are also rice and

The district has an area of 5,390 sq.mi. It lies between Siam and the Andaman sea of the Bay of Bengal, enclosed by mountains on three sides, viz., the main chain of the Bilauktaung on the east, rising in places to 5,000 ft, which, with its densely wooded spurs, forms an almost impassable barrier between Burmese and Siamese territory; the Nwahlabo in the centre, which takes its

name from its loftiest peak (5,000 ft ), and a third range, under the name of Thinmaw, between the Nwahlabo and the sea coast The Tavoy is navigable for vessels of any builden. It is interspersed with many islands, and with its numerous smaller tributaries affords easy and rapid communication. The climate is on the whole pleasant 
The annual rainfall averages more than 200 in. Pop (1941) 211,729, showing an increase of 31,765 in the decade. The staple crop is rice Forests cover an area of nearly 5,000 sq mi, of which considerable areas are "reserved." The leading industries of the district are rubber planting and tin mining, both of which are of recent development

Tavoy, with the rest of Tenasserim, was handed over to the

British at the end of the first Burmese war in 1826.

TAXACEAE, a small family of the Gymnospermae consisting entirely of evergreen shrubs and trees, containing only three small genera, Taxus including the yew (q v ) in Eurasia and various subspecies and varieties in North America, Torrya with five species in eastern Asia and North America, and Austrotaxus in New Caledonia As thus restricted to three genera, see R Pilges, "Taxaceae," in Engler and Prantl, Die Naturlschen Pflanzenfamilien, ed. 2, vol. 13, pp. 199-211, fig 113-115 (1926), and for a monographic treatment, including what is designated as the Podocarpaceae, see R. Pilger, "Taxaceae," in Pflanzenreich, no. 18 (iv, 5), pp 1-124, fig 1-24 (1903) (E. D. ML)

TAXATION. Taxes are compulsory government levies on

private units imposed for general public purposes, not as a direct charge for special services rendered. They are thus differentiated from borrowing, gifts, reparations, fees imposed to defray the costs of licensing and other special services, public prices like postal rates charged for goods and services sold by the government, and special assessments levied to pay for street paying and similar

specific improvements to real estate.

Clear-cut lines among the various types of public revenue are hard to draw, and each type shades into adjacent classes For example, in a twilight zone between taxation and borrowing are the compulsory loans levied by Canada, Great Britain and the United States during World War II (in the form of refundable income taxes) and by Denmark and Israel in the 1950s. Also difficult to classify are social insurance contributions (not generally designated by law as taxes, except in the United States); they progressively take on the character of taxes as the link weakens between the size of the individual's contributions and the scale of his benefits

Though generally thought of as an instrument of revenue, taxes are recognized also as a major instrument of national economic policy. In war and in armed peace, nations call on tax increases to subdue inflation, and in depression they grant tax reductions to stimulate private markets and employment. Especially when government spending equals one-fourth to one-third of the national product, as in western Europe and North America, taxes play a crucial role not only as a source of revenue but as a balance

wheel in the economy.

History.-Only late in human history did governments come to rely on taxes, especially on taxes levied equitably and with the consent of the governed, for the bulk of their revenue. For centuries, the public domain was the chief source of public revenue, and taxation consisted largely of excises on domestic consumption and customs duties on foreign trade. It was the duty of the unprivileged classes-slaves, vassals, peasants, colonists and conquered peoples-to support the ruling classes, be they the free citizens of Athens and Rome, the lords and nobles of the feudal barony or the courts of the Louis. Taxes as a badge of freedom rather than a mark of bondage are a modern phenomenon.

In ancient Greece and Rome, income from mines, tribute from subjugated countries, gifts from wealthy citizens and taxes on trade and consumption filled virtually all revenue needs. Except for Rome's famed inheritance and capitation taxes (both foreshadowed by ancient Egyptian taxes) and certain emergency levies in Greece, direct taxes on income and wealth were unknown.

Taxes of any kind had little place in the agrarian feudal system of the middle ages. The king, the duke, the count, the baron -each in turn derived income from the land he held directly and levied rentike dues on those who held land at his pleasure, e.g., on those beneath him in the feudal hierarchy. From the 14th century on, as the feudal system was gradually broken up by dissipation of the public domain, by growth of industry and commerce and by centralization of government, these patrimomal revenues

slowly gave way to taxes

Land, as the primary source of wealth, also became the primary source of traction during this period. Both local and central governments in England turned to land taxes, bissing them at first on area (the old hadage and carriage) but later on annual retails value. The French counterpart was the arbitrary annual taille on estimated iram income. The early American colones broadened the British type of land tax into a property tax whose base metisded land, bouses, personal property and faculty (the rated eaning capacity of one's trade or profession). With the great growth of foreign and domestic commerce between the 14th and 19th centures, import and export duties and internal excises became important, especially in France, Spain and other commercial centres. Poll taxes and such presumptive levies as the hearth tax and window it axis flourished in this period

Rebellion against arbitrary and oppressive taxation played a major role in modern history. Such milestones in Brutah constitutional history as the Magna Carta (12x5) and the Bill of Rights (1689) helped establish the principle of consent and representation in taxation. Failure to apply this principle to the colonies played no little part in the American Revolution Much of the desperation that exploded in the French Revolution grew out of one of the most oppressive and inequitable tax systems of all time

The establishment of representative democratic government, the advent of the industrial revolution and the development of modern ideals of social justice and equality left their imprint on both the principles and the forms of taxation. The 19th century saw exceptioncy and oppression in taxation gradually make way for equity and uniformity. With the unfolding of new forms and differentiated sources of wealth, taxes on incomes and inheritances were adopted and sefined, and property taxes were further broadened.

Great Britam adopted an income tax in 1798 and a death transfert ax in 1796, broadened both measures (after setting the income tax aside from 1816 to 1841) midway through the 19th century, and brought them to something like their modern form near the turn of the century. Although customs and excises contuned to be an important source of revenue, the central government during the first half of the ooth century greatly intensified its use of direct taxes on income and estates. "Local rates" on real estate continued to be the mainstay of local tax systems

Modern and effective use of income and death taxes was not made in the United States until about the time of World War I. Earlier, customs, excess on liquor and tobacco, and sales of land furnished the bulk of federal revenues. The peculiarly American state and local levels. But during World War I and in the interwar period, the federal government adopted an estate tax, developed its corporate and individual momen taxes, expanded its excises and introduced social security pay roll leves. The states meanwhile tapped such new sources as gasoline taxes, retail sales taxes, motor vehicle levels and net income taxes, largely abandoning the property tax to the local units.

Under the pressure of World War II, central government taxes everywhere were brought to new peaks, both in their seventy and in their adaptation to such nonrevenue ends as curbing of inflation and prevention of war profiteering. After the war, most behignerate granted only modest tax reductions in the face of large debts, continued inflation and deteriorating relations between the Soviet and western worlds. Outbreak of the Korean War in 1950 touched off. a new wave of tax increases, but within three or four years, such countries as Australia, New Zealand, the United States, Canada, Great Britain, the Netherlands and Germany were again reducing taxes.

Modern Forms.—As modern economic society progressively exposed new facets of wealth, income and transactions to tax planners and legislators, they responded with a bewildering array of

levies The production and receipt of income, the ownership and transfer of wealth, the sale and use of commodities and services, the carrying on of a business and a host of other economic factors all became bases of objects of taxation

The versatility of income as a tax base can be visualized by observing the gantlet of taxes it may have to run as it flows into, through and out of a corporation. At the point of entry, income may be subject to (r) taxes on gross receipts or gross income (often classed as consumption taxes because they are largely passed on to consumers in higher prices), (2) taxes on the net profits remaining after all expenses are deducted, (3) taxes on excessive profits, especially in waitime. Once inside the corporate walls, net income which is not distributed to stockholders may run athwart taxes on undistributed profits like the 1936-38 tax of 7%-28% in the United States or the British standard rate on retained earnings At the point of exit, income paid out as dividends may encounter a distributed profits tax like the post-World War II British tax of 221% As it reaches the stockholder, dividend income may be subject to (1) a progressive personal income tax applying a uniform schedule of rates to net income regardless of source (as in prevailing United States practice); (2) a schedular income tax applying different rates to different sources of income (as in Massachusetts), (3) a special tax or surtax on investment income (as in Canada), (4) special credits or allowances under the regular income tax (again, as in Canada) To this galaxy of income taxes should perhaps be added the low-rate levies on business pay rolls and individual wares so widely used to finance oldage and unemployment insurance programs

Property remains the principal local tax base in the Englishspeaking word Broadest of all property taxes is the US general property tax, an impersonal levy on both real estate and personal property, measured by exchange value and levied against owners. Narrower and more personal is the British system of local rates, confined to real estate, measured by annual rental value, and part levied as a tax on occupants Even narrower are the rural land taxes of Asia, the middle east and much of Europe

Most personal of the taxes on property ownership are the progressive taxes on personal net worth (assets minus habilities) levied in the form of (1) annual net worth taxes, as in Scandinavia, Germany and the Netherlands, and (2) one-time capital levies, as in many European countries in the wake of both World Wars I and II In the United States, constitutional barriers stand in the way of a national net worth tax

Transfers of wealth by death are taxed in most western countries under both estate taxes (levied on the decedent's estate as a whole) and inheritance, succession or legacy taxes (levied on the heirs' distributive shares). Comparable taxes apply to transfers by efft

Another major tax family are the consumption taxes, those which are generally passed on to consumers in higher prices even though initially levied on producers or distributors. The term hiden taxes ordinarily refers to this group of levies. In their more general forms, they are levied as turnover, gross income or valueded taxes at several stages of production, as sales or purchase taxes at the manufacturing, wholesale or retail stages; as use taxes on the consumer; and as tariffs or customs duties on imports and exports. In their more limited forms, they appear as selective excess on liquor, tobacco, gasoline, luzuries and many other commodities and services; or as profits from government monopolies of salt, liquor, matches, tobacco and the like.

Business taxes, in the broadest sense of the term, refer to all taxes arising out of the ownership and operation of businesses. More narrowly and usefully, it refers to a separate category of taxes applicable only to business entities as such and bearing on relation to the personal status of the owners or operators of the business. In this sense, it includes on one hand such genal privilege taxes as incorporation fees, capital stock taxes, the occupational taxes popular in the southern United States, the occupational taxes popular in the southern United States, the occupational taxes which single out certain types of business for special taxation, e.g., in the United States the state taxes on insurance companies, usually measured by gross premiums, and on

public utilities, measured by gross earnings or property Corporate income and profits taxes are also often labelled business taxes

Not readily classifiable as income, property, transfer, consumption or business taxes are such miscellaneous levies as poll taxes, prohibitory taxes like the United States levy on state bank notes, taxes on increments in wealth or land values and proposed graduated taxes on individual spending

(For further details on the various types of taxes and their use, see Taxation, Local, Capital Levy, Corporation Tax; ESTATE DUTIES, EXCESS PROFITS TAX; INCOME TAX; LAND TAXES, and SALES TAX)

General Classifications.-Tax literature and usage abound with general classifications Apart from groupings by tax base or source, one of the most useful classifications is by type of effective rate structure, se, progressive, proportional and regressive types The distinction depends upon the ratio of tax hability to net income (or net worth). If the ratio rises as income rises te. if the tax takes a greater percentage of a person's income, the larger that income-the tax is progressive If the ratio is constant, the tax is proportional If it declines as income rises, the tax is regressive The terms are applied both to particular taxes and to tax systems as a whole For example, studies by Gerhard Colm for 1941 and Richard Musgrave for 1948 indicate that the pattern of total tax burdens in the United States is regressive for incomes up to about \$2,000, roughly proportional for incomes between \$2,000 and \$7,500 and progressive for incomes above \$7,500 Among specific taxes, the personal net income, net worth, and death and gift taxes are almost universally progressive Most sales and excise taxes are levied at proportional rates but are regressive in effect; for example, a 5% sales tax takes a larger percentage of a small income than of a large income because the taxed items represent a larger percentage of the small-income than of the large-income budget.

Another widely used distinction is that between direct and indirect taxes Commonly, the term direct denotes a tax which tends to be borne by the persons upon whom the government levies it. Indirect denotes a tax which tends to be shifted, s.e., passed on to others in the form of higher prices received or lower prices paid by the taxpayer Since it is difficult to determine precisely who bears the final burden of a given tax, the line between the two is not easy to draw Customarily classed as direct are net income, net worth, death, gift and land taxes. Consumption taxes, many husiness taxes, pay roll taxes and taxes on realty other than land are ordinarily considered to be indirect. Relative emphasis on direct versus indirect taxes as thus classified varies greatly from country to country Of total tax revenues (excluding social insurance levies) at all levels of government in 1950, direct taxes accounted for 56% in the United States, 52% in the United Kingdom, 32% in Germany and 26% in France, indirect taxes, for 29%, 40%, 53% and 67% respectively; and property and wealth taxes, for 15%, 8%, 15% and 7%, respectively.

Another useful distinction, encountered particularly in discus-

sions of custom duties, is that between specific and ad valorem taxes. A tax or duty is specific when it is based on some physical measurement or quantity, e.g., so much per pound, per yard or per gallon. It is ad valorem when it is based on value and levied as a percentage of that value, e.g., 15 mills per dollar (1.5%) of property value.

Objectives and Criteria .- The pervading objective of taxation, in concert with other government policies, is to maximize the general welfare. Taxes contribute to this end by providing the financial foundation for the substantive functions of government and at the same time serving as an engine of social and economic betterment which nations can call upon to reduce excessive inequalities of wealth, to check inflation and war profiteering and to promote economic stability.

How can the broad welfare objectives of taxation be translated into guideposts for tax policy? In the search for an answer, the maxims propounded by Adam Smith in his Wealth of Nations in 1776 provide a traditional point of departure. He set forth the tests of equity, certainty, convenience and economy as follows:

I. The subjects of every state ought to contribute towards the

support of the government, as nearly as possible, in proportion to their respective abilities, that is, in proportion to the revenue what they respectively enjoy under the protection of the state.

If. The tax which each individual is bound to pay ought to be certain, and not arbitrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the quantitutic, and to every other person.

the contributor, and to every other person

III Every tax ought to be levied at the time, or in the manner, in which it is most likely to be convenient for the contributor

to pay it

to pay it Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible, over and above what it brings into the public treasury of the state

Appropriate as they were in his day, both as standards and as reform slogans in taxation, Smith's canons depend for their present-day validity largely on what is read into them For example, Smith directed his maxim of certainty against the evil of lodging power over the amount and terms of taxes in the "tax-gatherer, who can either aggravate the tax upon any obnoxious contributor, or extort, by the terror of such aggravation, some present or perquisite to himself" In its modern context, the demand for certainty is usually a protest against too-frequent changes in tax laws, regulations and court decisions. Moreover, the unfolding of the principle of progression in taxation has infused new meaning into Smith's maxim of equity. Even with modernized content, however, his canons furnish little more than three common-sense rules of tax administration and one basic principle, that of equity, for the distribution of tax burdens

That this set of guides is no longer adequate is hardly surprising in view of the sweeping economic, social and political developments since Smith's day. Concepts of justice have changed profoundly. Methods of measuring economic strength have been refined Democratic control of taxation has been won. Tax administration has vastly improved. Economic systems have become enormously more complex and interdependent. The sense of social responsibility and, with it, the role of government have steadily grown. In response to these changes, it was inevitable that the functions of taxation should be broadened and its standards recast. As adapted to modern circumstances, the canons may be 1e-exammed under four major headings (1) social justice, (2) consistency with economic goals; (3) ease of administration

and compliance; and (4) revenue adequacy.

Social Justice - That taxes should be just is a self-evident first principle of taxation. But in taxation, as in other fields, justice is a product not of scientific analysis but of a people's value judgments. As reflected in contemporary tax systems, the value decisions modern societies have made regarding social justice appear to require (1) that taxes be impartial in their application—the "equity" test; and (2) that taxes, on balance, be designed to reduce economic inequalities-the "equality" test. Unfortunately the precise meaning and the practical dictates of these tests are not readily definable and have, in fact, been the subject of extended controversy

It is, to be sure, widely agreed that equity in taxation requires impartial (not identical) treatment, i.e., equal taxes on persons in like circumstances and reasonably differentiated taxes on persons in units circumstances. Thus, the equity criterion sets up the presumption that even when taxation is asked to serve such external ends as redistribution even used taxation as assect to serve such external ends as redustribution of income or recepture of excessive war profits, the internal structure of the taxes levide should adhere to the principle of reasonable classification and impartial treatment. But the nub of the problem is. What is reasonable classification in taxution—what characteristics of a person identify him with or differentiate him from other persons for taxing identify him with or differentiate him from other persons for taxing classified and one acceptable criteria have been developed for classified people, what relative tax burdens should the different classes have a considerable criteria and the proposed of the considerable criteria have been developed for classified people, what relative tax burdens should the different classes

For a limited group of levies on the border line of taxation, it has been deemed equitable to classify people and tax them according to the been deemed equitable to classify people and tax them according to the quantity of benefits received from government. Where such benefits to the control of the control of the control of the control of the does not demand a subsidy to the individual to rind the social interest does not demand a subsidy to the individual to rind the social interest reasonable to apply the benefit principle. Gasdine taxes and social security employment levies are commonly justified on the ground that special benefits—the use of the highways and protection against inspecial cenents—the use of the nignways and protection against missecurity—accurate the taxpayer in more or less direct proportion to his in-payments. But the difficulty of measuring most government benefits and the desirability of providing many services on the basis of need narrowly limit the application of the benefit principle. And the day when "taxation according to benefits received" was a battle cry in the struggle to shift the yoke of taxation from the overburdened masses to the exempt nobility has long since passed.

Accordingly, the principle of ability to pay is generally invoked as a basis for classifying and differentiating among people for tax purposes bass for classifying and differentiating among people for tax purposes Deceptively simple in appearance, this concept involves many difficulties that the contract of the co but the amount of net income is only one element in the measurement of ability. Individual income tax laws also take into account (?) family obligations, recognized in marital and dependency exemptions and (?) less universally, the source of the income, recognized in differential treatment favouring "earned" over "unearned" income Even after this yardstok, propely to substrated, valuks induviduals according to

after this yardstuck, propelly calibrated, innks individuals according to their income, the question remains as to how much more the person of high rank should pay than the one of lower rank. The person of high rank should pay than the one of lower rank and the person of the person

"To make the burden of taxes equal . . . is not effected by a mere numerical proportion. The man who is taxed to the amount of one-

"To make the burden of taxes equal ... is not effected by a mere numerical proportion. The man who is taxed to the amount of one-seveley than the man who is taxed to the amount of one-seveley than the man who is taxed an equal proportion of an income of 1,000 rupes, and to a producious bigness more severely than the man who is taxed an equal proportion of 10,000 rupes per amnum" the "scrinfe" footnings have played a major role. An offshoot of hedonstic or utilitatan economics, these doctrines find their most refined expression in a C F good seat-secrifice theory. It bodds that progression is necessary to manimize the aggregate direct burden of the same of the second lightly on the more important units found at the margin of small in-comes. Modern welfare economists question the stated assumptions, pointing out that they cannot be verified until a way is found not only

is based on sacrifice doctrines. is bised on scenfec doctrons.

Not astisfied with attenuated translations of "ability to pay" into "progression," many noted thinkers have rested their case for progressive textuon might be a single progression of the bass of ability and scenfec become meaningful only in terms of greater economic equality. In this view, reducing inequality of incomes increases the general welfare by enabling more unger needs to be satisfied at the expense of less urgent

to measure satisfactions but to compare them among different peop

They are therefore disinclined to accept a defense of progression which

Taussig's later use of the equality criterion was based mainly on his

needs.

In the result of the squality criterion was based mainly on his interpretation of the democratic commensus that "1", such great degrees of inequality as the modern world shows are regarded as not commant with cannot of ustice." Hearty Simons, writing in the 1950, stated also that the case for sharp progression rests on the case against "Consistency with Economic Goods—The importance of harmonisms the control of the

 $db_{M_{\alpha}}$ 

capable of producing when fully employed. Whether that demand wills be forticoming depends on the supergate spending of consumers, bulanesses and governments. When income is withdrawn from the spending stream by individuals who netther spend it nor inventiones, plant and equipment), the eat result is to dry up duamed and employment equipment, the eat result is to dry up duamed and employment and augment their spending by boirowing money or drawing on assets, the result is to inflate demand and employment. Left to testle, the private economy will experience cyclical alumps and booms, aggravated perhaps by secular stagnation or inflation in this setting, it becomes vital that central government—avong taxes as part of a co-ordinated has sevultar balance wheels in the exponsibilities is cyclical and perhams sevultar balance wheels in the exponsibilities as cyclical and perhams sevultar balance wheels in the exponsibilities. capable of producing when fully employed Whether that demand will haps secular balance wheels in the economy

anga secular dualnes workes in the economy usalf, first of all, with the cycleal stability of total spending. Fletable taxes serve as one means of restants or correcting its instability, of restricting total spending in a boom period and expanding it in a slump. This approach calls for a boom period and expanding it in a slump. This approach calls for the compensation of the control of th contract more than in proportion to the ups and downs of national income, current collection and withholding magnify this stabilizing impact by making tax revenues respond instantly to changes in income Contracyclical tax policy also enlists short-term changes in tax rates Contracyclical tax policy also enhists short-term changes in tax rates to impound or free purchasing power. The British White Paper on Employment Policy (1944) stated that "the ideal to be aimed at a major of the theorem of the properties of the properties of the properties of the properties of the properties of the properties of the properties of taxation and the incorporation of some system of deferred coulds (repayable in bad times) as a permanent feature of national tavation

Unless contracyclical tax measures are already imbedded in the law. the necessary tax increases to combat inflation and tax decreases to toe necessary Law increases to compat innation and tax decreases to counter deflation may be unduly delayed in the legislative and administrative process. This is especially likely in the United States, where tax proposals by the executive branch do not have the thrust provided by the British and Canadian parliamentary systems, under which vioco by the British and Canadian parjiamentary systems, under winch the government in power stands or falls on the acceptance or rejection of its program. Under the US system, the executive proposes but the congress disposes—often slowly and only after successive modifications by the house of representatives through its ways and means committee, by the senate finance committee, by the senate itself and finally by the joint conference committee Nonetheless, in severe economic fluctuations, it may not be possible to generate the required deflationary surpluses or expansionary deficits unless automatic fluctuations in revenues are reinforced by discietionary changes in rates In contrast with the wide area of agreement among economists on the

Perenties are reminitors of which the wide area of agreement among economists on the broad principles of anticyclical tar policy, there is no consensus on the properties of anticyclical tar policy, there is no consensus on of the properties of th of the mature or stagnant economy, beste with persistent unemployment, weak markets, redundant savings and lagging investment. It may be a subject of the stagned of the saving source of the saving source of the saving with government expenditure should seek to activate over coupled with government expenditure should seek to activate over the saving saving the saving savi

after the war suggested that, at reast under conditions or armed peace, the problem of containing chronic inflation might replace the problem of sustaining aggregate demand. If this proved to be the case, advocates of progression would find little comfort in the economic argument. The more progressive the tax rates, the higher the level of tax revenues.

The more progressive the tax rates, the higher the level of tax revenues would have to be to achieve a given counternalismonary effect. As taxes rose to new heights during and after the war, their distinctive affects became a source of increasing concern. Colin Clark developed the thesis that beyond levels of z/5% to z/5% of antonia income, but the control of the

Taxation is often called upon to serve economic ends other than

those concerned with aggregate spending and saving. Taxes are emthose conceined with aggregate spending and saving "Lares are employed to subsidize the production of certain items, eg, protective tariffs, and to penalize the production of others, eg, the heavy taxes levied by dairying states on oleomargarine. In World War II, high exiles were imposed on goods like automobiles and radios to divert

exists were imposed on goods like automobiles and ridios to divert resources from their production into war production. The chimatation of unwarianted economic gain from war has been a pramey objective concession in the contract of the concession in their contract of the concession in their contract of the concession in their contract of the contra both government and taxpayers and without large-scale evasion by illegal means and avoidance through legal loopholes and subterfuges, the promes unworkable no matter how laudable its economic and social objectives. The sense of equity is as surely violated by a tax which applies unequally to taxpayers in identical circumstances because of lax administration as it is by a tax which is basically unfair in its statutory administration as it is by a tax which is basically unfair in its statutory provisions. From the standpoint of administration and compliance alone, taxes should be simple to compute and easy to understand (undestanding being a matter, not of the wording of the law, but of the concepts and tax returns which confront the taxpayer). assessed on an obvious base easily arrived at, levied at moderate rates and pay-

on an obvious base easily arrived at, levice at moderate rates and pay-able in a convenient manner.

But the degree of simplicity required or of complexity permissible is not an absolute. Much depends on the nature of the tax, for example, the minimum complexity required to bring about tolerable equity in the minimum complexity required to bring about tolerable equity in an excess profits tax is much greater than that required in a tobacco tax. Much also depends on the scope of the tax—how widely it applies and how deeply it cuts. The demands for ease and simplicity of the United States individual income tax were far less piessing in 1939, United States individual income tax were far less piesang in 1930, when it applied at moderate rates to 4,000000 people, than in 1944 on 1954, when it applied at heavy rates to more than 5,000,000. Factors external to a given tax must also be taken into account. The lack of co-ordination of federal, state and local tax systems, for example, imposes costs and irritations arising not out of a particular tax but out of the conflict and duplication among taxes and taxing jurisdictions. Even more important are the factors external to the tax system as

The general level and standards of the civil service establish a boundary beyond which taxes cannot go in the direction of refinement and complexity Administrative techniques and competence, in turn, depend in good part on the stage of development of society A country that is sparsely settled and industrially undeveloped is likely to have that is sparsely settled and industrially undeveloped is likely to have very simple administrative mechanics and their force to rely heavily on on imports and exports. In more advanced countries, the machinery and the economic data on which it depends are better geared to direct, personal taxes like those on income and mheritances. The levels of public education, the attitudes toward government and the prevailing concepts of justice in taxation similarly condition tax forms and practices They are vital in determining how complicated and refined a tax may be without jeopardizing its success in practice. As these limits of tolerance are broadened, the frontiers of taxation are automatically

extended

retunded.

Revenue Adequacy —The recipits of government must be sufficient to commandeer for the state that part of society's real resources which to commandeer for the state that part of society's real resources which to commandeer to the state that part of society's real resources which to the state of the state o

national economic budget.

In this conception, taxes are not levited for revenue alone. The test of adequate yield as applied to the tax system is not that it cover a predetermined level of government expenditure but rather that, to-gether with borrowing if necessary, it raise the required funds in the manner best calculated to further the end of full and stable employ-The quantitative role of taxation becomes interlocked with its

qualitative role.

qualitative role. This reasoning applies primarily to central governments Their facat policies may appropriately be designed to offset tendencies toward economic matability in the private sector of the conomy. But offset to the conomy is to the conomy to the conomy. But the private sector of the conomy. But the private sector is the private sector to the conomy and the private sector to the conomy and the private sector to the the private sector to the priva budgets remain valid.

Shifting, Incidence and Effects.—To know only who bears the

impact of a tax, i.e., who turns the money over to the government or its agents, is to know very little indeed about the social and economic consequences of that tar. The tax may set loose forces which enable the original payer to obtain higher prices for the goods or services he selfs or pay lowen prices for those he buys, the property of the prop governmental consumption and investment and help to the come of pass final judgment on a tax, one needs to know how it affects the distribution of teal income available for private use, called its incidence, and what repercussions it has on the level of national income, called its effects

income, called it effects .

TAXATION, LOCAL. The proportion of government costs that falls on the local and central authorities, respectively, near widely from one country to another In general, the local share is a larger proportion of the total in the federal states than the unitary states. (For taxes levied by the central national authority, see TAXATION)

All tax powers in unitary states rest with the central authority, local divisions have only delegated powers. In consequence, the local authorities are usually quite restricted in their chore of taxes. In federal states, on the contrary, the central government's powers of taxation have ordinarily been restricted, and the states or provinces have usually had under independent powers of taxation than the central government itself in the beginning

Over long penods of time, however, the central government's tax powers have been extended to meet their ever-increasing obligations, until they have senously encroached on the tax powers of the underlying authorities. There is a tendency for federal taxes to overlap and ultimately to supersede state or provincial taxes.

This centralization of taxes is apparent in both federal and unitary states 11 is the result of the growing centralization of most government activities that has come with improved facilities for transportation and communication. Few functions continue to be of strictly local concern, and few taxes can be successfully

administered by a small local jurisdiction. The same tendencies are at work for the different local levels of government, the larger jurisdiction growing continually at the expense of the smaller

The percentage of government revenues from local sources for several countress green in Tuble 1. This shows both the greater centralization in the unitary states and the increasing centralization over a period of approximately acy years. The two period selected are periods in which the proportions were not distorted by the extraordinary demands of the financing of the two wars

# STATE AND LOCAL TAXATION IN THE UNITED STATES

State and local governments in the United States have a larger share of governmental functions than local governments in unitary states, and a proportionately larger share of governmental revenues and expenditures. There are at least three layers of government throughout the country—federal, state and local—each with its own tax powers. And except for a few combined city and county governments, there are at least two layers of local government. There are at least two layers of local governments phase to townships or towns. These in turn are usually divided into school districts. Incorporated cities and villages sometimes replace these subdivisions and sometimes are in addition to them. Often there

are special districts besides. All these have independent tax

There is no shaip division of functions among the different levels of government. In general, schools are the responsibility of local governments, with some aid from the states. The highway system is a composite of state and local roads, often with state aid to the latter and federal and to the former. Welfare activates originated as a purely local matter, but by degrees state and federal authorities assumed increasing responsibility for them. Police and fire protection were still primarily local duties, but by mid-oth century the same centralizing tendencies were beginning to be apparent here, also. The same forces that house centralization of government activities in other countries were at work likewise on the Hunter States.

There are as many state and local tax systems in the United States as there are states. The only restrictions on state tax powers are that states may not tax interstate commerce. In consequence, only customs duties are not available to state authorities. Every other important form of taxation employed by the federal government is at the disposal of the states and is used by some of them, although excises, with the exception of higher theorem of them are the consequence of the disposal of the state of the state of the state of the disposal of the state and is used by a state of the st

The local subdivisions have only delegated tax powers. In The major part of their income Consequently, the wide diversity found among state tax systems does not extend to the tax systems of the smaller units of government.

The moving mean of the systems in the United States is flown in Table 11 and of the systems in the United States is flown in Table 11 and of the systems of

General Property Tax—The characteristic tax of the state and local tax systems of the United States is the general property tax Property taxes began in colonial days as levies on specific forms of property, especially land and houses. The taxes were levied on capital value rather than rental value, but values were often determined by arbitrary measures. Land was often classified, for example, as woodland, pasture or arable land, and the value per acre was the same for all land of a given class. Houses were vulued according to the number of doors, windows or chimneys. In the course of time, various classes of personal property were subjected to taxation. The items selected—e.g. slaves, carriages, watches and clocks and money—were those that indicated

Source Bureau of the Census, Reports on Government Finances Local revenues partly

unusual taxpaying ability When these levies became numerous, they were combined in a single general property tax

The general property tax is a levy on all property real and personal, tangible and intangible Valuation for tax purposes is made by local assessors The rate of the tax is determined annually by the different taxing authorities, usually by the process of dividing estimated expenditures that are not provided for through other revenue sources by the value of taxable property In other words, the property tax is usually the elastic element in the tax system, varying with expenditures

Up to the time of the American Civil War the tendency was, as indicated above, to combine various special levies into a general property tax After the Civil War this tendency was reversed One by one, various classes of property were withdrawn from the general property tax base, either to be taxed in other ways or to be exempted entirely. This tendency went so far in some states

that only real estate remained subject to the tax

The principal reason for this change was the increasing difficulty of reaching personal property, particularly intangibles The difficulty arises partly from the ease with which such property can be concealed from the tax assessor, or even removed from any tax jurisdiction where taxes are heavy Intangibles, in particular, so regularly evade the tax assessor that in many states the tax on this property is nominal only The fact that one owner of stocks, bonds and mortgages may be subject to a heavy tax and another escape entirely makes the taxation of intangibles grossly unequal. Moreover, in so far as such property is reached there is double taxation. No taxpaying ability is created by placing a mortgage on a farm, yet the mortgage is added to the full value of the farm in the local tax base

Tangible personalty, also, offers difficult problems of assessment Household furniture and clothing, no longer new, have no real market value Also, they are readily concealed from assessors who rarely cross the threshold Inventories in shops and factories are more readily valued, but they can easily be reduced to abnormally low levels on assessment day Consequently, personal property, as a result of evasion or legal exemption, has become

a declining proportion of the property tax base

Real estate, on the contrary, is both visible and immobile, and consequently bears the brunt of the property tax levies Real estate assessments for the entire United States amounted to fourfifths of the total by the 1950s Valuation of real estate is an expert's job, and local assessors have not always been chosen for their technical competence. This, together with political pressures, has resulted in serious inequalities in the distribution of the property tax burden.

In general, small properties are assessed at a higher percentage of true value than are large properties, principally because the assessor is better able to value a small house and lot than a large estate or department store. Also, there is a tendency to encourage new building through underassessment, and to compensate by leaving values unchanged on the older, deteriorating properties. (See also LAND TAXES.)

Much real estate is exempt. The larger part of this is government property, and large state or federal holdings in small local taxing jurisdictions have often created serious financial problems.

TABLE IV — U.S. State and Local Revenues from Specific Taret, 1951 However, there has been some effort to compensate such local (In millions of dollars) Nonprofit or units through special state or federal assistance Nonprofit organizations for educational, religious or philanthropic purposes have regularly been encouraged by tax exemption, and there has been a tendency to extend exemption to small home owners, through homestead exemptions, and to tenants, through the exemption of low-cost housing projects These exemptions made serious inroads on the local tax base.

States endeavoured to assist their local subdivisions by obtaining their own revenues increasingly from other sources Property taxes supplied 53% of state tax revenues in 1902 and only 3% in 1051 Even this assistance, however, left real estate taxes at high levels Property owners have sought protection from excessive taxes through state legislation fixing the maximum rate that can be levied by the local authorities These tax limits have been widely used but they have often proved arbitrary and have led to unbalanced local budgets or undesirable curtailment of local government services as well as to low tax rates.

Much of the hardship suffered by property taxpayers arises from inequalities in the tax. If real estate were assessed equitably, the tax would not be unduly burdensome in most areas Equitable assessment would not, of course, make the tax a satisfactory measure of ability However, approximately half of local expenditures are for street improvements, police and fire protection and other services bringing direct benefits to the property owners Welfare activities, education and other functions which would not benefit property owners as such are supported in increasing measure by federal and state governments

Consumption Taxes.—A variety of consumption taxes pro-

duce a large share of state tax revenues. The most important of this group of taxes are the motor fuel tax, taxes on alcoholic beverages and tobacco and the general sales taxes The revenues from these different consumption taxes are given in Tables III and IV for 1902 and 1951, respectively; and the number of states employing

such taxes is given in Table V. Motor fuel taxes are levied at varying amounts-ranging from

three to seven cents a gallon in 1952. They are quite regularly earmarked for highway construction or maintenance, and the states often share them with the local subdivisions for highway use In isolated instances local governments have been authorized to levy independent taxes. The first motor fuel tax was levied in 1919 It spread to all other states in the course of the following decade, and by 1952 only the general sales tax produced more state revenue In so far as the revenues of the motor fuel tax are used for highway purposes, it can be classified as a benefit tax, since the taxpayers contribute roughly in proportion to their use of the highways A tendency developed to use a disproportionate share of the proceeds for rural highway systems and to give relatively

little to the cities for their streets, but more and more states are recognizing the claims of urban highways Alcoholic beverage revenues from gallonage taxes and the profits

of state liquor monopolies became an important source of state income in most states after the repeal of prohibition in 1933, and tobacco taxes spread rapidly after the beginning of the 20th century These are comparatively easy taxes for the states to administer, and are usually defended as luxury taxes, although the cigarette taxes unquestionably fall heavily on the low-income General sales taxes also produce large revenues Most of these taxes were introduced in the 1330s, when relief expenditures were growing, and existing revenue sources were shinking. The nature of these taxes, and the dates of their introduction into state tax systems are given in Table VI. These taxes are regressive, particularly when food is included in the base, but they seem to be accepted with comparatively little protest

Consumption taxes as a whole produced about two-fifths of all state revenues in 1952 and about 4% of local revenues in this same year.

Personal Taxes.—State personal income taxes originated with a Wisconsin levy beginning in 1911. Other states followed until, by 1952, 32 were levying such a tax. This form of state taxation would probably have spread even more rapidly if the "equal and uniform" tax clauses in many state constitutions had not prevented

the imposition of progressive rates. This tax became an important source of revenue—in some states the most important tax in the system; but states were deterred from levying highly progressive taxes, partly through feat that wealthy residents would move to other states and partly because the federal government was well established in the field hefore most states had turned to it for new TEVENDER.

Local income taxes are found in a few large cities including, in 1952, Philadelphia, Pa.; Washington, D.C.; Louisville, Ky.; and Toledo, and Columbus, O. Also a number of smaller municipalities in the state of Pennsylvania levy such taxes. Except for Louisville, these taxes are in areas where there is no state tax.

All have low rates The revenues are substantial, and in Toledo in 1952 they exceeded property tax collections However, few states have permitted such levies.

Inheritance, estate and grft taxes are long-established sources of state revenue, but wide variations in yield from one year to the next make them undependable, and they are rarely one of the larger revenue producers. Here, as in the case of personal income taxes, interstate competition for wealthy residents has tended to keep rates low, and the federal tax has become much heavier than those imposed by the states. These taxes have rarely been used

by municipalities Business Taxes.—One of the earliest forms of taxation to be developed by the states was the corporation tax. The first taxes of this sort were mostly designed to replace or supplement unauccessful efforts to tax intangibles under the general property tax since corporations obtain their charters from state authorities, the states have unquestioned right to levy privilege taxes in exchange printer charter. Moreover, the case of assessment and collection of capital stock taxes,  $e_{\mathcal{E}}$ , on corporations which are already expisited with state officials, simplified administrative problems

Corporation taxes have taken many forms. Some are for the privilege of obtaining a charter, and others are for the annual privilege of domaining a charter, and others are for the annual privilege of domes and sometimes to a specific class of corporations, such as banks, insurance companies, railroads, power companies or business corporations. The base may be capital stock, the value of physical assets, gross receipts, net income or any other measure that the state can reach.

There is a tendency to replace earlier forms of corporation taxes with corporation net income taxes, but most of the states adopting corporation income taxes have continued to levy a variety of other corporation taxes. Local governments have had little opportunity to levy corporation taxes, but both counties and cittes have commonly imposed a variety of business incences. These are a more important source of revenue in the south than elsewhere, but they are to be found throughout the United States. They are rarely important sources of revenue. State pay roll taxes are important revenue produces, but they are earmarked for unemployment benefits and make no contribution to general state expenditures.

Other Sources of Revenue.—The only other important tax is the motor-webice become, employed by all states and some mumicipalities. This form of motor-vehicle taxation preceded the gasoline tax and has, for the most part, been retained at fairly high levels, although a few states have greatly reduced their licence taxes when they have introduced or increased gasoline tax.

There are many fees charged for special services, and other mome collected in the course of administering various state and local functions. Also, municipal public-service enterprises are for the most part self-supporting, although they incur deficits more frequently than do such enterprises in England. They rarely yield surpluses that can be contributed to the general revenue funds. Public-service enterprises are not responsible for either as large a share of municipal expenditures or revenues as in England They are even less important in state finance.

Grants-in-Aid.—Crants-in-aid from federal and state to state and local governments had become an important factor in state and local financing by the time of World War II. Federal grants were of little unportance until the federal government adopted the social security system and began to participate in relief financing in the 1930s These were, however, more than emergency assistance, and became a well-established method of financing state functions.

State aid to local governments has a much longer history; in fact it antestates the English grant system. Most of the earlier grants were for the development of the school systems. In 1902 nearly four-fifths of the total was for this purpose. Highway and welfare, however, received steadily growing assistance from state funds after the beginning of the 20th century, and many other local functions came to receive state assistance. Table VIII gives the distribution of federal and state grants-in-aid according

to functions The total of state aid grew from \$65,000,000 in 1902 to \$5,000,000,000 in 1952, and from less than one-tenth to about three-tenths of all local funds in the same period

The reasons for state aid are various Most of the earlier grants were to stimulate local activity and improve local standards of performance This was particularly true of the early school grants which were usually in the form of matching grants. Duiing the 20th century, however, school grants were made more and more to assist the poorer districts to achieve minimum standards The equalization grant grew at the expense of the matching grant. The same development became apparent in highway and welfare aid Highway aid more often took the form of sharing the motorfuel tax than grants from general revenues, but welfare grants were normally made from general revenue funds.

The effect of state aid was to improve local services greatly. Where equalization went so far, however, as to provide local districts with 80% or 90% of their revenues, difficult problems of control arose to prevent misuse of funds. For the most part, states did not extend controls over local governments to the extent that England did Even with generous grants local governments were

left comparatively free

Evaluation of the State and Local Tax System.—The outstanding developments in state and local tax systems after 1000 were the rapid development of new sources of state revenue, and the tendency for states to assist local governments by leaving the property tax for their exclusive use, by sharing state taxes or increasing grants from general revenues, and by taking over formerly local activities for state administration and support. This is the same centralizing process apparent in other countries. In spite of this, local governments continued to struggle with unbalanced budgets and excessive property tax levies, while state governments usually found revenue sources adequate for their needs.

Many authorities suggested that the remedy probably lay, in some measure, in speeding up the process of state assistance, but there was danger that local authorities would lean too heavily on the state The alternative was to improve administration of the tax on real estate, and reduce rather than continue to increase the properties exempted from this levy. Only thus could any substantial measure of local self-government be retained.

# LOCAL TAXATION IN ENGLAND AND WALES

The sphere of local government in England and Wales, measured in terms of revenues and expenditures, is far more limited than is that of the national government. It is more limited, also, than the sphere of local government in federal states, and in many other unitary states In 1931-32 less than one-third of government expenditures in England and Wales was incurred by local authorities, and an even smaller proportion of revenues came from independent local sources

There are a variety of local authorities, and most areas are subject to overlapping local jurisdictions. The large cities are organized as county boroughs and, except for the parish, normally comprise a single local government. The area outside these county boroughs is divided into administrative counties, and these in turn are subdivided into municipal boroughs, urban districts or rural districts. The smallest unit of local government, the parish, is found throughout England and Wales, but by the 20th century it

no longer exercised important local powers.

There was constant pressure to transfer functions from the smaller to the larger jurisdiction. Until the middle of the 19th century the parish was the most important area of local govern-In the early years of the 20th century 1t had become purely nominal in urban areas, and even in rural areas its activities had become few and unimportant. Parish expenditures declined to a fraction of 1% of all local expenditures. The total number of local units, excluding the parishes, declined from about 1,900 in 1929 to approximately 1,600 in 1944

This centralizing tendency resulted in the transfer of functions from parish to district, from district to county and from county to central government Poor rehef, for example, was originally the responsibility of the smallest unit of government, the parish. In 1934 it became primarily a national function and in 1948 the entire responsibility for public assistance was transferred to the national government. In 1946 health, also, became the responsibility of the national government.

The county is principally responsible for education, police and highways. Housing, minor roads and trading services are largely the responsibility of the districts and boroughs

The local revenue system is very simple. All local units are supported largely from two sources-rates and grants The first is the only tax the local authorities are permitted to levy, except for a few small county licences that produce only a fraction of 1% of local revenues Grants come from the general revenues of the national government.

The development of local rates and grants, and their relation to national tax revenue, is shown in Table VIII It is apparent that in the century preceding World War II, there was a clear trend toward sharing an increasing proportion of national tax revenues with local governments through the system of grants. This trend was reversed with World War II.

World War II increased national obligations, rather than local. The increased tax revenues were necessitated by war expenditures; but greater central government participation was required also for civilian functions such as housing. In 1950-51 local rates were less than 10% of national and local tax revenue, and grants had risen to more than half of all local revenues.

Rates .- History and Development .- Local governments derived their authority to levy rates; the one important local tax,

Source. Statistical Abstract of the United Kunsdom

from the Act for the Relief of the Poor of 1601. It had been common practice, however, long before the law of 1601, to levy comparable rates. The act of 1601 provided that every inhabitant of the parish should be taxed for the support of the poor "according to the ability of the same parish." No measure of ability was specified, and the tax developed into a personal tax levied in proportion to the iental value of the property occupied Personal property was sometimes included in the assessment in the early history of the rates but had been definitely exempted by the middle of the 19th century. Thus rates became levies on those persons occupying land or buildings, designated as "rateable hereditaments," within the jurisdiction of the local rating authority

Vacant property is exempt from the rates in England and Wales. In Scotland, half of the tax is levied on the owner and half on the occupier. The owner's share is levied on his property whether it is occupied or not

The occupier is assessed on rental value, which is usually determined by the actual rent paid for the specific property or similar

According to the Rating and Valuation act of 1925, sec 58, "gross value means the rent at which a heretatment might reasonably be expected to let from year to year if the tenant undertook to pay all usual tenant's rates and taxes, and if the landloid undertook to bear the cost of the repairs and murance, and other expenses, if any, necessary to maintain the hereditament in a state to command that rent."

Specialized ownen-occupied properties must receive special treatment. These are mostly business properties and the valuation is related to profits Machinery is exempted. Provision was made for quinquenail valuations under the Rating and Valuation and of 1925, but actual changes in value became comparatively infrequent. This act did not change methods of valuation materially, but attempted to secure uniform valuations throughout

The base of the local rates was reduced from time to time by successive "directings". The Agricultural Rates act of 1896 exempted one-half of the rental value of agricultural land from local rates. In 1923 this exemption was increased to three-fourths and in 1920 the total rental value of agricultural land was exempted. Agricultural buildines were exempted in 1023.

The Local Government act of 1929, which derated all agricultural land, also derated industrial properties and railroads, reducing the "net annul value" to which the rates apply to 25% of full value. As early as 1848, the land used for the actual railroad line, but not including the property used for stations, had been derated by this same percentage. Complete exemption was provided for the property of educational, religious and other nonprofit orgamzations. This left as the most important ratepayers the occupiers of houses and commercial buildings. The proportion of the total valuation attributable to these by mid-zoth century was approximately oxy5%.

Administration of Rates and Distribution of the Burden.—The valuation areas after 2032 were the boroughs and districts. The elected councils of the horoughs and districts were made responsible for the valuation. To ensure some degree of uniformity among valuation districts these were grouped into larger assessment areas, each with an assessment committee appointed by the rating authorities and the county council. The function of these committees its to supervise valuations, hear complaints and equalize.

Most counties also have full-time country valuation officials, to ensure uniformity withm the country. A Central Valuation committee for all of England and Wales serves in an advisory capacity, Railroad property, formerly valued piecemeal by local officials, was valued as a unit after 1930 by a national Railway Assessment authority. The valuation is based on revenues.

Each local tax authority fixes its own rates, but all the rates leved in a given area are levied as a consolidated rate. Collections are also combined. In case of delinquency, the local authorities have recourse only to the occupier's estate, which may be only personal property. If the delinquency is dehiberate the taxpayer may be impressed. The administration is largely the responsibility of boroughs and districts,

According to the early legislation authorizing rates, they were to be apportioned according to taxpaying ability. Later, however, this conception of taxpaying ability was modified in recognition of the fact that rentals are not closely related to incomes and tend to take a laiger proportion of small rather than large incomes. This makes the levy regressive. Moreover, rates vary considerably from one district to another, whether such variations are measured in terms of the taxable valuations or per capita. This is the tresult of wide differences in per capita wealth in different areas and the tendency for local needs to be in inverse proportion to wealth.

In so far as the rates are used for services, bringing direct benefits to the ratepayers, a case can be made for regarding rates as benefit taxes. If the occupiers receive benefits from local government roughly in pioportion to rates paid, the test of ability is inclevant. The original poor rates obvoosyly do not bring any such direct benefits to ratepayers. But many of the costs of local government met from the rates, are of direct henefit to the ratespayers.

Consequently there was a tendency to classify the rates as benefit taxes. Some authorities even took the position that rates are not strictly taxes at all, but charges for special services. However, the national government did not subscribe to this theory. Since the first half of the 19th century it had been assisting local authorities through an expanding system of grants, which was directed increasingly to the rehef of ratepayers, and especially to the equilabation of rates in different areas.

Grants-in-Aid.—The national government introduced grantsmead to local authorities early in the tyth century. The eathest of these went to individual local governments for specific and unusual expenditures. The first grant for an entire class of local authorities was introduced in 1835, with the reimbursement of counties by the central government for half the costs of criminal prosecutions and transportation of prisoners. This and many of the succeeding grants were made specifically for the relief of local ratepayers. The functions aided were those regarded as of national importance. Another important reason for the growth of grants was the desire of the central government to improve the standards of local services.

By the end of the 19th century the national government was assisting local governments by grants for police, education and various welfare and health activities Highways, for which grants had been provided intermittently during the 19th century, were given regular and beginning in 1908. Housing grants began in 1919.

Practically all the earlier grants were for specific functions and were usually fixed at a given percentage of approved local expenditures. The percentage met from national funds was substantial, usually amounting to from 25% to 75% of costs. Thus they tended to stimulate expenditure for the activities added, and to raise the level of local administration through the setting of national standards for these services.

The guiding motive in the development of the grant system prior to 1939 was the desire to stranulate local authorities to expand services for certain functions and to improve standards of local administration. In some instances relief to local ratepayers, as a consideration, but only for school grants was any effort made to equalize resources

Some indirect equalization was achieved through the enlargement of local districts and through national assistance with the workers burden. Unemployment insurance and old-age benefits, particularly, gave local ratepuyser relief. The total rate burden was probably not excessive in 1926, but inequalities in rates were very great. Moreover, the heaviest rates tended to fall on depressed areas. Rates for poor relief tripled between 1916 and 1927, and the increases were greatest in the areas with the greatest unemployment. This was the principal reason for the 1920 changes.

The Local Government act of 1929 was part of the government's recovery program The aim was to reduce local rates, particularly for agriculture and industry. There was no thought of simulating new and improved local government services. The block gram provided by this act was partly compensation for derating, partly a substitute for specific grants abolished by the act and partly additional funds for general rate reduction

Greater equalization was attained under this act, partly through the transfer of certain local functions to large local districts, and partly through the block grant. This giant was distributed according to an elaborate formula which weighted population is accordance with the proportion of children under five years of age in the population and with the proportion of the unemployed. It was also weighted to favour those districts with a low per capita rite base and relatively few inhabitants per mile of hierbows.

The formula was never completely satisfactory At first, however, the large sums available afforded real relact. The total of rates declined from £166,000,000 in 1928 to £146,000,000 in 1938. Rates increased after that, however, and exceeded the 1938 level in 1936. In 1948 the block grant was replaced by "exchequer equalization grants" which increased the total distributed and were designed to achieve greater equalization. Changes in the amount of grant revenue as a result of these acts are given in Table IX

The tendency for the national government to increase its assistance to local governments continued after the Local Govern-

ment act of 1929 New housing subsidies were introduced in 1920 and 1931 In 1935 the national government took over the entire administration of able-bodied poor relief, instead of increasing grants for this purpose. It did not, however, assume the whole cost, requiring local authorities to contribute 60% of their 1932—33 expenditures for this purpose. This ensured local government authorities of no increase in these costs but also prevented decreases

In 1938-39, £3,300,000 out of £44,000,000 spent for relief was contributed by local authorities. The 1940 Olid Age and Widows Pensions act transferred a large number of people from local public assistance to unemployment aid, and an act of 1948 transferred all important public assistance costs to the national government. During World War II the national government financed a variety of emegancy costs through grants or direct expenditure; and in 1946 it assumed full responsibility for the health function.

Trading Services and Miscellaneous Sources of Taxation.
—The third important source of British local revenue, fart sonal and grants-in-aid, is the earnings of trading services. These municipal industries comprise water supply, gas and electricity, tramways, buses, docks, harbours, canals and private street improvements

There is no tendency to use the trading services as a source of net income or to subsidize them from rates. For the most part charges cover the costs of the services in question. Sometimes, however, there are deficits to be met from rate funds, or surpluses that may be apouhed to rate reduction.

Other sources of net income are of very minor importance. There are a few county licence taxes, including dog licences, that bring in small revenues. Minor revenues are derived from various administrative fees. Special assessments are rare.

Local authorities can obtain money for capital improvements through loans. Local debts more than doubled in the decade from 1900 to 1930, largely because of the rapid development of municipal housing projects. They increased relatively little in the decade from 1930 to 1940. In 1940, however, the net debt of local authorities exceeded ±1,500,000,000. About one-third of this

sum was for trading services, an even larger share for housing and the remainder for miscellaneous local activities

Evaluation of the Local Revenue System.—The local revenues as the system of England and Wales is like that of most countries in the system of England and Wales is like that of most countries in the system of the

The need for extensive equalization seems not to have been apparent before World War I, although some effort was made from time to time to use grants at least partly for this purpose. In the years following that war, the decine of some of England's basic industries led to acute need in certain areas, together with commarkive affluence in other areas where industry was examidus.

The national government attempted to meet this situation by assuming a larger share of the cost of support for the unemployed, by widening the area of charge and by providing larger grants distributed on equalization bases

These measures proved of genuine assistance, but senous ficqualatuse contuned Complete equalization would result in the national government's contributing three-fourths, and in some areas even nun-tenths, of the revenues for a large number of local authorities. This increased the danges—always present when the spending authorities are not directly responsible to the tarpayers—of wasteful use of funds. One of the ments claimed for the block grant was the removal of central government controls. But, while many minor restrictions were withdrawn, important controls remained.

For the most part, the national government extended central supervision and control along with the grants-in-and, but if the controls were adequate for a system in which the larger share of the income took the form of grants, the freedom of local self-government, which is the principal virtue of independent local authorities, would be greatly curtailed. Moreover, there was some danger of maintaining the status quo in depressed areas, where emigration of workers might better be encouraged.

The gams of derating were also questioned In so far as local rates were benefit taxes it was difficult to justify the withdrawal of industrial and agnoultural values from the tax base. And the decrease in the local tax base decreased local independence somewhat in proportion. These, however, were tendencies to be found in local revenue systems in all industrialized countiles. The centralising trend is apparently irresistible

tralizing trend is apparently irresisting. Binizonasari.—An excellent account of the local revenue system is to be found in Herman Finer, English Local Government, part v (London, 1933, New York, 1934). #### LOCAL TAXATION IN OTHER COUNTRIES

The characteristics of the diverse local tax systems found throughout the world cannot be summarized briefly Instead, some of the more important deviations from the English and U S patterns have been described below

France.-The French system has many characteristics that are typical of European countries It differs from that of England or the United States in its high degree of centralization. France, before World War II, was a unitary state that did not delegate to local governments the degree of independence that English local authorities acquired It is divided into departments, which are in turn subdivided into communes Administration is highly centralized, with commune authorities, for the most part, responsible to department authorities, and these responsible to the national authorities. In consequence, local revenues and expenditures are a comparatively small part of the total

The second important difference between the French system on the one hand and the English and American on the other is that a large proportion of local revenues come from centimes additionnels. These are local levies on national tax bases, a form of taxation unknown in England and the United States Before the introduction of the income tax in France, in 1917, the national government had four direct taxes to which departments and communes could add centimes The taxes in question were on rental value of real estate, doors and windows, presumptive income (determined mostly by rentals) and business. After the income tax was introduced the national government gave up all these except for a modified real estate tax The old bases were retained, however, for local use, except for the door and window tax, and the commune taxes were continued as additional levies on department tax bases.

Local governments did not share in the national income tax, but the national government made substantial grants to communes for various purposes. These became an increasing proportion of

local revenues, exceeding one-fourth of the total in 1950 In addition, communes and departments have substantial independent tax sources. These include a variety of consumption taxes, amusement taxes and direct taxes for roads and other purposes. The amount of revenue from grants and local sources is given in Table X.

Germany .-- Before Hitler, Germany was a federal state and as such developed independent federal and state tax systems; or rather, the federal system was superimposed on existing state systems with relatively few changes in the latter. The state systems presented much the same diversity as did those of the United States.

Prior to World War I, the personal income tax was the central tax of most state and local systems. This tax was commonly supplemented by a true of taxes on land, buildings and trade. The land and building taxes were usually levied on owners, and the trade tax on occupiers. The base of these taxes was determined by the state; and local taxes took the form of additions to state taxes.

Local authorities were permitted to determine, within limits, the rates they wished to levy on the state tax base for income, land, building and trade taxes. These rates were added to state levies. In this respect the German system resembled the French system closely. It differed in the variety of taxes from one state to another and in the greater independence of Kreis and commune authorities. In some states the local authorities were permitted to levy independent taxes on income or property, and commonly did so in preference to using the state tax base. In others the local governments depended almost entirely on additions to state taxes, having few independent tax sources at their disposal. These direct

taxes produced more than three-fourths of all state and rocal revenues, the income tax alone producing more than half of all state and local revenues in 1913-14. There were, however, a variety of stamp, beverage and entertainment taxes that produced substantial income

Under the Weimar constitution, after World Wai I, the national government took over personal and corporation income taxes and shared these and other central government taxes with the states The states in turn redistributed part of the proceeds to local goveinments The result was to circumscribe state and local tax powers materially and to unify tax systems for the entire Reich By 1934, more than half of state tax revenues and more than onefourth of local tax revenues came from Reich taxes This use of shared taxes was found in other countries, but Germany developed it much further than any other important nation. Nevertheless, direct taxes on land and buildings and trade and a variety of consumption taxes remained at the disposal of state and local governments The larger share of state and local costs fell on local governments in 1932-33. Their expenditures were almost double those of the states State expenditures exceeded local for police and education, but other important functions were primarily the obligation of local authorities

configuration or local authornies

Centralization increased with the Nazi government. The federal

Centralization increased with the Nazi government. The federal

discovernment of the state became mere subdrustons of the central authority of the state and contained the

treatment of the yattleance. Thus the German yorkem became more

highly centralized than the French. Following World War II, state

taxes were restored, and in western Germany the state and local shane

of the total was 39% in 1951-52

Other European Countries.—Other European countries offer many deviations from the French and German patterns The limited local additions to central taxes are however, a very common form of local taxation Shared taxes are much less common They usually appear when the central government takes over a formerly local tax

source. Local consumption taxes and other indirect levies are found in varying degrees. In some countries they play a more and common waying degrees. In some countries they play a more mortant part than in dither France or Germany. There is a tendency, however, for national governments to obtain a larger share of their laxes from indirect levies than for local governments. In come taxes tend to be primarily national levies, but real estate taxes are almost universally primarily national levies, but real estate taxes are almost universally a local source of revenue

The local authorities of continental Europe have a much greater variety of taxes at their disposal than either the English or US local governments, but they have less freedom in determining the amount of the level.

## BRITISH COMMONWEALTH

Canada.-The Canadian tax system resembles that of the United States in many ways Both are adapted to the federal form of government, and in both the different levels of government have wide

ermment, and in both the different levels of government have wide powers of transition with substantial overlapping in the taxes of dif-rent estate taxes and state or provincial governments get large revenues from liquor, gasoline and motor vehicle hence taxes. Also, there is wide variation in the tax systems of the different provinces wide variation in the tax systems of the different provinces property tax differs both from the general property tax of the United States and from the English rates. The tax is levied on capital value as in the United States, but it is usually hunted to real estate and often has exempted improvements entirely or has assessed them at a lower value than land. The rapid rise in land values, especially during the opening years of the 20th century and the desire to encourage settle led to the attempt, in the western provinces especially, to place the en-tire burden of local taxation on land alone

the burden of local taxation on land alone. This proved to be a very unstable tax base. Land booms were followed by collapse. In some cities the tax base was cut in half in a short space of time. The result was frequent crises in municipal financing, and after World War I there was an effort to broaden the tax base. Improvements were generally included in assessments for

local taxes, although often at a fraction of full value Personal propeity was exempted but the real estate tax was often supplemented by a tax on business rentals

The provinces enjoyed a much wider variety of tax sources, but beginning with World War I, the Canadian government tended to encloach on provincial sources, even going so far as to conscript the personal income tax at the time of World War II The federal govpersonal monne tax at the functor world war it. The federal gov-ernment, however, follered the provinces generous compensation in the form of substantial grants for specific functions and general purposes in 1940 these amounted to mote than one-fourth of provincular eventues from taxes and grants. The largest were for old-age pensions and un-employment benefits, but there were also substantial sums that the provinces were free to spend as they chose

provinces were tree to spend as they chose my agreement with all the provinces excepting Quidec, these are ply agreement with all the provinces excepting the war. The more important local tax revenues are given in Table XI. Australia.—Australa, lake Canada, has a feederal government. The states have independent and widely yarying tax systems, and munica-phities here, as elsewhere, obtain their principal revenues from real

estate taxes
The local rates, as they are called, differ from the English rates and vary somewhat in the different states. In most states there are two separate levies—one on the unimproved capital value of land and one on the improved value

In some states the latter is on rental value and thus resembles the English rates In other states this, also, is on capital value Real estate is assessed for these levies by a state official The amount of the levy is, however, determined by local officials and varies with needs from one municipality to another and from one year to the next. Personal property is not subject to these taxes.

Municipalities have no other important independent some in-obtain substantial grants from state governments and obtain some in-obtain substantial grants from state governments and obtain some inrevenues from all sources for 1946-47 are shown in Table XII

Because of the sparse population in much of Australia the states
undertook many functions ordinarily left to local governments, in-

cluding education, health, welfare and much of the cost of highways.

Municipal expenditures are largely for public-service enterprises and public improvements

States obtain revenues from a large variety of taxes, as shown in Table XII. They no longer have at their disposal, however, the income taxes that provided them with more than half of their revenues in the period prior to World War II. Their largest single source is the inherit-The states also obtain exceptionally large revenues from land sales

and from public-service enterprises.

The Australian commonwealth, like the Canadian government, assisted the underlying governments with an extensive senes of grants, Some of these were in compensation for tax sources transferred to the federal government, and some were for aid to specific functions. Also some were special grants to particularly needy states. Beginning with World War I, the commonwealth began to encroach seriously on state sources of revenue. With the outbreak of World War II, the commonwealth appropriated the income tax in spite of vigorous protests from the states. State revenues from this source were replaced by a common-wealth grant of the same amount. This arrangement was continued after the war. Thus the centralizing tendencies apparent in other countries appeared in Australia, also.

BIBLIOGRAPHY.-The best summaries of the tax systems of the different countries of the world are to be found in Tax Systems of the deferent countries of the world are to be found in Tax Systems. TAXICAB: see TAXIMETER

TAXIDERMY, the art of lifelike representation of animals (and especially mammals and birds) by means of their prepared skins, has, by a natural association of ideas in museum practice come to include the making of habitat groups, in which animals are exhibited with their naturally associated plants, with or without a painted landscape background. Zoological collecting is related to taxidermy in origin and in the techniques of preparation of bird and mammal specimens (see ZOOLOGICAL COLLECTING)

History.-Taxidermy, like museum collecting of animals in general, evidently has its origins in the preservation of skins, horns and skulls as hunting trophies or as travel souvenis. The early perfection of tanning methods made possible the use of skins as clothing, rugs and bed coverings. The introduction, in the 18th century, of chemical poisons for protection of skins, hair and feathers from destructive insects, made possible the accumulation of great private and royal collections of mounted birds and mammals that preceded the development of modern museums. Taxidermy as an art is now carried on almost entirely under the auspices of larger museums. As a more or less skilled trade, the mounting of game buds, fishes and especially the heads of horned mammals continues in the hands of commercial establishments Great numbers of privately owned specimens of this sort gravitate to taverns in the United States; but the continued popularity of mounted heads of record deer or other native and even exotic animals as home decorations is by no means confined to the "trophy room" of the wealthy sportsman The skins of the West African gorilla brought by Hanno to Carthage in the 5th century B.C represent trophies of an early voyage of exploration.

The origins of a more ambitious taxidermy may be seen in the report of skins of the European bison and aurochs having been set up by the Austrian Baron Siegmund Herberstein, in the great hall of his residence, over a framework of boards, some time before the year 1550. Perhaps the oldest existing mounted skin of any animal is that of an Indian rhinoceros preserved in the Royal Museum of Florence, dating apparently from some time in the 16th century. The stuffed skin of a Nilotic crocodile in the Museum of St. Gall in Switzerland dates from the year 1627, and has thus survived for more than three centuries Such exotic or rare creatures, preserved with an educational purpose rather than pumarily as trophies, exhibit the beginnings of museum preparations of exhibits; and indeed, their collection and preservation represent the beginnings of museums of natural history

Early crude attempts to fill out skins of animals to lifelike size consisted in merely stuffing the sewed-up skin with hay or straw, or, at a later date, with excelsior Such specimens might have shown the hair or plumage well, but could only crudely represent lifelike form. There seem to have been critical attempts to improve methods of taxidermy, and even to supply vegetation and painted backgrounds early in the 19th century. Thus an account of the larger African mammals in Bullock's Museum, published in 1815, states that:

Various animals, as the lefty Giraffe, the Lian, the Elephant, the Rhinocrous, set, are exhibited as ranging in their native wilds and forests; whist exact Models, both in figure and colour, of the races and most invarint plants from every clims, give all the appearance of the control of th

The effort to mount large mammals in natural positions and even in positions representing great activity appears in the work of the Maison Verreaux, a commercial establishment in Paris under the direction of Jules Verreaux. Verreaux combined the roles of naturalist, explorer, taxidermist and business man, and the Maison Verreaux formed the prototype of Ward's Natural Science Establishment in the U S. For the International Exposition in Paris in 1867, the Maison Verreaux created the group showing an Arab courier on a camel attacked by two lions, and this group was purchased for the American museum in New York city in 1869.

The subsequent history of taxidermy is mainly American, and

centres to an extraordinary degree in the group of active young men who gravitated to Ward's Natural Science Establishment at Rochester, New York This unique business, evidently modelled on the example of the Maison Verreaux, was founded by Professor Henry A Ward of Rochester It engaged in the supply of museum materials, from minerals to mastodons and from birds of paradise to orangutans, to the schools, colleges and universities

The cartoons below, which date from 1883, illustrate the turning point in the history of taxidermy from "stuffing" to "modelling," and emphasize also the influence of the Ward group in the development of modern methods.

#### THE PRINCIPLES LAID DOWN

The triumphs of the art of Taxtdermy, displayed in Bird-stuffers' windows and in the museums of many of our institutions of learning,

windows she in the museums of many of our institutions of nearming, have ever had a facunation for our joint part of the fact of the state of the fact and his lotty praise or his own genuis, quite convinced him that this Professional who had, for fifty years past, blessed New York with his interesting productions, might give him some clue to the above mentioned mystery, S. therefore followed him down to Broadway to his sanctuary, saw his work and heard his discourse.

Fig. 1,—"All animal forms," said the Professional, "were intended by Nature to be allike, though a series of blunders and accidents have irreparably merred the design, it therefore rests with the Taxidernist to restore the universel similarity. All animals are composed of a head (A), a body (B), legg (C), and a cast (O) is a fost incontrovertibly proving our theory. Bone

"Touching the similarity theory, take the dog: add antiers

me, is always engaged in or

of the U.S., whose origin or development fell in the era from 1860 to about 1890 These decades were likewise the period of active growth of museums in the U.S., which supplied an additional market to Professor Ward

William T. Hornaday and his fellow taxidermists at the Rochester establishment, William Critchley, Frederick S Webster, George B Turner, Henry E Denslow and later Carl E. Akeley. seem to have been in extraordinary agreement in the hope of raising taxidermy to the status of an art. The accompanying cartoons from a set in the Ward's Natural Science Bulletin (1883) illustrate the feeling of the Ward group against the crude effects obtained by their colleagues who "stuffed" animals. The realization that natural positioning of animals depends on knowledge of their habits in life and on their anatomy, and in turn on a sculptural process to produce the manikin on which the skin was to be applied, was by no means new, but the Ward taxidermists experimented more actively with clay and plaster of Paris and with various techniques for making manikins than had any other group Their interest in themselves as a group with professional ambitions is illustrated by their leadership in a short-lived "American Society of Taxidermists," whose exhibitions were held in 1880, 1881 and 1883 The failure of the society to continue seems traceable to a peculiar secretiveness of commercial taxidermists. which still persists It may be well to point out that the struggle between the commercial point of view at Ward's and the ideals of the younger and more idealistic members of the staff could only he resolved by the development of preparation staffs under the auspices of great museums in the United States

Among the young men who came to Rochester to practise taxidermy by working at the Ward institution was Carl E. Akeley Akeley, benefiting especially by the advice of Critchley, the bird taxidermist, and with great native mechanical and artistic ability hit upon the process that represents the greatest single advance in the taxidermy of large mammals. This, briefly, consists in a method of transfer of the form of a model in clay to a light. strong and permanent manikin on which to mount the skin. The animal is modelled in the attitude desired for exhibition, in clay The armature over which the clay is placed may to advantage include the skeleton of the animal and should at least have the limb-bones to ensure basic correctness of the length of the limbs The clay model is sculptured to represent the muscular surface of the animal, with attention to the forms of the muscles involved in the particular posture chosen. The clay form is then converted into a plaster of Paris mould in such a way as to form a waste mould in three pieces By the application of burlan. composition (originally papier-mâché) and, in large animals, a layer of wire cloth, to the inside of the mould, there results (after removal of the mould) a light, strong, durable form, the manikin, with a surface well adapted to hold the skin of the animal it is to represent, while it is at the same time a satisfactory copy of the clay model So successfully does this process meet the requirements of scientific and artistic taxidermy, that with only minor changes it remains in use at all larger museums

Pupils, associates and colleagues using Akeley's methods, with occasional improvements, filled the large museums of the US with fine representations of the mammalian and bird life of the world. The Akeley tradition was capably carried on by his associate at the Chicago museum, Julius Friesser. Among Akeley's pupils in Chicago, Leon L. Pray may be mentioned for his experimentation with the technique of carved manikins, and, indeed, with the techniques of taxidermy in general. Carving of wooden limbs to represent correct muscular anatomy was suggested by the American artist, Charles Willson Peale for the "Peale Museum" of 1802. The use of balsa wood for this purpose retains the desirable quality of lightness in such manikms, which are almost always used for small mammals and birds, displacing the tow or excelsior manikins widely used for mounting such small creatures in the past. After working with Akeley in Chicago, James L. Clark continued as an associate of Akeley in New York and became one of the leaders in the field of artistic taxidermy

General Taxidermy Methods .- The emphasis on techniques in the above account may somewhat obscure the factors most es-

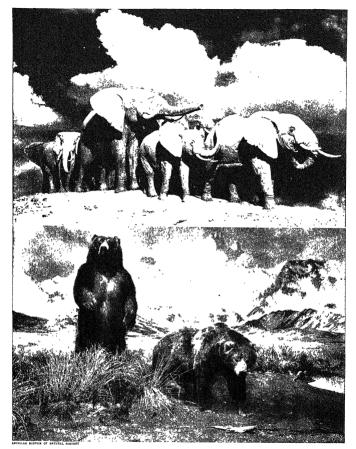

# VARIOUS TAXIDERMY TECHNIQUES USED IN A MODERN NATURAL HISTORY MUSEUM

- 2. Tanned skin of a large bird being fitted into place over the manikin.

  Legs, bill and the glass eyes have been set in place

  3. Plaster of-Paris place mould being removed from hollow burlap manlkin The animat's tanned skin will be fitted over this form
- Restile posed in position before being moulded A plaster-of-Paris
  and is then made over the body
  Tanned kin of a large birt beang stid nits place over the manikin.

  Tanned kin of a large birt beang stid nits place over the manikin.
  - Celluloid reproduction being removed from the plaster-of-Paris mould, it is then cleaned of all plaster still adhering to the zurface and completed for exhibition

MAMMAL HABITAT GROUPS IN THE AMERICAN MUSEUM OF NATURAL HISTORY

1. Africain elephants, taxifermy by Carl E Akeley and Robert H. Rockwell, foreground and beckground blown in

2. Alaskan brown bear, Aghlleen Pinnacles, Alaskan Peninsule; taxifermy by Robert H. Rockwell, background by Balmore Brown, foreground by G. Frederick Mason

sential to the new taxidemy, namely that its practitoner must combine the naturalist and the artist, with the naturalist's knowledge of the naimal in life, the scientist's critical attitude toward the shortcomings of his work and the artist's eye for form and composition If the taxidemist then be also a skilled carpenter, mechanic and inventor, he may hope to find employment in a museum or to succeed with an establishment of his own

The importance of bird taxidermy in museums and in commercial shops is next only to that of large mammals. The study of birds began with the collecting of specimens for their accunate description, and the specimens mounted in museum galleries are still essential for the development of an adequate acquaintance with the birds of a local region as well as for knowledge of birds of the world

# WARD 'ANTI STUFFING" CARTOONS, CONTINUED

## AN UNAPPRECIATED TRIUMPH

"The skins of animals," continued S—'s instructor, "were originally intended by Nature to be filled out to their fullest extent, though the failures in carrying out this principle are many and glaring Among such the greyhound is a painful example"

Fig. 4—"A gentleman possessed one of these animals, which died, and its

Fig. 5 —"The result was a great success; yet the owner was dissatisfied 'My deer, sir,' said i, 'we can't stuff it any tighter—human strength cannot do it' However, to please the genitleman, we promised to try"

Fig. 6.—"Well, sir, I invented a powerful air-pump, and blow that skin out until the result was a married of perfection in canine form. Would you believe it, sir? the owner granuloid more than before! Well, sir, we byfully took the specimen off his hands, are which tied it is an example of what of the form the National Museum!"

The critical examination of mounted skins of snakes, hazards and other reptise led Leon L. Walters, at the Chicago Natural History museum, to the conclusion that the tirdike representation of these creatures, as of amphibians and of many fishes, was impossible by the ordinary methods of taxidermy. The fundamentally important qualities of colour and translucence were lost in tanning reptile skins; and if the mounted skin, or indeed a model, was pannted to restore the colours, the resulting appearance was highly artificial. These difficulties led to the preparation of cold-blooded animals for museum exhibition as plaster or wax casts. By the Walters process, celluloidlike meterial is subskituted as the ma-

ternal of the cast, cellulose nutrate or cellulose acetate dissolved in a suitable solvent to form a thick liquid has the correct of pigments added to it for each element of the pattern in the animal to be reproduced, and these patts of the pattern may then be painted on the inner surfaces of a plaster mould made from the freshly-killed animal. Artistic ability to make a lifelike pose with the dead animal, and no hitle ingenuity in plaster moulding are requisate. The celluloid material dries as a thin layer, which may be reinforced by any suitable composition. When the plaster is removed, the resulting "celluloid" model combines the correct colours with the natural appearance of translucence, and the preservation of the scale detail of the mould avoids any appearance of being painted

Walters' critique of museum techniques applies also to many of the haules or thinly-harred mammals, to the coloured bills and feet of birds and especially to the fleshy base skin of birds (like a turkey gobble head), which can also be made lifeliek by reproduction in cellulord. The Walters hippopotamus, made as a cellulose acetate model, is thus the only existing lifelike representation of a hippopotamus whose inch-thick skin has a deep fleshy translucence A group of narwhals prepared by this technique 18

equally noteworthy

It is possible to combine models of soft pasts or of scaly pasts with the skin, as was done most notably in a cassowary and in a group of emperor pengiums. Most novel of all is the possibility of transfer of hair or feathers to the celluloid "skin". In a mould made from a fresh skin, after a few days of maceration, the hair "slips," ie, pulls out of the skin by the roots! Thus the plaster of the mould will include the hairs (or feathers) down to the skin suiface, and painting the liquid celluloid into the mould to form the new skin will hold the root of every hair in exactly its original place. The removal of plaste is accomplished by extended soaking in water and combing remaining particles out of the hair Such processes obviously form an important supplement to the ordinary techniques of museum taxedemy.

The extension of the term taxidermy to include life-size models in general is especially desarable in the case of the pieparation of museum exhibits of fishes. Fishes were at first quite simply skinned out and "stiffed". Such speciments newtably tended to be ill-shaped, and a great improvement was made by naking a plaster mould of one side of the fish (the side to be exhibited) before skinning out the specimen, and then fitting the skin into the mould and drying it before removing the plaster. When it was discovered that such skins crack in the course of 20 o1 gyers, the logical step was to make plaster casts in moulds of the original fish, and to paint them to represent the colours of the hiving fish, as, of course, was necessary for the skin itself, the natural fins of the fish, spread and prepared, were set into the plaster model. Further experimentation with fins carved from

sheet celluloid indicate that such fins are preferable to the natural fins and they are certainly more permanent; thus by degrees, the mounting of fish skins was entirely displaced by a process of modelmaking.

It comes as a considerable shock to many museum vistors that the hippopotanus they are admiring, or the brilliantly coloured parrot fish on the screen before them, is a model and not the original animal; there is much of the trophy collector's instinct in most human beings, but it is clear that museum tech-

AMERICAN MUSEUM OF MATURAL HISTORY Fig. 7 — "The Akeley Doe," modelled by James L. Clark under the direction of Carl E. Akeley, 1902

niques must aim at the most effective and lifelike representation of animals and plants, and must disregard the human failing that values a scrap of cloth from the Wright aeroplane above a completely accurate working model. The difficulty lies, perhaps, in a confusion of the quite incompatible aims of historical and scientific museums.

### TAXIDERMY TECHNIQUES

All the early books published on this subject, such as R. A. F. Redamurs' Treatuse (1749) and the guides and instructions on collecting and preserving natural history specimens, by E. Donovan, W. Swaisson and Capitan Thomas Bisown, are quite out of date, and are interesting only from a historical point of were for work in the field, the instructions issued by the different nuseums in their publications are of great assistance to the sportsman and collector. As regards the actual mounting, the work is so intricate and requires such special training that it is rarely undertaken with successful results by amateurs. A few works have been published dealing with this branch of taxdermy and the reader will find much that is helpful in John Rowley's Taxdermy and Museum Exhibition, an account of American taxidence methods.

Taxidermy may be considered under two separate headings (1) the skinning and preserving of specimens and (2) the mounting of such specimens in as lifelike attitudes as possible. It should be noted that only a very small number of the animals skinned and preserved are set up, or mounted; the great majority go to swell the large study collections maintained in museum.

and private collections, as so-called study skins

Birds .-- As soon as the specimen is collected, wine off all blood and dirt on the feathers, then plug up the mouth and nostrils with cotton to keep the blood and body juices from running out and staming the feathers Colour notes of all fleshy parts should be made, also a notation of the colour of the eyes, bill and legs The skinning of birds is accomplished by first making an incision along the breast, starting at the tip of the breastbone to the vent. The skin is worked down each side of the body to the legs, which are detached at the knee joint, the tail is next severed close to the body and the skin worked down over the back to the wings. Wings are disjointed where they join the body, and the skin is then worked down over the neck to the base of the skull, turning it inside out as you work. The skull is skinned out, first cutting away the ears, close to the head, then the eyes and down to the bill. The body is severed from the skin at the base of the skull, where the skull joins the neck; the skull is cleaned of all muscles, and the eyes and brain are removed Wing and leg bones and the base of the tail are cleaned of all flesh, muscles, etc. The skull, wing and leg bones and the base of the tail are left attached to the skin and are used in the mounting of birds. On some of the larger headed birds, whose skulls are too large to allow the neck skin to be turned over, it is necessary to make an incision along the top of the head, large enough to skin the skull through; also a cut will have to be made on the underside of the wings to allow the muscles of the wings to be removed The tendons found in the feet and legs will also have to be pulled out Powdered borax is used as a preservative on the skin. It is sifted on as soon as the opening incision is made, and the skin is allowed to absorb as much as possible throughout the entire skinning operation. The skin is prepared for mounting by removing all tissue and scraping the inside along the feather tracts. separating each feather at the base. It is then washed thoroughly with soap flakes and warm water, degreased in alcohol and benzine. To preserve the skin, it is immersed in a saturate solution of borax water, allowed to drain and the feathers dried and

Measurements from the natural body are taken, the specimen is sexed and the condition of the body noted. The artificial body is made of balsa wood, it being carved and shaped to the exact size of the natural one. The artificial neck, made of fine tow, is built on the balsa body, with a wire to hold it and the skull in position. Composition is placed in the eye sockets and the skin turned rightside out. Legs, tail and wings are wired, then cotton or tow is wrapped around the wire and bones to represent the muscles which were removed. The artificial body and neck are placed in the skin. The wings, legs and tail are anchored securely in their proper positions, and the moiston is sewed together.

The bird is now "set up" on its base, or a natural branch, and is held there by the wires extending from the feet. It is shaped

146

into a natural and lifelike attitude and the feather pattern is adjusted into place. Glass eyes of the proper colour and size are set in place and the feathers are arranged in position with wires, pins and thread. After the bud has dired for several weeks, depending upon the size and climate, all thread and portuding wires and pins are removed. When the faded parts are restored with oil paints, the specimen is completed.

Mammals—After a mammal is collected, many different measurements from all parts of the body must be recorded before the animal is skinned the total length, length of tail, of each foot and leg, distance from the up of the nostrit to the eyes and ears, crumference of different parts of the body and legs,

In skinning smaller mammals, only one incision is made, from a point between the front legs to the vent. The skin is then worked down each side of the body, cutting away the flesh close to the skin, when the legs are reached, they are disjointed from the body in much the same manner as in the skinning of birds. The tall is removed in one piece by pulling it from the skin Then, by turning the skin inside out, the body and skull are removed, the skull being cut away from the skin where it joins the guins or teeth.

With the larger mammals that are to be mounted, the skinning operation is somewhat different After all detailed measurements are taken, the opening cut, on all the horned mammals, is made from a point between the front legs, down the middle of the belly to the tip of the tail Another cut is made up the back of the neck, starting at a point between the shoulder blades to the base of the horns, or antlers An incision is next made up the inside of each leg, starting at the bottom of the foot, joining the belly cut, the skin is then removed as cleanly as possible, leaving no flesh or fat on it. It is skinned down over the body, legs and tail, then over the head, cutting away the ears, eyes and nostrils close to the skull and, on the horned mammals, loosening the skin from around the base of the horns. Attention must be given to the feet, eyes and lins, splitting them open so that these parts will not spoil and let the hair slip. The skin is then thoroughly salted, folded fleshside in and allowed to dry in a cool, dry, shady place. The skull, leg bones and pelvis are cleaned of all flesh and muscles, then dried and kept for future use in the mounting of the mammal. Sometimes the entire skeleton is cleaned and saved, especially if the anatomy of the mammal is not too well known.

Before mammal skins can be mounted, they must be tanned or leathered, which is a complicated and detailed process (see LEATHER). After the skins are tanned and properly poisoned, they will not crack, nor will the hair ever fall out

In the mounting of smaller mammals, the process is somewhat similar to the mounting of birds. An artificial body is built, the legs and tail are wired, and the body is placed misde the skin. Legs, tail and skull are anchored in place, the skin is sewed together and the mammal is given a lifelike stitlude.

The mounting of larger mammals requires a thorough knowledge of anatony Before the taddermis attempts to mount any specimen—bird, mammal, fish or reptile—he must be familiar with its habits and the different attrudes it assumes under various conditions. As a guide and help when modelling mammals, as soon as the animal is collected, plaster-of-Paris casts are made, in the field, of all important parts of the body before and after removing the skip.

An armature or framework is first constructed, following all measurements taken and using the skelcton, "setting" it up in the shape desired in the finished mount. Over this armature, modelling clay is applied in working out all anatomy and details; each muscle is put in its proper place and the clay model is built up to the correct lifelike size and shape. A plaster-of-Paris piece mould is then made over this clay model, in sections, so that it will come apart after the plaster has set The mould is removed, and a "manikin" is then built into each section of the mould by glueing in several layers of burlap. Iron rods are anchored up the inside of each leg in the manikin to support the animal after it is completed. The different sections of the mould are then

wired together, and the burlap manikin is allowed to dry inside the mould for several days After wetting the mould with water. it is broken up, leaving an exact copy of the animal's body in this light, hollow, burlap form. The manikin is covered with composition, the tanned skin is fitted, glued and adjusted into place, and the skin is sewed together. Glass eyes are set in and all details and anatomy of the nostrils and lips are modelled directly, the composition taking on the form and holding the expression of the face as modelled Antlers and hoofs are cleaned and oiled, the han is combed and brushed in its proper place, and the mammal is allowed to dry Colour is restored to the faded parts of the skin around the eyes, nostrils and hps.

Fish.-Several methods are used in the mounting of fish, one in which the skin is mounted over a modelled form, another (used by many museums), called the casting method, in which the fish is reproduced in plaster of Paris, using the natural fins and tail In fish taxideimy, one of the most important steps is to restore the correct colours of the living specimen to the mount. As soon as the fish is taken from the water, accurate colour notes are made, and the measurements and outline of the body are recorded In skinning the specimen, it is laid out on its "show" side and the opening incision is made on the reverse side. Only one cut is needed, down the centre from a point back of the gill coverts to the tail The skin is carefully separated from the body so as not to disturb the scales, as they are easily worked loose, until the fins and tail are reached These are cut loose and the skin is worked down to the head, which is cut from the body. The head is cleaned and the eyes and cheek muscles are taken out. The gills are also cleaned but are left attached in the skull. The skin is cleaned, washed, dipped in alcohol and the preservative and it is ready for mounting.

Working from the measurements and other data, an artificial body is built over a centreboard; then this is modelled in the shape and form with excelsior and finally covered with composition After the cheek muscles are filled out with composition, the skin is pulled over this form and adjusted in position. Composition is also used at the base of each of the fins and tail and the skin is then sewed together. The specimen is laid out on a board to dry, the head, gills, fins and tail being held in position with wires and strips of cardboard, this giving them their proper spread and shape After the specimen has dried for several weeks, all wies, cardboard, etc, are removed, glass eyes of the proper colour are set in and any depressions in the body are filled out with modelling wax. The fins and tail are reinforced with cloth and tissue, the specimen is shellacked, then painted, following the colour notes taken. The casting method gives a more natural reproduction and will remain a truer mount in years to come, as to form and colour. After the colour notes have been taken, the fish is opened in the "off" side and filled in with clean sand or corn meal to "build-out" the sunken belly. It is then posed sand or corn mear to "pund-out" the sunsen peny. It is shall possed in position and sponged off with alum water to remove the mucus which covers all fish. A mould is carefully made by pouring plaster of Pans over the specimen and removing the plaster as soon as it has Fins and tail are cut from the body, spread and dried into the shape in which they are later used

After the plaster mould has dried, a separator is painted on the inside, over the detail, and a thin layer of the plaster is poured in inside, over the detail, and a thin layer of the plaster's popured and backed with fine-cut tow. This plaster is allowed to set, the mould is soaked in water and is then broken away from the case in their natural positions, and the back of the cast is about up with when the back of the cast is built up with we mesh and libre, mixed with plaster, Glass eyes are set in place, and any rough spots found on the cast are "pointed up", the original colours are then restored to the cast with oil paints.

Reptiles.-Great advances have been made in the preparation of reptiles. No other method has been so revolutionary in its technique replies. No other memor has been so revolutionary in secunique since the dermoplastic method was developed for the mounting of mammals. There are still many museums and all the commercial taxidermists who mount the skms of reptiles, but the reproduction method has been outstanding in its results.

Where the skin is used, it is first removed from the body, cleaned of all the flesh, washed and poisoned. An artificial body is built which conforms to the natural one. The skin is then pulled and a justed over this artificial form. It is allowed to dry, glass eyes are set in and the natural colours are restored with oil paints.

In the more modern reproduction method, colour notes must be taken as soon as the reptile is collected, they must be accurate, as a great deal of the success in the finished specimen depends upon these notes. The reptile is posed in position and plaster of Paris is poured and brushed over it to make a true and accurate mould, transferring

all the detail, contour and anatomy of the original body to the plaster. A great deal of care must be exercised in making this plaster mould, which is sometimes in sections so that it will come apart. After the plaster has set, the reptile is removed and the work of making the reproduction takes place inside this mould

The reproduction is made of clear plastic, it is celluloid dissolved in one of its solvents—acetone, butyl acetate, anyl acetate—to form the body material. Oil pigment is then added For each colour ecoded when the notes were taken, a separate batch of coloured liquid celliquid must be made for the reproduction

Following carefully the colour notes and the preserved body of the rollowing carefully the colour notes and the preserved body of the repulse, which is saved for compareson and study, the undermust paints or the saved for compareson and study the undermust paints or the "lop" or pattern colour is painted in first, then the body or base colour is added This coloured collular material, as it is painted into the mould, takes on not only the colour and pattern of the repulse, but also the form and all details contained in the mould. Laying in these different colours requires a great deal of experience, time, care and patience. After all the colours are painted in, a backing of several different materials is worked into the mould for ing of several different materials is worked into the modul of stength, then the modul is land away to dry After thorough drying, which may take several weeks or months, the specimen is immersed in water and the plaster is broken away from the reproduction. It is then cleaned with water, brushed with a wire brush. Glass eyes are set in and the reproduction is oiled and placed on its base

This method of reproducing reptiles not only gives a truer form and anatomy, but preserves the translucency of colours found in the scales of all reptiles (J W M)

TAXIMETER, a registering apparatus used on taxicabs to compute the fare for riding and waiting time and for the recording of extras In addition it includes a series of counters that accumulate the fares that were recorded, and the paid and total mileage for the taxicab owner's information

The fare-indicating device in the meter is operated by a flexible shaft to record distance travelled and a clock to record waiting time, but only one of these means can operate on the fare drums at one time. The meter is put into operation by the movement of the flag which has three positions: vacant, hired, not recording, the not recording position meaning that waiting time is not recording and is used when the passenger is paying his fare or when a tire is being changed, etc. A fourth position known as double tariff is sometimes used in Europe and South America. In this position it will record at a higher late of fare and is used as a night rate. The meter is driven by a flexible shaft from the speedometer outlet at the transmission, and a reduction box is provided that reduces the flexible shaft speed to approximately 60 revolutions per mile Change gears are provided under the meter to compensate for difference in tire diameters.

Meters are also built that issue a receipt to the passenger for the fare paid and print a record of the fare and mileage on each trip for the owner's information. (B, C, P.)

TAXONOMY. The science of classification in a broad sense, usually restricted to biological classification and specifically to the classification of plants and animals. Taxonomy is thus the methodology of systematic botany and zoology, and sets up systems for the arrangement of the kinds of plants and animals in the form of hierarchies of superior and subordinate groups. Plant life as a whole and animal life as a whole are referred to as the plant and animal kingdoms; the subordinate groups are successively the phylum (the phyla are the main subdivisions of the kingdom), class, order, family, genus and species, each such cate-gory including one or more of the groups next subordinate to it. The more elaborate further subdivisions within this hierarchy are employed only when a comprehensive classification of a group of animals or plants is drawn up to express all that is known about the degrees of relationship of the component groups Such an elaboration of the system may result as shown on the following page (after G. G. Simpson, 1945).

The purpose of taxonomy is to develop a convenient and precise method of classifying human knowledge, and thereby preserving knowledge and making it accessible A classification based on extended examination, description and comparison of the forms of life, becomes in fact a short expression of a vast amount of the data of animal and plant structure (See articles Botany and Zoology)

The necessity for naming the systematic categories (many of which are recognized in common speech), and for establishing a comprehensive and accepted nomenclature for the kinds or species of animals and plants produces an initiate relation between taxonomy and zoological and botanical nomenclature (see Zoo-LOGICAL NOMENCLATURE).

Taxonomy depends on descriptive biology for its materials, but most descriptions of plants and animals, and most alterations of the system of classification, are now need with a little work set up by the taxonomists of the past. This work set up by the taxonomists of the past. This considerable with the slow growth of some two centures of proposal and critique in the pre-Darwanna era, the categories of the classification of the past of the pre-Darwanna era, the categories of the classification of organisms tends toward a more and more exact reflection of organisms tends toward a more and more exact reflection of their natural relations, s.e., of their phylogeny (see Animals, Phylogeny or the control of

The basic method of taxonomy is to compare and weigh the characteristics of the structure of plants and animals by the methods of comparative anatomy, and to interpret the major subdivisions in the light of comparative physiology and embryology. Systems of classification based upon a single set of characters, or drawn up from a single viewpoint, must be reinterpreted by the study of all available knowledge of the forms concerned. At the level of the species and subspecies every type of variation requires examination

Classification may begin purely as a matter of convenience, as was the case with early botanical classifications, which developed on account of the use of herbs and plant products in medicine Such classification may be entirely "articlal," being bissed on the more readily observable distinctions rather than on the more fundamental differences. Indeed, the distinction between an artificial and a natural classification was necessarily obscure in the calcular before C. Darwin With general acceptance of the theory of evolution, it became more and more "convenient" to have the classification reflect the natural (i.e., phylogenetic) relations of the organisms concerned. Systematic zoologists and botanists are still often driven to the identification of animals by means of "artificial keys," in which the features employed for the distinction of groups, and for the distinction of one form from another may be quite arbitrary, and be limited to the supericlical and read-

aly observable characteristics (referred to by taxonomists as "characters". Oute unnatural juxtaponitions result from the use of such characters Artificial keys are a necessary device for rapid identification, but are not to be regarded as classifications. The results of the control of the control of the control of the control (evident in much popular birdstudy) in which animals are referred to as if they had evolved into distinct species solely in order to be identified by taxonomists

The basic units of the classificatory system are the readily recognizable kinds or species of plants and animals. Some of these are contrasted as distinct in common knowledge, like the hoise and the ass, or white oak and red oak. These instances also illustrate the first step in the process of classification, the grouping together of the various single-hoofed animals related to the horse (horse, ass and zebra) as the horse genus, and similarly the grouping of acorn-bearing trees into the oak genus. By the simple device of combining the name of the genus with that of the species, the resulting names carry with them this much information as to the relationship of the animals named, and allow for additional species to be named if any remain to be discovered. This is done in the vernacular of many languages when a series of species is as readily recognizable as a group as are the oaks, the horse tribe or the common squirrels, but for the less familiar animals, and to establish a critical and international nomenclature, the technical scheme of generic and specific names in Latin, established by C Linnaeus in the 18th century, has proved satisfactory and has in fact greatly stimulated the exploration of the world for the distinguishable kinds of plants and animals

The merit of the Limnean system lay and hes in uts sutability for continued emendation as well as expansion in the light of increasing knowledge, without loss of its essential character. A large proportion of our knowledge of plants and animals comes to be correlated with the system of classification. The amplification and correction of the classification is a continuing active function of taxonomic research, and this is essentially the method of science as applied to any field of investigation.

The thoughtful definition of species by A. E. Emerson ("Taxonomy and Ecology," Ecology, vol. 22, p. 213 [124], Ecological Society of America) as "an evolved (and probably evolving) genetically distinctive, ieproductively solated, natural population requires only the extension of practical use, and becomes more understandable by the examination of the existent diversity of plant and animal life.

As the knowledge about the variability of species increased, and when species began to be studied as populations, it was realized that the collecting of specimens constitutes only a method of sampling. A subordinate category for series of animals that had been thought of as species, but which were found to be connected by transitional (or intergrading) populations—the subspecies—was found to be essential.

Geographic gradients of variation, eithei uniform or separated by "steps" as topographic, climatic or other harriers, form an important aspect of variation within species to be considered in atxonomy. A classical example as afforded by the Bergmann rule that warm-blooded animals become larger to the north and smaller to the south, essentially in association with the temperature gradient. Such gradients of variation are termed climes (Julian Huxley), and those in which there are interruptions or irregularies are referred to as step-clines. To distinguish as named subspecies the segments of a uniform variation gradient appears to be fallacious. The segments of a step-cline, however, may correspond exactly to a series of subspecies defined on other grounds.

The "subspecies" of zoological systematics is defined essentially on a geographic basis, and is derived from the Linnaen concept of "variety" subordmate to the species. The term variety has been used to cover so great a diversity of variation, including equally mutation, phenotypic variation and geographic form, as to be useless in a precise taxonomy. The transition to the subspecies concept in botanical nomenclature has lagged behind that m zoology. A great variety of infraspecies terms has been proposed, and is useful in the analysis of variation (cf. G. C. Robson and O. W. Richards).

Turning again to the species level, a most important clarification of the concept lies in the recognition that purely morphological definition must be subordinated to the insight that the species is composed of populations in which variability is inherent. The "closet naturalist" was (on is) exposed to the fallacy of describing variant individuals as species. Much of modern taxonic investigation is occupied in the essential re-evaluation of the work of earlier taxonomists, bringing to beat on classification on timerely the information from more adequate collections and anatomical study, but drawing upon embryology, physiology, genetics, psychology and geography

Re-examination on the basis of larger collections (i.e., a better sample) may unite a whole series of supposedly distinct forms into one, or may distinguish forms that had long been regarded as a single variable subspectes. A few species have now been subjected to exhaustive genetic analysis, especially among the fruit files of the genus Drosophida, and such analysis throws much light on the problem of definition of species, though it is obviously impossible to extend detailed genetic examination to more than a few forms.

The morphological characteristics distinguishing genera are ordinarly (but not necessarily) more sharply defined than those distinguishing species, and the distinctions between genera are to be thought of as having an origin more remote chronologically and those between species. Thus the concept of the genus comes to have essential importance to nalecontology.

So many genesa are familiar in ordinary thought and language, like the oaks (Quercus), the maples (Acer), the cats (Fex), some of the squirrels (Scurus), etc., that there should be no difficulty in the wider application of the concept of the genus as a natural group of related species. Definition of genera by means of characters thought to be of "generic value" may bead or arbitrary and unnatural assortment of species. The synthetic assortment of known species into their evident groups, as if they were building blocks, thus becomes an extremely important check on generic dassification. It is found that characteristics suitable for the definition of genera in one group may be useful only in the distinction of species in another.

When the number of species of a genus is large, these may fall min subordinate groups, which are referred to as subgener as business of the subgeneric group may be merely an artificial assemblage of species, serving to break a long series of forms into more convention smaller ones, when the subgeneric group is a natural one, the distinction from the genus may be mainly that between the used of the "splitter" and the "lumper". The splitter focuses his attention on differences, and emphasizes or overemphasizes then, while the lumper attends mainly to resemblances, and may overemphasize these in his turn

The study of fossi remans of both plants and animals obviously introduces the dimension of time into variation, and this affects all of the categories, and would complicate the distinction of the groups of lower rank even more were it not for the study that the gaps in the palaeontological record supply convenient agaps between the species and genera. As palaeontological accumulate, important modifications of the classification of the huber groups become necessary (see below)

The recognition that the geographic series of subspecies, comnected by intergradation where they meet, or simular series with overlapping variation (as on chains of islands) are matched by such as led to the concepts of the "Formenkreis," "Rassenkreis" and "Artenkreis" The component forms of such series may be thought to have originated by parallel rather than by divergent evolution. Ernst Maye clarifies this problem by the distinction of species as sympatric, if their areas of distribution overlap, and allopatric, for the series of forms, or "Kreise," if their geographic ranges are distinct

### THE HIGHER GROUPS

Just as such sharply defined species as man, the lion or the peacock, and such readily recognizable genera as those of the oaks, the maples, the cats or the common squirrels, serve to in-

troduce the words "species" and "genus" in the more precise sense of taxonomy, common knowledge is found to be reflected in the language for some of the larger divisions at the other end of the system of classification The primary division, into the plant and animal kingdoms, appears in various languages as well as in English Except for a few groups like the sponges, birds and ferns, the ordinary words for the phyla and classes usually fail to correspond precisely with the more exact zoological and betanical definitions

The taxonomy of the higher groups may be pursued analytically, beginning at the top and searching for the successive subdivisions of the two kingdoms, or it may be studied by the synthetic method, beginning with the mote factually defined groups nearer the bottom of the scale, and especially with the genera The arrangement of the groups above the species level has involved all of comparative anatomy and embryology, with much involved and of comparative anatomy and embryology, with much malasentology.

The difference between an artificial and a natural classification of the higher groups rests primarily on the distinction between analogy and homology The discernment of both homology and analogy in the structures of animals closely or remotely related forms the contribution of comparative anatomy to taxonomy The fundamental distinction of the homologous from the analogous may be far from simple, and even the definition of the terms becomes obscure in the light of embryology and genetics. As wings, the wings of a bird and of a bat are analogous, and not homologous, and must be presumed to have arisen independently and not one from the other As fore-limbs, the wings of a bird and those of a bat are plainly homologous, as they are also with the arm of a man or the fore-leg of an elephant, and support other evidence as to the relation of these several forms as "Vertebrata" In a broad sense, homology may be of quite a different type, like the correspondence between the alternating generations of ferns and flowering plants so brilliantly demonstrated by W F. Hof-

Homology of structures, essentially, predicates the common unheritance of the characters under consideration, while independently derived structures that resemble each other are said to be convergent or parallel. "Structural similarity is indicative of common phyletic origin, and as a rule its degree is proportional to the nearness of the common ancestry" (G. G. Simpson). The exceptions to this rule, and the reinterpretations made necessary by such exceptions, afford the major problems of phyletic comparative morphology.

The successive addoctination of the series of groups, with steadily increasing number of the lower categories in most types (not in all) is reflected in the familiar companison with a branching fire, with it is reflected in the familiar companison with a branching fire, with it is reflected in the familiar companison with a branching fire, with visit to the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the principal groups of animals, the phylin, appear in the carliest known fossil-berning string.

The exact relations of branch to branch or of branch to trunk are unknown, being for the most part lost in the imperfections of the palseontological record; there are accordingly numerous groups at every level in the classification that are regarded as equivalent, and much effort has been expended to make them reasonably so. It may be pointed out that much difference of opinion over taxononic groups in general applies to their rank in the hierarchy rather than to their validity as definable groups.

It may be pointed out that many of the intermediate group, especially the orders and families, are essentially the estimate of evolutionary specialization in a single direction (like the orders for the inchirposium sor whales, or the family of sea sunkey). An entirely included the control of the control o

gories under the same names is evident in the difference between the grades "order" and "family" in an ancestral group like the Reptilia, and a derived group such as the Mammalia.

An essential problem is introduced by palaeontology in groups in which the evidence of ancestral approximation (at the point of dvergence of the branches of the phylogenetic tree) has been discovted by the problem of the problem of the problem of the prosecond with their lister dereved and more distinctive descendent, in a "vertical classification," or with the primitive forms of the other branches to which they may be more closely striller in actual morphism of the problem of the problem of the problem of the genetic and morphological definition of groups is notably exemplified by the early Tertary smastery of horses, shonceroess and tapris

Since some classification is executal for the establishment of scientific botany and coology, taxonomy in its organs is the most elementary of disciplines. The record-keeping function of taxonomy affords an essential continuing service to all of the related belongical sciences Assembly and the second of the continuing service to all of the related belongical sciences Assembly to the second of the continuity of the second of the continuity of the second of the

this amply justifies Hunley's tulte of 1949 "The New Systematics Buttleonarys —Alfred E. Emerson, "Taxonomy and Ecology," Reloley, vol 2x, p 213, (1941), Julian Huvley, The New Systematics (1940), Ernst Mayry, Systematics and the Origin of Species (1942), G. C. Robson and O. W. Richards, The Variation of Animadis in Nature (1945), George Gaylord Simpson, "The Principles of Classification and a Classification of Mammals," Bull. Amer. Min. Nat. Hist, vol 38 (1943).

TAY, the longest river in Scotland. From its source in Ben Lui (3,708 ft), a mountain on the borders of Perthshire and Argyllshire, it flows northeast to Logierait, where it curves to the south by east as far as Dunkeld; there it turns southeast to the mouth of the Isla, where it bends southwest to the vicinity of Scone. From this point it makes a sharp descent southeast beyond the county town, where it sweeps to near Newburgh in Fifeshire; here it faces the northeast again as far as Broughty Ferry, whence it flows straight eastward into the North sea, off Buddon Ness in Forfarshire, after a total run of 117 mi. During the first 11 mi. it is known as the Fillan and discharges into Lock Dochart. From the lake it emerges as the Dochart (13 mi.), which enters Loch Tay at Killin. Flowing through the loch for 144 mi. it issues at Kenmore under its proper name of Tay. With its tributaries it drains all Perthshire and portions of Forfarshire and Argyllshire, having a catchment basin of 2,400 sq m1 In many parts the current is impetuous, and in flood has occasionally wrought much havoc. Its mean discharge of water every minute is estimated to be larger than that of any other stream in the United Kingdom.

Vessels make Dundee at all stages of the tide, and the estuary is navigable to Newburgh by vessels of 500 tons, and as far as Perth by ships of 200 tons. The navigation, however, is seriously obstructed by shifting sandbanks. The estuary varies in width from ½ mi. at Cairniepser Ferry to full 3 mi. at its mouth. The first railway viaduct across the firth, opened in 1877, was blown down along with a train in 1879. The second bridge, 2 mi. and 73 yd. in length, was erected 50 ft. higher up stream and opened in 1887. The Tay is famous for salmon

TAY, LOCH, the largest lake in Perthshire, Scotland. It is situated about the middle of the county and has a flatened oges form, with a general trend from northeast to southwest. It is rad, mi, long from Killin at the head to Kemmore at the floot, from \( \frac{1}{2} \) mit to fully r mi, wide. It receives at Killin the rivers Lochay and Dechart and discharges by the Tay at Kemmore. Ben Lawers (3,984 ft.) rises near the left blank. There are piers at Killin, Ardeonaig, Lawers, Ardelnaig, Farnan and Kemmore, at which the steamers call during the tourists season. At the foot of the lake is an island containing the ruins of the priory which was founded in 121 by Alexander 1 in memory of his wife Shyllad, daughter of Henry I. She was buried there. Loch Tay enjoys great repute for its salmon fishing.

TAYABAS, a municipality (with administrative centre and 46 barries or districts) of the province of Tayabas, Luzon, Philippine Islands, about 8 mi. north of Lucena, the provincial capital. Pop.

(1939) 18,172 (a gain of 3,189 aften 1918) of whom 9,182 were males and five were white Tayahas, which was the provincial capital from the middle of the 18th century until 1901, is situated on the slope of the extinct volcano, Banájao, and commands a fine view of the surrounding country. The chief agricultural products are palay (race) and conounts. Hatmaking is a household industry which has attained considerable importance. Tagalog and Bikol are the principal vernaculars. Of the inhabitants aged 6 to 19 inclusive, 41.4% attended school in 1939, and 66.2% of the population 10 years old and more was literate. (C S  $\upmu$ )

TAYGETUS, the highest mountain in the Peloponnesos, separating Laconia from Messenia, and traversed by the steep Langada pass The highest point is Hagios Elias (7,897 ft).

TAYLOR, ANN (1782-1866) aftervard Mrs Joseph Gilbert and TAYLOR, JANE (1783-1824), English writers for children, daughters of Isaac Taylor (1759-1829), were born in London Jan. 30, 1782, and Sept. 23, 1783, respectively. In 1786 the Taylors went to live at Lavenham in Suffolk, and ten years later removed to Colchester Jane was a lively and entertaining child, and composed plays and poems at a very early age Their father and mother held advanced views on education, and under their guidance the girls were instructed not only in their father's art of engraving, but in the principles of fortification. Ann introduced herself to the publishers Darton and Harvey by a rhymed answer to a puzzle in the Minor's Pocket Book for 1799, and Jane made her first appearance in print in the same periodical with "The Beggar Boy." The publishers then wrote to Isaac Taylor asking for more verses for children from his family, and the result was Original Poems for Infant Minds (2 vols, 1804-05), by "several young persons," of whom Ann and Jane were the largest contributors The book had an immediate and lasting success They followed up this success with Rhymes for the Nursery (1806), Hymns for Infant Minds (1808, 2nd ed 1810), Rural Scenes (1806); City Scenes (1809); a less-known collection, Signor Topsy Turvy's Wonderful Magic Lantern; or, The World Turned Upside Down (1810), and Original Hymns for Sunday School (1812). In 1813 Ann married a Congregational minister, Joseph Gilbert, and Jane went to live at Ilfracombe with her brother Isaac. In 1816 Jane returned to Ongar, where the family had been settled for some years, and died there on April 13, 1824 Ann Gilbert died at Nottingham on Dec. 20, 1866. Both sisters wrote after their separation, but none of their later works had the same vogue

The best edition of the Poetical Works of the sisters is that of 1877 There is an excellent edition (1903) of the Original Poems and Others, by Ann and Jane Taylor and Adelaide O'Keeffe, edited by E V. Lucas, with illustrations by F. D Bedford (1903).

TAYLOR, BAYARD (1825-1878), U.S. author, was born of English and German stock in Chester county (Pa ), Jan 11, 1825. He published at Philadelphia in 1844 a little volume. Ximena; or The Battle of the Sterra Morena, and Other Poems Remuneration for his poetry on a scale generous for the time and advance payments for travel letters by the publishers of the Saturday Evening Post and the editor of the United States Gazette, as well as a conditional engagement by Horace Greeley. made it possible for him to take (1844-46) the coveted trip to the old world which was his university education. His study in Germany and his happy roaming through Scotland, England, France and Italy are described in his Views Afoot (1846), which went through a number of editions. After a brief period of country journalism Taylor moved to New York city. The year 1848 brought him several lucrative magazine and newspaper offers, the most important of which was with the New York Tribune. The excitement of the gold rush at this period was responsible not only for his passionate Californian ballads but for his trip to the Pacific

Eldorado (2 vols , 1850) The wanderlust was in his blood His trips to almost every part of the globe continued until the end of his life, and, although the popularity of his narratives of travel has diminished, his vivid pictures of remote places, such as A Journey to Central Africa (1854) or Northern Travel (1857), in their day won many readers

For several years his lectures were equally in demand Quiet was afforded him in his country home. Cedarcroft, in which he entertained hospitably and read and wrote copiously Some of the works of his later period are The Poet's Journal (1862), The Picture of St John (1866), the translation of Faust (1870-71), Home Pastorals (1875), and the novels Hannah Thurston (1863), Joseph and His Friend (1870) and The Story of Kennett (1866) As a novelist Taylor is undistinguished, as a poet he is at his best in the Poems of the Orient (1854) or his rich and sonorous rendering of Faust in the original metres

In 1862 Taylor had entered the diplomatic service as secretary of the legation at St Petersburg, and in the following year he became chargé d'affaires at the Russian capital His disappointment at not being made minister there, which caused him to leave the service, was atoned for by his being made minister to Germany

early in 1878 He died on Dec. 10, 1878

Taylor's Studies in German Literature (1379), and Critical Risays and Latery Novies (1880) were published positionarily Gollected editions of his Postscal Works and of his Dramatic Works appeared in 1880. Bendes co-operating with H. S. Endder in the publication of works and the proper of the property of the Continuity of the Continuity of the Continuity of the Continuity (1995). All Smyth has a good biography (1896), with bibliography

TAYLOR, BROOK (1685-1731), English mathematician, son of John Taylor of Bifrons House, Kent, was born at Edmonton in Middlesex on Aug 18, 1685. He was educated at St. John's college, Cambridge, and studied mathematics under John Machin and John Keill He obtained in 1708 a remarkable solution of the problem of the "centre of oscillation," which, however, remaining unpublished until May 1714 (Phil Trans, vol. xxviii, p 11), his claim to priority was disputed by John Bernouilli

Taylor's Methodus Incrementorum Dwecta et Inversa (London, 1715) added a new branch to the higher mathematics, now designated the "calculus of finite differences," Among other ingenious applications, he used it to determine the form of movement of a vibrating string, by him first successfully reduced to mechanical principles.

The same work contained the celebrated formula known as "Taylor's theorem" (see Calculus, Differential and In-TEGRAL), the importance of which remained unrecognized until 1772, when J. L Lagrange realized its powers and termed it "le

principal Jondement du calcul différentiel"

In his essay on Linear Perspective (London, 1715, revised ed 1719) Taylor set forth the true principles of the art in an original and more general form than any of his predecessors; but the work suffered from the brevity and obscurity which affected most of his writings

Taylor was elected a fellow of the Royal society early in 1712. sat in the same year on the committee for adjudicating the claims of Newton and Leibniz, and acted as secretary to the society from 1714 to 1718. From 1715 his studies took a philosophical and religious bent Taylor died on Dec. 29, 1731, at Somerset House, and was buried at St. Ann's, Soho. See also Taylor's Theorem.

TAYLOR, FREDERICK WINSLOW (1856-1915), U.S. engineer, was born March 20, 1856, at Germantown, Pennsylvania. In 1875 he was apprenticed as patternmaker and machinist in a small Philadelphia shop. As early as 1880 or 1881, while gang boss in the employ of the Midvale Steel company, controversy with workers led him to realize the necessity of accurate measurement of what constituted a day's work on any operation. This in turn led to a series of careful experiments resulting in important achievements in two fields; in mechanical engineering, the discovery with Maunsel White of a new method of tempering tool steel permitting metal-cutting operations at high speed (1898); and in the field of management, perfection of that system of shop management which later came to be known as scien-

coast as correspondent for the Tribune, which he recounted in tific management. The remainder of his life was spent in forwaiding the principles of this system, by practising the new profession of consulting engineer in management for many plants (1893-1901), lecturing and writing

(1603-1901), secturing and writing.

He died March 21, 1915, in the city of Philadelphia.

Taylor's writings include Notes on Belling (1801), The Adjustment Of Wags to Effective (1805), The Principles of Scientific Management (1906), The Principles of Scientific Management (1904), Car Brompoon, The Taylor, Father of Scientific Management (1931), C. B. Thompson, The Taylor, System of Scientific Management (1932), C. B. Thompson, The Taylor, System of Scientific Management (1932), C. B. Thompson, The Taylor, System of Scientific Management (1932), C. B. Thompson, The Taylor, System of Scientific gement (1917)

TAYLOR, SIR HENRY (1800-1886), English poet and political official, was born Oct. 8, 1800, at Bishop-Middleham, Durham After a few months' service in the navy he obtained a clerkship ashore. From 1824 to 1872 he held important appointments in the colonial office, where he rendered active assistance to Sir James Stephen in drafting the Act of Emancipation He died at Bournemouth March 27, 1886 Taylor was the author of several plays, of which Philip van Artevelde was the most famous His dramatic poetry is generally better than his lyrical work, but some of his lyrics, notably "If I Had the Wings of a Dove" have found a place in many anthologies.

Taylor's Autobiography (2 vols 1885) should be supplemented by his Correspondence (1888), edited by Edward Dowden. His Works

were collected in five volumes in 1877-78.

TAYLOR, JEREMY (1613-1667), English divine and author, was baptized at Cambridge Aug. 15, 1613. His father, Nathaniel, a barber, was a man of some education, for Jeremy was "solely grounded in grammar and mathematics" by him before he became a pupil of Thomas Lovering, at the newly founded Perse grammar school. Lovering is first mentioned as master in 1619, so that Taylor probably spent seven years at the school before he was entered at Gonville and Caius college as a sizar in 1626. He was elected a Perse scholar in 1628, and fellow of his college in 1633. He took holy orders in 1633, and took the place of Thomas Risden for a short time as lecturer in St. Paul's Archbishop Laud sent for Taylor to preach before him at Lambeth, and took the young man under his special protection. Taylor retained his fellowship at Cambridge until 1636, for Laud desired that his "mighty parts should be afforded better opportunities of study and improvement than a course of constant preaching would allow of," but he seems to have spent much of his time in London In November 1635 he and been nominated by Laud to a fellowship at All Souls, Oxford, where, says Wood (Athen Oxon., Ed. Bliss, iii, 781), love and admiration still waited on him. He seems, however, to have spent little time there He became chaplain to his patron the archbishop, and chaplain in ordinary to Charles I. After two years in Oxford, he was presented, in March 1638, by Juxon, bishop of London, to the rectory of Uppingham, in Rutlandshire In 1642 he was appointed to preach in St. Mary's on the anniversary of the Gunpowder plot, and apparently used the occasion to clear himself of a suspicion, which, however, haunted him through life, of a secret leaning to the Roman Catholic communion. This suspicion may have arisen from his intimacy with Christopher Davenport, better known as Francis a Sancta Clara, the learned Franciscan chaplain of Queen Henrietta; but was probably strengthened by his known connection with Laud, as well as by his ascetic habits. More serious consequences followed his attachment to the royalist cause. The author of The Sacred Order and Offices of Episcopacy or Episcopacy Asserted against the Aerians and Acephali New and Old (1642) could scarcely hope to retain his parish, which was not, however, sequestrated until 1644. Taylor probably accompanied the king to Oxford. In 1643 he was presented to the rectory of Overstone, Northamptonshire, by Charles I. There he would be in close connection with his friend and patron Spencer Compton, and earl of Northampton. Taylor seems to have been in London during the last weeks

of Charles I's life, and is said to have received his watch and some jewels which ornamented the ebony case in which he kept his Bible. He had been captured while besieging Cardigan castle on Feb. 4, 1645. He found refuge, as private chaplain, with Richard Vaughan, 2nd earl of Carbery (1600-1686), whose hospitable mansion, Golden Grove, Carmarthenshire, is immortalized in the tulle of Taylor's great manual of devotion, and whose first wife was a constant friend of Taylor. The second Lady Carby was the original of the "Lady" in Mitton's Comus. Mis. Taylor died early in 1651. His second wife was Joanna Bridges, said on very doubtful authority to have been a natural daughter of Charles I. She owned a good estate, though probably impoversished by parliamentariane exactions.

From time to time Jeremy Taylor appears in London in the company of his friend Evelyn, in whose dury and correspondence his name repeatedly occurs. He was three times imprisoned in 1654–55 for an injudicious preface to his Golden Grove, again in Chepstow castle, from May to Oct 1655, on what charge does not appear; and a third time in the Tower in 1657–58, on account of the indiscretion of his publisher, Richard Royston, who had adomed his "Collection of Offices" with a print 1epresenting Christ in the attitude of prayer

Much of his best work was produced at Golden Grove In 1646 appeared his famous plea for toleration, Θεολογία Έκλεκτική A Discourse of the Liberty of Prophesying In 1649 he published the complete edition of his Apology for authorized and set forms of Liturgy against the Pretence of the Spirit, as well as his Great Exemplar . a History of . . . Jesus Christ, a book which was inspired, its author tells us, by his earlier intercourse with the earl of Northampton Then followed in rapid succession the Twenty-seven Sermons (1651), "for the summer half-year," and the Twenty-five (1653), "for the winter halfyear." The Rule and Exercises of Holy Living (1650), The Rule and Exercises of Holy Dying (1651), a controversial treatise on The Real Presence . . (1654), the Golden Grove; or a Manuall of daily prayers and letames . . . (1655), and the Unum Necessarum (1655), which brought upon him the accusation of Pelagianism In reply to a request from Katherine Phillips (the "matchless Orinda"), he wrote his Discourse of the Nature, Offices and Measures of Friendship (1657). His Ductor Dubitantium, or the Rule of Conscience . . . (1660) was intended to be a standard manual of casuistry and ethics for Christian people.

He probably left Wales in 1657, and his immediate connection with Golden Grows seems to have caused two years earlier. In 1658, through the kind offices of his friend John Evolyn, Taylor was offered a lectureship in Lisburn, Ireland, by Edward Conway, second Yosount Conway At first he declined a post in which the duty was to be shared with a Presbyterian, or, as he expressed it, "where a Presbyterian and myself shall be like Castor and Pollux, the one up and the other down," and to which also a very meagre salary was attached He was, however, induced to take it, and found in his patron's manison at Portmore, on Lough Neigh, a congenial retreat

At the Restoration, instead of being recalled to England, as he probably expected and certainly desired, he was appointed to the see of Down and Connor, to which was shortly added the small adjacent diocese of Dromore. He was also made a member of the Irish privy council and vice-chancellor of the University of Dublin. None of these honours were sinecures Of the university he writes, "I found all things in a perfect disorder . . . a heap of men and boys, but no body of a college, no one member, either fellow or scholar, having any legal title to his place, but thrust in by tyranny or chance." Accordingly he set himself vigorously to the task of framing and enforcing regulations for the admission and conduct of members of the university, and also of establishing lectureships. His episcopal labours were still more arduous. There were, at the date of the Restoration, about 70 Presbyterian ministers in the north of Ireland, and most of these were from the west of Scotland, and hated episcopacy. The new bishop had nothing to offer the Presbyterian clergy but the bare alternative-submission to episcopal ordination and jurisdiction or deprivation. Consequently, in his first visitation, he declared 36 churches vacant; and of these forcible possession was taken by his orders. At the same time many of the gentry were won by his undoubted sincerity and devotedness as well as by his eloquence. With the Roman Catholic population he had no success. At the instance of the Irish bishops Taylor undertook his last great work, the Dissuasive from Popery (in two

parts, 7664 and 7667), but, as he himself seemed partly conscious, he might have more effectually gamed his end by adopting the methods of Ussher and Bedell, and inducing his clergy to acquire the Irish tongue He died at Lasburn on Aug 13, 1667, and was buried in the cathedral of Dromoie

Of a genuine poetic temperament, fervid and mobile in feeling, and of a prolific fancy. Taylor had also the sense and with at come of varied contact with men. All his gifts were made available for influencing other men by his easy command of a style rarely matched in dignity and colour. With all the majesty and stately elaboration and musical rhythm of Milton's finest piose, Taylor's style is relieved and braphtened by an astomishing variety of felicitous illustrations, ranging from the most homely and terse to the most dignified and elaborate

terse to the most digmified and elaborate

The whole works of . Jeremy Trylor with a life of the author and a critical examination of his workings was published by Bushole Regmaid Hebre in 1822, resulted after careful revision by Charles Regmaid Hebre in 1822, resulted after careful revision by Charles Frophetaying, Holy Liviug, and Holy Dying have been often reprinted by Dr. A. TAYLOR, JOHN (1580-1653), English pamphleteer, commonly called the "Water-Poet," was born at Gloucester Aug. 24, 1580. After fulfilling his apprenticeship to a waterman, he served (1596) in Essex's fleet, and was present at Flores in 1597 and at the siege of Cadiz On his return to England he became a Thames waterman, and was at one time collector of the perquisites exacted by the lieutenant of the Tower. He was an expert in the art of self-advertisement, and achieved notoriety by a series of eccentric journeys. With a companion as featherbrained as himself he journeyed from London to Queenborough in a paper boat, with two stockfish tied to canes for oars. The Pennyles Pilgrimage, or the Moneylesse Perambulation of John Taylor . . . how he travailed on foot from London to Edenborough in Scotland . . . 1618, contains the account of a journey perhaps suggested by Ben Jonson's celebrated undertaking, though Taylor emphatically denies any intention of burlesque. He went as far as Aberdeen. At Leith he met Jonson, who good-naturedly gave him 22 shillings to drink his health in England. Other travels undertaken for a wager were a journey to Prague, where he is said to have been entertained (1620) by the queen of Bohemia, and those described respectively in A very merry, wherry ferry voyage, or Yorke for my money, and A New Discovery by sea with a Wherry from London to Salisbury (1623). At the outbreak of the civil war Taylor began to keep a public house at Oxford, but when the royalists surrendered the city he returned to London, where he set up a similar business at the sign of "The Crown" in Phoenix Alley, Long Acre. He was buried in the churchyard of St Martin's-in-the-Fields on Dec. 5, 1653

Staty-three of Taylors' "works" appeared in one volume in 150. This was reprinted by the Spenner society in 1868-69, being followed by other tracts not included in the collection (1879-18). Some of his more amusing productions were edited (1872) by Charles Hindley as The Works of John Praylor. They provide some very entertaining reading. Mr Hindley edited other tracts of Taylor's in his Macciones Antique Angleson (1873).

TAYLOR, JOSEPH (c. 1586-1652), English actor, is mentioned in the follo Shakespaere of 1623 as one of the 26 who took principal parts in all of these plays. He was with the duke of York's company in 167c, but involved himself in a lawsuit with John Heming, by leaving them to join the Lady Elizabeth's in the next year. He appeared in the actor list of the latter company in The Honest Marks Fortune (1613) and The Coxcomb (1613). From 1636 he was one of the prince's company, but left they to join the king's men in 1619. He remained with them until he retired, playing several of Burbage's parts, including Ferdinand in The Duchess of Malfi, and Hamlet There is a legend that he was trained by Shakespeare to play Hamlet In many of F Beaumont and I Fletcher's plays he had a leading role, and he is one of the ten actors who signed the dedication of the first tolio of these dramatists (1647) He led the king's men, with J Lowin, after Heming and H Condell, and in 1630, after Heming's death, obtained two shares in the Globe, and one in the Blackfriars theatres. In 1630 he was appointed veoman of the revels. He died at Richmond, where he was buried Nov. 4, 1652.

TAYLOR, TOM (1817-1880), English dramatist and editor of Punch, was boin at Bishop Wearmouth, on Oct 19, 1817 He was a fellow (1837) of Trinity college, Cambridge, and for two years professor of English literature at University college, London He was called to the bar (Middle Temple) in Nov 1846, and went on the northern circuit until, in 1850, he became assist-ant secretary of the Board of Health On the reconstruction of the board in 1854 he was made secretary, and on its abolition his services were transferred to a department of the Home Office He retired on a pension in 1876. Four burlesques of Tom Taylor's were produced at the Lyceum in 1844. He made his first but with To Parents and Guardians (Lyceum, 1845) He also wrote some burlesques in conjunction with Albert Smith and Charles Kenny, and collaborated with Charles Reade in Masks and Faces (1852) Before the close of his life his dramatic pieces numbered over 100. amongst the best known of which are Our American Cousin (1858), produced by Laura Keene in New York, in which Sothern created the part of Lord Dundreary; Still Waters Run Deep (1855), Victims (1857), and the Ticket of Leave Man (1863).

Taylor wrote leaders for the Morning Chronicle and the Daily News He was on the staff of Punch until 1874, when he succeeded Shriley Brooks as editor He was a good amateur actor, an artist, and an art critic of The Times. He died at Lavender

Sweep, Wandsworth, on July 12, 1880.
TAYLOR, ZACHARY (1784-1850), twelfth president of the United States, was born in Orange county, Virginia, Nov. 24, 1784 Within the year his father, Richard Taylor, an officer in the Revolutionary War, made a new home for his family in Kentucky where Washington appointed him collector of the port of Louisville, then on the border and Spaniards and Indians were still a menace In this environment Zachary Taylor spent his youth, and gained what little schooling he was to enjoy from Elisha Ayres, a New England tutor, who was employed by the elder Taylor to ground his numerous family in the rudiments. In 1806 he volunteered during the difficulties caused by Aaron Burr's southwestern schemes and saw brief service. Two years later through the instrumentality of his relative, James Madison, and others, Zachary Taylor was given a commission by Jefferson as first lieutenant in the seventh infantry

In 1810 he married Margaret Smith (1788-1852) As captain and major he served through Harrison's Indian campaign and the War of 1812 in the northwest territory and at the close of the war temporarily left the army because reduction to peace-time strength had lowered his rank. However in 1816 President Madison reappointed him to his old rank and there ensued twenty years of garrison life at various posts, varied in 1832 by an expedition against Black Hawk. The outbreak of the Seminole War in 1837 found him an infantry colonel in the Northwest and soon orders came for him to take his command to the Everglades. In this bewildering warfare he spent three years gaining promotion to the rank of brigadier-general by brevet for his service in the battle of Kissimmee on Lake Okeechobee and receiving command of operations. He was able to make little impression against these Indian foes and in 1840 asked to be relieved. He was given command of the first department with headquarters in Louisiana, which enabled him to acquire a plantation at Baton Rouge and establish a home where he spent many intervals between tours of inspection. When Texas was acquired in 1845 it fell to him to protect the new possession and he was ordered by the War department to occupy the borders of Texas, by the spring of 1846 he

over 3,000 men and established Ft Brown The Mexican army was concentrated across the river with orders to drive the Ameiicans out of the contested area, the result was a skirmish on the American side of the liver, April 24, and war was immediately declared Taylor found himself in a precarious situation because of the exposed position of his base of supplies at Pt Isabel and while manoeuvring to protect this base he fought the Mexican army winning two victories at Palo Alto (q v ) and Resaca de la Palma (qv) on May 8 and 9, 1846 These victories sent the Mexicans across the river to Matamoras Taylor was unprepared to follow up his advantage so when he finally crossed the river and occupied Matamoras (May 18), the enemy had gone The news of these victories was received with great appreciation throughout the country and various persons including Whig editors and politicians began to see the possibilities of a presidential candidate in the victorious general Thereupon, because Gen Winfield Scott, commander of the army, was so slow in preparing to take active charge, President Polk placed Taylor in command of the invasion of Mexico and appointed him major-general at first by brevet and then in full rank. After slow preparations at Matamoras he moved in August to the head of navigation on the Rio Grande where he established a depot at Camargo and then set out for his first objective, Monterey September 21-24 witnessed a senes of vigorous skirmishes, heroic assaults and grave errors Taylor with little knowledge of military science or the use of artillery resolved to take the town by bayonet assault which caused considerable slaughter of his own men. But the fighting was so effective that on the third day the Mexicans agreed to surrender if they be permitted to retreat and be granted an eight weeks' armistice, subject to the approval of the respective governments. Taylor accepted these terms, and "Old Rough and Ready," was acclaimed once more throughout the land Vexations followed The War department began to make sug-

gestions as to the movements of his subordinates and the administration disapproved the armistice. These matters incensed Taylor who was becoming convinced that Polk and Marcy were trying to discredit him because of their political differences. He vetoed the plans for his subordinates, wrote a letter to Gen. Gaines criticizing the administration which later found its way into the press and brought down Marcy's rebuke, and moved on to Saltillo which he occupied Nov 16, deciding to take possession of the territory between that point and the sea-coast where Tampico had fallen into the hands of the navy. While carrying out these plans he received a letter from Gen Scott informing him that Scott was to lead an expedition into Mexico and, without divulging the plan, indicated that he would need most of Taylor's troops, requesting a meeting to perfect the details Taylor upon receiving this note decided that instead of meeting Scott he would go as far away as he could and accordingly went to Victoria which Quitman had lately occupied When Scott learned of this move, he contented himself with ordering the greater part of Taylor's troops to the coast to embark for Vera Cruz while with the remainder Taylor was to defend the occupied territory in northern Mexico Taylor protested to the War department and informed Senator Crittenden that he was a receptive candidate for the presidency. Reluctantly he led the remnant of troops left him by Scott back to Monterey, but instead of remaining there moved southward where word came that Santa Anna with 20,000 troops was advancing upon Taylor who had only a quarter of that number. The armies met at Buena Vista (q.v.), Feb. 22, 1847, and in spite of his lack of skill, his army inspired by his presence snatched a victory from defeat and the north of Mexico was saved At home, the feeling was general that Taylor had been stripped of his troops by a jealous administration and left to perform the impossible. This ended his military activity but his political availability increased.

Shrewd politicians had become increasingly convinced of his potentialities as a candidate. The Whig party was especially in need of a strong candidate to retrieve the defeat of 1844. Very early in the war, Thurlow Weed of New York began pushing him and popular enthusiasm made his task easier. His correspondence was skillfully handled; he was reluctant, he maintained, and with had moved down to the mouth of the Rio Grande with a force of truth, to be a seeker for the office; he had never voted and though

a Whig in sympathy was not an avowed partition. As a slaveholder, also he was certain to gain votes in the south where there was a good deal of suspicion that northern uniteness dominated the Wing manages. These advantages were sufficient to ensure success and in the Wing convention on the fourth ballot, Taylor won the normanton from Clay, Webster and Scott. An opportune split in the Democratic party ensured his victory and on March 5, 1849, he was manuranted ensured.

Few presidents have had less knowledge of what was expected of them. The new executive expected to be a nonpartisan president, leaving to congress all legislative matters and confining himself to executing the laws "With Col Bliss, in so-in-rlaw, to phrase his thoughts, he, at first, was more or less influenced in his policies by Vice-Pers Fillmore, but it was not long before the superior astuteness of Sen. Seward, Fillmore's rival in New York state, accompladed results. The new president became convinced that it was his duty to build up the Whing party by means of elever natronace, and deservine Whise becam to come into their own

With these preliminary lessons learned, Taylor found his most perplexing problem to be the status of the newly acquired territory. As a soldier he was anxious to see stable government established. In order to hasten this he authorized Congressman King of Georgia to go to California and urge an application for statehood When congress met, Dec 1849, the president had the pleasure of reporting that California was ready to become a state and that New Mexico would be soon He recommended the admission of Cahfornia and hoped that the slave issue would not be injected into the situation. When southern representatives objected because California had prohibited slavery, he resented their protests He declared himself willing to accept any law providing for admission, passed by congress and warned southern leaders that he would take the field if necessary to carry out such a law and hang any who resisted His attitude was the natural reaction of a military executive to those opposed to the regular process of law and order. Consequently he was not in favour of conciliating those opposed and referred contemptuously to the Compromise measures of 1850 as the "Omnibus Bill." In other respects his administration was not proving a sinecure; charges were made against his secretary of war. Crawford, to the effect that he had used his official position to pursue a claim successfully before the secretary of the treasury by which he benefited financially This charge involving the secretaries of war and the treasury as well as the attorney general, deeply mortified Taylor who prided himself on scrupulous honesty and he determined to reorganize his cabinet. Then came the fatal July 4, 1850, when exposure to the heat and injudicious eating combined with worry, aggravated an attack of typhus fever, which caused his death five days later. A combination of honesty, simplicity, determination and common sense had brought him successfully through a variety of difficult situations and by a strange turn of the wheel carried him to the White House. Taylor had six children, three of whom survived him. One daughter, Sarah Knox Taylor, married a young subaltern, Jefferson Davis, in 1835, surviving the marriage but three months. His only son, Richard Taylor (1826-1879) graduated from Yale in 1845 and after a short service in his father's camp, became a sugar planter and politician in Louisiana. At the outbreak of the Civil War he entered the Confederate army and served in various capacities, finally commanding an army

and serven in various capacities, many commanding an army which surrendered in May 1366, "Scachary Taylor" in Great Communication of the Communication of the Communication of the Mexican War (1968); Justin H. Smith, War with Mexico (1976); Frederick Bancrott, Wilson H. Seeard (1899). (R. F. N.)

TAYLOR, an anthractic running borough of Luckawanna Co.,

TAYLOR, an anthracite-mining borough of Lackawanna Co., Pa , U.S., on the Lackawanna river. Pop. (1950) 7,167.

TAYLOR, a city of Williamson county, Texas, U.S., 35 ml. N.E. of Austin, on the Missouri-Kansas-Texas and the Missouri-Pacific railways. Pop. (1950) 9071; (1940) 7,875. Taylor is a great inland cotton market. A large bedding factory, pecanshelling plants and other industries using local raw materials were established there.

Taylor was founded in 1876 and incorporated in 1882. It established a council-manager form of government in 1914.

**TAYLOR'S THEOREM**, the statement of a formula discovered by Brook Taylor  $(q \ v)$  in 1/12 and published three years later in his Methodus incrementorum directa et inversa (1715) It may be written in the form of an infinite series.

(1) 
$$f(x+h) = f(x) + hf'(x) + \frac{h^2}{2}f''(x) +$$

$$a = 1$$
,  $log_o(x+h) = O + h - \frac{h^2}{2} + \frac{h^3}{3} - \frac{h^4}{4} + \dots$ 

Taylor's formula with remainder may be written as a finite sum:

(2) 
$$f(x+h) = f(x) + hf'(x) + \frac{h^{n-1}}{(n-1)!} \int_{0}^{\ln(n-1)} (x) + R_n,$$
  
where  $R_n = \frac{h^n}{n!} \int_{0}^{\ln(n)} (x + \Theta h)$ , and  $\Theta$  is

a fraction between o and r Several other formulas have been devised for R<sub>\*</sub> Sometimes one of these may be used to check on the accuracy obtained by using a given number of terms of (r). Moreover, formula (2) is valid m some cases when formula (1) is not

Infimita (1) is not

TAYLORVILLE, a city of central Illinois, U.S., near the south fork of the Sangamon river, 25 mi. S.E. of Springfield, the county seat of Christian county, it is on state highways 29, 48 and 104 and is served by the Baltimore and Ohio, the Chicago and Illinois Midland and the Wabsha rialways.

The population was 9,188 in 1950 and 8,313 in 1940 by the federal census

Bituminous coal is mined near the city Agricultural products include soybeans, grain and dairy products, and there are poultry and other livestock farms Paper and paper products, tools and feed are manufactured

The Taylorville Municipal airport is 1.2 mi SW of the city The Breeze-Courier, a daily newspaper, was founded in 1894 and St. Vincent's hospital was established in 1006

Incorporated as a city in 1882, Taylorville established the mayor-council form of government The city became the owner and operator of a city waterworks

TCHEREPNIN, NICOLAI (1872-1945), Russian composer, was horn at S. Petersharq (Leningrad) on May 15, 1873. In 1895 he entered the St. Petersharq conservatory, where he studied composition under Nicolas Runsley-Korsskov. In 1997 he became professor at the St. Petershurg conservatory, and from 1909-12 he conducted for Sergel Dasphiley the ballet producer, in Paris and other cities. In 1914 he returned to Russia and was director of the conservatory at Trills; 1038-21 Trills; 1038-21.

He settled in 1921 in Paris, where he was director of the Russian conservatory, 1923-27 and 1938-45. He became president of the Conseil du Curatelle of the M. P. Belaieff foundation in 1938. His works include the ballets Le pavullon d'Armude, Naccissus and The Romances of a Munmy (1925); the opens and Vanha; orchestral compositions; and more than 200 songs. He died on June 28, 1945, in Paris

His son ALEXANDER TCHEREPNIN, born in St. Petersburg of Jan. 21, 180,0 became a composer and pianat. His pruncipal works include The Prescoss of Afonta, a ballet produced by Anna Pavlova in 1933, the open of 10 (1928), a number of compositions for chamber orchestra and more than 100 piano pieces. He toured extensively in the orient, Europe and the US.

In 1949 he was named professor of composition and piano at DePaul university in Chicago, Ill.

TCHERNAIEV, MIKHAII. GREGORJOVICH (1828-1898), Russian general, a member of a noble family, was born on Oct. 24, 1828. Educated at the Nicholas Staff college, he en-

Me Lon

tered the army in 1847 and distinguished himself in the Crimean War and in the Caucasus

After serving as divisional chief of the staff in Poland, he went to Orenburg in ±85 as assistant to the commander of the line of the Syr-Darya, and the following year commanded an expedition to support the Kurghtz tribes on the borders of the Sea of that against the Khuvans. He did duty on the staff of the army of the Caucasis for a time, and returned to Orenburg as chief of the Staff the Shrunars.

In 1864, having teached the rank of major general, he made his famous march with 7,000 men across the steppe of Turkestan to Chunkent in Khokand, to meet another Russian column from Semipalatinsk, in Siberia, in conjunction with which he successfully stormed Chimkent, and then unsuccessfully attacked Tashkent, so mi farther south. Wintering at Chimkent, he captured Tashkent the following year. This was contrary to his instructions, and although he was received in St. Petersburg with enthusasm, and presented with a sword of honour by the emperor, he was not again employed in the military service, and retred from it in July 1874

Tchernaiev bought, and edited with great success, the Russkiy
Mir in Slavonic interests, devoting himself to the pan-Slavic idea.

In the summer of 1876 he was appointed commander in chief of the Serbian army, but on entering Turkey was driven back by Osman Pasha, who followed him into Serbia, defeating him at Zavechar and Yavor in July, and the campaign in Serbia proved disastrous He rashly proclaimed Milan king of Serbia in September, and in October Aleksmats and Deligrad were in the hands of the Turks and the road open to Belgrade An armistice was concluded, and Tchernaiev resigned his command. In 1877 he visited Austria in connection with his propaganda, but was expelled, and lived for a time in France. In 1879 he organized a Bulgarian rising, but was arrested at Admanople and sent back to Russia. He succeeded Kaufmann (q v.) as governor of Turkestan in 1882, but his aggressive policy led to his recall two years later, when he was appointed a member of the council of war at St. Petersburg. In 1886 his opposition to the central Asian military railway caused him to lose his seat in the council

Tchernaley died on Aug. 16, 1898, at his country seat in the province of Mogiley.

TCHIHATCHEFF, PIERRE DE (PETR ALEKSANDROVICH CHIKHACHEV) (1808-1890), Russan naturalist and geologist, was born at Gatchina near St. Petersburg, in 1808. He entered the diplomatic service and was (1842-44) attached to the embassy at Constantinople; whence he wisted Asa Minor, Syrua and Egypt In 1844 he was charged with a scientific mission to the Altai mountains.

He died at Florence on Oct. 13, 1890 (N.S.). His publications include. Voyage strentifique dans l'Altau oriental et les tions macude. Voyage strentifique dans l'Altau oriental et les Asse Minaure, soit de la frontière de Chine, with atta (1845); Asse Minaure, soit de la constitute de la constitute de cette contrée, 4 parts, Bouque, saint les cassasses de la constitution

TCZEW German Directary), a town of Gdansk province, Poland; pop. (1937) 24,728; (1946) 26,934; on the left bank of the Vistula, o m. S. from Gdansk (Danagy), at the junction of the Wistula, o m. S. from Gdansk (Danagy), at the junction of the wind railway to the wall railway with the main railway with one into nividges. The chief industries are railway with one with the main railway change and the manufacture of sugar, cement and agricultural mighements. It was at Tezew that some of the first battle of WW model.

of the first battles of World War II were fought.

The Poles blew up bridges across the Vistula in an effort to halt the Germans advancing from East Prussia and Danzig, but

the town was occupied in the early stage of the campaign.

TRA. The name given to the leaves or leaf huds of the ten tree
or tea shrub; the manufactured product prepared from the green
leaves by fermentation and firing, the drink prevend from the nair
ufactured product; the afternoon social function at which the
beverage is served.

The word "tea" comes from the Chinese local Amoy dialect word "te, pronounced "tay." In Cantonese it becomes ch'a, pronounced

"chah" The name travelled in this form to Japan, India, Pesia and Russia The Dutch brought the form 'fe to Europe via Para. The English word "tea," originally pronounced "tay" and later "ree" was derived through the Dutch. The word is not to be found in the Bible, the works of Shakespeare, or any other publication in English, previous to the latter half of the 7th century.

Early History .- There is a Chinese legend which places the introduction of tea drinking in the reign of the mythological Emperor Shên Nung, about 2737 BC, but the earliest credible mention is AD 350, when tea was described by Kuo P'o in the Erh Ya or ancient Chinese dictionary The original area of production was in that portion of southeast Asia which includes boidering provinces of southwest China, northeast India, Burma, Thailand (Siam) and Indochma Cultivation and the use of the beverage spread throughout China and Japan under the patronage of Buddhist priests, who sought a means of combating intemperance. Tea had its first handbook in the Ch'a Ching, written by the Chinese scholar, Lu Yu, about A D 780. In it the product appears as a kind of cake made from leaves that had been steamed, crushed and moulded. To prepare it the cake was fired or toasted and shredded, after which it was steeped in salted boiling water. Tea was taxed under the Tang dynasty in China AD 780

The earliest notice of tea in Japanese literature dates from A D. 593, and its cultivation from AD. 805. Japan also had its book of tea, but not until AD 1200

The favourite legend of the origin of tea concerns Bodhidharms or Daruma, a Buddhist saint, who, having fallen asleep over his devotions, cut off his eyelds on awakening and threw them on the ground, where they took root and grew up as a bush, the leaves of which, when drued and infused in hot water, produced a beverage that would bansh sleep.

From China the cultivation of tea spread to Japan from whence it was introduced into Java in 1684 by Andreas Cleyer, a German naturalist and doctor of medicine. Later, in 1837, J. I. L. L. J. Lacosson introduced the first tea plants from China into Java and became known as the founder of Indonesia's tea industry. Tea growing in Formosa dates from the early roll occurry.

Indigenous tea was discovered in northern India (upper Assam) by Major Robert Bruce in 1823, but the founding of the Indian industry dates from the appointment by Gov Gen. Lord William Charles Cavendish Bentinck, in 1834, of a committee to formulate a plan for the introduction of cultivation.

In Caylon, tea dramatically replaced coffee, destroyed by the coffee rust (Hemilien oscitatrs), in the late 1870s. Russia began growing tea in 1847; Uganda, Nyasaland and Kenya 1900. The U.S. experimented with its cultivation under the direction of Dr. Charlie U. Shepard at Summerville, S.C., from 1890 to 1975, when it was given up as impracticable from an economic standpoint. The climate was suitable, but labour was too high, and there was no tariff protection after the Spanish-American War tax of ten centis per pound was repealed (1903).

The first account of tea reached the Arabs A.D. 850; the Venetians in 1559; the English in 1598; the Portuguese in 1600. The Dutch brought the first tea to Europe about 1610; it reached Russia in 1618; Paris, 1648, and England and America about 1650.

Tea was first mentioned in European literature in 1559 as chaicata, "tea of Chma," in Voyages and Travels by Giambattista Ramusio, a noted Venetian author. The first printed reference to tea in English appeared as chas in a 1598 translation of the Travels of Jan Hago van Lin-Schoolen, a Dutch navigator.

R. L. Widdham, in charge of the English East India company/a seproy at Finando, Japan, achieved the distinction of supplying the first reference to tea by an Englishman. In a letter, dated June 27, 1615, to the company's agent at Macoo, Wickham said. "I pray you buy for me a pot of the best chaw." This is probably the earliest poign English for the Chinese che."

The earliest mention of the use of milk in tea appeared in a book of travel by the Dutch author, Jean Nieuhoff, who observed the practice in Canton, China, in 1655.

The first newspaper advertisement for tea appeared in Mercurius Politicus, London, in 1658. It announced: "That Excellent and by all Physitians approved China drink, called by the Chineans Tcha,

862 TEA

by other nations, Tay, alias Tee, is sold at the Sultaness Head Cophee House in Sweetings Rents, by The Royal Exchange, London." About this time metal or leather trade coms, used in lieu of small change, and known as tea and coffee tokens, were much in vague in London's 2,000 coffee houses

Samuel Pepys, in his famous diary for 1660, records that. "I did send for a cup of tee (a China dinik) of which I never had drank before" In 1662 Edmund Waller wrote the first eulogy of tea in English verse and at the same time eulogized England's first tea

FLOWERING SHOOT OF THE TEA PLANT (CAMELLIA SINENSIS), AND (A) SEED POD

drinking queen, Catherine of Braganza. The poem begins:

Venus her Myrtle, Phoebus has his bays, Tea both excels, which she vouchsafes to praise.

It is to Anna, duchess of Bedford, that we owe the custom of afternoon tea. She had tea and cakes served at 5 o'clock because, to quote her, she "had a sinking feeling."

After the coffee houses, tea was sold by chemists' shops, glass sellers, millhers, silk mercers and chmaware dealers. There is even a reference to a "short-hand author" selling tea—his only other trade. As late as 1805, grocers in the Strand were weighing tea in spothecartes' scales.

The world's greatest ten monopoly, the English East India company, on, as it was popularly known, John company, flourished from 1600 to 1858, when it was dissolved. Meanwhile, it figured in many adventures, including the introduction of China and India tess into England and America and the enactment of the Tea act of 1775, which caused the Boston Tea Party and helped precipitate the American Revolution. The Tea act attempted to perpetuate John company's monopoly of the tea trade, a thing distasteful like to British and American merchants. There followed, not one, but say American tea parties.

Here it is interesting to note that, just as England had started out to be a nation of coffee drinkers before John company began

sta propaganda for tea, America started as a nation of tea drinkers; it was the Boston Tea Party that cast the de for coffee. By mid20th century the tea and coffee habits of the two countries were reversed; on a per capita, pound basis. England drank about 5 times as much tea as coffee, the U S drank about 25 times as much coffee as tea.

One of the most picturesque eras in maritime history was the day of the clipper ships, which transported tea from China to England and America. Its most celebrated chapter was perhaps that of the Great Tea race of 1886, which started at Foochow and ended go days later at London after covering 16,000 mil Out of 11 clipper ships, "Taeping" was the winher at the London dock, "Anel," the winner at the Downs, ten muntes shaed of her rival

Three noted American pioneers made their fortunes in the China tea trade They were John Jacob Astor, Thomas Handasyd Per-

kins and Stephen Girard

The advent of the London pleasure gardens in the 18th century brought tea into the open for the first time in England, where it was drunk in public by both sexes Among the historic London tea gardens, Yauxhall, Ranelagh and Marylebone became famous

Tea in Literature and the Arts.—Tea and tea drinking have been celebrated in many ways in literature and the fine arts more than 12 centuries. A notable contribution to tea by the Japanese was its glorification in the art and practice of charno-yit, tea ceremony, literally, "hot water tea." The origin of the teaport is the Chinese wine jug Dr. Nicholas Brady, chaplain to the court of William and Mary, called tea "the sovereign drink of pleasure and of health," in his poem, "The Tea Table." William Cowper wrote of "the cups that cheer but not inchmate," borrowing the phiase trom Bishop Berkeley Paul Revers, the American particle, was farmed to the complex of

Production.—The world's production of tea in the 1900s totalled about 1,300,000,000 ibs annually from an area of approximately 2,000,000 at. These figures do not include production or acreage of China or the US SR, both of which have no bearing on the world supply as exports outside of the two areas are negligible. Authorative sources indicated 1951 production in China of 360,000,000 lb and in the US SR of 40,000,000 lb. For many years prior to World War II China was the largest tea producing country in the world, but India assumed that position in 1941, accounting for more than half of the known world total

While the total yield at best is an approximation, the amount actually placed on the world markets is obtainable from official sources, and according to official reports the quantity exported in 1952 was 918,200,000 lb. Table I shows tea exports of principal countries in 1048—52.

About 1930, increasing surplus supplies of tea on world markets led to unremunerative prices to producers. Regotations for the restrictions of exports from India, Ceylon and what was then the Netherlands East Indies led to the International Tea agreement which came into operation on April 1, 1933, and which established a quota system of exports on a percentage basis of fixed stander export figures. The agreement was renewed in practically the same form from time to time until March 20, 1950, when a new agreement was reached by India, Ceylon, Pakistan and Indionessa Which continued the main features of the previous agreement as regards

TABLE I.—Tea Exports of Principal Producing Countries
(In 1,000 lb.)

Country	1948	1949	1950	1951	1952

TEA 803

regulation of exposts and control of the extension of tea cultivation. After 1940 the export quotas were placed as high as 130% of the standard figure in order to assure unrestricted production of tea while none was available from China. Japan and Indonesia, and in the years 1010wing World War II when demand was aftead of the supply. Administration of the International Tea agreement was entrusted to the international tea committee. London

The bulk of the world's tea is grown in Asiatic countries, Ceylon tion second to India in 1952, with 24% of the total world production exclusive of China and the USSR Next were Japan 9%, Indonesia 6%, Pakistan 4%, British East Africa 3%, Foimosa 2% and other sources 2%

On an exporting basis in 1952 India also led with 44½% of the world total, Ceylon followed with 34%, Indonesia 7½%. British East Africa 3%; Pakistan 2½%, Japan and Formosa 2% each, and all others about 4½% Tea is grown commercially in 19 countries.

Consumption.—About two-thirds of the world's known tea production is shipped each year to importing countries and is consumed there barring stocks held in the principal markets, notably London. The largest tea consuming countries are the United Kingdom, which consumes half of the world's annual exports, the United States, Australia and Canada. The Bittish Commonwealth accounts for the bulk of the world's tea trade—more than two-thirds of all imports and about 109% of recorded exports in 1952.

TABLE II -World's Consumption of Tea (Net imports in 1.000 lb., per capita in pounds)

Countr	1946	1948	1950	1952	
United Kingdom	Total Per Capita	347,840	404,394 8 16	357,808	472,90E

\*Estimated †Incides tea imported into producing countries for domestic consumption,

The per capita consumption in the principal consuming countries (1952 estimated) was: United Kingdom, 9 lb.; Australia, 6,5 lb; Ireland, 5,3 lb, New Zealand, 5,1 lb, 1raq, 3 9 lb., Canada 3 4 lb; French Morocco, 3,2 lb.; South Africa, 1,9 lb.; Egypt, 1 78 lb; the Netherlands, 1,8 lb; United States, 66 lb. (W.H.U.)

Botany.-While the tea plant was originally designated by Linnaeus under the binomial system in 1753 as Thea smensis, it is now placed in Camella as C sinensis (family Theaceae). Later Linnaeus recognized two species as previously described by John Hill, viz., T viridis and T. bohea. It was erroneously assumed that the latter was a source of black tea, while T viridis was held to produce green tea. In 1843, however, Robert Fortune found that black and green tea were produced from the leaves of the same kind of plant by varying the process of manufacture There are many synonyms including Thea bohea, T viridis, T. cantonensis, T assamica, Camellia thea, C. theifera and others. At the same time various authors proposed numerous varieties, but many of these have been shown to be untenable, and there is no agreement among botanists or horticulturists as to varietal limits A part of the difficulties was due to the facts that early authors had wholly inadequate collections of reference material and that the tea plant in cultivation, like all cultivated plants, varies in characters, dependent on local conditions and on the special qualities for which various strains were selected and propagated

While the accepted binomial stems from Linnaeus in 1753, the species was well known to earlier European botanical authors, necluding Gaspard Baubin (1633), Dr Jacob Bontius (1658), Lornaeus gives no less than ten references to European pre-Linnaeus gives no less than ten references to European pre-Linnaeus protamial tentrature Linnaeus originally proposed two genera, Theo and Comellia, but it has been clearly shown that two groups cannot be recognized here, because of intergrading characters. The generic name Comellia was retained for this group by action of the International Botannical congress (See TERLECREE) (X)

The tea plant is an evergreen shrub, which in its natural state grows to a height of 5 to 5 of 1, but the tea planter keeps it pruned down to a height of 5 to 5 of 1. In its general appearance and the form of its leaf, it resembles the myrtle, its biossoms are white, with yellow anthers, and suggest the wild rose. These are succeeded by the tea fruit, containing three seeds. The plant grows best in the monsoon climate of the tropics, from sea level up to 6,000 ft; in most temperate zones, where there is danger of frost, it must be kept to low elevations. It does best in the higher altitudes of the tropies. The commercial tea belt of the world is largely confined to a ring of mountains around or near the equator, with as? Wand 33° S

Ten usually is grown from seed in nursery beds On large tea estates the young plants are transplanted to the prepared tea fields when they are 6 to 8 in high, usually in six months' time They are set out in rows, 3 to 6 if apart. In two years they reach a height of 4 to 6 if. Then they are cut down to something less than a foot By the end of the third year they are ready for plucking Chinese, Japanese and Formosan tea growers (mostly small family gardens) do not set out nurseries but propagate by planting the seed streetly where they are to be grown or by layering, i.e., transplanting Weeding, cultivation between the rows and prining go on regularly at different periods for 25 to 50 years, the average life of a tea bush. When in full berang—about the roth year a bush yields as much as a quarter of a pound of leaf in its several flushes during the season!

The quality of the tea is at its best at different seasons in the various tea countries. Teas are pinched all the year around in southern India, Ceylon and Indonesa. Seasonal teas are those countern from ordering finding, the China greens, congous, Japan teas when the countries of the countries

Kinds of Tea.—Generally speaking, teas may be divided into three classes. (1) fermented or black; (2) unfermented or green; and (3) the semifermented or oolong teas. Tea comes from practically the same plant in all countries, the differences in the various classes being due to methods of manufacture and local climatic, soil and cultivating conditions. There are about 1,500 different growths and about 2,000 possible blends.

The fermented, or black, tass include the China congou, or "Englash breakfast," teas, subdivided into north China congou (black leaf) from Hankow and the south China congou (red leaf) from Foochow, India, Ceylon, Java, African and, since 1929, Jana and Formosa blacks. The unfermented, or green teas, include two main varieties—Chinas and Japans; also, such green teas as may be manufactured in India, Ceylon and Indonesia. The semi-fermented (colong) teas are obtained from Formosa and Foochow in China

Manufacture.—Black and green teas result from different manufacturing processes applied to the same kind of leaf. After plucking, the leaf is withered by being spread on bamboo trays in the sun, or on withering tats within doors. The process takes 18 to 24

hours Next it is solled by hand or by machines. The object of rolling is to break the leaf cells and liberate the juices and enzymes sealed within. The roll may last as long as three hours Then it 15 taken to the roll breaker and green leaf sifting machine and after that fermented in baskets, on glass shelves or on cool cement floors under damp cloths for 1 to 41 hours The firing process (drying) follows, in pans or baskets or in firing machines It takes 30 to 40 min The difference between black tea and green tea is the result of manipulation Green tea is manufactured by steaming without fermentation in a perforated cylinder or boiler, thus retaining some of the green colour Black tea is allowed to ferment after being rolled and before firing. In the case of back tea the process of fermentation, or oxidation, reduces the astringency of the leaf and it is claimed, develops the colour and aroma of the liquor In making green tea, the fermentation process is arrested by steaming the leaf while it is green and by light rolling before drying

Semifermented or oolong teas have some of the characteristics of both black and green teas. They are allowed to wither in the process of manufacture and partially ferment

After hrang, teas are graded by being put through outting, sifting and sorting machines, before being packed in wood or mefal tea chests. The principal grades are broken orange pekoe, consisting of terminal buds with portions of the finest leaf that have broken off in the mauricature, orange pekoe, consisting of some terminal buds and the finest leaves; pekoe and pekoe Souchong, consisting of coarser leaves; pekoe dust, dust of the broken time.

Trade Characteristics—The teas that grow and are plucked all the year 'cound are those of southern India, Ceylon and Indonesia. The best qualities in southern India are the fermented teas produced in December and January. In Ceylon the finest quality fermented teas are produced in the months of February, March, April, July, August and September Cypion teas are known chiefly by their garden marks Fernented teas of Indonesia are best in July, August and September. These teas are also known as Javas or Sunatrias or by their garden marks

Northern India's fermented tess are best when made from the second flushes of July, August and September In Assam and the Duars, however, the finest tess are made in November and December Indian tess are named after certain distracts, the best known being Dargeeling. The first pickings from April to October of the north and south Clinia blacks are the best. The north China congous are the burgundres of China tess, the south Chinas are the Clarks. The best China prens are made in June and July although the China are the constant of the China prens are made in June and July although the China are the China prens are made in June and July although and second (July and June) are several crops, but the first and second (July and June) are best, Japans are the white wines of tess. In Formosa there are five recognized crops, viz., spring, summer (two), autumn and winer. The sesson octands from April to November First and second dismere crops (June and July) are the finest. They have been called the champagnes of tess.

Chemical Aspects and Tea Brewing.—The principal chemical constituents of tea are afferne, tannin and essential oil. The first supplies the stimulating quality, which, because of its purity, is without harmful reaction; the second, the strength of body, and the third, the flavour and aroma, chief factors in determining our value in a trade sense:

Arguments against the healthfulness of tea are frequently founded on the experience of individuals or on the assumption that tea is taken in excess; however, tea is the beverage of people in many parts of the world, living in every kind of climate, and generalizations are dangerous.

In 1935 Dr. C. R. Harder, a chemist of the Indian Tea association, said: "A cup of tea contains, on the average, a little under a grain of caffeine and about two grains of tamin. The medical dose of caffeine assignated in the British Pharmacentical codex is 10 5 grains and of tamin 5 to 10 grains. It will be realized, therefore, thick, the average cup of tea these two most important constituents of tea are present in very small amounts, especially, when it is remembered that the caffiene is injected gradually and the tamin is fixed by proteins during its journey through the alimentary tract. The infusion is faintly acid, almost neutral.

Gastric fuice is a thousand times as acid

"When milk is added to tea, the tannin is fixed by the casein in the milk. Sugar added to the tea merely sweetens it and adds to the value of the drink as a food. The addition of milk to tea robs it of practically all its astringency.

"When the infusion is drunk, it passes first into the stomach, where the sugars are absorbed as ordinary foods, and the ingestion of caffeine begins. The comforting effect of the warmth of the drink is at once felt, but the stimulus due to the caffeine comes about a quarter of an hour later."

Table III - Chemical Analysis of Leading Teas\*

	Cafferne per cent	Tannin per cent	Soluble solids per cent
Java (Indonesia) black teas	2 7-4 4	6-20	16-26
Japan green teas	2 0-3 3	4-12	16-26
China black teas	2 0-3 7	5-10	16-22

Trive-minute intusion
Source J J B Deuss, L'Agronomic Coloniale (Paris, 1924), No 80 and C R Harler,
the Callure and Marketing of Tea (New York, 1933)

In the British Isles, Australasia, North America and the Netherlands, where most of the black teas of India, Ceylon and Indonesia are consumed, the beverage is drunk primarily for its stimulating effect. The alkaloid caffeine, responsible for the stimula, has a slightly bitter taste when taken in medicinal quantities, but the small amount present in the usual cup of tea is practically tasteless. Usually, sugar, milk or cream is added

In Russia a pot of strong China tea is brewed and put in the samovar. A little of the extract is put in a glass, hot water added, also a slice of lemon, sugar or jam. Americans have made iced tea

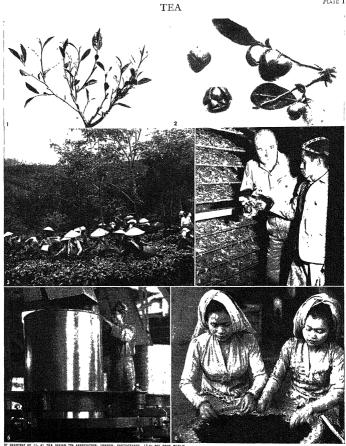

a favourite summer drink The ideal preparation of tea is one which extracts a maximum of caffeine and a not excessive amount of tannin. Such a preparation also conserves the aroma and flavour-evanescent qualities easily lost by careless preparation. From the chemist's point of view the two main essentials in tea brewing are fresh water, freshly boiled, and a three- to five-minute infusion. The tea used should be suitable to the water of the locality in which one lives. Tea infuses more readily in soft water than in hard. Small, thick, full teas are required for soft water, brisk, full, flavoury teas where the water is hard. Liverpool water, which comes from the Welsh mountains near by, is said to be the softest water in England and the best for making tea Water fresh from the tap is the first essential The second is to bring it to a bubbling boil and pour it at once upon the tea leaves To delay means that the water will go flat, and flat water will spoil the finest tea Hence the discouraging concoctions on steamships and railways

Generally speaking, a five-minute infusion is best for fully fermented teas like those of India, Ceylon or Indonesia, but George F. Mitchell, a U.S supervising tea examiner, reached a slightly different conclusion in a series of tests in 1904-05 at the U.S. department of agriculture.

These investigations demonstrated that a perfect cup of tea from a chemical standpoint was, unfortunately, not a perfect cup of tea from the consumer's standpoint. From a chemical standpoint the length of time in which the maximum amount of caffeine and total soluble matter was extracted, with the minimum amount of tamm, averaged three minutes after boiling water had been poured on the leaves. After that time more tannin was extracted, with only a small amount of caffeine. Usually, however, this makes a view "skinny" cup of tea, lacking body and a certain amount of punequely that is desired by all tea drinkers; and, of course, if cream or milk is added to this beverage, it takes away from the small amount of pungency that is dost of the standard papears even less desirable.

For this reason Mitchell concluded it best to brew tea, that is to be drunk without cream or milk, from three to four minutes, and that to be drunk with cream or milk from four to five and even six minutes, as in some teas the real flavour does not come out until after a sx-minute infusion.

Stated in general terms for all loose teas, this, then, is the best practice: (x) buy the highest grade of the kind of tea suited to your taste and the locality where you intend to use it; (2) use

PREPARATION OF TEA FOR MARKET

- 1. A tea shoot Only the bud spike and the first two leaves are plucked 2 Tea seed-vessels, showing the seeds
- 3. Harvesting tea in Java The pickers ordinarily pluck the tender new flushes from the tea shrubs every ten days
- Drying room, where het air dries out the sap and moisture in the leaf

TEA-CADDY, a box, jat, canister or other receptacle for a. The word is believed to be derived from catty, the Chinese pound, equal to about a pound and a third avourdupors. The centrest examples that came to Europe were of Chinese porcelain, and in shape resembled the ginger-jar. They had lide or stopers likewase of china, and were most frequently blue and white. The English kilns at first imitated them, but speedily devised forms and ornament of their own, and there was hardly a ceramic factory in the country which did not compete for the supply of the own fashion. But tea-caddies were not for long confined to pormation and the control of the

TEA CEREMONY is a time-honoured institution in Japanan institution rooted in the principles of Zen (a sect of Buddhism) and founded upon the adoration of the beautiful in the daily nonline of life, such as preparing a meal and tea, cleaning the house and garden, etc. The Japanese word for tea ceremony, Cha-no-yu, literally hot water of tea, means an aesthetic way of entertaining guests, usually five at a time, with thick and weak tea of pulverized tea-leaf whipped in hot water, preceded by a meal, according to the established rules of etiquette. The entertainment takes place in the tea-room (chaseki), usually a small building constructed to suggest a refined poverty, though with great forethought and after endless trouble in the choice of the material and in the construction. The room in which the guests are entertained is generally about 9 ft. square, or smaller, containing an alcove for ornaments and a small fire-place for boiling the kettle, sunk into the floor. Into that room each guest in humility crawls through a small opening less than 3 ft. square. It is connected with the waiting room by stepping stones through a garden path (roji), which should contain a water basin (tsukubai) for the guests to rinse mouth and wash hands before entering the tea-room.

In this ancient institution—for it was founded under the Shogun Yoshimasa (1449-73) and perfected by Senon Rikyu in the 16th century—which still continues to influence the life of the Japanese people and all their art, the spirit of old Japan still lives.

TEACH [Tharcit or Thack!]. EDWARD (d. 1718), English pirate, popularly known as Blackbeard, is believed to have been born at Bristol. He is said to have gone out to the West Indies during the war of the Spanish Succession, to have enged in privateering, and after the declaration of peace (1713) to have turned pirate, but he is not actually heard of in this capacity till the end of 1716. The following year he captured a large French merchantman, rechiratened her "Queen Anne's Revenge," and converted her into a warship of forty guns. His outrages in the Spanish main, the West Indies, and on the coasts of Carolina and Virginia, quickly earned him an infamous notoiety. He made his winter quarters ha an inlet in North Carolina, the of his crimes, but the governor of Virginia at last despatched two sloops, manned from the British warships on the station, to cubim out On Nov. 22, 1718 Lieutenant Maynard boarded Teach's sloop, after a sharp fight, and himself shot the pirate dead

TEACHERS, TRAINING OF. The traumg of teachers dates, in England, from the beginning of the 19th century, when the National Society for Promoting the Education of the Poor in the Principles of the Church of England and its Nonconformist rival, the British and Foreign School society, first attacked the problem of elementary education on a national scale. Both these societies adopted the "monitorial system," the principle of which was that picked older scholars should learn their lessons from the adult teacher in charge of the school and hand them on to the younger children. Some training of the instruments of this system was found to be necessary and training schools were accordingly set up to give it. One of these developed into the Borough Road training college which is still in existence. About 1840 James Kay (afterward Sir James Kay-Shuttleworth), a far-seeing official to whom, more than to any other single man, the English educational system is due, began the movement which replaced the monitors by "pupil-teachers"; i.e., boys and girls who were regularly apprenticed for a period of five years from the age of 13, and both learned the art of teaching and continued their education under the head teacher of an elementary school. Kay's scheme also involved training colleges where the professional and academic education of at least the best pupil-teachers could be carried to a higher stage after their apprenticeship was completed. He himself founded the college which, as St. John's college, Battersea, London, was taken over by the National society and furnished a model widely imitated. Within a few years the church had training colleges in a large proportion of its dioceses and there was a smaller number of others founded by Nonconformist bodies. As the result of Kay-Shuttleworth's efforts these colleges came into a definite relationship with the government; they received financial assistance toward the cost both of building and of maintenance, a competitive examination was instituted upon the results of which "Queen's scholarships" were awarded to former pupil-teachers who came to them for a period of training, and contributions were made to the salaries of the teachers they turned out. As a condition of this financial aid to the colleges and their students, the government laid down the courses to be followed, conducted the examinations on the results of which it awarded to successful candidates its Elementary School Teacher's certificate and required the colleges to submit to inspection.

The voluntary colleges which developed on this basis are still an important factor in the training of teachers. At the beginning of the 20th century the length of their course became standardized at two years; they are, accordingly, often referred to as two-year colleges. Their monopoly of training was broken in 1893, when new regulations made it possible for the universities to open grant-ided departments for the training of teachers. All the universities and university colleges have taken advantage of these regulations. The Education act of 1902 made it possible also for local educational authorities to found and maintain training colleges. These differed from the voluntary colleges in having no religious affiliation and in being often day as distinguished from residential colleges.

The act of 1902 led also to drastic changes in the education of pupil-teachers. Under the act the local authorities were given

powers in connection with secondary as well as elementary educa- year students who had taken a degree in honours at the end of tion and could establish secondary schools. It thus became possible for the board of education to insist that entrants to training colleges should normally have taken a four-year course in a secondary school. The effect of this reform upon the culture and outlook of the elementary school teacher-who had hitherto spent his life, as a rule, within the confines of the elementary systemwas without doubt highly beneficial It also led to the gradual disappearance of the pupil-teacher system, for as the standards of secondary education rose it proved impossible for the young intending teacher to comply with them, and at the same time to receive the old thorough training in teaching. Pupil-teachers tended first to give place to "student-teachers," who after an uninterrupted general education until the age of 17 entered upon a year of preliminary training in an elementary school chequered by continued attendance at their secondary school But a departmental committee on the training of teachers for elementary schools reported in 1925 against the perpetuation even of this remnant of the old system, and although many local authorities long clung to a belief in its efficacy there was a growing tendency to follow the recommendations of the report and to allow intending teachers to complete the full secondary course terminating at the age of 18 and to enter college without passing through any considerable period of professional probation or initiation. The resultant advantages were a wider and deeper culture in the teachers and the preservation of a power of growth which the older system, it is alleged, often destroyed; it is, on the other hand, only fair to note that the strain upon the disciplinary powers of the young teacher-which only the drastic training of the old system could enable him to meet-has largely disappeared under modern condi-

The curriculum in the two-year colleges has always included academic and professional elements side by side With the improvement in the educational standard of the entrants and the attenuation of their preliminary training there was for long a growing tendency to emphasize the professional side of the work The academic studies were practically confined to subjects within the curriculum of elementary schools, the professional work comprised instruction in the theory of education, methods of teaching, hygiene, practical subjects and teaching practice under supervision in schools Until 1930 the curriculums were laid down by the board of education, which also conducted the final examination for the Elementary School Teacher's certificate In that year the training colleges were classified into groups around the universities and university colleges and joint examining boards. representative of the universities and the colleges concerned, took over the conduct of the final examination Boards of studies, similarly representative, framed the syllabuses. The board of education retained the right to judge the efficiency of the practical training given by the colleges.

Concurrently there were important developments in the university training departments. These were established to enable a select number of intending elementary school teachers to come under the broadening influences of university life and teaching; they developed into institutions by whose aid future teachers might obtain a university degree and professional training. For some time the maximum length of the course was three years and professional training was given along with the student's academic studies. It was, however, found that the full value of the scheme could not thus be obtained; the course was, accordingly, extended to four years, the first three being devoted entirely to preparation for a degree and the last wholly to a course of professional training. Students admitted to the four-year course received a free academic teaching and professional training and, like the two-year students, an annual grant for maintenance from the board of education.

The original theory of the four-year course was that it was to supply the elementary school system with teachers of superior ability, education and training; but a very large proportion of the graduates it turned out found their way into secondary schools. Eventually the board extended its grant system to include graduates in honours in the university departments, and permitted fourthe third year to be transferred to those departments So slight a change in official regulations has not often produced greater consequences Formerly training expressly intended to fit teachers for secondary school work was almost nonexistent; within a few years it became almost universal

After World War II radical changes transformed the organization, curriculums and methods of teacher training. In 1944 a departmental committee, under the chairmanship of Sir Arnold MacNair, recommended (though not unanimously) that the universities should assume responsibility for the training of all teachers, establishing schools of education for the purpose With three exceptions the universities and university colleges acted upon this recommendation In 17 geographical areas university (or college), local education authorities and training establishments (including university training departments) combined to form area training organizations (ATO), responsible for the training and examining of intending teachers, providing refresher courses and other services for serving teachers and promoting research. At the centre of each ATO was the school (generally called institute) of education In the three areas where the university had not accepted full responsibility the organization was similar, but financed by the ministry of education

The Education act, 1944, demanded a greatly increased teaching force Between 1945 and 1951 the ministry of education organized an emergency training scheme Men and women from the armed services and war industries were given an intensive 13-months' course in 55 colleges specially created, staffed (largely by serving teachers) and equipped for the purpose The scheme produced about 35,000 qualified teachers, and a large amount of experimental work, the fruits of which were incorporated into the prac-tice of the permanent colleges The two-year course comprises professional studies (including supervised teaching practice) and personal education The former, obligatory for all students, covers the principles and practice of education, health education, physical training and a course in English usage. The latter is a matter for personal choice The student selects, with guidance, two (occasionally more) subjects from the list the college has to offer, one to be studied intensively to the highest standard within his capacity, the other more extensively but to less depth.

Training facilities were more than doubled during these postwar years By 1952 there were 24 university training departments, III general and 25 specialist colleges and 16 approved art schools with an annual production of about 14,000 teachers

Europe.-In continental countries it is usual for elementary and secondary school teachers to be trained separately and differently, the former in training colleges and the latter by graduating at a university-to which professional training may or may not be added. In France all teachers in state elementary schools have to be trained, but only those teachers in secondary schools who are teaching pupils who have come from elementary schools. In Germany the secondary school teacher does his training by working in a school, the elementary school teacher in a Padagogische Akademie The Danish training colleges qualify graduates for both elementary and secondary schools, but most secondary school teachers have attended a university. (H. C. D.)

## UNITED STATES

In the United States, as in England, teacher training began in the monitorial schools. The Lancasterian system was introduced into New York in 1806 and spread quickly to other cities. The system could be used only in large schools; and to direct these the head teacher had to be skilled in organization and management Joseph Lancaster himself instituted a model school to train head teachers for his system in Philadelphia in 1818, and some who were prepared there organized monitorial schools in other cities. Lancaster's book entitled Improvements in Education was imitated by U.S. writers who prepared guides to the system The popularity of the monitorial schools soon declined and by 1830 they were dying out.

Academies flourished in the 19th century and became the second type of teacher-training institution. In an academy at Concord,

# TEACHERS REGISTRATION COUNCIL

Vt., Samuel Read Hall began in 1893 and continued for some years to conduct classes for teachers, and he prepared a textbook, Lectures on School-Keping (1820), which dealt with school discipline, the course of study and methods of teaching. His book was used in other academy training classes and was otherwise widely distributed. The legislature of New York had 10,000 comes initied for the teachers of that state

In 1844 the New York legislature authorized the regents to substidie training classes in selected academies. They were required to teach, in addition to other subjects, "the principles of teaching." This may be, as has been claimed, the first state was on the training of teachers. Except for a short interval, the substidies to the academies were continued even after the state

had begun to maintain normal schools

State Normal Schools.—The preparation of public-schools teachers gradually came to be considered a function of the states, and this was the beginning of the modern teacher-training system In 1839 Massachusetts created a state normal school at Lexington This paralleled similar foundations in Europe, Great Britand Latin America, and was everywhere due in part to the sprand of the teachings of Johann H Pestalozia (qr v) Against opposition, Horace Mann persuaded Massachusetts to establish three additional state normal schools The policy of so locating the schools that they would be accessable from different sections of a state was widely adopted Before 1800 eight states and by 1900 nearly all of the states had one or more such institutions.

The normal schools admitted pupils who came directly from the elementary schools and prepared them to teach in those schools. The length of the course of study was, at first, only a year or less, but was in time increased to two or even three years It comprised reviews of the common school branches, professional studies including school management, principles of teaching and observation and practice teaching in a model school

Advanced subjects were taught to provide some secondary education, but this tended to change the normal schools into collegepreparatory institutions, and the custom of using the vocation of teaching as a steppingstone to a more lucrative profession rein-

forced this trend

The typical normal school was neither organized nor staffed to prepare teachers for high school students—a group that expanded rapidly after about 1890. The failure of the normal school to meet the rising standards of the teaching profession and of its graduates to compete successfully with graduates of colleges and universities became increasingly apparent and, by 1915, the regardination of normal schools into degree-granting four-year teachers' colleges, a movement that had begun before the turn of the century, was well under way.

The progress of the whole movement may be traced in the sense of organizations formed to promote it. The American Normal School association (18,88) was followed by the department of normal schools (18,70) of the National Education association, and this in 1917, under a slightly different name, by the American Association of Colleges for Teacher Education.

Supplementary Training—At no time were the normal schools themselves able to supply the schools with enough qualified teachers and, therefore, other, often mere stopgap, means to provide some degree of training were organized. From about 1850 several of the young and struggling state universities maintained normal departments for a time. They discontinued this practice when their casdemic enrolments became larger, but in one or more cases it led to the formation of collegized departments of education (see below). Some cities maintained normal classes to prepare teachers for their own schools. County normal schools to prepare teachers for their own schools. County normal schools and normal institutes lasting four their anothers alsting a week and normal institutes lasting four their properties of the properties

Teacher Training in Universities.—In colleges, teacher training is administered in special departments, but in large institutions the departments were expanded and reorganized into schools or colleges of education. The larger self-administered

units are able to control their own programs; to aid teachers and schools with practical problems; and to develop specialized and technical courses and research in school administration, psychology, etc.

Lectures on teaching were given at Brown university, Providence, R I., as early as 1850 and at the University of Michigan. Ann Arbor, in 1860, but neither course was continued Permanent departments in which education was taught were instituted at the State University of Iowa, Iowa City, in 1873, at the University of Michigan in 1879, at the University of Wisconsin, Madison, in 1881 and at others soon after. Teachers college in New York city was an independent school for about a decade before it became affiliated with Columbia university in 1898 The University of Chicago organized its school of education in 1900. The department at the State University of Iowa became a school of education in 1907 An example in the south was the George Peabody College for Teachers in Nashville, Tenn, which began as a normal school in 1875, was later given most of what was left in the Peabody fund and became a teachers' college in 1000 By the 1050s departments or schools of education were to be found in nearly all academic colleges and universities

TEACHERS REGISTRATION COUNCIL. Originally authorated by the English Education (Administrative Provisions) act of 1907, the Teachers Registration council was established by an order in council of Feb 29, 1912 It consisted 61 44 members, all of whom were teachers or persons recently engaged in teaching

These members were elected by the appointing bodies named in the first schedule of the order in such a manner that I I universities and 42 associations of teachers were represented on the council, II members being drawn from each of the 4 main groups of teachers

Under a new order, officially known as the "Teachers Registration Council Order, 1966," the number of the council may be increased to 50. There are 4, groups representing, respectively, university teachers, teachers in public elementary schools, teachers in secondary schools, specialist teachers with teachers in technical institutes, and each group is represented by 12 registered teachers engaged in the type of teaching work to which the group belongs These 48 elected members may, if they choose, co-opt two additional members to represent any type of teaching work which, in their opinion, is inadequately represented among their own number. The period of office for each council was extended from three to five years. The 12 university members are appointed by the 12 universities in England and Wales.

Representatives of teachers other than university teachers are elected directly by the registered teachers of the country, who vote according to the types of teaching work to which they belong and have a number of votes equal to the number of representatives assigned to that particular type in the order. For admission to the register, the council framed conditions

which must be fulfilled by all applicants. The great variety of examinatons in special subjects renders the task of standardization very difficult, but the council established standards of attainment and of professional training in connection with the teaching of such subjects as muse, at, handwork and domestic science. The man principle kept in view was that no one should be permitted to become a fully recognized teacher or to claim promitted to become a fully recognized teacher or to claim pro-

fessional status who has not undertaken a suitable course of study and a course of training in the art of teaching.

The council took steps to bring within its purview not only those eligible to become registered, but also those likely to become eligible, by the institution of a list of associate teachers, open to all passing an approved entrance examination. The council decided to remove from the list of associate teachers all who did not become fully registered within seven years of their admission to

In the United States there is no teachers' organization that corresponds to the Teachers Registration council. There the governmental agencies certificate teachers directly, and there is no legister kept except the list of persons who have been granted governmental certificates

TEAK (Tectoma grander) is one of the most valuable of timbers The Sankent name is sade, it is certain that in India tesh has been known and used largely for more than 2,000 years Teak is a large deciduous tree, of the family Verbenaceae, with a fall, straight but often buttressed stem, a spreading crown, and the branchlets four-sided with large quadrangular pith. It is a native of the Indian pennyula, Burma and Thalland, and is also found in the Thilippine Islands, in Java and elsewhere in the Malay archipelage, although there is no record of its being native in these places. In India proper its northern limit is 24° 40° on the west side of the Aravalli hills, and in the centre, near Jhansi, 25° vs N lat.

In Burna it extends to near Myitkyina, in lat. 25° 30′. In Bengal or Assam it is not indegenous, but plantations have been formed in Assam as far as the 27th parallel. In the Punjab it is grown in gardens to the 2nd Teak thrives best in districts with a mean annual rainfall of more than 50 in. The mean annual temperature which assist it best here between 75° F. and 85° F. Near the coast the tree is absent, and inland the most valuable forests are on low

hills up to 4,000 ft.

It grows on a great variety of soils, but there is one indispensable condition—perfect drainage or a dry subsoil. On level ground, with deep alluvial soil, teak does not always form regularly shaped stems, probably because the subsoil drainage is imperfeat.

During the dry season the tree is leafless; in hot localities the leaves fall in January, but in moist places the tree remains green till March

At the end of the dry season, when the first monsoon rains fall, the fresh foliage comes out The leaves, which stand opposite, or only whorled in very young specimens, are from 1 to 2 ft in length and from 6 to 12 in. in breadth. On coppuce shoots the leaves are much larger, and not rarely from 2 to 5 ft. long.

In shape they somewhat resemble those of the tobacco plant, but their substance is hard and the surface rough. The small white flowers are very numerous, on large erect cross-branched panicles, which terminate the branches.

The tree seeds freely every year, but its spread by selfsown seed is impeded by the forest fires of the dry season, which in India generally occur in March and April, after the seeds have ripened and have partly fallen. Germination is slow.

The bark of the stem is about half an inch thick, grey or brownish grey, the sapwood white; the heartwood of the green tree has a pleasant and strong aromatic fragrance and a beautiful golden-yellow colour, which on seasoning soon darkens into brown, mottled with darker streaks. The tumber retains its aromatic fragrance to a great age

Durability of Teak.—The principal value of teak timber for use in warm countries its text-nordinary durability. In India and in Burma heams of the wood in good preservation are often found in bulldings sweet conturies old, and instances are known of teak heams having lasted more than 1,000 years. In one of the oldest bulldings among the ruins of the old city of Vijayanagar, on the hanks of the Tungabhadra in southern India, the superstructure is supported by planks of teakwood y in thick. These planks were examined in 7881; they were in a good state of preservation and showd the peculiar structure of teak timber in a very marked mainer. They had been in the bullding for 500 years (Indian Prosters, vii, 260).

In the wall of a palace of the Persian kings near Baghdad, which was pillaged in the 7th century, two Americans found in 1811 pletes of Indian teak which were perfectly sound (Ouseley, Travels' in Perious Constries of the East, it, 250, no. 67). In the old cave temples of Saleste and elsewhere in western India pieces of teak have been found in good preservation which must have been more this acco versa old.

Teak is used for shipbuilding, for furniture, for door and window frames, for the construction of railway carriages and for many other purposes. White ants eat the sapwood, but rarely attack the heartwood of teak I tis not, however, proof against the bornings of the feredo, from whose attacks the teak piles of the wharves in the Rangoon rurer are protected by metal.

Growth.—In its youth the tree grows with extreme rapidity Two-year-old seedings on good soil are five to ten feet high, and instances of more rapid growth are not uncommon. In the plantations which have been made since 1856 in Burma, the teach kas on good soil attained an average height of 60 ft. in 15 years, with a girth, breast high, of 19 in This is between 16° and 18° N lat, with a mean annual temperature of 78° F, and a minfall of roc in In the Burma plantations it is estimated that the tree will, under favourable circumstances, attain a diameter of 24 in (girth 22 in), at the age of 80°.

Timber of that saze is maketable, but the timber of the natural forests which is at present brought to market in Burma has grown much more slowly, the chief reason being the annual forest fires, which harden and impoverish the soil. In the natural forests of Burma and India teak timber with a diameter of 24 in is never less than 100 and often more than 200 years old. The trees are not generally more than 100 to 150 ft. high, even under favourable circumstances.

#### THE TEAK TRADE

While it is true that by far the largest volume of the teakwood produced is used in India and Burma, Cevlon and the east, nearly all of the best quality is exported to other parts of the world, the demand from all countries having been on a continually increasing scale Nearly all the produce of the forests of Travancore, Cochin, Madras, Coorg, Mysore, Bombay, Berar and Madhya Pradesh is so consumed, although small supplies from Travancore and Madras and Bombay have continued almost annually to find their way to Europe. The actual output from Burma, shipped from Rangoon and Moulmein, far exceeds anything which is produced from any other source, with about 500,000 tons cut annually prior to World War II. In 1938-39, 204,000 cubic tons (a cubic ton equals 50 cu ft.) were exported from Burma by sea, 160,000 cubic tons of the total going to India Next in volume is ordinarily that produced in Thailand and shipped from Bangkok; certain quantities have been regularly shipped from Java and Saigon The timber brought to the Burma poits is derived from the forests in the coast provinces. Pegu and Tenasserim: from the forests in the former kingdom of Burma, floated to Rangoon down the Sittang and Irrawaddy rivers; and from the forests in the Shan states formerly tributary to Burma, from the Karenni country and from western Thailand, where it is floated to Moulmein by the Salwin river. In India and Burma a large portion of the teak-producing tracts were placed under conservancy management in 1856 to prevent overcutting and to maintain a permanent and gradually increasing supply Similar measures were taken in Thailand and in the teak-producing native states in the peninsula. The teak plantations in Java had come into bearing in 1908, but the expectation that teak might be produced in the Philippine Islands was not ful-(X.: A. L. H.)

TEAL, a small and beautiful duck, highly esteemed for the table. It inhabits the whole of Europe and Asia, visiting northern Africa in winter. In habits and nesting sites this species (Anas creeca) resembles the wild duck (q.v.) though it more often nests at a distance from water.

The teal is replaced in North America by the green-winged teal, A carolinense or Nettion carolinense, and in China by the mandarin duck, Aix galericulata. Hardly less showy than these are the two species of the subgenus Eumetta,—the falcated duck, E. falcate, and the Balkal teal, E. formosa.

TEANO (anc. Teanum Siducinum), a town of Campania, Italy, in the province of Caserta, 21 mi N.W. of Caserta on the old main line to Rome from Naples, forming conjointly with Calvi an episcopal see. Pop. (1951) 15,236 (commune). It is at the S.E. foot of Rocca Monfana, 643 ft. above sea level.

There is a feudal castle built by the dukes of Sessa in the 15th

century. Teanum Sidicinum (there is a Teanum Apulum in Apulia) was the capital of the Oscan tribe of the Sidicini which drove the Aurunci from Rocca Monfina Remains of the city walls, of a theatre and an amphitheatre still exist, and some extensive baths and Roman dwellings, both some way below the modern town

A tomb with a mosaic representing the visit of the three kings to Bethlehem was found in 1907

TEAPOY (Hindustani tēpāi), a small table, supported upon a tupod, for holding a tea service

TEA ROOM: see RESTAURANT.

TEASEL. Wild teasel is a common plant of the English copses and hedges, with a tall, stout, rigid, prickly stem, bearing large spreading opposite leaves, the midub of which is prickly, and conspicuous oblong heads, the purplish flowers in which are subtended by very long, narrow, stiff, upright bracts The plant is known botanically as Dipsacus sylvestris

Fuller's teasel. D fullonum, in which the bracts are hooked, is probably a cultivated form of the wild species, the dry heads are used to comb up the nap on cloth The wild teasel is extensively, and the fuller's teasel sparingly, naturalized in the eastern parts of the United States

TEATE MARRUCINORUM: see CHYETI

TEBESSA (the Roman Theveste), a town of Algeria in the department of Constantine, 146 mi S.E of Bona by rail and 12 mi W of the Tunisian frontier, on a plateau 2,950 ft. above the sea Pop (1948) 18,573 The modern town, which is within the walls of the Byzantine citadel, boasts nothing of interest save a church built from the ancient ruins.

The Byzantine walls, pierced by three gates, are in tolerable preservation. They are strengthened by numerous square towers. One of the gates is formed by the quadrifrontal arch of Caracalla, a rate form of construction. The arch, elected AD 214, 18 in good preservation. A pair of monolithic columns, disengaged,

flank each facade

The most important ruins are those of the great basilica This building, one of the finest Roman monuments in Algeria, bears evidence of having been built at various epochs; the earlier portions probably date from not later than the beginning of the and century A.D

The basilica was partially destroyed by the Berbers in the 5th century, and was rebuilt in A D. 535 by the Byzantine general Solo-mon, who surrounded it with a wall about 25 ft. high, still standing The tessellated pavement which covers the basilica proper is in almost perfect condition. Next to the basilica are the ruins of the forum

Theyeste was founded toward the close of the 1st century A.D. In the next century it was connected with Carthage by a great highway. In the 5th century, under Vandal dominion, it declined

in importance

Refounded by the Byzantines in the 6th century, the city disappeared from history at the time of the Arab conquest of the country in the 7th century. In the 16th century the Turks placed a small garrison of janussaries in the place, but Tebessa continued to be but a small village until establishment of French rule. Near by are the important phosphate quarries of Jebel Kouif, with annual output of 450,000 tons

TEBU ("men of Tu"; i.e, "of the rocks"), a nomad Negro-Beiber race of the eastern Sahara. Their westernmost settlements are the oases of Agram, Kawar and Jebado, their northernmost the district of Gatron (Qatrun) within the Fezzan frontier, while south and southeast they merge in the negroid populations of Kanem, Bornu (Chad basin), Wadai and northwest Darfur. But the bulk of the nation is concentrated in Tibesti or Tu. hence

There are two main divisions—the northern Teda, or less negroid Tebu, and the southern Daza; or more negroid Tebu. Less closely connected are the Baele of the eastern and southeastern

oases and the Zoghawa (Zaghwa) of Darfur.

The Tebu are usually identified with the Garamantes of Herodotus (1v, 183), whose capital was Garama (Idrisi's Germa) in Phazania (Fezzan), and of whom Ptolemy spoke doubtfully as Ethiopians (Negroes?) But Leo Africanus transfers them to the Berber connection, whose fifth great division he deals with under the names of Gumeri (Garamantes?) and Bardaei oi Bardoa, that is, the Teda of the Bardai oasis, Tibesti

TECHNETIUM (from the Greek, τεχνητός, artificial), element 43, is the homologue of manganese (25) and ihenium (75) m the periodic system. Formerly known as masuium, it follows molybdenum (42) and precedes ruthenium (44). The chemical

symbol is Tc.

This element has been extensively sought in natural ores by several authors, notably I. and W. Noddack, who in 1925 claimed to have detected its X-ray spectrum in the same series of experiments that led to the discovery of rhenium However, the findings of the Noddacks were not confirmed by other experimenters, and since their initial paper nothing had by 1948 been published on a natural element 43 We now know that its natural existence is most improbable because it would contradict well-established rules of nuclear stability

In 1937 C. Perner and E. Segrè found several radioactive isotopes of element 43 in molybdenum targets that had been bombarded with deuterons in the cyclotron. Using the methods of adjochemistry they gave positive proof that some of the radioactivities were caused by element 43. At the same time they established several chemical properties of the new element This was the first example of the creation of a hitherto unknown ele-

ment by artificial means.

Element 43 can be produced by several types of nuclear bornbardments, such as neutrons on molybdenum or deuterons on molybdenum, and is also a product of the fission of uranium (O. Hahn and F Strassmann, E Segrè and C. S Wu). The latter nuclear reaction promises to supply the largest amounts of element 43 If it existed in nature, its geochemistry would probably be similar to that of rhenium

The element is undoubtedly metallic in its properties as is thenum. In the course of a chemical analysis it would senarate in the second group (sulphides insoluble in acid solution) and would usually appear with rhemum, although it can be separated from this element by a distillation at 180° C. in a current of hydrogen chloride. Its separation from molybdenum, which is often of practical importance, can be obtained by precipitating the molybdenum from an acetic acid solution with 8-hydroxyquinoline Element 43 stays in solution.

Not less than 12 isotopes of 43 are known. They are all radioactive, some emitting electrons, some decaying by orbital electron capture while at least one undergoes an isomeric transition. Following this isomeric transition the characteristic X-ray radiation of element 43 is emitted and this has provided an opportunity for the spectroscopic observation of the K X-ray lines of this element.

Beginning in 1944, substantial progress in the study of technetium was made in the laboratories of the U.S. Atomic Energy commission. Taking advantage of the fact that the technetium isotope of mass on has a beta decay period of about 1,000,000 years, it was possible to isolate several milligrams of it. This isotope is obtained either as a fission product, or by neutron capture of molybdenum followed by a beta decay.

The availability of relatively large amounts of technetium permitted study of it through the ordinary methods of chemistry and physics, without taking advantage of its radioactive properties. Its X-ray spectrum by external excitation, the crystal structures of the element and some of its compounds, and the main optical spectral lines were investigated. Also several chemical compounds were prepared in pure form and studied, confirming the general analogy with rhemum.

See C. Perrier and E. Segrè, "Some Chemical Properties of Element (3)" Journ. Chem Phys., 5, 775 (1937). TECHNICAL EDUCATION. Technical education (Greek τέχνη, art or craft) may be defined as instruction in the sciences and skills required for the practice of trades or professions, especially those nuvolving the use of machinery or scientific equipment. In Great Britain a distinction is increasingly being drawn between technological education, a term used to describe the higher levels at which advanced knowledge of theory is important, and technical education, directed primarily at the equipment of skill in techinques. The term vocational education embraces all studies tolated to any form of employment.

### THE UNITED STATES

The first technical instruction in the United States appears to have been given in connection with the US Mintary academy, organized in 1802 at West Point, NY Naturally the instruction was concerned with military prolibems in 1824 Rensselaer Polytechnic institute was founded at Troy, NY, and started the work of training "crill", so-called in distinction to "military," engineers. Rensselaer conferred its first engineering degrees in 1835. Harvard opiened the Lawrence scientific school and Vale established the Sheffield scientific school in 1847. The University of Michigan began instruction in engineering in 1853. The Polytechnic Institute of Brooklyn was founded in 1844, Cooper Union in 1859 and the Massachustets Institute of Technology in 1861.

In 1862 congress passed the Morrill Land Grant act and thus laid the foundation of the land-grant colleges from which have grown many of the state universities. The act in setting aside public lands for the support of these colleges specifically prescribed that they shall teach "such branches of learning as are related to agructiive and the mechanic arts" Under the impetus of this act and the economic pressure resulting from the needs of a new country engineering grew apace.

Thus, Cornell university was founded in 1865, the University of

Illinois in 1867, etc.

Technical education of university grade grew therefore under two auspices, namely, private ownership and state ownership. In the first group were to be found technical schools of high grade. independent of general educational functions as illustrated by the Massachusetts Institute of Technology, Rensselaer Polytechnic institute and California Institute of Technology Again many large privately endowed universities such as Harvard. Yale. Cornell, etc, have engineering colleges which are integral parts of a group of colleges that comprise the university. Others such as Stanford and Princeton have engineering courses integrated with general education In some of the state universities the colleges of engineering and agriculture are separated from the general courses not only educationally but geographically as well. Thus, the University of Michigan proper is at Ann Aibor while the Michigan State College of Agriculture and Applied Science is at East Lansing some distance away. The increase in the number of technical schools of collegiate rank is noteworthy. In 1866 there were but six engineering colleges of established reputation and only 300 men had been graduated in the previous 31 years. In 1951 there were more than 150 degree-granting colleges with a total enrolment of about 150,000.

While there is considerable variation in the entrance requirements of this large group, in general a high school education is required.

In general, the entrance requirements of the privately endowed colleges are somewhat higher than those of the state institutions, the latter from the nature of state educational systems being closely articulated with the high schools of the state.

There is also a considerable degree of uniformity in the curricula of the better type of technical college. This is necessarily so in a measure since engineering is an application of the basis sciences of mathematics, physica and chemistry and their deray-tives. Analytic mechanics, which is a key course, is usually completed by the middle of the third year, leaving at least one and one-balf years of the four-year course for engineering fundamentals and applications. There is considerable variance, however, in the matter of instruction for specific technical callings. Pentically all colleges recognize four principal fields of engineering, namely, civil, mechanical, electrical and chemical. For the most part also the higher technical schools recognize the necess-

sity of offering a limited amount of instruction in specialized fields such as heat-power, radio, industrial, hydraulic engineering. etc. in the senior year, usually as optional studies. There is always, however, a strong pressure from the industrial field in the direction of highly specialized courses with their beginnings much earlier and not a few colleges have yielded to this pressure. Thus, there are many colleges offering engineering courses of good quality and accredited courses in aeronautical, agricultural, architectural, ceramic, chemical, civil, electrical, electrochemical, fuel technology, general, industrial, mechanical, metallurgical, mining, naval architecture and marine, petroleum, and samtary engineering For the most part, however, educators have become convinced that the student's time is best spent dining the first three years, at least, in acquiring fundamentals Specialization should be deferred as long as possible and any extended special study should be carried to a fifth-year study. All technical colleges of repute offer graduate study

Until comparatively recent years the technical colleges were the principal centre of research work in engineering and the chief sources of engineering data. The growth of commercial research laboratories has changed this situation but there is still an immense amount of research conducted in college laboratories. There is a growing tendency for industrial enterprises to co-perate with college laboratories in the prosecution of special problems. If properly conducted such joint efforts are most fruitful since the commercial concern can supply the practical data for the problem and the funds for its prosecution while the college can supply the necessary apparatus and knowledge

The growing tendency of the engineer to take a leading place in industrial administration gave ruse to a need for a broadening of the curriculum by the introduction of economics, accounting and subjects of a more liberalising character such as history. While a certain amount of such topics were introduced into the standard four-year courses any great addition necessitated a lengthening of the curriculum and five-year courses came into

No outline of US technical education would be complete without mention of the co-operative methods in many colleges whereby
the student spends part of his time in practical work and part in
study, thus obtaming his practical training and theoretical work
at the same time. Students in such courses may "earn as they
learn" and contact with industry stimulates interest in theory.
There is also an important group of polytechnical institutes offering instruction in technology somewhat below the level of the
higher schools but of great importance. Pratt institute in Brooklyin, N.Y., may be cited as an excellent illustration. The high
schools during this period also tended more and more to prepare
boys and girls specifically for life and to lay less accent on college
preparation. Many state educational departments continued to
offer technical training in the high school grades. (D. S.K.)

## UNITED KINGDOM

England and Wales.—Technical education in the modern sense did not develop in England on any substantial scale until the last decade of the 19th century. The mechanics' institutes, founded in great numbers from 1833 to about 1860, were intended to mistruct workingmen 'in the scientific principles of arts and manufactures,' but for the most part they quickly became diverted to social and literary rather than industrial education. The Great exhibition of 1851, which confirmed fears that Britain's industrial primacy was being threatened, led the government to establish a science and art department, but the grants that it distributed did little beyond developing an and exammation system

The 1807 international exhibition at Paris shook British complenency. It led to a royal commission which, reporting in 1875, moved the livery companies of the City of London to found in 1880 the City and Guilds of London institute to promote the teaching of applied science. In 1838, the institute opened the Fins-bury Technical college for the training of artisans and in 1834 the Central Training college at South Kessington to train technical teachers and the higher ranks of industry. Meanwhile, quite independently, Jouint's Mego geneed in 1838 the Polytechnic in

Regent street, London (See Polytechnics)

By that time another 10yal commission on technical instruction (1881-84) was sitting Its recommendations brought about the Technical Instruction act, 1889, which empowered the newly created county councils and the county borough councils to give limited aid to technical education out of public funds. In 1891 the Local Taxation (Customs and Excise) act unexpectedly made further large sums of money (popularly called "whiskey money") available for this purpose Consequently, the decade 1889-99 saw great activity in the provision of buildings for the teaching of applied science and technology In addition to public effort, funds provided by the City of London Parochial Charities act, 1883, aided the building in London of more polytechnics

In 1899 the Board of Education act created a single national department charged with the supervision of public education throughout England and Wales The Education act, 1902, similarly made the county and county borough councils general purpose education authorities, responsible for supplying or aiding the supply of secondary and technical as well as elementary edu-Unfortunately, the preoccupation of the board of education and the local education authorities with the development of the newly established secondary system considerably slowed down provision for technical education for more than a decade

Nevertheless, three important developments took place during that period. About 1905 trade schools for boys and girls leaving elementary schools began to be established in London, Middlesex and elsewhere In 1913 these schools were made eligible for grant as "junior technical schools" In 1907 the Imperial College of Science and Technology was founded by royal charter which merged the Royal College of Science, the Royal School of Mines and the City and Guilds of London Institute Engineering college into a single institution (though functioning largely as three bodies) devoted to the highest levels of education and research in science and technology, especially in their application to industry. In 1908 the college became a school of the University of London. The third development was the most important of all. This was the foundation, between 1900 and 1909, of six universities. Birmingham, Liverpool, Manchester, Leeds, Sheffield and Bristol The importance to technical education lay in the fact that three of these universities-Birmingham, Leeds and Sheffield-had grown out of colleges mainly devoted to applied science and were already strongly biased thereto, while the others were much more disposed to grant it a prominent place in their program than the older universities This remained the case

The period between World Wars I and II was one of slow and fitful but continuous expansion and improvement of facilities for technical education, made almost exclusively by the local education authorities The years of greatest progress were 1925-29, when Lord Eustace Percy was president of the board of education He not only encouraged building but set on foot a number of investigations, which resulted, among other things, in the board of education Report on Education for Industry and Commerce (1928), the Clerk Report on Education for the Engineering Group of Industries (1929) and the Goodenough Report on Education for Salesmanship (1931). A scheme for a big expansion of facilities was prepared during the late 1930s, but World War II pre-

vented its being implemented.

A previous development calls for special note. Shortly after World War I the board of education, in co-operation with professional institutions related to industry, established an entirely new system of examination and certification for technicians, leading to the award of national certificates and diplomas. The certificates, available to part-time students only, were awarded on the cumulative results of concurrent industrial experience and technical education. They were of two grades: ordinary, to be obtained normally after a three-year course, and higher, following a further two-year course. The first scheme begun was for mechanical engineering, in 1921. By 1951 a dozen technologies had similar schemes, and the national certificate was firmly established as the nongraduate technician's recognized qualification.

World War II brought to England full recognition of the im-

portance of technical education in an industrial society outbreak the country found itself dangerously short of technologists, technicians and skilled craftsmen and of means to train them By ingenuity and improvisation-the latter including the introduction of two- or three-shift training programs into many technical colleges-the shortages were temporarily overcome. Technical colleges alone gave special courses of training to nearly 300,000 men and women

Meanwhile the nation looked to the future. In 1943 the ministry of labour asked industry to consider the recruitment and training of juvenile employees after the war, as a result, by the early 1950s about 80 sections of industry had drawn up national apprenticeship schemes including systematic education and training, and the number of young employees receiving such training in working hours had increased sevenfold. In 1944 the minister of education appointed a committee on higher technological education, under the chairmanship of Lord Eustace Percy. It reported in 1945, recommending the upgrading of technical college courses to train technologists and the development of joint consultation between education and industry for national and regional planning of vocational education The latter recommendation was carried into effect in 1947-48 by the creation of the National Advisory Council on Education for Industry and Commerce and ten regional advisory councils for further education

The Education act of 1944 made it the statutory duty of the local education authorities to secure sufficient facilities for all types of education (except university education) in their areas. But until 1947 hardly any new building was possible, so that with a greatly increased demand for vocational education many technical institutions became grossly overcrowded. The demand was partly a result of the government's Further Education and Training scheme, under which men and women who had served in the armed services or work of national importance during World War II could receive grants for higher education and training It was also a result of a progressively increasing demand from industry for vocational training, especially during working hours, of all kinds for employees of all ranks.

In 1946 the ministry of education urged technical colleges to undertake more research and invited their co-operation in establishing national schools devoted to advanced work in particular branches of technology By 1951 seven such national colleges had been established for aeronautics, foundry work, rubber, leather and food technology, horology and instrument technology and heating, ventilating, refrigeration and fan engineering. In Jan. 1953 the government announced its intention, during the years 1957-62, to double the number of students at the Imperial College of Science and Technology so as to establish a technological institution of university rank (in accordance with an announcement of June 1952). It further offered technical colleges increased grants for approved high-level courses.

In 1951 there were 530 major establishments with 672,000 students, 203 art schools with 98,500 students and 10,705 evening institutes with 1,228,000 students.

Scotland.-Modern technical education in Scotland began with the founding by George Birkbeck in 1800 of a class for instructing Glasgow operatives in "mechanical and chemical philosophy." In 1823 this class broke away from the Andersonian institute to which it was attached to form the first Mechanics institution, Two years previously there was opened in Edinburgh the School of Arts, claimed to be the first institution in Great Britain founded

expressly to give scientific instruction to workingmen,

Until 1897 the English science and art department covered Scotland as well, and consequently statutory development of technical education was broadly parallel with England, except that under the Educational Endowments (Scotland) act, 1882, schemes were made and money was provided for establishing and maintaining technical schools. Among other changes, the Andersonian institute and the Glasgow Mechanics institution were merged in what became the Royal Technical college, Glasgow, and the School of Arts in the Heriot-Watt college.

Codes of regulations made in 1899 and 1901 organized elementary technical instruction in "continuation classes." To encourage advanced work the 1901 code provided that outstandingly good and well-equipped technical colleges could be exempted from its regulations and grant-aided on special terms. The Education (Scotland) act, 1908, recognized 11 of these "central institutions, as they became known. In 1951 there were 17, including 3 agricultural and 2 veterinary colleges Among them the Royal Technical college, Glasgow, and the Henot-Watt college, Edinburgh, were affiliated to the universities in these cities. Other technical education was given in "continuation class centres." There were 31,669 students in central institutions and 227,878 in continuation class centies

In the early 1950s the pattern of technical education in Scotland was (nomenclature apart) closely similar to that in England, except that the latter had no designated central institutions. Five

regional advisory councils had been established

Northern Ireland .- Before 1922 education throughout Ireland was regulated from England In the 19th century, despite the nonindustrial character of the country, technical education de veloped remarkably It received an added stimulus in 1849 when a department of agriculture and technical instruction was created In 1922, 30 technical schools managed by local authorities were handed over to the Northern Ireland government They included the Belfast College of Technology, one of the largest and best in the British Isles

The Education (Northern Ireland) act, 1923, further stimulated technical education by abolishing the restriction on expenditure to a 2d rate and merging it in the general expenditure of the local authorities Junior technical and commercial schools expanded, especially in the provision of day classes. The Belfast College of Technology prepares students for degrees in engineering and related subjects offered by the Queen's university. Among its students are also trades scholars, who are apprentices granted scholarships by the ministry of education for extended courses.

## REPUBLIC OF IRELAND

The department of education set up in 1924 took over the functions of the technical instruction branch of the department of agriculture and technical instruction established by the Agricultural Technical Instruction (Ireland) act, 1899. Following the report of the Commission on Technical Education, issued in 1927, which noted especially the lack of technical instruction in rural areas, a system of rural continuation schools was developed offering full- and part-time classes to meet the needs of their localities. Technical colleges and schools maintained by local authorities were established in all cities and large towns.

The National University of Ireland established faculties of engineering at two of its three constituent colleges, Cork and Dublin, and the University of Dublin (Trinity college) also established an engineering faculty. Both universities offer degrees in agriculture.

## BRITISH COMMONWEALTH NATIONS

Australia .- With increasing industrialization, much attention was paid to technical education, especially after 1940. In all states there are technical secondary schools or courses. In South Australia all apprentices in "proclaimed" trades and areas are required to attend trade schools for one half-day a week and one evening. Most apprentices in New South Wales attend technical colleges on a similar basis.

Many new technical colleges and schools have been built in Australia. In 1947 the New South Wales University of Technology was founded; it provides degree courses in civil, electrical, chemical and mechanical engineering, mining, applied mathe-matics, physics and chemistry. The Gordon Institute of Technology at Geelong in Victoria includes a textile college which meets the requirements of the whole commonwealth for highly trained executives for the wool industry. The School of Mines of Western Australia at Kalgoorlie similarly covers the mining industry. The University of Queensland runs correspondence courses in technical education up to degree standard.

New Zealand,-At the secondary level there are technical high schools in the large towns; in the smaller ones consolidated ture.

schools offer technical courses. The Auckland and Canterbury colleges of the university have engineering schools and Otago has a school of mines that grants its own diplomas The Lincoln and Massey agricultural colleges are affiliated to the university, of which they form the school of agriculture

Canada.-Recent years have seen great educational developments, especially in the piairie provinces In both English and French educational systems there are technical high schools and trade schools at the secondary level Technical institutes covering the senior high school years and beyond were increasing in the early 1950s The Nova Scotia Technical college, and the agricultural, pharmacy and veterinary colleges in Ontario are of university status, as is Macdonald college, the agricultural faculty of McGill university, Montreal, Que The western universities and New Brunswick have schools of engineering and agriculture

Union of South Africa .- Though each province had its own department of education, all forms of university and vocational education were financed by the union education department, which also conducted the examinations, during the early 1950s Technical education was provided in universities, technical colleges and schools and agricultural schools. The universities of Cape Town, Natal and Stellenbosch had schools of engineering and agriculture, those of South Africa and the Witwatersrand engineering schools

India.-Despite recent progress, facilities for technical education were far below the country's needs during the early 1950s In many elementary and some secondary schools instruction in handcrafts was made compulsory Beyond that, technical education was provided in universities and technical institutions at four levels institutions which could be entered from the seventh standard of a high school and offering courses leading to a certificate, institutions requiring matriculation for entry and offering diplomas; institutions offering degrees or equivalent courses, and institutions doing mainly postgraduate and research work

The responsibility for education was assumed by the states, but the central government, through the All-India Council for Technical Education, co-ordinated and improved facilities It maintained the Delhi polytechnic and was establishing similar national establishments such as the Institute of Technology at

Kharagpur in West Bengal (1950)

Pakistan .-- At the time of partition in 1947 Pakistan had three engineering colleges and some industrial institutes. The Council of Technical Education prepared a national development plan In 1951 the first of six technical secondary schools was opened at Karachi and the establishment of the Karachi polytechnic (assisted by the Ford foundation) begun. By 1953 the establishment of new engineering colleges in the Punjab and the North-West Frontier Province was in hand and Dacca engineering college was re-equipped. Technicians were being sent overseas for practical training. The universities had faculties of engineering and agriculture and there were agricultural colleges at Lyallpur and Sakrand.

## EUROPEAN COUNTRIES

France.-Technical education was brought under state control in 1892 and codified by the Loi Astier of 1919. Provisions were made for three main levels; apprenticeship, intermediate and higher. The first and second were usually entered from the elementary school; the third was open only to students possessing the baccalauréat awarded at the end of a secondary course.

At mid-20th century elementary school children could get the rudiments of technical education in the collèges modernes (formerly écoles primaires supérieures) and the cours complémentaires, both available from the age of 12. For elementary school leavers there was, after 1945, a great development of centres d'apprentissage, which offered to young people between the ages of 14 and 18 a three-year course of full-time trade training along with general education, leading to the certificat d'aptitude professionelle, awarded for a wide variety of crafts. At a higher level there was the development of colleges techniques and of regional schools of agriculture, the latter run by the ministry of agricul-

At the highest level are the national schools such as the École Polytechnique, which trains engineers for state service, both military and civilian, the École Centrale des Arts et Manufactures, whose aim is to produce future industrial leaders, and the Écoles Nationales d'Agriculture at Grignon, Montpellier and Rennes There are similar national schools for horticulture, veterinary

science, aviation and mining German Federal Republic,—During the 19th and early 20th centuries Germany built up a comprehensive national system of vocational training for workers of all grades. The Hitler regime perverted this, and the collapse of Germany in 1945 temporarily laid it in ruins. It was later built up again on similar lines, at

varying rates in the different Lander

In the early 1950s there were four main levels. Berufschule, Fachschule, Hohere Fuchschule and Technische Hochschule All boys and girls leaving elementary schools at 14 were due to enter Berufschulen, and by 1951 compulsion was said to be generally operative throughout the republic. They had to attend for three years, eight hours of instruction a week being required Alternatively, in some Lander they could attend a full-time Berufsfachschule for one year or more Fachschulen served students who completed their basic vocational education and wished to be more highly qualified in their trades, these schools were usually full time for one year Höhere Fachschulen are equivalent to English technical colleges, though usually possessing fewer departments, and recruit mainly from the gymnasien (grammai schools).

Technische Hochschulen, of which there were 13 in the Federal Republic in the early 1950s, had university status The famous Charlottenburg institution in Berlin was made a full university in 1946 to compensate for the fact that the Friedrich Wilhelm

university was in the Russian sector of the city

Netherlands .-- A system of continued education with a vocational bias for children leaving the elementary school is followed by junior technical schools (ambachts scholen) giving general and vocational education, trade schools (vakscholen) giving more intensive training in one trade (or group of allied trades), and technical schools, training for supervisory posts At university level are the Technical High school at Delft, offering degrees up to the doctorate in engineering, and the Agricultural institute at Wageningen, offering doctorates in agricultural science to students qualified as agricultural engineers

Belgium,-Technical education is largely in the hands of private bodies though it was placed under the supervision of the ministry of education in 1945. At Verviers a municipal École Supéneure de Textiles training textile engineers was established; by study there and at Liège university a degree can be obtained. The Faculté Polytechnique de Mons, devoted principally to en-

gineering, has university status.

Denmark.-There are many technical schools and three institutions for advanced instruction, of which two, the Royal Veterinary and Agricultural college and the Technical University of Denmark (both in Copenhagen) grant degrees. Some of the newer folk high schools have vocational biases, notably those

preparing women for nursing.

Norway.—Some continuation schools provide vocational courses for young people leaving the elementary schools. Youth schools cater for rather older students (aged 17-20) who wish to prepare for entry to more advanced vocational training. Trade schools for crafts, industrial occupations, seamanship and domestic science are numerous. At university level there are the Norwegian Institute of Technology at Trondheim and the Agricul-tural College of Norway at Vollebekk,

Sweden .- Practical lower secondary schools and upper secondary schools emphasize vocational work; the former offer a certificate for it. Full-time technical instruction is given in trade schools. There are two national technical colleges, the Royal Institute of Technology at Stockholm and the Chalmers Institute of Technology at Göteborg, both under the same governing board; they grant degrees up to the doctorate. Many of the folk high schools include vocational and quasi-vocational work in their programs, especially in gardening, farming, forestry, domestic science and gymnastics.

Finland.—There are numerous trade, technical and agricultural schools The National Institute of Technology, at Helsinki, grants bachelors' and doctors' degrees. The people's high schools teach handicrafts, agriculture for men and domestic subjects for women.

Italy.-After the elementary school, which gives a five-year course from the age of 6 to 11, pupils wishing to learn a trade can (on passing an entrance examination) enter the scuola di avmamento al lavoro, which offers three-year vocational courses and a diploma ranking in status with the secondary school certificate

Alternatively, elementary school children may (again on passing the necessary entrance examination) go to the scuola media (lower secondary school) between 11 and 14, which also offers prevocational courses. After the scuola media students can (by examination) enter an istituto tecnico for a four-year course leading to the abilitazione (professional diploma).

General postschool technical education is administered by provincial associations under the control of the ministry of public education Courses granting vocational qualifications are conducted by professional bodies, such as the National Institute for Training and Improvement of Industrial Workers (I.N A.P.I ), which work under the control of the ministry of labour highest level the government maintains polytechnics in Milan and Turin, and schools of engineering in Rome, Naples, Bologna, Padua, Palermo and Pisa

Switzerland .- There are many excellent technical schools administered by the cantons, to which the federal government delegates responsibility for education The École Polytechnique at Lausanne constitutes a faculty of the cantonal university famous Swiss Federal Institute of Technology (Eidgenössische Technische Hochschule) at Zurich 15 maintained and administered by the federal government, ranks as a university and has an international reputation. It was organized in it schools of architecture, civil, electrical and mechanical engineering, agriculture, agricultural engineering and surveying, forestry, chemistry, mathematics, physics, natural science, military science and pharmacy It also established a department of optional studies teaching the humanities, politics and economics

Turkey.-Steady progress toward a comprehensive system was made after the act of 1942, which outlined a ten-year plan. Mobile courses teach smithing and carpentry in villages Primary school leavers can enter three- or five-year trade schools and go on from there to two- or four-year technical schools or a school for master builders. There are also evening trade schools for men and women. The Technical University of Istanbul, created in 1944 from the former Imperial Engineering school, admits graduates of lycées and technical schools to a five-year course. In the early 1950s a similar university was projected for Ankara. There are training colleges for technical teachers (men and women) at Ankara.

TECHNOCRACY. The movement known as technocracy originated in the United States in 1932 It sought to give expression to a group of principles which for many years had found place in the writings of a few engineers, economists and students of science. Its basic principles were (1) Social phenomena are measurable and the laws of social control may be derived from these measurable and the laws of social control may be derived from these measurable and the laws of social control may be derived from these measurable and the laws of social control may be derived from these measurable and the laws of social control may be derived from these measurable and the laws of social control may be derived from these measurables. ments (1) In application of the fractune to the production to good and services has made it impossible to measure the value of the goods produced in terms of any single commodity (gold, for example) and thus the enginee bad destroyed the price system (3) The expansion of credit, sometimes termed the creation of debt, under the capitalistic system has disturbed the relative claims of capital and labour to the goods produced to such an extent that the capitalistic system has already collapsed (4) The economics of the social order are too compli-cated to be understood and controlled by politicians Control should in the hands of engineers and scientists.

TECK, a ducal castle stuated in Wuttemberg, immediately to the north of the Swabian Jura and south of the town of Kirchheim, crowning a ridge (2,544 ft ) of the same name. It

was destroyed in the Peasants' War (1525)

The duchy of Teck was acquired early in the 11th century by Berthold, count of Zahringen, whose great-grandson Albert, or Adalbert, styled himself duke of Teck In 1381 it passed both by conquest and purchase to Wurttemberg The title, which had lapsed with quel and purchase to wurttenners. The title, which are mpeer write the extinction of the Zahringen line ritgs, was revived in ragig by the temberg. The dignity was renounced by Duke Frederick William Chales upon his elevation to the rank of king in 1866. In 1863 the title "pnoze of Teck" was conferred by King William I of Wuttenstein the Challes upon helder of Duke Alexander of Wurttenberg (1862). perg upon the children of Diluce Alexander of Wurtchinderg (1804-85) by his morganistic marriage with Claudine, countess Rhédey, emobled as countess of Hobanstein; in 1871 Prince Francis, the eldest son of Duke Alexander, was created duke of Teck. His eldest son Adolphus (b. 1863) was in 1910 the holder of the title TECUCI, the capital of the Tecuci department of Rumanus TECUCI, the capital of the Tecuci department of Rumanus.

picturesquely situated among wooded hills on the right bank of the river Bêrlad, and at the junction of railways from Bacau, Bêrlad and Galatz Pop. 17,259 Tecuci has a large transit trade in grain, timber, cattle and horses, between northern and eastern

Moldavia and the Danubian ports.

TECUMSEH. TECUMTHE OF TECUMTHA (¢ 1768-1813). American Shawnee chief, was born probably in the old Shawnee village of Piqua, near the site of Springfield, O , between 1768 and 1780 While still a youth he took part in attacks on settlers passing down the Ohio river and in widely extended hunting expeditions or predatory forays to the west and south; and he served in the Indian wars preceding the treaty of Greenville in 1705 His eloquence and his self-control made him a leader in conferences between the Indians and whites as early as 1800, and when in 1804 and 1805 the Indians of the northwest became aroused by a series of treaties calling for new cessions of their territory and by the prospect of war between Great Britain and the United States, the opportunity was presented to Tecumseh and his brother Tenskwatawa (1e., the Open Door), popularly called "the Prophet," to put into operation a scheme which followed the ambitious dream of Pontiac. With some scattered Shawnee clans as a nucleus, the routine. With some scattered Snawmer claim as a nucleus, the borders proceeded to organize, first near Generville, O, and borders proceeded to organize, first near Generville, O, and els town," which was based on a sort of communism and was apparently devoted to industry and sobneys, but their actual plan was to combine all the Indians from Canada to Florida in a great democratic confederacy to resist the encreachment of the whites Tholarmatic confederacy to resist the encreachment of the whites Tholarmatic confederacy to resist the metaconduct of the whites Tholarmatic confederacy to resist the metaconduct of the whites Tholarmatic confederacy to resist the metaconduct of the whites Tholarmatic Confederacy to resist the metaconduct of the whites Tholarmatic Confederacy to resist the metaconduct of the whites Tholarmatic Confederacy to resist the metaconduct of the whites Tholarmatic Confederacy to resist the metaconduct of the whites Tholarmatic Confederacy to the metaconduct of the metaconduct of the whites Tholarmatic Confederacy to the metaconduct of the whites Tholarmatic Confederacy to the confederacy to the metaconduct of the whites Tholarmatic Confederacy to the confederacy to the metaconduct of the metaconduct of the whites Tholarmatic Confederacy the metaconduct of the metac organizations were to be disregarded, but all warrors were to be represented at pronderal assemblages where matters on interest to all Indian sensitive and assemblages where matters on treets to all Indian mate this league was the adocument and political lageauity of To commit and the superstitutions reverence aroused by the Prophet. This program alarmed the whites along the northwestern border. In the course of the parent three years of two William Harry Harriston of Indian held interest the properties of the organizations were to be disregarded, but all warriors were to be repreing that of 1869 which deprived the Indians of their best hunting ground, were given up and it no purchases were made thereafter with a ground, were given up and it no purchases were made thereafter with a ment and, during Tecunsesh's absence in the south, made a hostile ment and, during Tecunsesh's absence in the south, made a hostile ment against the Peripher's town.\[The Technology of the property of the purchase of the purchase of the purchase of the purchase of the purchase of the purchase of the purchase of the purchase of the purchase states of the purchase state of the purchase of the purcha

m 1834 Like Pontiac, whom he doubless imitated consciously, he had a wonderful eloquence and a power of organization rare among the Indians. He is depicted in many historical plays and novels to the product of the pr

He studied in England and in France and deducated himself chiefly to bibliography and library administration In 1873 he became librarian to Lord Acton and several years later librarian of the Athenaeum club. In 1889 he was also appointed secretary of the club and held both offices until his resignation in 1922. He was one of the active promoters of the first international conference of librarians held in London in 1877, out of which grew the Library Association of the United Kingdom of which Tedder was first honorary secretary and, from 1880 until his death, treasurer. He was active in all the society's meetings and undertakings and contributed about 20 papers to its different publications He was treasurer of the Royal Historical society from 1904 until his death, secretary to the Herbert Spencer trustees and editor of a continuation of Spencer's Descriptive Sociology, and a member of the Royal Commission on Public Records from 1910 to 1919 He wrote for the Encyclopædia Britannica, 11th edition, and for the Dictionary of National Biography and Dictionary of Political Economy. He died Aug. 1, 1924.

TEDDER: see HARVESTING MACHINERY

TEDDINGTON, a parish in the borough of Twickenham Middlesex, Eng., close to the Thames, 12 mi. WSW of Hyde Park corner, London. The district is residential Teddington is well known for its lock, largest on the Thames, being 650 ft. long, 25 ft wide and 10½ ft. deep The intake of all London water companies must be above it. Teddington is the headquarters of the National Physical laboratory.

TE DEUM, opening words of the ancient Latin hymn Te Deum laudamus (We praise Thee O God), at one time believed to have been written by St. Ambrose of Milan and now generally ascribed to Nicetas, bishop of Remesiana in Dacia. Its noble character speedily procured its incorporation in the liturgy of the Latin church while it has been set separately by countless composers as a hymn of thanksgiving for special occasions.

TEE, in golf a small conical mound made of damp earth on which the ball is placed before making the first drive for a hole Sometimes an artificial tee, usually made of rubber or wood, is used. In some games, such as quoits, horseshoes and hobs, the

tee is the mark toward which the player throws.

TEELE, RAY PALMER (1868-1927), U.S economist, was born in Fillmore county, Minn, on Oct 22, 1868 He was educated at the University of Nebraska (MA, 1899), and from 1899 until his death was economist of the US department of agriculture. In 1910-12 and 1919-21 he served as special agent of the bureau of the census in charge of irrigation. He made investigations and wrote a number of government reports on water rights and irrigation and also contributed numerous articles to periodicals on these subjects He was the author of a large number of government bulletins, including "Land Reclamation Policies in the United States" (department of agriculture, Bull, No. 1257 [1924]) and "The Western Farmer's Water Right" (department of agriculture, Bull. No 913 [1920]). He also wrote Irrigation in the United States (1915) and The Economics of Land Reclamation in the United States (1927). He died at Myton, Utah, on Sept. 1, 1927.

educated in law at St. Petersburg university and began to practise in Reval (Tallinn) In 1905, however, he associated himself with the revolutionary movement for which he was condemned to death by the Russian government He escaped to Switzerland but after a number of years he returned to Russia and served a sentence of impusonment. After the 1917 revolution he took an active part in paying the way for an Estonian government, was a member of the constituent assembly, 1919-20, and after 1920 of the Estonian diet He rose to power as a leader of the Agrarian party and was prime minister from Dec 1925 to 1927 and again in 1932 but failed to be re-elected to parliament in 1938. He was arrested and deported in 1940 by the Soviet occupation forces, after which his fate was unknown

TEES, a river of England, rising on the east side of Cross Fell (see Pennine Chain), 8 mi. N of Appleby in Westmorland and flowing 70 mi SE and E to the North sea Part of its earlier course forms the boundary between the counties of Westmorland and Durham. From its source to Middleton-in-Teesdale it flows through bleak moorland with hills using 2,500 ft and more above the sea Two famous falls above Middleton-in-Teesdale where the brown, peaty niver traverses the hard, black dolerite of the Whin Sill, are known as Caldron Snout and High Force At Caldron Snout the water dashes over huge steps of rock and at High Force it falls from a vertical rock 70 ft high into a swiling pool below From a point immediately below Caldron Snout to its mouth the river forms the boundary between Durham and Yorkshire almost without a break. Below Caldron Snout trees appear, contrasting with the broken rocks, and as the river flows through the wide vale past Middleton-in-Teesdale the scenery becomes gentler The town of Barnard Castle, Eggleston abbey and Rokeby hall-well-known through Sir Walter Scott's poems-are passed, and then the valley begins to open out, and the river crosses the rich plain south and east of Darlington. The Tees now becomes an important commercial highway, having on its banks such ports as Stockton-on-Tees and Middlesbrough and forming an outlet for the chemical plant at Billingham and the iron-working district of Cleveland in the North Riding of Yorkshire The drainage area is 708 sq mi.

TEETH, the modified papillae or elevations of the mucous membrane of the mouth, impregnated with lime salts Each tooth has a biting part or crown covered by enamel, a neck where the gum surrounds it, and one or more roots or fangs fitting into sockets (alveoli) in the jaw bone. For surgery of the teeth see DENTISTRY.

There are 32 permanent teeth in man, 16 in the upper and 16 in the lower jaw; they are also arranged in symmetrical sets of 8 teeth on each side. The upper and lower symmetrical sets of 8 will be described The two teeth from the mid-line in front are "incisors" and have chisel-shaped crowns The central mcisor of the upper jaw is broader than any of the others, and bites against the central and lateral incisors of the lower jaw, the same want of exact adaptation continues throughout the series, so that every tooth in the upper jaw except the last molar bites against its corresponding tooth of the lower jaw and also against the tooth hehind that

Next to the incisors comes the "canine (or eve) tooth," the crown of which is somewhat peg-shaped, while behind this are the two "premolars" or "bicuspids," whose crowns are flattened from before backward and bear two cusps, the larger of which is external As a rule there is a single root, though sometimes in the first upper premolar it is double

The three "molars" are placed behind the premolars, and the upper and lower sets can be easily distinguished because the upper have three roots while the lower have only two The grinding surface of the crowns of the upper molars shows three or four cusps, while on the grinding surface of the lower molars four or five cusps are found.

Of the three molars the first is the largest, and the third, or wisdom tooth, the smallest, while the upper wisdom tooth is smaller than the lower.

are only 20 teeth, to in each jaw and 5 in each segment. They

TEEMANT, JAAN (1872-? ), Estonian statesman, was are two incisors, one canine and two so-called molars These molars occupy the position which the permanent premolars later on take. The temporary teeth differ from the permanent in their smaller size, their whiter colour, the greater constriction of their necks, and in the fact that the roots of the molars are widely splayed

The dates at which the milk teeth are cut are very variable The lower central incisors come first between the sixth and ninth

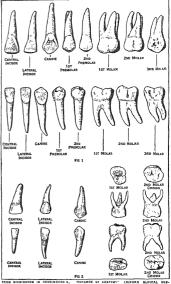

FIG 1-PERMANENT TEETH OF THE RIGHT SIDE. SHOWING INNER OR

LINGUAL ASPECT. FIG 2 -MILK TEETH OF THE LEFT SIDE

month, or even later, then come the central and lateral upper mcisors, then the lower lateral incisors, followed closely by the first molars. After a rest of four or five months come the canines, while by about the end of the second year the second molars have appeared, and the milk dentition is complete. The milk teeth are cut in batches with resting intervals between.

The first permanent tooth to be cut is the first molar, and this happens during or soon after the sixth year. It does not displace any of the milk teeth, but comes down behind the second milk molar. During the seventh year the central milk incisors fall out and their place is taken by the permanent ones; the shed teeth are mere shells of the crown, all the root having been absorbed.

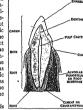

The lateral incisors succeed their milk predecessors at about In the "milk teeth" or temporary dentition of the child there eight years old, the first premolar takes the place of the first temporary molar about nine, the second premolar that of the 876

the second molar comes down behind the first about twelve The third molar, or wisdom tooth, usually appears between eighteen and twenty, but may be much later, indeed it is sometimes never cut at all, and when it is, it often does not come down to a level with the other teeth It is believed that man is gradually undergoing a suppression of his last molar teeth.

Histology .- In a vertical section the exposed part or crown is seen to be covered with enamel, which, microscopically, is composed of fine hexagonal prisms arranged at right angles to

the surface of the tooth, and formed chiefly of calcium phosphate with small amounts of calcium carbonate, magnesium phosphate and calcium fluoride, but containing practically no organic matter The enamel rests on the "dentine," of which hard vet elastic substance by far the greater part of the tooth is composed. It is made of the same salts as the enamel, but contains in addition a good deal of organic matter and forms a structureless mass through which the fine "dentinal tubes" run from the pulp cavity to the periphery.

PRON SIRKINGHAM IN CUNNINGHAM'S, "TEXT BOOK OF ANATOMY" (OXFORD MEDICAL FOR-LICATIONS) FIG 3 --- VERTICAL SECTION OF CANINE TOOTH ILLUSTRATING ITS

epithelial cells, the "odontoblasts," lying close against the wall of the cavity and forming new dentine. Slender processes ("Tomes's fibrils") project from these cells into the dentinal tubes and are probably sensory. A nerve and artery enter the apex of the root of the tooth, but it is not understood how the nerve ends

Surrounding the dentine where it is not covered by enamel is the "cement" or "crusta petrosa," a thin layer of bone which is only separated from the bony socket by the alveolar periosteum

Embryology.-The lip is marked off in the mouth by a "lip groove," which, in the case of the lower jaw, grows obliquely downward and backward, and the mass of ectodermal cells bounding it penetrates for some distance into the surrounding mesoderm below the bottom of the groove. This is known as the "tooth band"

On the under surface of this oblique tooth band (still taking the lower jaw), and close to its edge, appear ten thickenings, below each of which the mesoderm rises up into a "dental papilla," and so moulds the thickening into a cap for itself-the "enamel organ" The superficial cells of the dental papilla become the "odontoblasts" and manufacture the dentine, while those cells of the cap (enamel organ) which are on its concave surface and therefore nearest the dental papilla are called "ameloblasts," and form the enamel. The cutting or grinding part of the tooth is first formed, and the crown gradually closes round the dental papilla, so that at last, when the root is formed, the central part of the papilla remains as the pulp cavity surrounded by dentine except at the apex of the root. The roots, however, are formed slowly, and as a rule are not complete until some time after the tooth is cut. The mesoblastic connective tissue surrounding the developing tooth becomes condensed into a fibrous bag called the tooth-sac, and round this the lower jaw grows to form the alveolus. The crusta petrosa covering the root is developed from the tooth-sac, Hence of the various structures which make up a tooth, the enamel is derived from the ectoderm, while the dentine, pulp and crusta petrosa or cement are mesodermal.

Comparative Anatomy.-The details of the teeth vary so greatly in different animals, and, on account of their being the most durable tissues of the body, are so important for classifica-tory purposes, that they are dealt with freely in the various

second temporary molar about ten, the canine about eleven, while zoological articles All that can be done here is to give a broad general survey, taking the details of man's dentition as a point of denarture

In some fishes the teeth are continuous over the edges of the jaws with the scales on the surface of the body, and there is no doubt that teeth should be regarded as modified scales which have migrated into the mouth

In the Cyclostomata (lampreys and hags) the teeth are horny cones, but beneath them there are papillae of the mesoderm covered with ectoderm which resemble the dental papillae and enamel organs although no calcification occurs except in Bdellostoma In the Elasmobranchii (cartilaginous fishes) the teeth are arranged in several rows, and as those of the front row fall out the hinder row take their place, sometimes they are triangular and very sharp as in the sharks, sometimes flattened and arranged like a pavement for crushing as in rays. These teeth only represent the crowns of man's teeth, and they are not embedded in sockets except the teeth in the saw of the saw-fish (Pristis), moreover the dentine of which they are largely composed resembles bone and fills up the whole pulp cavity. From its structure it is known as osteodentine.

In the Teleostomi (teleostean and ganoid fishes) there is great variability; sometimes, as in the sturgeon, there are no teeth at all, while in others every bone bounding the mouth, including the branchial arches, bears teeth. As an example of a very full tooth armature the pike's mouth and pharynx may be instanced Both in the pike and the hake hinged teeth occur; these bend backward during the passage of prey down the throat, but are re-erected by elastic ligaments As a rule, the dentine of the Teleostomi is osteodentine, but sometimes, as in the bake, it is vascular and is known as vasodentine

In the Amphibia teeth are not so numerous as in the fishes, though like them they are not confined to the jaws, since vomerine teeth are very constant. The toad is edentulous, while the frog has no teeth in the lower jaw. An extinct order of tailed amphibians, the Stegocephali, are often called labyrinthodonts on account of the complex way in which the enamel is involuted into the interior of the teeth.

In the Reptilia various arrangements of the teeth are found. In the Chelonia (turtles) there are no teeth, although the ectodermal ingrowth (dental band) from which they are developed in other animals is present in the embryo. The place of the teeth in these reptiles is taken by horny jaw-cases.

In the Ophidia the non-poisonous snakes have two rows of teeth in the upper jaw, one on the maxillae and another on the palatine and pterygoid bones, while in the lower jaw there is only one row These teeth are sharp pegs anchylosed to the bones and so strongly recurved that one of these snakes would be unable, even if it wished to do so, to let any prey which had once entered its mouth escape. The poisonous snakes have a special poison fang in the maxilla of each side; these have a deep groove or canal running down them which transmits the poison from the poison gland. In the colubrine snakes, such as the cobra, the poison fang is always erect, but in the viperine, such as the adder and rattlesnake, there is a mechanism by which the tooth is only erected when the jaws are opened for striking. At other times the teeth lie flat in the roof of the mouth.

In the lizards or Lacertilia the teeth usually consist of a series of pegs in the upper and lower jaw, each resembling the one in front of it; sometimes, as in the chameleon, they are anchylosed by their bases to the bone, but at others, as in the iguana, they are fused by their sides to a ridge of bone which forms a low wall on their lateral surface. In the former case the dentition is spoken of as "acrodont," in the latter as "pleurodont,"

In the Crocoditia the teeth are fitted into definite sockets as in mammals and are not anchylosed with the jaws. This arrangement is spoken of as "thecodont." Existing birds are coothless, but palaeontology shows that they

originally had teeth of a reptilian character.

In all these lower vertebrates then, the teeth are similar or nearly similar in character; at least they are not divided into definite incisor, canine, premolar and molar regions. Their denti-

877 TEFTH

tion is therefore known as "homodont." Another characteristic is that in almost all of them there is an arrangement for a continuous succession of teeth, so that when one is lost another from behind takes its place, and to this arrangement the term "polyphyodont" is applied

Mammalia.- In the Mammalia the different groups of teeth (incisor, canine, etc.) already noticed in man are found, and these animals are characterized, with some exceptions, by having a "heterodont" as opposed to a homodont dentition. In the mammals too the polyphyodont or continuous succession of teeth is reduced to a "diphyodont" dentition, which means that there is only one relay of teeth to replace the first set In the marsupials the reduction of the succession is carried still further, for only one premolar in each segment of the law is replaced, while in the toothed whales there is no succession at all When one set has to

do duty throughout life the dentition is called "monophyodont" It is uncertain how the complex back teeth of mammals with their numerous cusps were derived from the simple conical teeth which are generally assumed to have been the primitive arrangement The "tritubercular" theory, which is most favoured, is largely based on the researches of E D. Cope and H F. Osborn, two American palaeontologists. According to this theory a simple peg-like ("haplodont") tooth develops two additional smaller pegs or cones, one in front and one behind the original main cone. This is known as the triconodont stage, and it is found in some of the oldest extinct mammals. As a later adaptation the two small cones become external to the original cone in the upper jaw and internal in the lower. The surface of the tooth has now a triangular shape with a cone at each angle, and this is the "tritubercular tooth" which is very common among the ancestral mammals Other cusps may be developed later, and so the quadricuspid and quinquecuspid molar teeth of man and other mammals are accounted for.

Incisor teeth are those which in the upper jaw have their sockets in the premaxillary bone; they are generally chisel-shaped, and with their opponents of the lower jaw act like scissors The canine tooth is the first tooth behind the premaxillo-maxillary suture, provided it be not far behind it, it is almost always the first of the maxillary series, speaking accurately, which is elongated and sharply pointed. The premolar teeth are those in the maxillary bone which are preceded by milk teeth. The molar teeth are those, behind the premolars, which are not preceded by temporary teeth

In front of the premolar teeth, and between them and the canine, if it be present, or the incisors, if it be absent, there is often a space called the "diastema." It is best marked in the Rodentia and Ungulata, and in the horse is familiar as the place where the bit lies. The elephant's tusks are modified incisors, those of the walrus and wild boar are modified canines.

Dental Formulae .- In recording the teeth of any particular mammal it saves time and space if a dental formula be used This simply means setting down the number of each kind of tooth in one side of the upper and lower jaw in their order from before backward. Thus man's formula would be, incisors  $\stackrel{2}{\rightarrow}$ 

canines  $\frac{1}{1}$ , premolars  $\frac{2}{2}$ , molars  $\frac{3}{3}$ . This is condensed into  $\frac{2 \cdot 1}{2 \cdot 1 \cdot 2} \cdot \frac{3}{3}$ Some other typical formulae are-

Cetacea -In the living toothed whales (Odontoceti) the dentition is homodont and may be as great as

There is every reason to believe, however, that they are derived from heterodont ancestors

The homodont dentition of the whales is a retrograde process, and is therefore not comparable to the homodont dentition of the

vertebrates below mammals. Sitenia -The dentition is monophyodont. The manatee has

1.  $\frac{2}{2}$ , c $\frac{o}{o}$ , back teeth  $\frac{\text{II}}{\text{II}}$ , these are replaced, like packages in a

vending machine, from behind

Edentata -The anteaters (Myrmecophagidae) are toothless, while the armadillos (Dasypodidae) and sloths (Bradypodidae) have a homodont dentition, which, like that of the whales, is retrogressive In the giant armadillo (Priodon gigas) the formula is

25 This animal therefore has a hundred teeth. In none of the 25

Edentata are the teeth covered with enamel.

Pholidota .- The pangolins or scaly anteaters are toothless, but show tooth germs in the foetus

Tubulidentata.—The aardvark (Orycteropus) has 5 to 6 enamelless cheek teeth These are simple for the most part, but several are bilobed. They lack a pulp cavity, but are provided with numerous prisms, each with a nutriant canal.

In the Marsupiaha the typical formula is 5 1.3 4. They are

divided into diprotodont, in which there are not more than 3

incisors, often 3 as in kangaroos, and polyprotodont, in which

the incisors are more than 3, as in the Tasmanian wolf (Thyla-

cinus) and Tasmanian devil (Sarcophilus).

In the Monotremata the echidna or spiny anteater is quite edentulous, while the duck-mole (Ornsthorhynchus) has functional molar teeth in youth, though in the adult these are lost, and their place is taken by horny plates.

Reviewing the various tooth formulae of mammals the following is usually regarded as primitive.

3.1.4.3

This, it will be noticed, is the formula of the pig, and it is also that of almost all the Eccene Ungulata

Brief Dental Glossary.—As the teeth are of such importance in the classification of animals, some of the chief terms by which they are described are recapitulated and briefly defined here

Acrodont, a tooth which is anchylosed by its base to the summit

1 ACCOGOM, a toout when is analytically a solution of a paraget on the jaw.
2. Biophodom, a molar tooth having two transverse ridges on its grunding snikee, as in the tapir.
3 Brackyodom, a low-crowned molar tooth—the opposite of hypso-

oht.

# Baucodout, a tooth bearing conical cusps

5. Diphyodout, having two series of teeth (milk and permanent)

6. Diphyodout, a marsupal with not more than § incisors, often
nly one on each side of the mandable

Haplodont, a tooth having a simple conical crown with a single

8. Heterodont, a dentition in which the teeth are not all alike, chiefly characteristic of the Manufielia
9. Homodont, a dentition in which the teeth are all alike, as in many of the lower vertebrates and some mammals

in the control vertex and some manners.

16. Hysiochem, a high-crowned molar tooth, such as that of the horse—the opposite to brachyodont.

11. Lophogodont, a transversely ridged molar tooth.

12. Monophyodont, having only one dentition (cf. diphyand molar tooth.)

polyphy-odont) 13. Multituberculate, a tooth, the crown of which bears numerous coulcal cusps; held by some to be the primitive condition of the mam-

14. Pleuradont, a tooth anchylosed to the inner side of a parapet on the law.

15 Polybunodout, a synonym foi multituberculate.
16 Polybhyodout, having an endless succession of teeth, as in most vertebrates below the mammals.
17 Polyprotodout, a marsup J having an incisor formula of more than \$\hat{a}\$.

18 Protodont, a stage met with in fossil mammals which is an advance on the haplodont tooth in that two small cusps are added

to the main cone 19. Secodont, a back tooth adapted to cutting, as in many of the Carnivora.

20 Selenodont, a molar tooth with crescentic ridges on its grinding

surface, as in most rummants
21 Thecodont, a tooth embedded in a socket or alveolus, as m mammals

Triconodont, a fossil stage in advance of the protodont. There

are three well-marked cones in an antero-posterior line
23 Tritubercular, a fossil stage succeeding the triconodont The
main cone is external in the lower teeth and internal in the upper A

man cone is external in the lower teeth and internal in the upper A very common form of back tooth in tosis forms and one which gives its name to the "tritubercular theory."

Bullionary.—Sir C. T. Times and the proper of the property of t

TEETH, ARTIFICIAL. Artificial teeth are those inserted in dentures to take the place of missing natural teeth. They are to be distinguished from artificial crowns, which replace only the crowns of teeth when the roots are retained, and from facings, which replace a visible surface of a metal tooth on a bridge (see DENTISTRY)

In early times the materials used were bone, ivory and hippopotamus tooth, and the restoration was often made in one piece, the teeth being carved from the same material as the base which rested on the gum tissue Individual human teeth or the teeth of various animals, especially the sheep, were sometimes mounted on gold or ivory bases, and were the best before the introduction of porcelain.

In the last quarter of the 18th century, one-piece restorations of porcelain began to be used, and at the beginning of the 19th century Giuseppangelo Fonzi, an Italian dentist practising in Paris, introduced individual porcelain teeth which were mounted on gold or platinum bases.

Porcelain teeth were introduced into the United States about 1817, reputedly by Anthony A Plantou (1774-1837). The form and quality of these teeth were much improved in America during the early decades of the 19th century,

The materials used in making teeth are essentially the same as those employed for other fine porcelain. Silica of exceptionally high fusing point is used to hold the form of the tooth. Kaolin forms the body material of the tooth Feldspar is the flux. A porcelain fine in texture, translucency and strength results Colour is supplied by metallic oxides which are incorporated in the basic ingredients

When vulcanized rubber (vulcante) began to be used about 1860 for bases on which the potoclam teeth were mounted, the teeth were designed with recesses in their bases (diatoric teeth) by means of which the vulcante retained them in position on the denture. In the fourth decade of the zoth century, when synthetic resus were introduced for denture bases, denture teeth were retained in the same manner. At middenture bases, definite tech were retained in the same manner. At mic-century the rapid development of many nontrillating plastics was bidding fair to revolutionize the production of all types of dentures. Early in the roth century, through the efforts of J Leon Williams, the appearance of artificial teeth was much improved by designing the

teeth to harmonize with the shape of the face. Teeth were made in three typical facial forms, square, tapering and ovoid. At the same time the effectiveness of the chewing surfaces of the back teeth was improved by the anatomical designs of Alfred Gysi of Switzerland During the fourth quarter of the 19th century several new designs of the posterior teeth were introduced which varied from the natural form and were intended by their inventors to increase the effectiveness of the teeth in mastication

Am., Dent. (G. B. D.) Assn., vol. 22, pp. 2291-2307 (Dec. 1936).

TEGEA, an ancient Greek city of Arcadia, on a plateau enclosed by Mts Pathenum and Maenalus on east and west, and by transverse tanges which separate it from the plateau of Orchomenus and from the Eurotas valley Tegean territory occuped the southern part of this plani; the northern half belonged to Mantineas ( $q \circ$ ). Its geographical position accounts for the conficts which arose with Mantinea and with Sparta

Terea was one of the most ancient cities of Peloponnesus; tradition ascribed its concentration (synoecism) out of eight or nine primitive cantons to a mythical king Aleus As several Cretan townships passed for colonies of Tegea, oversea connections may be inferred in prehistoric days. The prominence which legend assigns to its king Echemus in opposing the Heraclid invasion shows that it was one of the chief Peloponnesian communities in pre-Dorian days For several centuries Tegea screened Arcadia against expanding Sparta; ultimately subdued about 550 BC it was allowed to retain independence and Arcadian nationality During the Persian invasion the Tegeans displayed a readiness unusual among Peloponnesian cities, in the battle of Plataea they were the first to enter the enemy's camp A few years later they headed an Arcadian and Argive league against Sparta, but after losing two pitched battles at Tegea and Dipaca they resumed their former loyalty about 468-467 In 423 there was open war with the Mantinesans, and when the latter rebelled against Sparta and allied themselves with Argos and Athens, the Tegeans stood firmly by Sparta's side in the decisive battle of Mantineia (418) their troops had large share in the overthrow of the coalition, and during the early 4th century Tegea continued to support Sparta against the Mantineians and other malcontents. But after the battle of Leuctra the philo-Laconian party was expelled with Mantmeian help

Tegea henceforth took an active part in the revival of the Ar-cadian League and in alliance with Thebes against Sparta (371-362), and the defection of Mantineia confirmed its federalist tendencies The foundation of the new federal capital Megalopolis threw Tegea somewhat into the shade Hostile to the Macedomans, in 266 it joined the Chremonidean League against Antigonus Gonatas To the incorporation of Mantineia into the Achaean League (233) Tegea replied by allying itself with the Actolians, who in turn made it over to Cleomenes III of Sparta (228). From the latter it was transferred by Antigonus Doson to the Achaean League (222); in 218 it was again occupied by the Spartans but reconquered in 207 by the Achaean general Philopoemen In Augustus' time Tegea was the only important town of Arcadia, but its history throughout the Roman and Byzantine periods is obscure, it ceased to exist as a Greek city after the Gothic invasion of 395. The site is now occupied by the small village of Piah

Archaeology.-The temple of Athena Alca at Tegea is described by Pausanias as excelling all others in Peloponnese The original temple built by Aleus, the founder of the city, was superseded by a larger one which was destroyed by fire in 395 B C. Rebuilding was entrusted to Scopas, the great sculptor; and probably he also provided the pediment sculptures, representing at the front, the hunt of the Calydonian boar, and, at the back. the battle of Achilles and Telephus. Both subjects were intimately associated with the temple, for Atalanta had dedicated in it the face and tusks of the boar, and Telephus was the son of Heracles and the priestess Auge. Two heads of heroes and that of the boar were found before 1880; later excavation, in 1883, showed the plan of the temple, which had six columns at front and back, and thirteen at the sides. Like the temple at Phigalia (q.v.) it combined all three orders-Doric, Ionic and Corinthian. In 1900 the French School at Athens recovered more fragments, including a head of Heracles and the torso and possibly the head of Atalanta, these last two of Parian marble. See GREEK ART.

TEGERNSEE, a lake in Upper Bavaria, situated in a beautiful mountan country, 2,38 ft. above the sea, 34 m south from Munch by rail to Gmund, a village on the north shore. The lake is 4 m long, 12 broad, and about 235 ft deep. Its waters discharge through the Mangfall into the Inn It is one of the most frequented summer resorts in the vicinity of Munich

The village of Tegernsee, on the east bank, has a 15th century parish church and a ducal castle (formerly a Benedictine monastery)

TÉGETTHOFF, WILHELM VON, Bason (1827–1871). Austrian admiral, son of Leutenant-Colonal Karl von Tegethan was born at Maribor (Marburg) on Dec 23, 1837, After passing through the navla college at Ventice, he cease ensign in 1848 and heutenant in 1853. He served in the North Sea against the Danes (1848 and heutenant in 1856). He served in 1866 heutenant of the effective force of the Austrian 1867 and the North Sea against the Danes (1865). In 1866 he was placed his channel of the effective force of the Austrian 1867 and the Sea an

at Vienna on April 7, 1871.

TEGNER, ESAIAS (1782-1846), Swedish writer, was born on Nov. 13, 1782, at Kyıkerud in Wermland. His father, a pastor, whose name had been Esaias Lucasson, took the surname of Tegnerus-altered by his fifth son, the poet, to Tegnér-from the hamlet of Tegnaby in Småland In 1792 Tegnerus died. In 1799 Esaias Tegnér, educated in the country, entered the University of Lund, where he graduated in philosophy in 1802, and continued as tutor until 1810, when he was elected Greek lecturer. In 1806 he married Anna Maria Gustava Myhrman In 1812 he was named professor, and continued as a lecturer in Lund until 1824, when he was made bishop of Vexió. At Vexió he remained until his death, twenty-two years later. Tegnér's early poems have little merit. He was comparatively slow in development His first great success was a dithyrambic war-song for the army of 1808, which stirred every Swedish heart. In 1811 his patriotic poem Svea won the great prize of the Swedish Academy, and made him famous.

In the same year was founded in Stockholm the Gothic League (Gotisha forbundet), of young and patriotic men of letters, of whom Tegaér quickly became the chief. The club published an excellent magazine, Idana, in which it urged the study of old Icelandic literature and history. Tegnér, Geiper, Afzelius, and Nicander became the most famous members of the Gothic League. Tegnér's fame rests principally on three longer poems Nativerdibarnes ("The First Communion," 1820), well known in Long-follow's version; Pribhiofs, 30g (1820-25), a romantic paraphrase of an old saga, which was translated into nearly every European language; and the romance, Agaér (1820). In later years Tegnér began, but left unfinished, two important epic poems, Gerda and Kronbrades.

The period of the publication of Pritipiofs sage (1825) was the critical epoch of his career. It made him one of the most famous poets in Europe; it transferred him from his study in Lund to the bishop's palace in Vexiô; it marked the first breakdown of his health, which had hitherto been excellent; and it witnessed his unhappy passion for Euphrosyne Palm. On Nov. 2, 184,6 led diel Nexiô Torm 1879 he had been a member of the Swedish Academy, where he was succeeded by his biographer and best imitates Böttiger.

See Böttiger, Techning af Tegnérs Lefnad; Georg Brandes, Esalas Tegnér; Thommander, Tankar och Löjen; E. Böök, Esalas Tegnér (vol. i, 1917).

TEGUCIGALPA (tā-goo-thē-gahl'pa), the capital of Honduras and of the department of Francisco Morazán; 3,200 ft, above

sea level, on the Choluteca, at the head of a highway to the port, development of Tehran is remarkable. There is a beet sugar of San Lorenzo on Fonseca bay. Tegucigalpa is the only capital city of the American republics without railway connections. Pop (1950) 72,385, including the twin city of Comayaguela. Tegucigalpa became capital of Honduras, a status it had previously shared with Comayagua, in 1880. During the 18th century the neighbourhood was famous for its gold, silver and marble, but in modern times the mines and quarries have greatly declined in value and farming is the chief local industry.

TEHRAN (te-rahn'), capital of Iran and of a province of that name, is situated in 35° 41' N., 51° 25' E., at an elevation of 3,810 ft., on an extensive gravel deposit which slopes down from the foot of the Elburz mountains (some 10 mi, distant) and extends for 52 miles beyond the city, on the south. It occupies a radical position in Iran commanding routes in all directions, Isfahan being 224 mi. distant on the south, Bushire 677 mi, Baghdad 500 mi. west, Tabriz 374 mi. northwest, Meshed 471 mi. northeast, Herat 672 mi., and the Caspian sea 70 mi. distant.

Streets and Buildings. Formerly Tehran consisted of a fortified polygon of 4-5 mi. circuit surrounded by a battlemented mud wall 20 ft, high flanked with circular towers and having a dry ditch and six gates. In 1860 under the reign of Nasr-ed-Din Shah the old walls and towers were demolished and replaced by a moat and earthen ramparts 12 mi. in circumference, constructed on the plan of the fortifications of Paris, as they were before the Franco-German war. Riza Shah decided to pull down these constructions including the 12 gates consisting of lofty archways and turrets all adorned with coloured tiles. The city now extends everywhere beyond the old circumferences, particularly to the north where the modern residential section is rapidly developing The centre of the city is the Meidan Sepah (formerly Topkhaneh) a large square surrounded by modern government buildings, the ministry of post and telegraph, the municipality, the police buildings and the Imperial Bank of Iran. To the south is the old royal palace within the precincts of which are the Talar, or throne room, with the marble throne of Karim Khan Zand brought from Shiraz; the Takht-i-taus or Peacock throne, made for Fath Ali Shah, largely made from lewels looted from India by Nadir Shah. In this part of the town are several other ministries and the bazaars. The new palace is in the western part of the city somewhat south of the Shah avenue which runs east-west and leads to the house of parliament, the Majlis, and the Mosque Sepah-salar, grand vizier and minister of war of Nasr-ed-Din Shah. North of the Meidan Sepah are most of the embassies and legations. Large avenues and thoroughfares, paved or asphalted and planted with trees, cut through the old parts, and new buildings combining modern architecture with Iranian motives are springing up everywhere. Tehran is the junction of the Trans-Iranian railway leading from the Caspian sea to the Persian gulf and the East-West line connecting Khurasan (Meshed) with Azerbaijan (Tabriz).

Pop. (1940 census) 540,087; but it is said to have increased considerably after that year, because of the influx from the country. The government's estimate (1944) made for rationing purposes was approximately 800,000. The overwhelming majority are Persians and Shiites. Baha'is are numerous and there are some 4,000 Jews and about the same number of Armenians.

Riza Shah made Tehran a modern city with all improvements, such as electricity, telephone, motorbus service, clubs, cinemas, etc.; the essential desideratum is still canalization and a sewage system. The water supply is almost wholly from kanats bringing the water from the Shemran slopes of the Elburz. There are some 40 of them, 5-8 mi, in length, the majority fed from underground sources, and entirely dependent upon the snow and rainfall. Tehran has a modern university with all faculties represented; it is co-educational. There are a large number of hospitals, a nursing school, etc. The foreign schools and colleges were taken over by the government in 1940. Much has been done in the way of sanitation in recent years and there is a distinct improvement in the health of the city. Tehran has a royal museum in the old palace (Gullstan, or Rose Garden) where the crown jewels are kept, a modern Museum of Iranian Art and Archaeology and a Museum of Iranian Ethnology. The industrial

refinery, a cotton spinning factory, a tobacco plant, an ammunition factory, a plant for the manufacturing of soap, a cement plant, a brewery, distillenes, a plant for the manufacturing of glass, etc. North of Tehran is the village district of Shemran with the summer seats of the legations, hotels, and many private residences for the hot season. Two broad asphalted avenues have been constructed to connect Shemran with Tehran. South of Tehran are the rums of Rayy, one of the oldest cities of Iran and

THE DAUGHTER OF A RUG-

intimately connected with her history until it was destroyed by the Mongols in 1221. It was famous for its beautiful nottery of the 12th and 13th centuries (commonly called Rhages). A few miles farther south is the Shahzadeh Abd ul Azim a place of pilgrimage whose shrine with its golden dome is much visited. The place is connected with Tehran by a narrow-gauge railway constructed in 1888.

TEHRAN PROVINCE is bounded N by Mazanderan, W by Kazvin and Hamadan, S by Qum, and E. by Semnan-Damghan provinces, and it embraces a large part of the southern slopes of the Elburz range, while again to the south is found the Dana-i-Namak, a salt lake or morass, which extends 150 mi. E. and W and has a breadth of 35 mi. in some places.

History.-Though a modern capital MAKER OF TEHRAN Tehran is old historically, but was for long small and insignificant. It is thought that the name means "the plains" in contradiction to shamran, ie, "mountains" Almost the earliest mention of the place is by Yaqut (12th century) who speaks of its houses, constructed underground. It is described by Hamdullah Mustawfi, in the 14th century, as of some importance,

Under the later Safavis (end of the 17th and beginning of the 18th centuries) Tehran was sometimes the residence of the count. Sir Thomas Herbert who visited the city in 1627 states that it then contained 3,000 houses built of sun-dried bricks and supplied with water from a little river. The town was taken and pillaged by the Afghans in 1723, and receives mention by Jonas Hanway, 1744. With the rise of the Qajar dynasty at the close of the 18th century, the first epoch of the city's ascendancy began, Agha Mohammed Khan selecting it, about 1788, to supersede Isfahan or Shiraz as his capital. Riza Shah Pahlavi made of Tehran (q v.) a modern city Under the rule of Fath Ali Shah the city so increased in size

and population that when visited by Ouseley and Morier about 1810, it had 12,000 houses and 40,000-60,000 people. It remained at about this size for the first 70 years of the 19th century until it underwent an entire renovation at the hands of Nasr-ed-Din Shah. Tehran province is the seat of many industries as beet sugar refineries, cotton spinning factories, mining industries (coal,

sugar refineries, cotton spinuing factories, mining industries (coal, manganese, copper), a high furnace, cement plant, etc.

TEHRI GARHWAL, a mountain state in northern India, in the Punjab Hill agency: area, 4,516 sq.mi.; population (1941) 397,369. It lies entirely amid the Himalayas, containing ranges from 20,000 to 23,000 ft. above sea level, and also the sources of both the Ganges and the Jumna, with the places of pilgrimage associated with them. The forests, which have been leased to the British government, are very valuable, yielding several kinds of pine, oak and cedar. The chief, whose title is raja, is descended from a Rajput family which formerly ruled over all Garhwal. and enjoys a salute of 11 guns. The existing state was created by the British after the war with Nepal in 1815.

TEHUANTEPEC, town, Oaxnes state, Mexico The name Tehuantepee. (from teeuant-tepee—")-gauer hill") is also given to the sithmus, guif and tailway. The town is on the Tehuantepee river about 1.5 mi from its mouth and 13 mi by real from Salma Cius Pop (1950) 10.687 It is a typical Indian town, occupying the slope of a hill on the Pacific side of the divide, with a view of the river valley and the distant serras to the north. Most of the streets are little more than crooked paths up the hillside, and the habitations are for the most part thatched, mud-walled huts The population of the town and of the surrounding district is composed aimset whelloy of Zanotec Indians (or v)

TEHUANTEPEC, an isthmus of Mexico lying between the gulfs of Campeche (Campeachy) and Tehuantepec, with the Mexican states of Tabasco and Chiapas on the east and Veracruz and Oaxaca on the west. It includes that part of Mexico lying between the 04th and 06th meridians of longitude W, or the southeastern parts of Veraciuz and Oaxaca, with perhaps small districts of Chiapas and Tabasco. It is 125 mi. across at its narrowest part from gulf to gulf, or 120 mi to the head of Laguna Superior on The Sierra Madre breaks down at this point into the Pacific coast a broad, plateaulike ridge, whose elevation, at the highest point reached by the Tehuantepec railway (Chivela pass) is 735 ft The northern side of the isthmus is swampy and densely covered with jungle. The whole region is hot and malarial, except the open elevations where the winds from the Pacific render it comparatively cool and healthful The annual rainfall on the Atlantic or northern slope is 48 in (10-year average) and the maximum temperature about oso in the shade. The Pacific slope has a light rainfall and drier climate.

Since the days of Cortés, the Tehanstepe isthmus has been consident of avourable route, first for an interconance canal, and then for an interconance ruliway. His proximity to the axis of international trade paper it some advantage over the Fhannit toute, which was continpred in the continuous control of a constant of a canal across the sthmus compelled engineers and capitalists to give it up as impracticable, numerous projects for the construction of a ruliway were undertaken and abandoned. TERUELCHE, an almost extinct Indian tribe once occupying the plans of Patagona from the Rio Negro to the Strate of Magellan. Their great stature and physical vigour have created a gaint-tradition in European literature. As the and, wind-swept nature of Patagona unifits if for agriculture, the Tehuelche necessarily were nomadic hunters. Before the 16th century they lived much as did their kinsmen, the Ona, in Tierra del Fuego, but the advant of the horse resulted in greatly enlarging their sphere of action and in various cultural changes.

See G. C. Muster, A. home with the Patagonium (London, 1871);
F. F. Outer, La dad de pitadra en Patagonia (Bunnoa Aires, 1872);
TEIGNMOUTH, JOHN SHORE, 187 Banon (1751—1834), governor-general of India, was horn on Oct 8, 1751, the son of Thomas Shore, a supercargo in the service of the East India company. He was educated at Harrow and went out to India as writer in the Bengal civil service in 176). He became a member of the supreme council (1787—89) and assisted Lord Cornauliis in introducing many reforms, but dd not approve his permanent settlement of Bengal. On the retirement of Cornwallis, he was appointed governor-general (1792—98) and adopted a policy of noninterference; but he deposed Wasir Ali, for whom he substituted Saadat Ali as nawab of Oudh. He met a mutiny of In-

dian army officers with concessions. He died Feb. 14, 1834.

Bellocarrix Charles Shore, 2nd Baron Teignmouth, Memoir of Bet Life and Correspondence of John, Lord Teignmouth, 2 vol. (London, 1831); also Pooma Residency Correspondence, vol iv, ed. by V. G. Dighe (Sombay, 1937).

Gun 1825/1827
Dithe (Rombo, 1917), a seaside resort and residential town in the TEGINMOUTH, a seaside resort and residential town in the Twetton parliamentary division of Devon, Eng., 16 mi. S.S.E. of Exeter by road. It lies on the north side of the Teign, and the urban disturt includes the parish of Shaldon on the south side of

the river, there crossed by a bridge At Shaldon the Ness head-land and estate are a public park Pop of urban district (1951) 10.580 Area 32 sq m The town spreads along the valley and over the wooded uplands to Little Haldon (800 ft ) where 43 ac of heathland belong to the national trust

Tegnmouth possessed a church of St. Michael as early as 1044, when what is now East Teignmouth was granted by Edward the Coatessor to Leofric, bishop of Exeter In the middle ages Teignmouth was a flourishing port, able to supply 7 ships and 120 mariners to the Calais expedition of 1347, and depending chiefly on the fishing and sall industries. Teignmouth was midded by the French in 1340 and again in 1690. In the 179th century it was a fashionable watering place The harbour is still used, and there is sea and river fishing

TEIRESIAS, in Greek legend, a famous Theban seer, son of Eueres and Chariclo, a descendant of the Spartos (see CADMUS) He was blinded early in life either because he saw Athena (or Artemis) bathing naked, or because he told Zeus and Hera that women had far more pleasure of love than men, thus bitterly offending the latter At all events, he was comforted by the gift of seer-craft and granted a very long life, finally being allowed, even in Hades, to retain his wits and not be a mere phantom As a result of killing coupling snakes he turned into a woman, years later he repeated the action, and became a man again He died just after the capture of Thebes by the Epigoni. His grave was at the Tilphusian spring; but there was a cenotaph of him at Thebes, and also in later times his "observatory," or place for watching for omens from birds, was pointed out (Pausanias ix 16, Sophocles, Antigone, 999). He had an oracle at Orchomenus, but during a plague it became silent and remained so in Plutarch's time (De Defectu Oraculorum, 44)

TEISSERENC DE BORT, LEON PHILIPPE (1855-1913), Fiench meteorologist, was born in Paris on Nov. 5, 1855, the son of an engineer He began his scientific career in 1880, when he entered the meteorological department of the Bureau Central Météorologique in Paris under E E W Mascart In 1883, 1885 and 1887 he made journeys to north Africa to study geology and terrestrial magnetism, and during this period published some important charts of the distribution of pressure at a height of 4,000 metres. In 1892 he became chief meteorologist to the bureau but resigned in 1896 and founded a private meteorological observatory at Trappes, near Versailles, where he carried out investigations on clouds and the problems of the upper air In 1898 he published an important paper in Comptes upper all in 1999 to purpose an improvant paper in Compress Results detailing his researches by means of balloons into the con-stitution of the atmosphere. His discovery of the so-allief nothermal layer, or structosphere, as it is now generally called, will always stand out as one of the most important events in the study of the upper throughner. He also carried out investigations in Sweden and over the Zuider Zee, the Mediterranean and the tropical region of the Atlantic, and fitted out a special vessel in order to study the currents above the trade winds. He collaborated with Hugo Hildebrandsson in Les Basses e la météorologie dynamique (1900-05). He died at Cannes on Jan. 2, 1913.

TERIRDAG, a city of European Turkey, on the Sea of Marmara, 76 m. W. of Istanbul. A Greek settlement founded probably in the 7th century ne., it was originally called Rhaedestus or Blasnthe, later Rodosto. Since 1923 it has been officially known under the Turketh name of Technica (princes hill). Rodosto was under the Auditanople (Edirne) area, but its trade suffered when Dédérade (he namardroupoil), on the Aegean sea, became the terminus of the Canandroupoil), on the Aegean sea, became the terminus of the Turketh of the Auditanople (Edirne) area, but its trade suffered when Dédérade hill the Turketh of the Auditanople (Edirne) area, but its trade suffered when Dédérade hill the Turketh of the 1st it was occupied by the Russians in 1877-78, by the Bulgars of the North of Panage Remove the State of Panage Remove the Panag

TEKTITE, the name given by F. E. Suess to the glass bodies occurring isolated on the surface or in gravels, in Moravia

and Bohemia, where they are called moldavites, the East Indies, where they are known as billitonites, and Australia, there known under the name of australites and obsidianites (from Gr τηκτός, "melted"). In Tasmania, an exceptional type is met with in the Mt Darwin region on the west coast, these glass bodies are known as Darwin glass (or queenstownite) Isolated types of tektites have also been seen in Sweden and Colombia (South

In the Moldau district of Bohemia the moldavites occur as flat, rounded or ellipsoidal bodies of a bottle-green colour, and usually with a pitted or corrugated surface. The homes of these tektites are river gravels or deposits of late Tertiary or recent age. The colour of this material led to its being commonly called Bouteillenstein Australites are found distributed over wide areas remote from volcanic regions in Australia, principally in Victoria and the central goldfields of Western Australia They exhibit a great variety of curious forms suggestive of flight and rotation while in a molten or plastic state These shapes are ellipsoidal, pear-shaped or buttonlike with a projecting rim like a saucer. They are darker and less transparent than moldavites Billitonites resemble australites more than moldavites, being dark like the former. They occur in river gravels in the island of Billiton, and are for the most part roughly spherical or ellipsoidal and possess glossy, deeply sculptured surfaces Billitonites reach in size up to 3 in in diameter and in weight to 16 oz.

Composition .- While possessing the silica content of natural obsidians (70%-90% SiO2) the tektites contain a higher percentage of iron and magnesium, and excess of calcium and potassium over sodium. Nor do they contain, with one doubtful exception, signs of incipient crystallization as is common in obsidians The distinctive chemical composition of these bodies is reflected in their specific gravity and light refraction, which enables them to be separated from rhyolite and trachyte obsidians It has been claimed that they originated by the fusion of dust in the air by lightning and that they are really fulgurites, but little can be said for this view. Though they are of widely different composition from the iron or ultrabasic meteorites, a meteoritic origin remains as the least objectionable of all theories.

Analyses of some typical tektites are given below:

	SiO <sub>2</sub>	Al <sub>2</sub> O <sub>3</sub>	Fe <sub>2</sub> O <sub>2</sub>	FeO	MgO	CaO	$Na_2O$	K <sub>2</sub> O

TELAMON (mod. TALAMONE), an ancient city on the coast of Etrura, 11 mi. N. of Orbetello, where the Romans defeated the invading Gauls in 225 BC. Marius disembarked there on his return from Africa in 87 BC., but in 82 the town was destroyed by Sulla's troops and thereafter declined. The harbour was of some importance in the middle ages. The ancient site lay on the hill of Talamonaccio, (H. H. SD.)

TELANG, KASHINATH TRIMBAK (1850-1893), Indian orientalist, was born at Bombay on Aug. 30, 1850. In 1889 he became a judge of the high court, where his judgments are recognized as authoritative. He was a great Sanskrit scholar, his translation of the Bhagavadgita into English is a standard work, and he criticized Weber's theory of Homeric influence on the Ramayana.

Telang died at Bombay on Sept. 1, 1893.

See R. West, Telang's Legislative Council Speeches (Bombay, 1895). TELAY (Georgian TELAYI), a small town in the Georgian S.S.R., on the Alazan river, alt. 2,420 ft, in 41° 55' N., 45° 24'

in 803, it was the capital of Kakhetia until 1762, when King Herachus II of Kakhetia succeeded his father Teimuraz II as king of Georgia and united the two kingdoms, and the ruins of its forts still exist. In its environs are religious foundations of great antiquity, the 6th-century Iqalto monastery, the Alaverdi cathedral founded in the 10th century and the 16th-century Shuantı monastery

About 5 mi E of Telav is situated Tsinandali, once the domain of the princes Chavchavadze, where the best Kakhetian wine is produced (See Georgia )

TEL AVIV, a city in Israel, founded by Zionist settlers in 1909 on the sand dunes north of Jaffa. At the beginning of World War I it counted 182 houses with a population of 1,313 With the growth of Jewish immigration after the establishment of the British mandate in 1922 the population rose rapidly. By 1943 the city counted about 220,000 inhabitants and had surpassed in size and importance the neighbouring Jaffa, thus making Tel Aviv the largest city in Palestine.

Tel Aviv is a thoroughly modern city with up-to-date houses affording the most modern comfort, with broad shaded avenues and a bustling atmosphere of business in the American way. It is entirely inhabited by Jews, and thus forms the first all-Jewish city anywhere. After 1936 a new harbour was built to supplement or replace the old-established harbour of Jaffa The first Hebrew high school (gymnasium) in Tel Aviv was opened before World War I, and the city is today a centre of Jewish cultural life in Israel, the home of the Hebrew theatre and the place of publication of most Hebrew books and newspapers. Part of the long shore line of the city has been converted into a fashionable bathing resort.

Athletic competitions in which Jews from all countries participate are held every second year in Tel Aviv and are called Maccabiah In the first period of Israel's independence, Tel Aviv was the seat of government
In 1950 Jaffa was incorporated into Tel Aviv giving the city

a combined population estimated at 310,000. (H Ko , X )

TELECHRON, an electric timekeeper invented by Henry E. Warren which is operated and regulated by alternating current. The motive power is a small self-starting motor running in exact synchronization with a central station generator.

TELEGRAPH. Before the Christian era the attracting properties of rubbed amber and the magnetic attraction of the lodestone had been observed, but they were regarded purely as interesting phenomena until Giovanni della Porta, in 1558, suggested a "sympathetic telegraph." This he described as two needle-shaped pieces of steel, each mounted at the centre of a dial with letters equally spaced around the periphery, and "both needles magnetized by the same lodestone" A movement of the needle of one instrument was supposed to cause a synchronous movement of the other instrument, and it was thought communication could thus be set up between two distant points. Actually no practical results were obtained until after the discovery of the Leyden jar about 1745. Pieter van Musschenbroek demonstrated that the charge from a Leyden jar could be conveyed a distance over a wire conductor, and about the same time Benjamin Franklin disclosed the results of his investigations of electricity.

## EARLY TELEGRAPHS

Spark and Pith Ball.-Sir William Watson in England demonstrated in 1747 that an electric current could be transmitted through a considerable length of wire using the earth for the com-pletion of the circuit Eleven years after Watson's discovery, the first suggestion for an electrical telegraph was made in Scotland by an anonymous writer to Scots Magazine, signing himself C. M., who advised using an insulated wire for each letter of the alphabet. At the receiving end of each wire a pith ball was to be suspended above a piece of paper marked with an alphabetical letter. As a charge was sent along a given wire, the ball would attract the paper beneath it, and, by observation, words could be spelled out. He further suggested that bells might be substituted for the E., on a branch railway from Tilis. Its population (8,766) is papers, which could be struck in turn by a ball as a charge was sent mainly occupied in silk weaving and wine, production. Founded along any desired wire. The idea was carried out by Georg Louis Le Sage in Geneva in 1744, and similar telegraph systems were suggested by Bétancourt and Lomond in 1785. Then followed ones suggestions using a separate wire for each letter, by Reuzen in 1794, and by Don Francisco Salva in 1798, who each proposed a system of visual telegraphy by causing a spark to appear at a gan at the receiving end of each wire as desuited.

Sir Francis Ronalds worked a telegraph in England in 1816 with tanamitting and ieceving apparitus consisting of circular plates, on which were inscribed letters and figures. In fiont of each plate was a disk with an aperture which allowed one letter and its corresponding figure to be visible. The plates were rotated by clockwork regulated so that the same letter was displayed simultanously at both ends. A crude electric machine charged the line when the sender desired, and the divergence of a pair of pith balls at the roceving end indicated to the operator that the letter or figure appearing at that moment was to be recorded

Toward the end of the 18th century, Lung Galvam and Alessandro Volta conducted experiments which revolutionized presondre Volta conducted experiments when revolutionized presoncewed ideas of electricity and its effects. In 1786, Galvam accidentally discovered that it was possible to cause a direct conduction by bringing two dissimilar metals into contact with a most substance in 1800, Volta introduced an electric battery which became known as the voltaic pile, the principles of which became embodied in the modern battery, and in that year Salva demonstrated that voltaic currents could be used for transmitting simals

Electrolytic Telegraphs.—An immediate result of the introduction of the voltaic pile was the discovery by William Nicholson and Sir Anthony Carlisle in 1800, that the passage of an electric current caused decomposition of liquids into their constituent elements Based on this principle, Salva in 1805 and Samuel Thomas von Soemmerring in 1809 introduced apparatus in which a voltaic pile was used for sending signals whose presence were indicated at the receiving end by the liberation of hydrogen In Sommerring's instrument, 35 wires, each allotted to letters of the German alphabet and the ten numerals, terminated in a receptacle containing water (fig 1) At the sending station a voltaic battery was connected as desired to any of the line wires, and the message was read by observing at which of the terminals the bubbles of gas appeared Later researches by Sir Humphry Davy on the decomposition of chemical compounds by electric current were applied in the United States to another type of telegraph by John Redman Coxe in 1816, and Harrison Gray Dyar in 1828, who each operated a telegraph using the electric current to produce electrical decomposition at the end of the conductors. Dyar operated his telegraph line over 8 mi. on Long Island, using a single wire with ground return circuit to mark coded signals on a moving strip of litmus paper by discoloration from the received electric current.

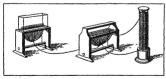

FIG. 1.-SOEMMERRING'S ELECTROLYTIC TELEGRAPH

Electromagnetic Needle—At the beginning of the 19th century, a new set of ideas followed the introduction of the electromagnet. In 1819, Hans Christian Oersted discovered that a magnetic needle could be deflected from its normal position by passing a current through an adjacent wire, and that the deflection was to the right or left, according to the direction of current. A year later Johann Salomo Christion Schweiger found that the deflection of the needle could be increased by surrounding it with a number of turns of wire, and in 1825 William Sturgeon in England

produced and named the electromagnet (fig 2).

The action of the electric current on a magnet was first applied to telegraphy by Andre Mares Ampier in 1820, at the suggestion of Perre Simon Laplace has the deflections of small magnets placed at the recurring the state of the surface of the surface of the state 

FIG 2 .- ELECTROMAGNET

In 1831, Joseph Henry constructed and successfully operated an electromagnetic signalhag apparatus which consisted of a magnetized steel bar supported on a pivot in a horizontal position, which could be attracted by a magnet When the magnet was energized by current the extremity of the bar was caused to strike a suttably adjusted bell

and intelligence was conveyed by coded sound combinations Gauss and Weber conducted important experiments in 1833 on line conductors in which they demonstrated that the line conductor need not be insulated over its entire length. In their experiments they used a single-needle telegraph to communicate with each other, and proved that by proper combination, five signs are sufficient for communication. In the early experiments of Cooke and Wheatstone, five wires and five needles were employed but later were reduced to one of each. In the single-needle instruments a magnetic needle was provided in the centre of a wire coil, and by deflecting it to the right or left, in accordance with a prearranged code, intelligence was transmitted.

### MORSE ELECTROMAGNETIC TELEGRAPH

In Oct 1832, Samuel F B Morse, a US artist, was returning from Europe on the packet ship "Gully." Following discussion with other passengers of a recent publication by Michael Faraday on electromagnetism, he made plans for a telegraph recording instrument and laid the principles for his dot-dash-space code, based on the duration or absence of the electrical impulses Three years later. Morse constructed an experimental model on a picture frame (fig. 3) The mechanical action of an electromagnet A, operated a lever B, carrying a pencil C Passage of electrical impulses through the electromagnet caused the pencil to move in contact with a paper tape D, moving over a cylinder E, under the pencil, thus drawing an undulated line embodying his code. The sending device, called a "portrule," sent electrical impulses over the line by causing contacts at the end of the lever I to close the line circuit The projections K were pieces of metal on the "rule" L to actuate the lever, and were so spaced as to form his code A crude model was privately exhibited at New York university in

As experiments progressed, it was found that the electric current, after passang over a line or mic or so in length, became too feeble to operate the receiving apparatus. With the assistance of Leonard Dunnell Gale and Henry, Morse devised a relay (fig. 4) which would automatically repeat signals into another section of line and join circuits in this manner for any desired distance.

In improved apparatus a number of modifications were made. The "portrule" was abandoned in favour of a simple cituit-closer, or key, by which the signals could be formed by hand. For the original penal-marking method three recording methods were substituted—the fountain pen, an inked wheel or a stylus which indented the paper. Later (r&4) Alfred Vail made the valuel educated when the substituted with the substituted with the substituted with the substituted with the substituted with the substitute of the substi

In Feb. 1838, Morse demonstrated his telegraph before Pres. Martin Van Buren and his cabinet. On March 3, 1843, a bill was

mental line was constructed between Washington, D.C., and dash and the space between words is twice one dash Baltimore, Md At first a portion of the line was an insulated, lead-covered pair of conductors buried in the ground by means of a specially constructed plow, but later the line was built above ground, on poles Morse sent the first public telegram, "What hath God wrought," over this 40-mi line on May 24, 1844 After

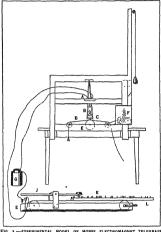

FIG. 3.-EXPERIMENTAL MODEL OF MORSE ELECTROMAGNET TELEGRAPH

a period of exhibition, the postmaster general decided the telegraph was a toy that never would support itself, and the government withdrew its support Morse then enlisted private capital, and in 1845 a company was organized to extend the telegraph line to Philadelphia, Pa., and New York city. By 1851, 50 companies using Morse telegraph patents were in operation in the United States, and by 1861 Morse systems were in use in Europe.

Although Morse methods were used to handle less than 5% of the telegrams in the United States after automatic printing tele-

FIG. 4 .- DIAGRAM OF THE MORSE RELAY

graph systems came into general use in the 1920s, telegraph circuits in various parts of the world still employ the fundamental principles of the original Morse system. On circuits of this class, signals, in accordance with the Morse code (fig. 5), are transmitted as short and long pulses of current, separated by intervals of no current. The short and long pulses are termed, respectively, dots and dashes. The dot is a very short signal; when made by hand on a telegraph key it is about 1/24 of a second. The dashes are about three times as long. The space between components of a

passed appropriating funds to test its practicability An experi- letter is equal to one dot, the space between letters is equal to one

FIG 5 .-- ADAPTATIONS OF THE HORSE CODE

The single-current Morse system most used in Europe employs an open-circuit arrangement (fig. 6), so called because no current passes over the circuit while it is idle. Sending and receiving instruments are connected to the line at each station, and whenever

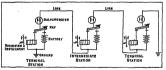

FIG. 6 .- DIAGRAM OF OPEN CIRCUIT

the transmitting key at any station is depressed the circuit is closed, causing the receiving instruments at all other stations to respond. American single-current Morse circuits are generally operated upon the closed-circuit plan (fig. 7). The only periods during which no current flows are those corresponding to the spaces between dots and dashes, this condition being affected by the opening of the transmitting key at one of the stations.

Double-current Morse systems (fig 8) have the great advantage of operating more rehably and with less need of readjustments of apparatus upon circuits of inferior transmission qualities, such sthose caused by excessive length of line, poor insulation or the

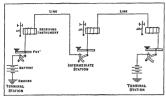

FIG. 7 -- DIAGRAM OF CLOSED CIRCUIT

inclusion of long sections of cable. They require a polarized receiving instrument and means for sending two polarities of battery from each terminal Battery of one polarity or the other is always applied to the line, one pole used for "marking" and the other for "spacing"

Duplex and Quadruplex Systems.—In the telegraph systems so far described, only one message can be transmitted over the line at a time. The economic advantages of being able to send two telegrams simultaneously over one wire led to the develop-

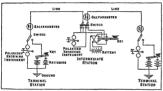

FIG 8 -DIAGRAM OF DOUBLE-CURRENT MORSE CIRCUIT

ment of duplex systems in which the two sendings can be in opposite directions. The first duplex arrangement was devised by Wilhelm Gintl of Vienna in 1853. An essential feature of any duplex system is the provision at each station of a relay or other receiving instrument, so arranged as to be unaffected by any signals sent out from that station, but fully responsive to all signals received from the distant station. All duplex schemes

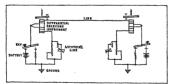

FIG 9 .- DIAGRAM OF DIFFERENTIAL DUPLEX CIRCUIT

employ the principle of having the sending impulses of current divided into equal parts, half going over the line to the distant station, and the other half going to an "artificial line" adjusted to be the equivalent of the real line in electrical characteristics

Differential Duplex.—In the method shown in fig 9, the electromagnet of the relay is wound with two equal coils of wire Curient through the sending key passes through the two coils of the lelay at the sending station in opposite directions, and the magnetic effects neutralize each other, resulting in no response of the instrument at the sending end. At the receiving end, however, the line current passes through the two coils in such a way that their magnetic effect is additive, and the distant instrument thus esponds to signals received. With apparatus arranged in this way, at each end of the line, both stations may send to each other at the same time without interference

Bridge Duplex.—Another method of duplex working employs the pumelps of the Wheatstone bridge, as shown in fig to The outgoing impulses pass to the line and artificial line through equal bridge arms and have no effect upon the receiving instrument forming the cross-connection at the extremities of those arms. The receiving matriment is, however, responsive to the unbalancing effect of any application of current at the distant station. It is possible to operate both differential and bridge duplexes by either single-current of double-current methods, but the double-current scheme is generally preferred.

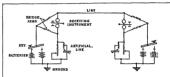

FIG 10 -DIAGRAM OF BRIDGE DUPLEX CIRCUIT

Quadruplex.—By combining a modified single-current system with the double-current dupler in 1874, Thomas Alva Edison produced the quadruplex. With this scheme four messages, two in each direction, may be simultaneously transmitted over one line wire. The two relays at each terminal of the line are arranged to be unresponsive to outgoing signal by either the differential or bridge methods. In receiving signals one of the relays responds only to reversals of current effected by the distant double-current key. The other relay responds only to microsist and decreasers in current strength, regardless of the direction in which the current is flowing. These variations in applied current are controlled by a single-current key at the distant station (fig. 11).

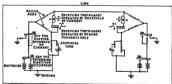

FIG. 11.-QUADRUPLEX CIRCUIT

#### AUTOMATIC TELEGRAPHS

The classification of automatic telegraphs may broadly include all systems in which signals are transmitted by machine methods and automatically recorded. Automatic means of transmitting and recording were proposed prior to Morse's invention, and Morse employed them in his first models, but it was only after the beginning of the 20th century that printing telegraph systems came into general use. Automatic systems fall generally into three classifications (1) signals recorded in code form, which must be transcribed; (2) messages received in printed form; and (3) reproduction of a facsimile of the original

Recording Systems .- The recording systems, which by 1930 had almost completely been displaced by other methods, comprised means much like the original Morse apparatus in which coded signals were recorded in various ways on a moving paper tape. In the Wheatstone system, which at one time was quite ex-

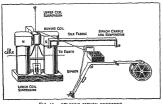

FIG 12 --- KELVIN'S SIPHON RECORDER

tensively used, the dots and dashes were printed as long and short marks, caused by the receiving electromagnet attracting an inked wheel against the moving paper.

Various chemical recorders, proposed by Dyar, Alexander Bain and Edison, used a metallic wire resting upon a moving chemically treated tape, the wire and tape forming part of the circuit. When current passed through them, an electrolytic decomposition occurred which caused discoloration of the tape.

The recording systems used on some older types of ocean cables were developments of ideas proposed by Werner Stemens and Johann Georg Halske, and Lord Kelvin In these systems the dots and dashes are received as impulses of equal duration but opposite in polarity, while spaces are intervals of no current. The recorder (fig 12) is a galvanometer with an ink siphon attached to the moving coil. The siphon rests against a moving paper tape, drawing a continuous line undulated above or below the centre by deflections of the galvanometer when impulses of dot or dash polarity are received.

Transmitters used with these recording systems were motordriven mechanical devices arranged so that perforations in a paper tape were caused to control the sending of proper impulses

to the line. The simpler types merely permitted a brush to make contact through the perforations with a metallic bed Perforated tape used for transmission in these systems was prepared in various types of perforating machines, the more modern of which were provided with keyboards like a typewriter, so arranged that the depression of a single key perforated the proper combination of dots and dashes for that character The first suggestion for a

reperforator was made by Bain in 1846.

Printing Telegraphs.—The early printing telegraphs incorporated the so-called step-by-step principle. Printers using this principle are provided with a rotatable type wheel upon which characters are evenly spaced around the periphery. The type wheel is provided with a stepping device operated by an electromagnet so arranged that each impulse received from the line will advance the type wheel one character. Assuming that the initial position and arrangement of the type wheel are known, the sending operator may transmit a sufficient number of impulses to move any desired character into printing position. When this has been done, an impulse of a different nature is transmitted which energizes a printing magnet to make the impression. These systems were commonly provided with an automatic keyboard transmitter containing a motor-driven commutator which, in the interval between the depression of any two keys, would send the required number of impulses to move the type wheel from its

previous position to the character corresponding to the key next depressed Names prominently associated with step-by-step printer developments were Royal E House, David Edward Hughes, George May Phelps, John E. Wright, John Burry and George B Scott The Hughes system, which was an improvement of House's idea, was the only one to be used to any extent for telegraph handling Several of the other step-by-step systems were extensively used for reporting gold prices and stock quota-

Modern printing telegraph systems make use of five-unit permutation code, early suggested by Gauss and Weber, but first applied by Jean Maurice Émile Baudot and commonly known as the Baudot code In these systems, five impulses are transmitted for every character, any one of which may be either selecting or nonselecting. With such a code it is possible to obtain 32 different combinations, 26 of which are assigned to letters of the alphabet, leaving 1 for the idle condition and 5 for functions such as space, figure shift, letter shift, etc (fig 13) The five impulses making up the code are sent to the line successively by means of a rotating distributor or commutator, and are distributed at the receiving end by a similar means to five receiving devices. These devices, through any of several selecting mechanisms, determine which one of the characters of a typewriting machine is to be printed. In order that the first impulse may properly operate the first receiving device, etc, each must be associated with the line while the corresponding impulse is being transmitted, ie, the sending and receiving distributors must operate in synchronism. This is accomplished in several different ways with different systems. In some, extra pulses are transmitted, while in others, the signals themselves are used. The printers used in these systems are arranged to record a telegram on a page, or on a paper tape which is then pasted on a blank by the receiving operator

Various transmitting mechanisms are used with these systems The earliest and simplest used five separate keys which had to be set up simultaneously in their various combinations by the operator, later methods employed a direct keyboard like a typewriter, each key acting upon five transmitting keys to set up the combinations. Another common method uses a keyboard perforator which prepares a paper tape which then passes through an automatic transmitter. The perforations in the tape actuate five key levers in the transmitter

FIG. 13 -TRANSMITTING TAPE PERFORATED WITH FIVE UNIT CODE

Among the printing systems employing the five-unit code may be mentioned the Murray, Morkrum, Kleinschmidt, Siemens-Halske and Creed. Other printing systems, developed by Charles L. Buckingham, Frederick G. Creed and John C Barclay, used the dot-dash code Multiplex Methods.-The multiplex system of printing teleg-

raphy, placed in general use on trunk telegraph lines in the U S in 1914, employs synchronous distributors to provide additional transmissions or channels of communication on a single-line circuit. This is accomplished by dividing the use of the line between the several channels, the distributors being used for this purpose The multiplex principle, illustrated by fig 14, shows a sending and receiving distributor, the brushes of which are rotated in constant synchronism and phase The sending distributor is provided with five segments, to which are connected five keys which may be operated manually or by automatic means to set up the five-unit combinations of the Baudot code. Five corresponding segments on the receiving distributor are connected to five selecting magnets of a printer. Assuming that a combination corresponding to the desired character has been set up on the transmitting keys, signals forming this combination will be transmitted to the line as the sending brushes pass over the sending segments. At the instant when the sending brush is in contact with the first sending segment, the receiving brush will be in contact with the first receiving segment, and if no 1 key is in an operated position the circuit will be completed and the first selecting magnet will be energized

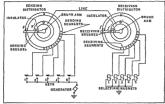

FIG 14 -DIAGRAM SHOWING THE MULTIPLEX THEORY

As the sending brushes pass to the succeeding segments, the remaning selecting magnetis will be operated or remain inoperative, depending upon the position of the corresponding key at the sending station, thus in each revolution an entire character is transmitted by the transmitter and received by the printer. While fig ar illustrates only one channel of communication, it is obvious that the section of the rings A and A' between segments 3 and 1 may be provided with additional groups of five segments which can be connected to other sets of keys and selecting magnets to provide additional channels of communication. The transmission is such that duplex methods may be applied to permit simultaneous operation in both directions

Multiplex methods were first proposed by Moses G Farmer in Amenca, who suggested duyson of ine tume between two or more operators. Myer and Patrick Bernard Delaney endeavoured to improve the system, but it was Baudot who developed the first practical multiplex printing system using five-unit code. This system became the basis of other multiplex systems such as the Murray, American and Morkrum multiplex systems of their multiplex systems employed codes of more than five-unit length in order to meet certain special requirements

Teleprinters.—In the early 1900s, it became apparent that a simple printing telegraph apparatus was needed which could be operated in locations without constant expert attention. To fill this need, telegraph printers, later classified as teleprinters, were developed by Edward E. Kleinschmidt and the Morkrum company in America, Creed and company in England and Stemens-Halske in Germany.

The teleprinter has a keyboard and printing unt and resembles a typewriter, but in the teleprinter these two units are not mechanically interconnected, except that they use a common electric motor drive. When a key of the keyboard is depressed, it sets up a code combination for the corresponding character which is transmitted to the line circuit by a distributor. The intelligence code employed was established, by international agreement, as the five-unit Baudot code, to which is added a start impulse and a rest impulse used for the purpose of maintaining an approximate synchronous relationship between the sending and receiving devices.

On the teleprinter at the other end of the line, the responses of the armature of a single electromagnet are distributed by mechanical means to position selector devices which cause the corresponding character to be prunted. The home-office printer may be connected in series with the ine circuit to give a home record from the transmission, or it may be connected in a duplex arrangement so that it will receive only incoming signals from the distant station.

The use of stop and start pulses added to the five-umt intelligence code gives the equivalent of a seven-unit code and such systems are frequently referred to as seven-unit start-stop printing telegraphs. These systems have been used extensively, not only for point-to-point telegraph trunk circuits, but they have been installed in great numbers in customers' premises and connected by direct wire with the commercial telegraph hetwork. They are also extensively used in telegraph exchange systems and in private leased-wire networks

The growth of punting telegraphy was particularly rand following World War I, with at least 95% of US. landline trafficbeing handled in this way. Prior to World War II telepiniters gave more than 20,000 US. telegraph customers direct wire connection with the telegraph system and extensive telepiniterexchange networks were started in the United States, England and Europe During the war, great impeties was given to increasing printing telegraph facilities, and extensive teleprinter networks, some encompassing the entire globe, were set up war ardio, landline and submarine cables, for use of the US armed services and other government agencies

Fassimile Telegraphy—Among the facsimile systems may be included writing telegraphs, such as the early telautograph invented by Elisha Gray (fig. 15). The transmitter for these writing telegraph systems consists of two rheostats which are varied through suitable linkages by the motion of a stylus. Each rheorizatis compected to a separate line wire which terminates in a sole-noid at the receiving end. The armatures of these solenoids are connected by smullar linkages to a recording pen. As the sending stylus is moved to form a letter, the vertical components of the motion are caused to vary one of the rheostats, while horizontal components vary the other, changing the currents in the two line write. In this way the attractive forces of the two receiving solenoids are changed in proportion and the receiving pen is caused to diplicate troughly the motion of the sending stylas World Was II developments improved the principle of the telautograph, using more modern techniques to gue faster and more faithfull reproduc-

Other types of facsimle systems are properly regarded as systems of telephotography. They are developments of early systems such as Bakewell's and D'Alneourt's copying telegraphs. In these systems be picture or text is specially prepared for transmission and then exposed, a minute area at a time, to a transmitting device, by means of which the line current is varied proportionately with the degree of shading in the exposed area. At the receiving end, equivalent mutuet areas of a sensitized paper are synchronously exposed to discoloration, the degree being controlled by the variations in line current, thus duplicating the contrasts of the original picture. "Scaming" of the sent and received copy is customarily done by either closely spaced binomontal lines across a flat page, or by a helix around the message when placed on a cylindical dium.

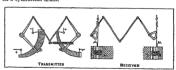

FIG 15 -GRAY'S FACSIMILE SYSTEM

Because early facsimale methods employed time-consuming processes in preparing the transmitted copy and developing the received telegram, these methods were not particularly suitable to the handling of fast telegraph tradific. The development by Western Union in 1924 of a high-speed, dry, permanent recording paper made it possible to scan optically any handwritten or typewritten telegram text and instantly receive a copy ready for delivery. As a result of this development, small low-cost facsimile machines were extensively installed in the United States to connect customers and branch offices to central telegraph offices, and the convenient application of this method of telegraphy resulted in the

uses Transmitters and recorders for heavily-loaded circuits were designed in which the telegram to be sent of a receiving blank may be placed upon cylinders which are loaded into a magazine from which the machines are automatically fed. In another type of transmitter, the telegram to be transmitted is merely dropped into a slot and the machine automatically wraps it around a drum and transmits it The Desk-Fax, a miniature facsimile machine, was installed in customers' offices to bring telegraph tacilities within aim's reach of the businessman These small sending and receiving machines enable the user to send telegrams by merely placing the message around the cylinder and pressing a button Electrical impulses, transmitted by an electric eye or a stylus scanning the message, flash over the wire and cause a receiving machine at the main telegraph office to create an exact pictorial reproduction on a special telegraph blank. The same machine also receives messages which arrive on the recipient's desk ready for immediate

Telephoto systems, designed prumatily for handling piess photographs, were developed by the American Telephone and Telegraph company, Radio Corporation of America, the Associated Press and the New York Times A telephoto system especially designed for use on submartice achile was developed by Western Union Other systems by Western Union, W. G. H. Finch and J. V. L. Hogan, using dry recording paper, were natended primanly for reproducing black-and-white copy in the form of messages or diagrams, although they reproduce haltfores with moderate success.

Telegraph Repeaters.—As Morse learned early in his experiments, wire telegraph creuts are subject to transmission dificulties which limit the length of line over which direct working is is practicable. Because of these difficulties, it is the practice to break up long telegraph circuits into sections, each of which is relatively easy to operate These sections are then connected together by relays or repeaters which receive the signals from one section and automatically retransmit them into the next section.

A very simple repeater, consisting of only two relays, may be used in single-current open-circuit working. When a pulse of current, representing a signal, is received over one section of line, the magnet of a relay is energized and its amature lever, in responding, applies a source of current to the other line, thus repeating the signal. For closed-ricuit working, a more complex preparating the signal. For closed-ricuit working, a more complex ramagement is necessary to avoid the tendency of each relay to repeat signals back into the line from which they were needwid. This tendency is overcome by interlocking electromagnetic de-

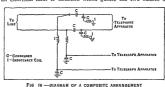

The repating elements of duplex repeaters are similar to those of open-circuit Morse repeaters, comprising a receiving relay for each of the line sections. This relay retransmits into the other line section the signal by which it is operated. An artificial line must be provided for each of the sections of line, and each relay must be arranged differentially or in accordance with the bridge method to respond only to incoming signals.

In printing telegraph operation it is often desirable that the signals not only be repeated with renewed power, but also be corrected and reformed so that they leave the repeater with all the characteristics of the original signal. The general principle upon which regenerative repeaters are based is to select from each received signal a small portice which is most likely to be free from imperfections. By using this fraction of the signal to operate a relay, and other mechanisms which control the length of pulses to be applied to 'the next section, the retransmitted signal can be made practically perfect.

Simultaneous Telegraphy and Telephony.—There are two methods for superposing telegraph circuits upon wires used as telephone circuits—composite and simplex.

Composite Mathod.—In the composite arrangement (fig. 16), two ground-return (elegraph circuits are obtained from the two wires forming a metallic-return telephone circuit. This is accomplished by (sking advantage of the fact that a condenser offers little impedance to the relatively high-frequency alternating currents which operate the telephone, but is an effective barrier to the much slower changes of current used in telegraphy, and that

development of a number of types of mechanisms for different an inductance coil can be so constructed that it will guestly opuses. Transmitters and recronders for heavily-blanded circuits were pose telephone currents but will readily pass the telegraph curdesigned in which the telegram to be sent on a receiving blank may rent: By forming an network of such condensers and inductances, be placed upon cylinders which are leaded into a magazime from an electrical filter is obtained which guides the two classes of

PIG 16 -- PIAGRAM OF A COMPOSITE ARRANGEMENT

currents into the proper channels for operation of the telegraph and telephone apparatus

Simplex Method —The simplex method of superposing permits one ground-return telegraph circuit to be operated over the two wires forming a metallic-return telephone circuit. In a common form (fig. 17), a repeating coil or transformer is intercosed at

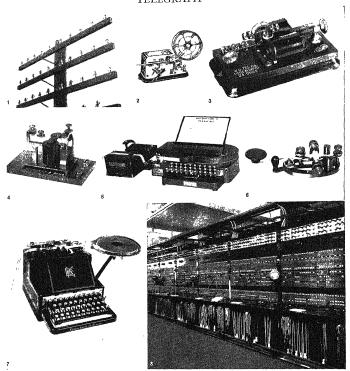

FIG 17 -DIAGRAM OF THE SIMPLEX CIRCUIT

each terminal between the telephone apparatus and the line The transformer wounding which is connected to the line wires has a centre tap connected to the telegraph apparatus. By this arrangement the telegraph currents are divided, half passing over each wire; no effect is produced upon the telephone apparatus because, in dividing equally, he two halves neutralize each other's magnetic effect. The alternating currents of the speech transmission so transverse the line wondings of the transformer as to cust the maximum magnetic effect and are thus repeated to the telephone amounts of the contract of t

Carrier Systems.—During the latter half of the 10th century, proposals were made for obtaining multiple transmissions over a single-line circuit by sending various tones and providing receiving instruments, each responsive to a particular tone. This principle was embodied in the Elisha Gray harmonic system, wherein vibrating reeds of different profis were arranged to transmit different frequencies to the line, each being controlled by a separate key. The receiving relays were also vibrating reeds, each airranged to respond to only one of the several frequencies impressed upon the line. These relays were caused to actuate sounders which received the messages in dots and dashes. Such systems were unstable and never achieved any great success

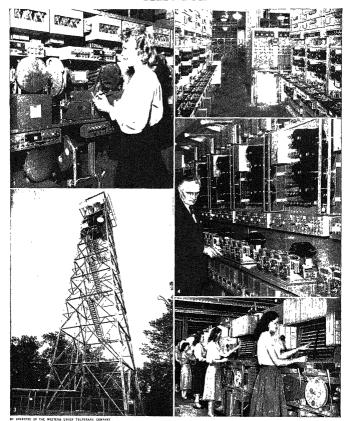

Following World War I, the above principles, using techniques developed in connection with radio, were applied to landline telegraphy to provide what later became known as carrier circuits. In such systems each telegraph instrument, by mid-soth century universally an automatic printing mechanism, controls a separate tone or carrier frequency. The pascing between these frequencies is determined by speed of operation of the particular printing system used. Usually spacings range from 100 cycles to 300 cycles. Control of these telegraph carriers is effected in either of two ways, the older method whiching the carrier off and on in ferred control method the carrier frequency. If continuously transmitted but its frequency is altered by a small increment to convey the code impulses. By either method the channels are separated at the receiving terminal by electrical filters, each of which rejects

  5. The Delefface, a ministers featinite machine used by businessmen for the printing and machine and the printing and machine printer.
  6 Teleprint printing and machine printer of Newfoundiand The use of amplifiers increased international message states by the prince than 6000,0000 weeks.

unwanted channel frequencies and delivers to the receiving equipment only the frequency carrying the desired intelligence for that particular channel. If the on-off switching method (amplitude modulation) is used, the receiver is a ranaged to desert the presence or absence of a carrier. If the frequency change method (frequency modulation) is employed, the electionic receiver responds to frequency change alone and not to amplitude change. A marked improvement in dependiability accrues to the FM method since the transmission circuit is prone to introduce unwanted amplitude changes.

Cairer telegraph channel frequencies are usually confined to a group covering about the range required ior the speech current of telephony (2,000 to 3,000 cycles) Groups of such channels, usually ro to 2 on number, are then stacked above one another in frequency, by a process of frequency translation—the same process by which multiple-channel carrier telephone is achieved on open-wire or cable pains it is common to operate roo-200 telegraph channels, with an operator transmitting a telegram on each channel, smultaneously over a single-line pair. Microwave radio relay systems are also available as a transmission medium of extremely high capacity carrier telegraph systems operated by the same multiple-tange principle.

Telegraph Statistics .-- At mid-20th century the United States had about one-third of the world's telegraph wine, with Western Union, world's largest telegraph company, using nearly 2,000,000 mi of wire in its nation-wide network Of this wire about 400,000 my were in cable, the remainder being single-wire on more than 125,000 mi of pole line. Wire mileage, however, was no longer of real significance because of the general use of high-speed printing telegraph and multichannel methods of operation. For example, carrier systems installed throughout the United States made possible the transmission of as many as 288 telegrams simultaneously over a single pair of wires. A nation-wide telegraph service was provided through about 30,000 Western Union offices and agencies at mid-century More than 200,000,000 telegrams were sent annually, not including a great volume of traffic flowing over private leased wires, ticker systems and press circuits carrying news Western Umon's investment in telegraph plant and equipment exceeded \$350,000,000.

#### TELEGRAPH HANDLING; OTHER SERVICES

Almost from the beginning of commercial telegraph service, it was usual practice to establish large centres as annual relaying points for telegraph traffic. Messages originating in a large area surrounding such relay points were manually transamted to the relay office where they were teceived and recorded on a telegraph blank. This message was moved across the relay office by belt conveyor, pneumatic tube or messenger, and given to a sending operator who transmitted it over a crustit to another relay office serving the point of destination. At the second relay office the message was again received on a telegraph blank and moved across the office to a sending operator serving the office of destination, where it was finally received for delivery.

Reperforator Switching.—A number of proposals were made from time to time for doing away with intermediate manual handlings at relay offices. None of them, however, attained any significant success until 1937. In that year Western Union made an extensive test at Ft. Worth, Tex., of a relaying system in which all moming business was received in the form of perforated tape. The tape fed into automatic transmitters which could be connected by a switching operator to feed any outgoing circuit. The text of the message was printed simultaneously on the perforated tape so that the switching operator could readily read the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message, and connect the transmitter to the destination of each message and connect the transmitter to the destination of each message and connect the transmitters are the each of

Western Union proceeded to design a tape reperforator in which printed characters corresponding to the perforations appeared upon the perforated tape, greatly facilitating the work of the switching operator: Switching centres using this printer perforator were installed in Richmond (1937) and Atlanta (1941). About this time the Postal Telegraph company (merged with Western Union in 1944) developed a system in which all incoming business was also secured on printed perforated tape. In the Postal system, however, each received message tape was form off and physically transported to an outgoing transmitter serving the desired circuit. With the tremendously increased traffic demands of World War II, both systems of reperfonator relay materially contributed toward expediting the huge volume of wartime traffic

Following World Wai II, Western Union started an extensive program of mechanization, and by mid-century had established a nation-wide network of 14 high-speed reperforator switching centres, each handling all telegrams to and from an area of one or more states.

In this new switching system telegrams are typed only at the point of origin and then that through the switching centres to their destinations without manual retransmission. The operation transmitting a telegram from the point of origin simply types a call letter at the beginning of each telegram. That symbol automatically routes the message swiftly to its destination. When the call letter reaches the switching centre a large "electrical brain" automatically selects the wire over which the message transits to its destination. This system vastly improved the speed and efficiency of telegram's services.

Similar switching centres, on a much smaller scale, were widely installed in private-wire networks leased from the telegraph company by government agencies and large industrial enterprises in America.

Subsidiary Services—Most telegraph administrations estabhished subsidiary services such as distributing time signals for controlling clocks and other timepieces to keep them in agreement with a recognized standard of correct time. In the United States Western Union distributes, over a very extensive network of circuits, the noon signals furnished by the Naval observatory. These signals are used to control the operation of master clocks of great accuracy, in all principal cities, which in turn control the performance of thousands of clocks and other timing mechanisms.

Another adjunct to commercial telegraph service is the provision of call boxes whereby a patton may readily summon a messenger who will pick up any telegram which the patron may wish to send, or provide other services The call box is essentially an automatic telegraph transmitter which, when operated by turning a key, sends to the felegraph office code signals which identify the patron. Signals are recorded on a Morse ink-writing register

In the U.S. the telegraph company provides extensive networks supplying to interested patrons quotation services on stocks, bonds, produce, etc, and reports of news and sporting events. These systems are operated in only one direction, the patron having a rectiving-only pruntug telegraph, known as a ticker, service from a single central transmitter at a point where the information is originally assembled.

Early quotation "tickers" were operated by the step-by-step principle described above. In the later stock quotation systems the tickers are operated by the start-stop principle. In such systems an eight-unit code is often used, which provides the usual in addition an impulse which determines whether the character printed shall be a figure or letter. In printing quotations, where shifts from letters to figures and vice verse occur every two or three characters, a considerable increase in output, is achieved by this arrangement as compared with the method in which an entire code combination is transmitted for each shift.

## AUXILIARY EQUIPMENT

Central Office Equipment—In any large telegraph system it is necessary to concentrate operating equipment at certain it is necessary to tencentrate operating equipment at certain points which are called central offices or telegraph centres. These act at sclearing houses for a large area and vary in size, depending youn the volume of traffic their areas produce. Special attention must be paid to design of the facilities in central office buildings, operating rooms must be in large units, adequately provided hight and air. Illumination and proper condition of the air are important factors in increasing speed and accuracy of operators.

The building must provide space for switchboards, testing equipment, power supplies, for the service and maintenance departments, and for test 100ms and lavatones for the operators and staff

Power Supply.-The power required for operation of telegraph circuits must be largely direct current, which is usually not available from commercial sources. It must also be thoroughly reliable Where commercial sources of D C supply are available, sufficiently steady and free from interruption, they are used directly, and booster sets are installed to provide higher voltages when needed. Where only alternating current commercial power is available, it is used to drive D.C. motor generator sets of through tectifiers to charge a storage battery supply, if the local supply is subject to frequent interruptions. To guard against temporary failures of the main source of supply, an emergency source is always furnished-a storage battery or a generator set driven by steam or a gasoline engine. This emergency engine generator must be sufficiently large to provide all telegraph power required and maintain sufficient lights and building service to enable work to be carried on. In larger offices storage batteries are provided to carry the load for an interval between the failure of the main power and the starting of the emergency engine Automatic changeover switches are provided which operate so rapidly that when a failure occurs circuit interruptions are scarcely noticeable

Switchboards—All telegraph wres which enter an office are grouped in a switchbard which also accommodates conductors to all the telegraph apparatus in the office. The switchboard is usually a collection of jacks arranged in groups, one line wire being pinied normally to one operating set. If a temporary change is necessity because of failure of a wire, it is made by means of plugs and the jacks on the switchboard so. The front of the switchboard is a shelf equipped with necessary apparatus for testing wires and locating faults. This test equipment may be associated with any of the lines by means of jacks and plugs.

Line wires and wries to operating sets, before going to the switchboard, are termunated on a distributing frame placed immediately behind the switchboard. This frame has connecting blocks in vertical rows on one ade on which outside wries are terminated, and in horizontal rows on the other side connected to wries from the operating sets. Cross-connecting wires, which may easily be changed if required, are used to interconnect the vertical blocks with the borozontal blocks. On the distributing frame each outside wire has a lightning arrester and fuse. The arrester consust of two small carbon blocks, separated by only a few thousandlis of an inch of air, one side being connected to the line and the lindle office writing or apparatus, by diverting to ground through the air gap voltages high enough to injure the apparatus or employees. Eves are placed in the line election percent any foreign current which may have been picked up by the outside wire from damaging the office instruments.

Message Conveyors.—In any central office means must be provided for carrying messages between different parts of the operaing rooms. Many types of conveyors are in general use, moving belts being the most common. The main considerations are speed and accessibility, with all features eliminated that would tend to lose, mutilate or delay a message. Peaturatic tubes are also used, both for carrying messages within the confines of an office and sometimes for connection with near-by branch offices.

## OUTSIDE PLANT

As early as 1816, when Ronalds demonstrated his telegraph system, he utilized as a line conductor a bare wire covered with glass tubing impregnated with pitch and buried in the ground for several hundred feet. However, for reasons of economy, the early commercial telegraphs were operated with bare wires supported overhead on poles. This open-wire pole-line construction has been very generally used thereafter, and even by the middle of the 20th control will constituted a large portion of outside telegraph plant. Cables, which are groups of insulated wire held together by a common cover or sheath, were introduced early in the century to a limited extent, and their utilisation, both areinfly suspended, and

underground, greatly increased thereafter Open-wire pole-line construction and suspended serial cable are commonly used in open country, but as telegraph lines approach congested areas, cables are generally used underground Underground cable is also used almost exclusively for local distribution within a congested

Overhead Lines.—Poles used to support wives and cables are usually of wood, although steel and concrete poles are sometimes used. They are of such height as to provide a suitable clearance from the ground for the wires or cables. The size of poles required, and the distance they are placed apart, depend upon geographical location and upon the load to be carried. Lines situated where ter or snow is likely to collect upon them require the use of larger poles placed closer together than for lines in locations where ize does not form.

In open-wire construction the bare line wires are supported on insulators, usually of glass or rubber, mounted on juns set vertically in wooden crossaims. On heavy trusk pole lines crossaims are used which are to ft in length, accommodating to pins spaced approximately 12 in apair. These crossaims are securely fastened to the pole, and when more than one arm is used they are vertically soaced about 2 ft. apair.

In general, bare copper wires are used, ordinarily about 0.14 in in diameter, weighing 210 lb to the mile of 0.14 in in diameter weighing 172 lb, per mile. Other sizes are employed to a limited extent, and wires of galvanized iron, bronze and other materials have been used with considerable success. The choice of materials and size is usually dictated by economic considerations.

Cables, when placed on poles, are supported by suspension strands, consisting of high-strength stranded wires. The weight of the cable to be supported determines the strength of suspension strands used, the heavier cables requiring strands having a strength exceeding 18,000 lb Cables are fastened to the suspension strands by various means, and the suspension strands are fastened to the poles by means of small metal clamps.

Conductors in cables designed for telegraph service are of soft diawn copper varying in diameter from 0.036 in to 0.102 in. Otdmarily, cable conductors are separated and insulated by means of paper wrapped spirally about them, although cables having rubber insulated conductors are often used for short distances. The insulated conductors are arranged in pairs which consist of two conductors twisted together or in quads consisting of two pairs twisted together, or four wires in spiral form. These pairs and quads are arranged compactly in layers. Paper insulated conductors are always enclosed in a lead sheath, while rubber-covered conductors may be enclosed in lead or a covering of heavy braid.

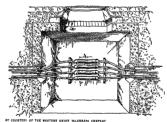

Fig. 18.—cross section of a manhole showing the cable ducts and joint rack

The number of conductors provided in telegraph cables varies, the largest in common use at mid-century being 404 pairs. The

outside diameter of this cable is 28 in. and the weight 73 lb per frequency need be transmitted.

Underground Construction .- Where cables are placed underground within a city, some form of conduit with independent duct space for each cable is usually employed to permit the cables to be readily installed and removed. The ducts are usually of hollow tile, creosoted wood or fibre Iron pipe may be used in special situations. All ducts are 3 in oi more in diameter, and the conduit is buried to a depth of at least 2 ft As the length of cable which can be pulled through a duct is limited, splicing chambers or manholes are provided at intervals of about 500 ft These manholes are at least 3 ft wide, 5 ft. long and 4½ ft deep, and in many cases considerably larger sizes are required. They are usually constructed of brick or concrete with a removable cover (Fig 18)

Cable is pulled into conduits one length at a time, and the ends are spliced together In splicing paper-insulated cables, a foot or more of sheath is removed from the end and a few inches of the insulation is removed from the conductors. Conductors are then joined by twisting, soldering or other means, and the joints are insulated with small paper or impregnated cotton tubes all conductors are joined, the splice is wrapped with strips of mushn and a lead sleeve shpped over it. This sleeve is held at each end to the cable sheath by means of wiped soldered joints

Where cables are laid underground in open country, it is feasible to bury such cables directly in the ground without conduit protection Large machines prepare a trench, lay the cable and cover

the trench in a single operation

Radio Beam .- Between World Wars I and II. considerable experimentation was carried on in applying printing telegraph systems to radio transmission Although operation was successfully achieved, continuity of service left much to be desired because of static disturbances and propagation difficulties World War II saw advances in the art of generating higher and higher radio frequencies which brought a new tool to communications. The short wave lengths made available many more frequency bands, and the short waves are practical for use in reflecting and beaming, as light energy may be beamed. Developments based on these concepts made it possible to establish microwave radio-beam relay circuits, around the curvature of the earth and over terrain pregularities, which are not afflicted with the unreliability commonly associated with long-distance radio work. In these systems the radio transmission is beamed by reflectors and lenses in a line-of-sight path between tall towers located on high points of ground and spaced 20 to 50 mi. apart, depending upon the terrain, thus compensating for the earth's curvature The intermediate towers between terminals serve as unattended relay stations which instantly repeat the received signals, regenerated and redirected to the next tower. Shortly after the end of World War II, several microwave radiorelay circuits were established to give dependably practical trunk line circuits of extremely large message-carrying capacity.

In 1946 Western Union installed a 4,000-mc microwave radiorelay system connecting New York, Phrladelphia, Washington and Pittsburgh and capable of handling more than 1,000 telegrams simultaneously in each direction Time division techniques were developed for dividing the radio beam signals into voice frequency channels and these were further divided into telegraph channels by FM carrier systems.

## THEORY OF TRANSMISSION AND INTERFERENCE

Transmission.-The fundamental requirement of a telegraph system is a source of potential controlled in accordance with the code to be transmitted, which sends sufficient energy through a circuit to operate a suitable receiving device at the distant end. Where interference is present, as is usually the case, the received energy must be sufficiently greater than the interference to enable a signal to be distinguished. The sending source of energy usually consists of a direct current supply, but from what follows, it will be evident that the transmission of telegraph signals requires the use of apparatus and lines capable of transmitting sine wave alternating currents of various frequencies. A communication circuit is thus fundamentally different from a circuit for transmitting power in which direct current or alternating current of only one

In a telegraph system the signals sent are continuously changing in character, and there will be times when several reversals are sent at the highest frequency of transmission for the given circuit The number of such complete reversals per second may be spoken of as the fundamental signalling frequency. Common fundamental signalling frequencies for various circuits are as fol-

ows. Messenger call circuits	2	cycles	per	
Key-operated Morse	6 to 18	",,	",,	"
Automatic telegraph systems	15 to 70	"	"	17
Submarine cables nonloaded	4 to 20	"	,,	"
Submarine cables homoaded	30 to 100	,,	"	"

The alternating current characteristics of signal combinations may be most readily considered by examining a number of typical combinations of signals such as are shown in fig 19, the combinations being assumed to repeat themselves Such combinations may be analyzed by the Jean Baptiste Joseph Fourier method into

FIG. 19 -EXAMPLES OF SIGNAL COMBINATIONS

a series of sine wave components. Analyses of a considerable number of these recurring combinations show that all frequencies from zero to infinity (excluding even multiples of the fundamental signalling frequency) are present in the transmitted signals It is not possible to transmit all these frequencies through the line with unimpaired amplitude and phase relations The voltages and currents originating at the transmitter are modified by any impedance at the sending end of the hne, by the line itself and by

the receiving equipment. The effect of the line resistance and capacity is to reduce the amount of higher frequencies received However, in order to operate a receiving instrument at the distant end of the line, it is not necessary that all frequency components of the original signal be received. In a submarine cable system, which ordinarily is operated with efficient corrective devices to compensate for loss of the higher frequencies, it is usually sufficient to receive frequencies from zero up to about one and six-tenths times the fundamental signalling frequency. In landline telegraph systems, operated with less complex terminal equipment, it is preferable that frequencies from zero to about three times the fundamental frequency be received.

In order to counteract the effect of line capacity in causing loss of signal energy, the inductance of the line may be increased by artificial means known as loading. This is especially successful with long submarine cables. The effect of the inductance is particularly to sustain the higher frequencies. The velocity of propagation is decreased but the signal is received with increased energy and reduced distortion.

Interference.-Telegraph operation is more or less affected by parasitic currents from various outside sources including: (1 earth potentials arising from natural causes; (2) earth potentials arising from electric railway systems, etc; (3) induction from one telegraph 'ircuit to another; (4) induction from power-supply systems. Long submarine cables are more seriously affected by interference than are landlines because of the much lower level of received signal energy on the former. In respect to methods of operation, interference to multiplex presents the most serious problem. Small amounts of potential from extraneous sources result in impairment of the maximum speed at which these circuits may be operated. Large amounts render the circuit inoperative. To mutigate the interference from these parasitic currents, various means may be applied to the telegraph circuit or to the source of the interference if this is an electrical railway or power-supply system. In application to telegraph circuits these mitigative devices may take the form of impedances whose function is to filter out the extraneous current, or of transformers or generators whose function is to interpose in the circuit a potential to counteract power systems, impedances inserted at appropriate points, selection of proper transformer connections and favourable operating methods or transpositions may often be advantageously employed to reduce the inductive influence of the interfering system. Sometimes, however, an increase in the physical separation from the interfering lines is the only practicable remedy.

An interference-free method of transmission is provided by the microwave radio-beam system which is not subject to the same kinds of interference as are landlines and cables. They are not affected by inductive interference, the aurora borealis, static or lightning disturbances. Also ice and windstorms do not affect them as they do line wires.

#### STERMADINE TELECOA" HV

Except for a few river and harbour cables, the first submarine cable was that laid in 1850 between England and France. It was broken shortly after communication had been established but was followed the next year by another, between Dover and Calais, which was successful. The first transatlantic attempt in 1857 was a failure when the cable broke at 2,000 fathoms' depth during laying and could not be recovered However, the Atlantic was spanned in 1858 between Ireland and Newfoundland After about three months' use the cable broke in deep water and had to be abandoned. It was 1866 before the first permanently successful transatlantic cable was laid. In the same year another cable, par-tially laid in 1865, was also completed. These two, with which the U.S. financier Cyrus Field and the British scientist Lord Kelvin were closely associated, were the only transatlantic cables until 1860, when the French laid a cable. Thereafter, with success established, growth of submarine cable systems was rapid; there were 21 spanning the Atlantic by 1928 Subsequently the message-handling canacity of the cables was increased so greatly by technical advances in the art of transmission that no further physical expansion was necessary. Only 15 letters could be sent per minute through the first transatlantic cable and the minimum rate per message was \$100; each message had to be manually rehandled six times. By mid-20th century 2,400 letters per minute could be transmitted instantaneously between New York city and London over a single cable (containing but one conductor) at a maximum charge of 25 cents per word. Transmission was fully automatic, and direct teleprinter service between customers' offices in New York city and London was available on a metered basis. Improvements in the physical and electrical design of cables and terminal equipment continued to make this dependable method of communication attractive in competition with other services.

Construction .- Fig. 20 shows the constructional details of a submarine cable. The conductor is made of copper, stranded or

FIG. 20,-CONSTRUCTIONAL DETAILS OF A MODERN SUBMARINE CABLE

having a central wire surrounded by strips wound spirally. Over this is moulded the insulation. Formerly gutta percha was almost universally employed for the insulator, but deproteinized rubber, both natural and synthetic, later competed successfully with gutta percha, while polyethylene bid fair to supplant both of them. Continuous inductance loading in the form of a thin ribbon or thread of highly permeable nickel-iron alloy wound around the conductor greatly increased the speed at which the later cables could be worked. To protect the insulation at depths where

that from the outside source In application to electric railway or marine borers are found a brass tape is wound around it. Next comes a cushion of jute yarns upon which the spirally wound armour, or sheathing wires, rest. In the deeper portions of the ocean galvanized high-tensile steel wires are used, sometimes individually covered by taired cotton tape or braid. As the depth decreases these are replaced by galvanized wrought iron wires of larger size and the armour gradually is increased in size and weight until, near the shore, a double layer is used. The added protection is necessary to prevent damage from anchors, trawler fishing gear, chafing against rocks, and, in northern latitudes, ice. An outer double wrapping of tarred jute yain or jute tape, steeped in a compound of ter and pitch further preserves the armour from coriosion. The outside diameter of the ordinary deep-sea type of cable is about one inch, and the weight in air about two tons per nautical The shore-end types run as large as three and one-half inches in diameter and weigh as much as 30 tons per nautical mile.

Cable Laying .- It is the usual practice for the manufacturer to lay the cable and test it to ascertain whether the specified electrical characteristics have been met before turning it over to the operating company. The ships used for laying are specially constructed to carry cable in cylindrical tanks built into the ship's structure The largest ship of its kind in the world at mid-20th century was H M.T.S. "Monaich." owned and operated by the British post office. With four tanks and a net coiling capacity of 126,645 cu ft., it was capable of stowing away a cable more than 2,500 nautical miles long The cable is coiled down around a central hub-shaped cone in horizontal layers, starting at the tank wall and coiling in toward the centre. When the cone is reached the cable is run out radially to the wall again, with wedge-shaped strips of wood, called "feather-edges," on either side to protect it from the weight of the layers above, and the process is repeated When paying out the cable it is pulled through a circular hatch in the deck above the cone, several men being stationed in the tank to guard against kinks forming or the cable fouling In loading the vessel, the cable from the top of one tank is led over into the bottom of the adjacent tank, making it necessary only to slacken the speed of paying out when changing over from one tank to the

From the tank the cable passes to the paying-out gear. This machinery for controlling the stress on the cable is placed both at the bow and stern. All long pay-outs are made over the stern, but it is often more convenient to pay out short sections over the bow, as It is often more convenient to pay out stort sections over the now, as the ship can be more easily maneeuverd, and it is to this point that the cable is brought for splicing. The machine consists of a large drum usually about six feet in diameter, around which several turns of cable and the state to provide the necessary friction. On the same shaft is a series for bright of the control of the same shaft is a series of the bright of the cold than series takes and connected to it is a large fan brake. The cable then passes through a dynamometer, which gives an indication of the stress on the cable leaving the ship over the bow or stern guide, as the case may be. It is not uncommon for the stress on stern guide, as the case may be. It is not uncommon for the stress on the cable in paying out in deep water to amount to as much as two tons. In order to check the amount of slack in the cable there is paid out at the same time a taut steel piano whre which is carefully measured and compared with the length of cable paid out When passing over

and compared with the length of cable paid out When passing over fairly smooth bottom the amount of slack rarely exceeds 10%, but can is taken not to leave the cable un a state of tension on an uneven bottom, or asspanded in bights over rocks.

If the compared the control of starts on her long voyage. When approaching her destination the cable is cut and the end buoyed in deep water When this shore end of the cable has been laid out to meet the buoyed deep-sea end, both ends are taken aboard and tested; the final splice is then made and the cable dropped over the bow. During cable laying, testing is carried on continuously by a staff of electricians to detect and report any fault

in the cable. Should the cable develop a fault or break while being laid, the ship is equipped with special means of coping with the trouble. From the results of electrical testing it is possible to arrive at the length of cable being and the fault.

results of electrical testing it is possible to arrive at the length of cable between the ship and the fault develops in a submarine cable it is usually possible to "locate" the fault or break with a fair degree of accuracy by the Wheatstone bridge method, by determining the electrical resistance in ohms, or the capacitance in microparads of the core between the testing point ashore and the point of failure at sea. Know-

ing the characteristics of the cable, it is possible to deduce the distance in miles, which, interpreted in conjunction with the charted route, in miles, which, interpreted in conjunction with the charted route, mahles the navigator of the repair abig to proceed to the vicinity of the trouble and to place a mark buoy within working range. Electrocked the chartest and the place of the property of the chartest and including a single property of the chartest and including a cutting graphed which auto-indicated graphed which alto the chartest and the chartest away one end when it is lifted without the cable has been raised to the surface, it is secured with a rope, or chain stoppen, and taken about Text leads are attribed to determine chain stoppe, and taken aboard Test leads are attached to determine deternate conduction, and the fault is localized. When the line is electrated to the conduction of the conduction of the electrated in the conduction of the conduction of the ship's tanks is spliced on and paid out until all the cable suspended off the bottom is new The ship is then free to go after the cable on the other side of the fault. When this end has been assed and the tests other side of the fault. When this end has been raised and the tests indicate its continuity and sistifactory insulation all the way to the shore station, cable from the ship's tacket on the ship's tacket of the ship's and the ship's tacket of the ship's tacket of the ship's tanks is stoppered off and cut, and the final splice is made on the ship's tanks is stoppered off and cut, and the final splice is made on the ship's deck. The cable is eased over the bow and drops to the ocean

bottom. With electronic aids to navigation such as echo sounding, radar and loran in use, many operations can be carried out in foggy weather which formerly was unlit for repair work.

Simplex Operation.—The simplex method of operating—sending

messages in one direction only—may be employed where the number of submarine cables available is sufficient to make duplex operation unnecessary, or where it is difficult to maintain a duplex balance. With modern methods of transmission it is possible to operate two or more

modern methods of transmission it is possible to operate two or mose sumpler printer channels over calles formerly dupleted, thereby gaining sumpler printer channels over calles formerly dupleted, thereby gaining Duplets,—Duplet operation, or the transmission of messages in both directions at the same time, is made possible by so arranging the recording instruments that while responding to signals from the discretion of the called at which they are located. There are several methods of duplexing, all of which depend upon the use of an artificial line for balancing, as is the case in landfuls dupler operation. The artificial line for balancing, as is the case in landline duplex operation. The artificial line for ocean cable operation must more nearly dupleate the real cable in electrical characteristics and it is therefore designed and built to the cable which it is to balance

Transmission.—In fast automatic printing telegraph operation signals are transmitted by means of a motor-driven transmitter controlled by a perforated paper tape (fig 21). The tape is prepared in

FIG. 21.-PERFORATED CABLE SENDING TAPE

a keyboard perforator by means of which the depression of a single key will perforate the entire combination of dots and dashes corre-sponding to the letter. This tape is then passed through the transmitter in which transmitting contacts for either dot or dash polarity are con-trolled through mechanical levers by the perforations in the tape. The transmitter is operated at the highest speed permitted by the electrical characteristics of the cable. In many cases the speed of the cable per-mits a further subdivision of the carrying capacity through the use of the American multiplex printing telegraph system, thereby providing from two to eight or more channels of traffic, each served by a single transmitter operating through a synchronously operated distributor into the cable

Receiving.—In the old method of receiving submarine cable signals, an extremely delicate galvanometer of the moving-coil type was attached originally to a mirror, and later a siphon recorder, in con-

FIG. 22 .- UNDULATING LINE EMBODYING CODE

junction with highly sensitive magnifiers of the pre-vacuum tube era Junction with nightly sensitive magniners of the pre-vacuum tune era (fig. 22). In many areas this was supplianted by electronic amplifiers associated with shaping networks to amplify and improve the shape of the received signals and to filter out extraneous interference. These devices were first used in connection with the high-speed loaded cables

operating on the American multiplex printing system, and usually are associated with that method of operation Reception of multiplex operating on the American multiplex printing system, and usually are associated with that method of operation Reception of multiplex signals involves passing the signals thus strengthened and reformed through a receiving distributor synchronized with the transmitting end, which reconstitutes them into separate channels, after which the

signals are recorded on automatic printers Automatic Relays.—In many cases it is desirable to repeat sig-Automatic Relays.—In many cases it is desirable to repeat sig-nals automatically from one section into another rather than to recor-them Except in short connecting cables a regenerative type of repeater is necessary to overcome signal distortion. This repeater is

nals automatically from one section mode, expenses true type of preparet is pre-easily to overcome signal distortion. This repeater is similar to the regenerative repeaters employed on landines. TELEKI, PAL, COUNT (1879-1941), Hungarian politician and geographer, studied jurisprudence and geography in Budapest. After being elected to parliament in 1905 he spent some years in geographical study abroad, and published Atlas zur Geschichte der Kartographie der Japanischen Inseln (Budapest, 1909). He was foreign minister in the cabinet of Adm. N. Horthy (April 1920), and in July 1920 became prime minister. He resigned in 1021 after the first attempt of King Charles to 1 egain his throne, and was appointed professor of economic geography in the University of Budapest. In Feb. 1939 he again became prime minister and remained in office until April 3, 1941, when he killed himself, reputedly because he could not sanction the part Hungary was to take a few days later in the German invasion of Yugoslavia,

TEL EL AMARNA, the name now given to a collection of ruins and rock tombs in Upper Egypt near the east bank of the Nile, 58 mi, by river below Asyut and 100 mi, above Cairo, The ruins are those of Akhetaton, a city built c. 1360 B.C. by Ikhnaton (Amenophis IV) as the new capital of his empire (in place of Thebes) when he abandoned the worship of Ammon and devoted himself to that of Aton; i.e., the sun. Shortly after the death of Ikhnaton the court retuined to Thebes, and the city, after an existence of perhaps only 20 years—of 50 years at the utmost—was abandoned. Not having been inhabited since, the lines of the streets and the ground plans of many buildings can still be traced. The chief ruins are those of the royal palace and of the House of the Rolls; there are scanty remains of the great temple. In the palace are four pavements of painted stucco work in fair preservation. They were discovered in 1891-92 by Flinders Petrie. In the Rolls house were discovered in 1887 by the fellahin approximately 300 clay tablets inscribed with cunei-form characters. They are letters and state documents addressed to Amenophis IV and his father, from the kings of Babylon, Assyra, etc, and from the Egyptian governors in Syria and neighbouring districts. The greater part of them were purchased for the Beilm imissum, but a large number were secured for the British museum. Their contents proved invulsable for the reconstruction of the history, social and political, of Egypt and western Asia during that period.

Hown out of the sales of the hills on the east are two groups of tombs; case group hes 3-½ m. NE, and the other 3 m. So of the cuty. The tombs, all of which belong to the time of Ribhaton, are full of interesting scenes in the peculiar style of the penol, accompanied by hymns to the sun god. The most important tomb is perhaps, that of Meri-Ra, high press of the sun, which has a fande nearly 100 ft long and two large chambers. In the early containes of Molesier rule in Egypt the northern tombs were inhabited by Copts, one tomb, that of Pa-Nehes, being turned into

The tombs and the great steles sculptured on the cliffs which mark the bounds of the city of Akhetaton have been the object of special study by N de G. Daves on behalf of the Archaeological Survey of Egypt The results, with numerous plates and plans, are embodied in a series of memons, Rock Tombs of Bi Amaria (six parts, 1903–60).

TELEMACHUS, in Greek legend, son of Odysseus and Penedope (Odyssey, p-ix, vx-avit, Ygymus, Fab, 127). When he reached manhood he vasifed Pylos and Sparta to make inquiries about has father. On his return, he found that Odysseus had reached home before hum Then father and son, aided by Eumaeus and Philositus, slew the suitors of Penelope (see Owsseus), According to later tradition he married Circe (or Calypso) after Odysseu's death

TELEMARK or THELEMARK, a district of southern Norway, in the emt (county) of Butaberg Area 5,430 sq.m.; pop. (1330) 121,754 It covers the uplands and fjelds of the southward projection of the country, having its highest point in the Gustaffield (6,500 ft.), and contains several large lakes, as Nordsp., Bandaksvand, Tmsjo, Mjosvand and Totakvand. The two first are connected by the Bandaks cand, giving access from the port of Skien to Dalen at the head of Bandaksvand. From Dalen, a read runs northwest; if crosses the fjelds at a helght of 3,05 ft, on the way to Roldal from which branches run to Odde and through Bradandsdal respectively.

One of the finest waterfalls in Europe, Rjukanfos (415 ft.), provides power for nitric acid works, and Ulefos, near the Bandak canal, for pulp mills. Notodden is a growing town with saltpetre works. Skien (qv), the capital, is a port; also Kraguō, Porsgrund and Brevik

TELEOLOGY, in philosophy and biology, means explanation by reference to the realization of some purpose or end (Greek τέλος, an end), contrasted with explanation by efficient causes only. Teleology is one of the oldest, probably the oldest, mode of explanation. Human conduct is nearly always explained by reference to the ends pursued, or alleged to be pursued; and the tendency to explain everything else after the analogy of human behaviour is very old, as old probably as human nature itself. The method of explanation by reference to ends received formal and explicit recognition in Aristotle's list of four causes which included "final" causes. Aristotle, of course, insisted on the importance of discovering the "material," "formal," and "efficient" causes as well as the "final" causes. But during the middle ages the others tended to be ignored more or less, and too much attention was paid to "final" causes even in physical and chemical investigations, which consequently became rather fantastic. The founders of modern science had a hard struggle to instate or reinstate the "mechanical philosophy" at least side by side with teleological explanation. The pendulum naturally swung to the other extreme. Not only physical and chemical phenomena, but even biological phenomena were explained mechanically. Descartes, for example, regarded the lower animals as mere automata. In time. however, it was found impossible to explain biological facts adequately by means of mechanical conceptions only, and teleology of one kind or another has met with increasing recognition in recent times.

See Emergence, Evolution, Organic; Mechanism; Metaphysics; Scientific Method; L. T Hobhouse, Development and Pub bose (1013)

TELEOSTEI. In the classification issued in 1846 by Johannes Muller, the recent hosy fishes were arranged in three subclasses, Dipneusti, Ganodei and Telesster, the last including the great majority of the fishes, all those with a homocorcal caudal fin Subsequent work, especially on fossil fishes, has shown that the ganods are not a natural group, some being related to very primitive fishes, others approaching the telessis, namely the Holoster, which include the recent Anna and Lepsosteus. The extinct Pholoster, which include the recent Anna and Telessteri, and have been included by some authorities in the one group, by others in the other This has led C T. Regan to combine the Holoster and Teleoste to form one subclass, termed Keopterygii. (See Fishiss)

TELEOSTOMI, a name given by some authorities to the bony fishes, either with or (usually) without the lungfishes, in the former sense it is equivalent to the class Pisces, above the

level of the Selachians. (See FISHES )

TELEPATHY was defined by F. W. H. Myers, who invented the word in 1882, as "the communication of impressions of any lend from one mind to another, independent of the recognized channels of sense." It is to be noted that Myers does not postulate that both or either of the minds he mentions should be the minds of living persons; for supernormal communication between the minds of living persons the phrase "telepathy between the living" should in strictness be used, but often "telepathy" by itself is lossely used in this sense. "Thought transference" is a less technical word with the same meaning. (See also CLAIRVOYANCE, PSYCHICAL RESEARCH )

TELEPHONE. In a broad sense, the term telephone or telephony includes the entre art of speech transmission with the many accessories and operating methods which research, development and invention have supplied to facilitate and extend conversation at a distance by electrical means. The telephone was invented in 1896, at Boston, Mass, U SA., by Aleardee Graham Bell (q.v.). His studies of sound and of electricity led him in 1874 to conceive the correct principle of telephone transmission, which he later stated, as follows:

If I could make a current of electricity vary in intensity precisely as the air varies in density during the production of sound, I should be able to transmit speech telegraphically.

The conception of this indulatory or wave-shaped current was Bell's great contribution to the art of communication. Others, notably Charles Bourseul in France (1854) and Philipp Res in Germany (1867), had written of or had attempted electral speech transmission, but had employed the make-and-break principle of the telegraph, and had failed.

In the summer of 1874, while on a vacation trip to Canada, Bell described to his father a form of apparatus consisting of a strip of steel, attached to a membrane, which when actuated by the voice would wibrate in front of a magnet. Theoretically this would produce an undulatory magneto-electric current which would transmit speech, But Bell doubted that the current would be strong enough to be of practical value. For almost a year he made no attempt to construct the superartus.

On June 2, 1875, while working on another of his inventions, he heard the twang of a steel spring over an electric wire. He comprehended immediately that it had been transmitted by an undulatory current strong enough to be useful. He gave his asistant, Thomas A. Watson, natructions for making the first Bell telephone. It transmitted speech sounds the next day, June 3, 1875. Further experiments produced on March 1o, 1876, an instrument that transmitted the first complete sentence: "Mr. Watson, come here, I want you;"

In the United Sates, several other experimenters were working at about the same time on the problem of electrical speech transmission. Prof. Elisha Gray filed a caveat ( $q \circ v$ ) on the subject m the U.S. patent office only a few hours after Bell had filed his telephone patent application. The claims of Gray and others to the invention of the telephone were threshed out in prolonged

litigation, involving some 600 separate suits, which resulted in Bell's patent being upheld and his claims to be the inventor of the telephone established.

Introduction.—Public apathy in the United States and in Oreal Britan and other countries was one of the most disheartening discullies faced by those who were endeavouring to introduce the telephone The development of the telephone business was undertaken by a group of Prof. Bell's backers, under the leadership of Thomas Sanders and Gardiner G Hubbard, whese daughter Bell soon afterward married They began renting or lending telephones in pairs to individuals for local communication The telephoning was all done over a single iron wire connecting the two instruments with ground return circuits. There were no syntch-boards to afford communication among a number of users, calling poor at best In 1878 the first telephone switchboard for commercial service was placed in operation at New Haven, Conn., with 21 subscribers

Those interested in introducing the Bell telephone to public use early adopted the permanent policy of leasing telephones instead of selling them, and granted hieraces to authorized agents or hieraces for the commercial development of the telephone business in many parts of the United States These licensee agencies gradually developed into local exchange systems and ultimately into local operating commanies.

The owners of the telephone patent early incorporated their business, and funds were raised for its progressive development, under the leadership of Theodore N. Vail, who became general manager in 1878 Within ten years after the issuance of the Bell patent the Bell Telephone system had attained an organization approximating its present form. The local systems were gradually brought together into regional companies operating throughout a state or several states The telephone systems of these regional companies were linked together by long distance circuits operated by the American Telephone and Telegraph company This company was originally formed to build and operate the long lines as a subsidiary of the American Bell Telephone company, which had become the parent company of the Bell system by acquiring the ownership of the Bell patents and purchasing stock in the regional telephone companies. Later the American Telephone and Telegraph company exchanged its stock for that of the American Bell Telephone company and became the parent company of the Bell system

About 1881 it became apparent that standardization of equipment and centralized research on improvements were essentials to telephone progress. Accordingly, the Western Electric company was acquired as chief manufacturer and supplier for the Bell system. Western Electric, in turn, purchased or consolidated with the principal Bell system manufacturing licensees of that pernol.

Growth of the Business,-Following the expiration of the basic telephone patents, a large number of independent telephone companies, not affiliated with the Bell system, were established all over the country. In many cases these companies brought telephone service to places in which the Bell system did not operate. Some, however, engaged in competition with the Bell companies in their localities; and it required actual experience of the inconveniences of telephone competition to convince the public of the fact that two telephone companies in a single community are a source of annoyance and unnecessary expense to the telephone-using public. The fact that one had to subscribe for both the competing telephone services in order to be in communication with all of the telephone subscribers in the locality finally resulted in a popular demand for the unification of the telephone service In many communities competing telephone systems were consolidated. Independent companies were afforded facilities for physical connection with the lines of the Bell system. The linking up of these local telephone systems, which are now known as connecting companies, makes possible interconnection among practically all the telephones in the United States. Subscribers of the Bell companies and of the connecting companies are thus alike afforded access over the long distance lines of the Bell system to almost any other telephone anywhere in the United States as well

as in other countries in North America and by radio to overseas On Jan. 1, 1947, the 21 associated companies, which with the American Telephone and Telegraph company make up the Beil system, owned and operated 25,709,000 telephones and 7,501 central offices In addition, the connecting companies, which number nearly 6,000 besides more than 60,000 connecting rural lines, owned and operated more than 5,800,000 telephones and more than 11,000 central offices. The total investment in telephone plant and equipment in the United States was, on Jan 1, 1947, more than \$7,000,000,080, of which \$6,294,000,000 represented the investment of the Bell system During the year ended Dec 31, 1946, the Bell system traffic averaged daily 100,-401,000 exchange conversations and 5,361,000 toll conversations, a total of 105,762,000 In addition, the connecting companies transmitted a daily average of 21,964,000 exchange conversations and 274,000 toll conversations (excluding duplications), a total of 22,238,000 conversations The grand total of telephone messages for the US during that year was about 128,000,000 completed conversations a day. About 580,000 persons were employed by the telephone industry in the U.S., of whom 496,400 were employees of Bell companies. In addition, about 114,500 were employed by the Western Electric company, and more than 10,000 by independent manufacturers of telephone equipment. The Bell Telephone Laboratories, Inc , which conducts research along lines connected with every phase of the electrical transmission of speech, then employed a total of more than 6,000 people

#### DEVELOPMENT AS TO USE

The telephone industry in the United States has attained its present development in response to a rapid growth in public demand for telephone service throughout the country This is illustrated in the following table showing the increase in the total number of telephones in the United States since 1880:

Telephone Development in the United States

	E	nd of	year			Number of telephones	Telephones per 100 population
1880				-		47,900	0.00
1885						155,800	027
1800						227,900	0.36
1895						339,500	0.48
1000						1,355,900	1 76
1905						4,126,000	4.85
1910						7,635,400	8.19
1915						10,523,500	10,39
1920						13,329,400	12.41
1925						16,935,900	14 63
1930						20,201,000	16.36
1935					•	17,424,000	13 64
1940						21,928,000	16.56
1945						27,867,000	21 03
1946						31,611,000	22 37

Coincident with the severe recession, the number of telephones declined between 1930 and 1933, but growth was resumed in the fall of the latter year. The table indicates the extent to which the American people have made the telephone an integral part of daily life. The more telephones in service, the more useful the service to the subscriber, and Americans now depend on it for business, finance and personal affairs, as well as fire and police protection.

# TELEPHONE PLANT IN THE UNITED STATES

The term "telephone plant" includes: (1) the telephone apparatus and wiring at the subscriberty premuser; (2) the central office equipment (with the buildings that contain tt) for interconnecting subscribers' lines; and (2) the sarial and underground wires and cables with their pole lines and conduits, which connect the subscribers' stations with the central offices and the latter with each other, whether they be in the same city or in different cities. Telephone plant includes also radio telephone equipment used to furnish channels between certain points. This plant makes it possible, at the present time, for any user of the telephone service to be connected promptly with any other station of the telephone

system, and to converse easily, by electrical means, with the person called, after the connection is established, regardless of distance The systems which enable this nation-wide service to be rendered are necessarily complex and intricate and they include a multitude of auxiliary devices and appurtenances The following buef description deals only with the principal kinds of telephone

Plant at Subscribers' Premises .- This includes a wide variety of equipment, of which the following classes may be considered typical.

Station Set -This consists of a transmitter, which converts the speech waves in the air into their electrical replicas on the wire. a receiver, which performs the reverse operation of converting the incoming electrical waves into sound waves, an induction coil, which is a form of transformer designed to permit efficient use of a single pair of wires for speech in both directions alternately, without requiring the users to operate a switch to convert from talking to listening or vice versa, a bell or other calling device. a switch hook, to control connection of the station set to the central office line; one or more condensers; and, on certain types of party has arranged to ring only the bell of the particular station called, a relay or a cold cathode tube In the case of dial systems, described later, a pulsing device or dial is also required. In magneto system a hand-operated generator is necessary for signalling, and batteries for operating the transmitter

The apparatus comprising the station set may be assembled in various combinations, of which the most common have been (1) the wall set; (2) the desk stand, and (3) the handset, in which the transmitter and receiver are mounted at opposite ends of a handle. The handset usually rests on a cradle surmounting a base which, in later designs, known as combined sets, includes the bell, induction coil, condensers and other apparatus. These in earlier designs, were generally housed in a separate subscriber set or bell box. The combined set may also include push-button or other type keys to perform various functions as described later under key equipments

The Receiver .- The receiver was the original telephone, for at first a single instrument, placed alternately to the mouth and ear, was used for talking and listening. Continuous development of Bell's basic instrument led to vast improvement in the naturalness of its reproduction of the voice. Fundamentally, it consists of a permanent magnet having pole pieces bearing coils of insulated fine wire, and a circular diaphragm of magnetic alloy supported by the case or shell of the instrument, with its centre close to the ends of the pole pieces, but not in contact with them. Speech currents, passing through the coils, vary the attraction of the permanent magnet for the diaphragm, causing the latter to vibrate and produce sound waves in the air corresponding to the speech currents. Recent improvements in the U.S receiver are new types of magnetic alloys, dustproof case and welded construction. The design of the complete electromechanical system has been continuously improved to provide uniformly better talking quali-

The Transmitter .- Bell himself early pointed the way to improvement of the transmitting function of his telephone by his liquid transmitter in which the electrical resistance of the transmitting element varied under control of the vibrations of the voice. Following the Berliner and Edison transmitters of 1877. based on the principle of the microphone (variable resistance contacts in a battery circuit) came the Blake transmitter, introduced into the Bell system in 1878; the granular carbon type, growing out of an invention by Henry Hunnings; and the "solid back" type, an improved form of granular carbon transmitter, invented by Anthony C. White in 1800. This form of transmitter has been retained in modern sets but improvements, particularly as regards efficiency, naturalness of voice reproduction and better resistance to aging, have resulted from continuing scientific research.

The Station Circuit.-The transmitter and receiver may be connected to the line in various ways by means of the induction coil, and substantial improvements were made, particularly after 1930, not only in the design of the coll itself but in the development and introduction of commercially practicable antisidetone circuits, whereby most of the electrical energy generated in the transmitter is directed toward the distant station, with a minimum entering the speaker's receiver.

Coin Telephone Stations -Generally provided in public or semipublic locations, these include, in addition to the usual station equipment, a coin collector having one or more slots designed to accept legitimate coins and reject slugs or spurious coins. The coms, in passing down their respective slots, strike distinctive gongs, the tones of which permit operators to supervise the deposits Many coin collectors are arranged to hold the coins in suspension in a hopper, with means provided whereby the operator (or automatic devices in a dial office) can either collect or refund the coms so suspended, depending on whether or not the called party is reached

Key Telephone Systems -In business offices and residences. additional telephone facilities in great variety, beyond the scope of a single station set, are frequently employed for greater convenience and utility Various combinations of push-button, turnbutton or lever-type keys, installed on a desk or table, or mounted integrally in the base of a telephone set, can be arranged to perform many combinations of functions, particularly where two or more lines and a number of stations are involved. Thus, an extension telephone may be cut off, a telephone may be connected to any of several lines; a call can be held on one line while one is talking on another, etc

Private Branch Exchange .- This name is applied to a switchboard, generally small but occasionally of very large size, located at the subscriber's premises. It is connected with the central office switchboard by a number of trunk lines and to it are connected the station sets of the subscriber's establishment. The smaller private branch exchanges are capable of being placed on a desk and operated by a clerk who may also perform other duties. Large private branch exchanges resemble central office switchboards. These may be of either the manual or the dial type

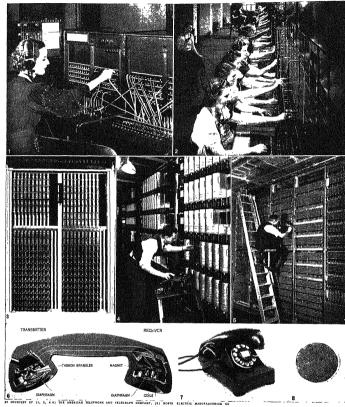

Special Equipment.-Special equipment and arrangements are available to meet unusual requirements of various kinds. Among these are loud gongs or other signalling devices for noisy locations, amplifier equipment for use by the hard-of-hearing, conference systems utilizing loud speakers and paging systems for

public buildings such as hospitals.

Central Office Switching Equipment.-To enable telephone conversations to take place, two station sets must be connected by a pair of wires constituting an electrical circuit called the line If each person having a telephone wished to talk only to one other station, the telephone plant would be very simple. Its complications arise from the necessity of selecting the proper one of millions of telephones, almost anywhere in the world, connecting the calling station to it and providing satisfactory talking conditions. Thus, each call is custom-made and in consequence telephone service is very different from water, gas and electric supply services in which each customer satisfies his demands by merely drawing what he needs from a set of mains.

Whether the switching equipment in the central office is manually operated or of the dial type, it comprises means for connecting to the calling line when the subscriber raises his receiver from the switch hook; means for selecting, on the basis of the subscriber's order for the call, an available path to the called party's telephone, whether that telephone be connected to the same switchboard as is his own, or to some other switchboard in the same city, or whether it must be reached over a trunk line to some suburban point or over a toll or long distance line extending to a more remote place; means for determining whether the called line is already in use; means for ringing the bell at the called station; and finally when signals indicate that the conversation is ended, means for restoring all circuits to readiness for other calls

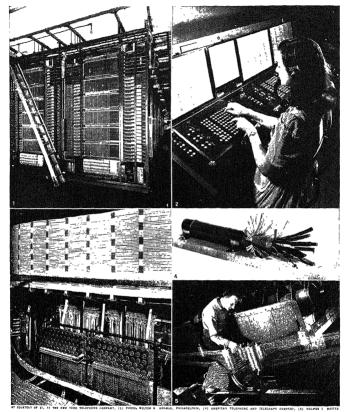

There are certain limits to the number of telephones which can be given service advantageously on one switchboard or group of switchboards in a given building One of these is the economic limit which indicates that, in order to keep down the length and cost of the lines connecting the telephones with the central office, the lines in certain conveniently sized areas should be grouped to

BY COURTEST OF THE AMERICAN TELEPHONE AND TELEGRAPH CO
FIG 1 -- SCHEMATIC DIAGRAM OF TELEPHONE CONNECTION IN COMMON BATTERY MANUAL EXCHANGE

When the suberriber (left) removes his telephone from the cradle on acceptant circuit is completed through his set, the line rather of the cradle on acceptance in the center of the cen

one central office in each area and the several central offices interconnected by trunk lines The number of central offices, their locations, the boundaries of their areas, the type of switchboards and the number and character of the trunk lines are all matters requing careful engineering study and intricate planning, usually far in advance of actual construction.

Historical—The first commercial telephone switchboard, put mto service in New Haven, Conn., on Jan 28, 1878, provided primitive means for accomplishing the fundamental operations of interconnecting subscribers' lines It served 21 stations on 8 grounded lines. In contrast, a modern central office may contain five or more switchboards, each serving perhaps 20,000 telephones on 10,000 lines.

One of the more important developments in manually operated switchboards was that of the common battery system, in which a large battery at the central office replaced the individual batteries previously required at each station to actuate the transmitter This system also permitted elimination of the magnetic generators which subscribes operated by turning a hand crank, thus generating an electric current which caused an annunciator or drop to operate at the switchboard. In contrast, the common battery system permits the subscriber to signal the operator by merely lifting the receiver from its switch hook, thereby lighting a tiny electric lamp associated with his line at the switchboard. The electrical circuit of this type of switchboard is shown diagrammatically in fig. 1, its operation being explained in the text below the figure.

An essential step in the evolution of the manual switchboard was the introduction of the multiple system, wherein a connection to each subscriber's, line appears at intervals along the switch-board so that the line is within reach of every operator. In practice this means one multiple jack per line for every three adjacent operators. This permits any operator to establish a connection directly between any subscriber whose line lamp appears before her and any other subscriber connected with the office. Previously, when the number of subscribers which a single operator could reach was exceeded, trunk circuits were provided between operation. This same syntheboard, but this reduced the speed of service. This can be also also be a subscriber when the content is an experimental content of the speed of service. The same syntheboard, but this reduced the speed of service. The same syntheboard, but this reduced the speed of service. The same syntheboard is a subscriber of selecting devices to assure a high probability that a circuit will be available whenever someone disks the line.

With the introduction of the multiple system it became necessary to develop a buy test, to determine whether or not a line, with which connection was desired, was already in use through a connection made at some other part of the switchboard. In the

common battery manual system the operator performs this test by touching the tip of a connecting plug to the jack of the desired line. If the line is busy, a click is heard in the operator's receiver. In the dual system the busy test is made automatically

Buddings:—Telephone buildings are usually specially designed to house the telephone plant. They range in szer from small onestory structures to huge multistory combination office and equipment buildings. Uniform equipment layouts are followed wherever possible but each building is individually planned to meet the needs of the area it is to serve including provision for economical and orderly enlargement to eare for future requirements.

Telephone Lines .- Telephone lines connect (1) each telephone to a central office; (2) each central office in a city to every other central office in that city; and (3) all cities, towns, villages and community centres, by means of a vast network of wires. These wire lines are of two forms-cable and open wire. Cable consists of insulated copper waes, twisted in pairs and assembled into a core which is covered with an envelope of lead alloy About 04% of the telephone wire mileage in the U.S. is in cable placed either underground or suspended aerially by means of steel strand attached to poles Open-wire lines consist of bare wires, generally of copper or steel, attached to glass insulators supported on pins m crossarms attached to the tops of poles. The lines in a city area may be divided into two classes. (1) subscribers' lines connecting the subscribers' stations to a central office; and (2) trunk lines which connect the offices together. In a typical city installation, a rubber-covered pair of wires, known as the "drop" wire, runs from the subscriber's premises to a cable terminal. In densely built blocks the connection is frequently made by wires attached to the walls of buildings. From the cable termmal, the line is continued toward the central office in a small cable, containing from 25 to 100 pairs of wires and known as "block" cable, which connects with the larger "feeder" cables that run as directly as practicable to a central office. In densely built areas the feeder cables are generally placed in underground ducts; elsewhere they are placed overhead.

As the result of the cable development work described in a later section, telephone cables containing many hundreds of pairs of wires are now available and are employed in the more congested districts. A cable of the type which is used for main feeder routes may contain as many as 2,121 pairs of 36-gauge wires. The installation of the subscribers' cable distribution plant, consisting of block cables, and main and subsidiary feeder cables is preceded by a careful engineering study of the present and probable future demand for telephone service in order that the plant may be so planned as to cnable these domands to be adequately met with over-all economy.

Tunk cables usually contain larger wires than subscribers' cables In large mentopolitan districts, where there are many central offices, the number of trunk circuits required is very large; sometimes as high as one runk circuit for each eight subscribers' lines. Trunk routes are usually double-tracked, 1e, 1wo groups of circuits (one for traffic in each direction) are ordinatily required between each pair of central offices, except where tandem or intermediate switching is employed. To provide adequate transmission efficiency in the case of the longer trunk circuits, it is frequently economical to "flaud" then, as described in a subsequent section. The longing coils usually are usually as the contraction of the case of the longer trunk circuits, it is frequently economical to "flaud" then, as described in a subsequent section. The longing coils usually are usually as the contraction of the case of the longer trunk circuits and the contraction of the case of the longer trunk circuits and the contraction of the case of the longer trunk circuits and the contraction of the case of the longer trunk circuits and the contraction of the case of the longer trunk circuits and the contraction of the case of the longer trunk circuits and the contraction of the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and the case of the longer trunk circuits and case of the longer trunk circuits and case of the longer trunk circuits and case of the longer trunk circuits and case of the longer trunk circuits and case of the longer trunk circuits and case of the longer trunk circuits and case of the longer trunk circuits and case of the longer trunk circuits and case of the lon

Toll and Long Distance Lines.—The network of toll and long distance lines which interconnect some poopoc communities in the US, utilized at the beginning of 1947 approximately 20,00,000 ml, of copper wire on over 20,000 ml, of route. About 55% of the wires were in cable with the remainder on open-wrie lines. Starting with a cable placed in 1950 between New York city and Philadelphia, Pa., the intercity cable plant grew into the country-wide network shown on fig. 2. The central transcontinental cable route linking the sastem and weeken networks was completed in 1924. Most of the intercity wires are works was completed in 1924. Most of the intercity wires are quenches above the voice range are utilized for transmission, as discussed in a subscenent section. Also these wires are extended incussed in a subscenent section. Also these wires are extended to the contract of

sively used to provide telegraph circuits.

A large part of the toll cable construction employs paperinsulated conductors, usually 36 mils in diameter, weighing 201 lb to the mile (19 B and S gauge). In the construction of this type of cable, two wires, each insulated with dry paper, are first twisted together to form a pair. Then a quad is formed by twisting two pairs together. The twisting aids in the prevention of cross talk or overhearing between the pairs. Each quad furnishes three talking paths when used for voice circuits-two "physical" circuits and one "phantom" circuit, the latter resulting from a combination of the two physical circuits. The quads are formed together and enclosed in a metallic sheath. Toll cables range in size from a few quads to approximately 150 quads. Two 44-quad cables, if arranged for both voice and carrier transmission (see below, Examples of Improvements), could furnish about 800 talking circuits or even a greater number of telegraph circuits. A toll cable with a suitable protective covering such as jute or spirally wrapped steel tape is buried in the ground. Only storms or floods of most unusual severity can interrupt service with construction of this type. In passing through cities, the cable is usually placed in underground ducts. Loading coils are connected in each voice telephone circuit a little more than a mile apart and at intervals of about 45 miles repeater stations for amplifying the speech currents are placed along the route. The carrier circuits in paper-insulated cables operate over nonloaded pairs and repeater stations for amplifying the carrier currents are spaced at about 16-mile intervals. In addition to the paper-insulated cable conductors a new type of structure exclusively for carrier use has been introduced and is being employed extensively in new construction. The conductors in this new structure as described in a subsequent section are arranged coaxially.

#### EXAMPLES OF IMPROVEMENTS

Many times during the period that elapsed after the invention of the telephone, scientific research and againering development not only found the way out of difficult situations which threateast to humper the growth of telephone service but, in advance of immediate, seeds, they often created new instrumentalities which, in turn, led to further extensions and improvements of the service.

Cables.—Telephone cables not only provide a means for placing a large number of telephone circuits compactly either overhead or underground, but they enable the lines to be carried

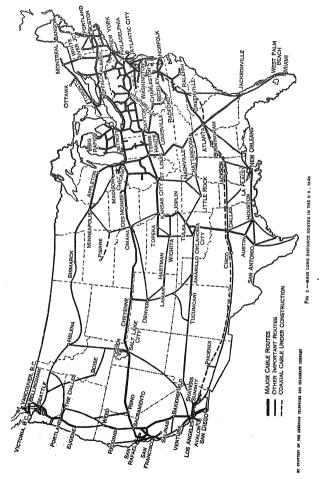

across the beds of rivers and other waterways. In the cables first employed, single wires with a ground return were used and the wires were insulated with either gutta-percha or rubber. It was soon found, however, that such cables were not well-suited for telephone purposes. After experiments with many kinds of insulating materials it was found that dry paper was the best for telephone cables. This discovery and the concurrent development of means for encasing the paper-insulated wires in a metallic sheath or tube which protected them from moisture laid the foundation for the modern telephone cable Research and development covering many materials and processes made it possible gradually to increase the number of pairs of wires in a fullsized cable for subscribers' lines, from a maximum of 50 in the year 1888 to 2,100 in 1939. This great progress resulted in a greatly increased effectiveness of utilization of the space in underground ducts in addition to other marked advantages. The increase in the number of pairs in a single cable was accompanied by a reduction in the size of the copper wires, those used in the 2,100-pair cable, for example, weighing only about 4 lb, per wire mile, while those used in the so-pair cable of 1888 weighed about 25 lb. per wire mile

In order to realize the maxmum use of carrier frequencies in the toil plant it became apparent to telephone engeneers that a new type of conductor would be necessary. Consideration of this problem led to the development of the coaxual unit consisting of a cylindrical copper conductor surrounded by a copper tube. The copper conductor is held in place by polyethylene disk insulators. This coaxal unit is suitable not only for carrier telephone transmission but for television transmission as well. A cable containing both coaxial units and quads is shown in fig. 4 of Plate II. Coaxial cables over heavy routes usually include eight coaxial units, Six and sometimes four units are employed on the lighter routes.

Loading .- For some time prior to the year 1900, it had been known to those technically skilled in the art of telephony that the transmission efficiency of long telephone circuits could be improved by increasing their electrical property known as the "uniformly distributed inductance." Numerous investigators sought unsuccessfully to simulate the beneficial effect of increasing the uniformly distributed inductance by introducing, into the circuit, inductance concentrated, or lumped, in the form of coils. However it was reserved for Prof Michael I. Pupin of Columbia university, New York, to discover, in 1900, that the proper spacing of the coils along the telephone circuit was the key to the solution and it was from failure to establish this that earlier workers had failed. The proper spacing of the inductance coils along a telephone circuit is referred to as "loading." Loading, which now is applied exclusively to cable circuits, reduces the attenuation of the waves of speech current in the circuit. To indicate its practical value, it can be stated that, under favourable circumstances, a loaded cable circuit is as good a conductor for telephonic currents as would be a nonloaded circuit of conductors weighing about eight times as much

Satisfactory loading also requires that the loading coils should have very low energy loses in their magnetic cores and their copper windings, and that their inductances should be uniform and stable. The toroidal-shaped cores of modern loading coils make use of a powdered magnetic alloy; having the mdivodual particles suitably insulated and then compressed under very high pressure, after which a suitable heat treatment is applied to develop their optimum magnetic properties. The present standard Bell system core materials is an alloy of nickel, (rion and moly)-denum known as "moly)denum permalloy," one of a series of permalloy materials discovered by G. W. Elmen of the Bell Telephone laboratories. The progressive improvement of magnetic core materials has permitted very large reductions in the size and cost of loading coils since 1935, while also making moderate improvements in their performance characteristics.

Repeaters.—As the telephonic currents pass over the line they decrease in strength, so that after travelling a distance which varies with the character of the line, they become too weak to actuate the telephone receiver properly. The idea of inserting one or more repeaters in a line for the purpose of reinforcing or

amplifying the telephonic currents from some local source of energy is almost as old as the telephone itself, but many years elapsed before the quest for a satisfactory repeater culminated in success. The solution of this problem involved the production of a repeater element which, when actuated by weak telephonic currents, is capable of emitting greatly strengthened currents without appreciable loss in the clearness of voice transmission A socalled "mechanical" element was used commercially in 1904 but this presented inherent limitations owing to the mechanical mertia of the moving parts. A satisfactory solution of the problem was found about 1914 by improving and utilizing the three-electrode vacuum tube in which the weakened speech currents control a local source of energy by means of a practically weightless stream of electrons. The three-electrode vacuum tube of Lee De Forest, prior to its development for use in telephone repeaters, was employed for radio telegraph reception. In the form in which it was used for that purpose it was not suited for telephony. A large amount of research and development work was required before a satisfactory tube could be produced.

Continuing development work looking toward improved efficiency in vacuum tubes used in telephony resulted in many improvements. To illustrate, the life of the vacuum tube most commonly used in 1917 was about 1,000 hours. Tubes of a new type first introduced in 1938, have a life of fully 70,000 hours, which is equivalent to about eight years of continuous operation. In addition, the first cost was reduced by more than one-half and the power required to heat the tube filaments was also reduced to less than one-half of that required in 1917. The amount of testing needed to secure good operation was likewise decreased. This research also led to new types of tube with four and five elements which are especially adapted for use in carrier and radio systems. The very large use of vacuum tube repeaters is shown by the fact that in 1944 there were about 175,000 voice and carrier repeaters using about 600,000 vacuum tubes in the telephone plants in the U.S.

The repeater element would have been of lutle use without the concurrent development of efficient and convenient circuits and annulary equipment to enable the repeater element to be associated properly with the line circuits. The development of a satisfactory repeater has also carried with it the necessity for extensive investigations of the characteristics of telephone lines is which the repeater must work. Prominent among such auxiliary equipment are the equalizer which compensates for the poor line characteristics at various frequencies and the transmission regulator which automatically compensates for the large variation in line loss due to temperature variation.

Carrier. -Practically all of the long distance routes shown in fig. 2 have been greatly increased in message-carrying capacity by the application of carrier telephone systems. These are called "carrier" systems because of the basic principle whereby the frequencies ordinarily involved in voice transmission vary or modulate a higher frequency current which then may be said to carry the telephone currents by which it is controlled. The ordinary voice telephone frequencies, about 200 to 3,000 cycles, are in effect transposed to a frequency band of equal width in a different and heretofore unused part of the frequency scale. By bringing about a suitable reaction with a carrier current of, say, 7,000 cycles, the voice frequencies of 200 to 3,000 cycles can be transposed to frequencies of 7,200 to 10,000 cycles. At the distant end of the circuit the latter currents are restored by a process known as demodulation to the original 200 to 3,000 cycle frequencies. By the use of additional and higher frequency carrier currents other messages can be transmitted simultaneously over the same circuit.

Carrier systems and associated equipment have been the subject of continuous study and development by communications research people. It was, in fact, during experiments of the carrier principle applied to telegraphy that Bell made his original discreyer, Applied commercially first to open-write circuits, in 1758, to transmit four additional messages over a pair of wires, carrier telephone systems are now available in varied types and capacities depending on the needs in the particular case and on the type of line structure on which applied. Open-wire systems commonly

provide 1, 3, or 15 additional circuits over one pair of wires The cable system utilizing two pairs of nonloaded 19-gauge conductors provides 12 circuits. Two coaxial cable units provide for up to 480 telephone circuits or for a television channel.

As a consequence of the very large line losses involved due to the necessity of using nonloaded conductors and very high frequencies, the carrier development has made even more necessary than in the previously mentioned voice frequency system the need for transmission equalizing arrangements, automatic transmission regulating systems, and other associated equipments and circuits. The individual amplifiers used on these systems, for example, provide amplification for the entire band of frequencies ranmitted and not only must give very high amplification but must be extremely stable in performance.

Switching Systems .- In the continual improvement of manually operated switchboards, the tendency was naturally toward the provision of automatic devices to relieve the operators of their more routine functions. The accomplishments in this direction became more marked after the introduction of common battery operation with lamp signalling. Parallelling this development, considerable progress was made in the field of fully automatic, or "dial" switching systems. U.S. patents covering such a system were first applied for in 1879, but the system which they described never became a commercial success. In 1889, however, A. B. Strowger invented a system which was subsequently improved by others and is in wide use under the name "step-bystep" system The original Strowger system employed push buttons at subscriber stations. The subscriber station dial with finger wheel was invented in 1898 by Alexander E. Keith and the brothers, C. and C. J. Erickson Other automatic systems, containing important features contributing greatly to the success of automatic switching, appeared both in the U.S. and elsewhere Independent telephone manufacturers played important parts in these developments.

The Bell system became actively engaged in the development of automatic switching equipment prior to 1900. After exhaustive inquiry, in its effort to determine fundamentally the type of machinery best suited to the needs of the larger cities, a large trail installation of semiautomatic equipment was made in 1914, leading to the installation in 1921 of the first completely automatic exchange of the "panel" type, so called because of the appearance of the switch frames used. This system employs switching mechanisms operated by common control circuits. In the step-by-under control of the subscriber's dial, whereas in the panel system the dial impulses are registered in common control circuits known as senders, which in turn control the setting of the switches. The system provides flexibility and efficiency essential to the needs of the larger cities.

The application of dial telephones grew rapidly until, in 1947, both 138, of the telephones in the US and about 15% of the telephones in the US and about 15% of the telephone in the Boll system were operated on a dial hasis. Considering as earch led to the development of a bascally new switchings greaten, known as "crossbar," from the appearance of the switches used. This system also operates on the common control basis similar to the panel system. The first complete exchange of this year was placed in service in 1938. This system, designed originally for the larger cities and hence arranged to work readily with type was placed in service in 1938. This system, designed originally for the larger cities and hence arranged to work readily with existing paule type offices, presented so many advantages as compared with earlier systems that its basic principles were gradually applied to other fields. Thus, in 1943 the first large application of crossbar equipment to the handling of long distance calls was placed in service. There was also in 1947 a trend toward the use of crossbar principles in the smaller exchanges and even in cities already having considerable step-by-step equipment.

Another important development was the application of automatic switching to very small communities. By 1947 nearly 1,000 of these 'community dial offices' had been installed in the Bell system alone, most of them in outlying or rural localities. Many of these small exchanges were of the step-by-step type, but there were also a number of types of "all-relay" equipment produced by various smanufactures. The introduction of these com-

standing step in the telephone industry's program for improving rural telephone service.

The foregoing are but a few of the many improvements brought about by development and research. Among others may be mentioned transoceanic telephony; telephotography (q v ), which enables pictures to be reproduced at distant points; dialing of toll calls, and automatic ticketing, which consists of automatic equipment for recording on a ticket calls dialed to short-haul toll points, thus permitting the completion of such calls by fully automatic means without requiring the services of an operator for billing purposes, and crossbar tandem equipment, which is a modern version of the tandem principle, developed originally for manual systems, whereby traffic between offices on opposite sides of a large city, for example, is handled through an intermediate switchboard which acts as a clearing house for these relatively small amounts of traffic, handling them more efficiently than if direct paths were provided and thus reducing the number of trunks required

Extension of Long Distance Communication.-The first long distance conversation took place in 1876 over a line two miles in length between Cambridge and Boston, Mass. Conversation by telephone became possible in 1880 between Boston and Providence, RI, and in 1884 between Boston and New York city The long distance lines from New York reached Chicago, Ill, in 1892 and in 1911 were extended to Denver, Colo. Salt Lake City, Utah, was connected with the eastern seaboard in 1913 In 1915 the first transcontinental telephone line was opened between New York and San Francisco, Calif. As public demand for long distance service grew greater, a second open-wire line across the country became necessary and in 1923 a southern transcontinental line was opened to service through New Orleans. La., and El Paso, Tex., to Los Angeles, Calif. A third open-wire line across the continent was opened in 1927 by way of Minneapolis, Minn, to Seattle, Wash, and Portland, Ore, The fourth open-wre line was established in 1930 between St. Louis, Mo., and Los Angeles using a route somewhat north of the southern transcontinental line in passing through Holbrook and Kingman, Ariz The reliability of the long distance telephone service was substantially enhanced by the placing of many of the important lines, such as the central transcontinental, in underground cables which are practically stormproof. A start was made in 1944 on a second transcontinental cable which was to follow a southern route from New York through Atlanta, Ga., and Dallas, Tex., to Los Angeles. Out of a total of about 105,307,000 miles of Bell system telephone wire on Dec. 31, 1946 (consisting of 86,384,000 mi. of exchange wire and 18,923,000 mi. of toll wire), 61%, or 64,203,000 mi., was in underground cable; about 34%, or 35,704,-000 mi., was in aerial cable; and the remainder, 5,400,000 mi. was in open wire.

The most populated sections of the U.S. in 1945 were largely covered by the spreading network of telephone cables and other important routes shown in fig. 2. Telephone messages can now be transmitted entirely through cable from Bangor or Ellsworth, Me., in the extreme northeast to San Diego, Calif., in the west, 3,900 mi. In the New York-Philadelphia section, seven cables provided facilities in 1944 for about 2,940 telephone conversations and 540 telegraph messages simultaneously.

Canada was brought into communication with the U.S. many years ago and in 1945 the eastern toll cable network extended to Montreal, Quebec, Toronto and London, Ontario. Three telephone cables under the Florida straits between Key West and Havana, Cuba, providing three talking circuits, were opened to service in 1921 making it possible to talk between the North American continent and Cuba, A fourth cable equipped with three-carrier channels was placed in service in 1931, In 1942 the total number of telephone circuits was increased to ten by replacing the threechannel carrier system with a seven-channel system. In 1927 communication was established over land lines to principal cities of Mexico. Communication to Fairbanks, Alaska, by land line was established in 1042.

munity dial offices in place of manual switchboards was an out- trons resulted in the transmission by radio of intelligible speech from Arlington, Va., to Hawan on Sept. 30, and to the Eiffel tower in Paris, France, on Oct. 21. In 1927 with the co-operation of the British post office the first commercial overseas circuit was opened, making possible telephone connection between anyone in the US and anyone in England and Scotland In 1931 radio stations were established on the Pacific coast which furnished service between the US and the Hawaiian Islands, Philippine Islands, Netherlands Indies and Japan Facilities established in New Jersey in 1930 and at Miami, Fla, in 1932 provide service between the US. and most of the countries in Central and South America Radiotelephone service is available between the United States and 68 countries and territories throughout the world Of these, 48 are reached by direct circuits and the 20 others through connecting wire lines or radio links.

Facilities in the US are available for telephone service by radio to suitably equipped ships operating in both the Atlantic and Pacific oceans. Radiotelephone service is also given to large numbers of vessels engaged in harbour and coastwise operations

Radio is used in the US telephone plant for short distance toll circuits between locations where the use of wire would be unusually difficult. Examples are service to Smith and Tangier Islands in Chesapeake bay, and a 12-channel system between Cape Charles and Norfolk, Va. Portable radiotelephone equipments are used in emergencies such as floods or hurricanes to bridge gaps in the regular toll circuits until normal service can be restored.

To determine further the field of usefulness of radio in the telephone plant, work was begun in the summer of 1945 on a trial of a microwave relayed radio system between New York and Boston. In 1946 came the first installations of mobile radiotelephone service providing two-way telephone communication between the land telephone system and motor vehicles both in urban areas and along intercity highways

Communications in War,-World War II saw a revolutionary change in military communication facilities both as to magnitude and variety. This in a sense reflected the extraordinary progress in the communications art made in the 20-year period after World War I. In this period occurred almost the entire development of the radiotelephone facilities, of carrier systems both telegraph and telephone, and of such allied systems as telephotography and wire networks for the interconnection of radio broadcasting stations.

Communications played an important part in the success of the European invasion in 1944. The magnitude of the telephone net-work involved is evidenced by the fact that during the period from D-day (June 6, 1944) to March 1945, the U.S. army in Europe employed 820,000 mi. of field and assault wire, 239,900 mi. of spiral 4-carrier telephone cable, 294,000 telephones and 17,740 switchboards. In addition use was made of the permanently installed telephone plant in the countries invaded In forward combat zones, radiotelephone was used extensively for communicating with tanks and other vehicles, with scouting groups carrying portable radio sets, and for establishing communications in advance of the time when wire facilities could be placed. Radio also served for communication with aeroplanes.

Communications were also an important adjunct in the naval operations of World War II. For example, in one landing operation against a Japanese-held stronghold in the Pacific in 1944 the U.S. navy used about 800 warships equipped with 48,166 telephones. These shipboard telephones were connected by some 5,000,000 ft. of telephone cable of various sizes. The 48,166 telephones are equal to the number serving a city about the size of Flint, Mich., or Youngstown, Ohio.

Telephone research and manufacturing organizations were expanded during the war years and their efforts were almost wholly devoted to supplying the communications needs of the armed services of the U.S. and its Allies.

## TELEPHONE IN VARIOUS COUNTRIES

The introduction of the telephone and the development of the In 1915 experimental work by Bell system research organiza- business in countries other than the U.S. will be briefly outlined

in the following paragraphs. The expansion of international telephone communications in Europe, the recent development of long distance telephone cable facilities in the various European countries, and statistics reflecting the status as of Jan. 1, 1947, of telephone development throughout the world will be presented in

the remaining sections of this article, Great Britain .- Earnest efforts were made by the early backers of the telephone in the US to introduce it to use in Europe Bell himself visited England and Scotland on his wedding trip m 1878 in the hope of developing a demand for the telephone in his native country Queen Victoria congratulated Bell upon the success of his invention and offered to purchase a pair of telephones, but the inventor made her a present of two instruments especially done in ivory. This assisted in bringing the telephone to public attention and in 1879 the first telephone exchange was opened in London with seven or eight subscribers. Several companies were established for the purpose of introducing the telephone in various parts of the United Kingdom, but in 1880 the British courts held that the telephone system was legally a telegraph system within the meaning of the acts of parliament making the telegraph a monopoly of the postmaster general. The British post office thereafter issued licences on a royalty basis to several private companies, which were ultimately consolidated into a single large company. Licences for the establishment of

cutes and several such systems were established.
In 1896 the post office bought the long distance lines throughout the United Kingdom and after that the privately owned telephone company confined its activities to the operation of local exhanges. The post office, however, began establishing its own local telephone exchanges in Londom in 1902 and these were connected with the company's system. Upon the expiration of the company's hence on Dec. 32, 1911, the post office acquired till telephones in Great Britain with the exception of the numicipal systems at Hull and the Channel islands of Gorensey and Jersey. Upon the establishment of the Irish Free State the British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post office transferred to the Free State to British post of British Free British Brit

municipal telephone systems were also issued to a number of

tem in southern Ireland.

In most of the continental countries, as well as in Great Britain, the telegraph system was already a government monopoly when the telephone was introduced The government telegraph officials in continental countries, apparently regarding Bell's invention as a possible competitor of the telegraphs, were, therefore, reluctant to encourage it. In most cases, moreover, the government officials did not feel justified in undertaking the risks of attempting to develop this new means of communication. The usual procedure, therefore, was to allow the private companies to do the pioneer work of bringing the telephone into use under licences imposing more or less restrictive conditions. However, as the potential factors of telephone communication gradually were appreciated, most of the governments on the continent took over the company-operated systems and the telephone service was thereafter administered along with the postal and telegraph system. Motives of military preparedness unquestionably actuated government officials in taking steps in the early days of the tele-phone to secure full control of all means of communication.

Germany.—In Germany the telephone was a government monopoly from the very beginning. Helmich von Stephan was posimaster general of Germany and manager of the Imperial Telesembs at the time the telephone was first brought to public notice. He was an active administrator, founder of the Universal Postal Union, and was quick to grap the possibilities of the new invention. In 1877 he wrote enthusiastically to the imperial chanciden, Prince Bignarck, of experiments in the establishment of color, Prince Bignarck, of experiments in the establishment of suggested that the telephone be utilized as an adjunct of the telegraph service in rural post offices where there was not sufficient tuffic to require the services of a trained telegraph operator. The first publicuses of the telephone in Germany was along these lines which, it will be noted, differ from its early utilization in the U.S. In the JU.S. exchange service between persons in, the same com-

munity was the basis of the early public service, the local areas being gradually linked by long distance hies In Germany, on the other hand, the toll lines came first as a substitute for the more expensive telegraph facilities Later, however, the German government introduced exchange service in Berlin, Hamburg, Colome, Frankfurt, Breslau and elsewhere

A like policy of government ownership from the first was followed in the German states of Bavaria and Wurttenberg, where the telephone systems were operated by separate state administrations until 1900 when they were transferred to the administration of the Rechtspostministerium. In 1939, Germany had more telephones in source the name of the control of the Rechtspostministerium.

telephones in service than any other country except the U.S. France and Switzerland.—In France the telephone was first exhibited at the Paris World's Fair in 1878, where it attracted little interest In the following year, however, representatives of American telephone manufacturers approached the French telegraph authorities with a view to securing permission for the establishment of telephone service in Paris The French telegraph officials were unwilling to undertake the development of telephone service themselves, but granted concessions on a royalty basis to several different telephone companies. These concessions were passed about from one concern to another until in 1880 they were all consolidated in a single company called the Société Générale des Téléphones Public telephone service was opened by this company in Paris early in 1881. The French government established telephone exchanges at Reims, Roubaix and Tourçoing in 1882 and in several other commercial centres during the next few years. The private company also established exchanges in some other cities besides Paus, but in 1889 its entire system was taken over by the French government, which has operated the telephone service throughout France from that time. The French telephone system has been developed to a much greater extent in Paris than in the less densely populated sections of the country.

In Switzerland a concession was granted by the government for the establishment of a privately owned telephone system at Zurich in 1880; and the government itself opened exchanges in Basle and Berne during; 1881 and a year later at Geneva, Lausame and Winterthur. After that the government proceeded rapidly with the establishment of new exchanges and purchased the private system at Zurich upon the expiration of the franchise. After 1886 the government itself operated all telephones in Switzerland and the service has been developed to a greater extent than in many other European countries.

Belgium and the Netherlands.—In Belgium concessions were granted to a number of private companies which established telephone systems at various cities, but these properties were bought by the government at the expiration of their respective franchises and after 1896 the telephone was administered as a government monopoly throughout the country. In the Netherlands a number of concessions were issued, several of the most important ones being ultimately consolidated in a single company which also enjoyed the right to establish interurban telephone lines. The competition of these lines with the government telegraphs, however, led the authorities to acquire the interurban telephone lines upon the expiration of their licences. Municipal telephone systems were established in various Dutch cities succeeding those of the private company Later the government adopted a policy of acquiring these local municipal networks with a view toward the ultimate creation of a single government system operating throughout the country.

Austria and Italy.—In Austria concessions were early granted to private companies for the establishment of telephone services at Vienna and a number of other important cities. Long distances at Vienna and a number of other important cities. Long distances the services of the constructed by the telegraph authorities, who also opened their first local exchanges in 1887. Subsequently the concessions were bought in by the government and the telephone business became a government monopoly. Much the same course was followed in Hungary. It alzy granted a large number of concessions for local telephone companies and telephone competition was insugurated in a number of the important cities. Ultimately, however, the disadvantages of competition became apparent and consolidation took place, either voluntarity or at the instance of

and placed upon a uniform basis surrounded by somewhat onerous conditions In 1892 the conditions surrounding these concessions were liberalized, but Italy nevertheless failed to keep pace with other great powers in the development of telephone service. After various legislative attempts to encourage the private companies the government in 1907 adopted the policy of buying certain of their systems from time to time. With the accession of the fascist régime, however, there was a return to private ownership in Italy, territorial concessions for the operation of local telephone systems in various sections of the country being granted to private interests while the government maintained the operation of the long distance lines

Scandinavia .- The Scandinavian countries have gone further than any other European community in the development of telephone service. In 1880 the International Bell Telephone Co of New York secured local franchises for the Norwegian cities of Oslo and Drammen In the following year local telephone companies undertook the establishment of exchanges in other cities and a competitive system was even opened for service in Oslo In 1886 the two systems were consolidated and the Bell exchange in Drammen was later acquired by a local company The telephone soon came to hold much the same place in Norwegian rural life as it does in the sparsely settled districts of the US, and although the government did not encourage the construction of lines which would compete with the government telegraphs, the development of telephone networks throughout the rural districts went on apace. Ten years after the introduction of the telephone into Norway it had extended to almost every village, and even the small towns were surrounded by lines reaching far into the open country. This remarkable development was secured by local enterprise, independent telephone companies being formed in almost every town or village, and in this respect the Norwegian development was a marked contrast to that obtained in France and Italy. The construction of long distance lines in Norway was finally undertaken by large stock companies and ultimately the state took up the policy of acquiring the more important local telephone systems upon the expiration of their respective franchises. The greater part of the telephone business in Norway, particularly in the larger cities, in 1947 was operated by the government.

In Sweden, the telephone attained a higher degree of development than in any other European country. The International Bell Telephone company opened exchanges in 1881 in Stockholm, Gothenburg and Malmo. A couple of years later mutual telephone associations were established in many rural communities throughout Sweden and the Stockholm General Telephone company was established under the leadership of enterprising Swedish engineers to compete with the Bell company. The two systems were finally consolidated; but later telephone competition was renewed m Stockholm, the government opening an exchange system to compete with that of the General Telephone company In 1918 the government acquired the company's system and the considerable duplication which resulted from the competitive situation in Stockholm was later eliminated. The Swedish capital, however, remains the best developed city, from a telephone standpoint, in the world outside of the U.S.

In Denmark the telephone was introduced and developed by private enterprise and in the year 1947 more than 95% of the Danish telephones were owned and operated by private concerns.

Spain.-Spain entered upon a new era of telephone develop ment in 1024 when a concession was granted to the National Telephone Company of Spain, a subsidiary of the International Telephone and Telegraph Corporation of New York, for the development of a nation-wide system to supersede the pre-existing gov-ernmental and privately owned telephone services which had attained only a relatively limited development. The new company entered energetically upon the task of providing Spain with an up-to-date telephone system, the equipment being of Spanish manufacture so far as conditions permit. Within a very short time after the concession was granted, telephone communication was established across the Straits of Gibraltar by submarine cable connecting the Spanish wire system with telephones installed in

the municipal authorities In 1883 the concessions were regularized the zone of Spanish military occupation in Morocco. As of 1945, subsidiaries of the International Telephone and Telegraph corporation also operated telephone systems in Cuba, Puerto Rico, Mexico, Chile, Argentina, Brazil, Peru and Uruguay, but the Spanish company was taken over in 1945 by the government of

Telephone development in the rest of the civilized world may be summarized with the statement that while some sort of telephone service is to be found almost everywhere, the facilities have attained a relatively high development in the English-speaking dominions of New Zealand and Australia Japan, in 1939, had more telephones than any other country in Asia, but with the greater part of the facilities confined to a few large cities.

# DEVELOPMENT OF TELEPHONE LINES IN EUROPE

Particular attention has been directed to the extension and improvement of long distance facilities in Europe, especially as regards the circuits linking up the various countries on the conti-

FIG 3 .- DISTRIBUTION OF THE WORLD'S TELEPHONES, JAN. 1, 1947

nent. Much of the impressive progress that was made in international telephone communication on the continent of Europe after World War I may be attributed to the activities of the International Advisory Committee on Long Distance Telephone Communication. This committee was formed as a result of an international conference at Paris in 1923, at which delegates from Belgium, France, Great Britain, Italy, Spain and Switzerland assembled at the invitation of the French Post, Telegraph and Telephone administration This conference proposed

that a consulting committee should be formed which should undertake to unify as far as possible the practices of the various European telephone administrations bearing on international telephone communication, and should gather statistics and prepare technical recommendations to be submitted to the telephone authorities of the participating countries. Nineteen nations accepted the recommendations of the Paris conference of 1923 and their delegates assembled at Paris the following year to form the International Advisory Committee on Long Distance Telephone Communication. A constitution was prepared and a subcommittee appointed to prepare the agenda for the next conference. The recommendations of the preliminary conference were considered and some additional matters were discussed, particularly a proposal for a standard transmission unit and proposals relating to rates for in-

ternational messages. In 1925 the International Advisory committee held its second meeting, at which representatives of European telephone manu-

facturers were present. Transmission and inductive interference problems were added to the subjects to be studied. Much was later done by way of developing recommended standards of service and instructions for the operation of international circuits. Engineering problems in particular received exhaustive consideration and much attention was given to the question of suitable rates and classes of service. The opening of commercial tele-FIG. 4-OWNERSHIP OF THE phone service from the U.S. to

WORLD'S TELEPHONES, JAN. 1, 1947 England in 1927, to continental Europe in 1928, and the rapid subsequent expansion of this service to other countries and of similar services between other continents emphasized the importance of good engineering and transmassion standards to a truly world-wide communication service. The work of the International Advisory committee was accordingly broadened to include matters of world-wide significance; and beginning in 1929, the communication interests in countries outside of Europe became affiliated with the committee's activities.

Among the countries represented were China, Japan, South Africa, Netherlands Indies, US, Mexico, Cuba, Argentina and Chile.

Further recognition of the importance of long distance telephony was accorded by resolutions which were adopted at the 1925 Congress of the International Chamber of Commerce at Brussels, and at the later conventions of the same organization

This recognition of the importance of long distance telephone communication, supplemented by the concrete recommendations of the International Advisory committee, helped stimulate the European telephone administrations to take advantage of recent improvements in telephone equipment, notably as regards the increased efficiency of long distance telephone cables made possible by loading, the development of the vacuum tube repeater, the application of carrier systems and by other advances in the telephone att.

Long distance telephone cables were extensively introduced in the various European countries until in 1945 they provided not only an effective long distance service within the individual countries but likewase an effective international long distance telephone cable system for the continent as a whole Through the medium of intercontinental circuits and systems on other continents a world-wide system was made available.

Status of the Telephone Throughout the World, 1946.— Figs. 3, 4 and 5 indicate the status of the telephone throughout the world at the latest date for which comprehensive statistics covering practically all countries were available in 1947. At the end of 1946 there was a grand total of 54,650,000 telephones in service in all telephone systems throughout the world Approxmately 38% of all the telephones in the world were then in the

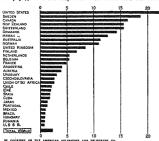

FIG. 5.—TELEPHONES PER 100 POPULATION, JAN. 1, 1947

U.S., the total for that country being 31,611,000. At the same date Europe had 15,750,000 telephones, or about 29% of the world's total.

Of these, 3,976,936 (March 31, 1946) were in the United Kingdom, 1,997,335 were in France, and Sweden had (Jan. 1, 1946) 1,144,673. The remaining telephones were distributed among the centinents of Asia, Africa, Oceania, South America and North America visitation of the United States. Canada had 2,073,000. Of the remainder, 1,378,000 were in South America, 1,541,000 in Asia (more that three-fifths of which were in Japan), 59,000 in Africa and 1,850,000 in Oceania (Including about 875,000 in Astralias and at March 3,17,477,785,000 in New Zeland).

In proportion to population the U S. had, on Jan 1, 1947, 2-23, telephones per roo population. The world as a whole had eithe same date 2.32 telephones for every roo inhabitants. At the end of 1945, Sweden had 18.64 telephones per roo people At Jan. 1, 1947, Canada had 16.33, Switzerland 15.57, New Zealand 15.57, Denmark 14.33, Hawau 12.60, Austraha (June 30, 1945) 11.22, Norway (June 30, 1945) 10.94, Dilted Kingdom (March 31, 1946) 8.43, Finland 6.78, Netherlands 5.41, Belgium 5.37 and France 4.03.

The U.S. has, however, not always been in advance of Europe in number of telephones. In 1885, about ten years after the telephone shorth, there were, to be sure, 155,800 telephones in the U.S, or almost twice as many as in Europe. Nevertheless, by the beginning of 1892 Europe had attained a total of about 254,000 telephones, which placed it ahead of the U.S. where there were then only 239,300 telephones Europe maintained its lead over the U.S. in telephone totals by a comfortable margin for nearly serve years thereafter, but in the latter part of 1898 the U.S. again passed Europe and the margin of U.S. leadership increased after that time. On Jan 1, 1947, the U.S. had twice as many telephones as all of Europe.

Among the South American nations Argentina had a development of a of telephones per roo people, or go,ooo telephones, at the end of 1946 Brazil then had 439,500 telephones, so that to gether these countries accounted for almost three-fourths to to 1378,000 telephones in South America Chile's 133,000 telephones amounted to 2.07 for each 100 of population.

Japan had a development of 1.27 telephones per 100 people at March 31, 1947.

as Marm 31, 1947.

As regards distribution of telephones with respect to the size of communities, it may be said that in general the smaller size of communities, it may be said that it is considered to the size of the size

In the U.S., no one city embraced more than 7% of the country's telephones. Yet, the three large urban centres of New York, Chicago and Los Angeles had in the agerteste far more stations than the top ranking telephone system in the world outside of the United States. New York, at Jan. 1, 1947, had 38 84 telephones for every roo inhabitants; Chicago 35,98 and Los Angeles 36 88, Washington, D.C., 4,10.8 and San Francisco 444.8. Stockholm had 39 of per roo inhabitants, Copenhagen had 27,94, 605 22.17 and Zurích 28,79. Toronto, Can, had 33,10 telephones per reop people, Brussels had 16.04, The Hague had 17.10 and Vienna had 8 93. Tokyo had 3.14 telephones for every coppulation, Melbourne had 15,94 and Rio de Janeiro had 7.68. Mexico, D.F., had 6.87 and Havana had 7,08.

In respect to telephone conversations during the year 1946, the latest period for which comparative data covering various countries were available by 1947, the U.S. had a total of 4,2,80,000.

On. The figures for telephone conversations included both local and toll, or long distance conversations. So far as they relate to the U.S. they cover completed messages only.

Americans, during the year 19,69, used the telephone 50.7. times per capita, while Canada, Sweden and Demmark during the year 1945 had 2649, 258.4 and 252.2 conversations per capita, respectively. For the year ended June 30, 1045, Norway and Australia had 152.3 and 102.6 conversations per capita, respectively. There were 130.5 telephone conversations per person during the year 1946 in Switzerland, 123.3 in Finland, 44.2 in Belgium and 36.0 in France.

Much has already been accomplished toward the integration of telephone communication facilities not only in countries like the U.S., Canada, Sweden and elsewhere, but also in regard to international communications on the North American and European continents and by overseas radio circuits between continents. The day is still not here when anyone anywhere in the world can communicate by telephone with anyone else anywhere in the world. Progress in extending the range of telephone compoint to further progress at a rapid pace

ideal measurably nearer to accomplishment. Present indications point to further progress at a rapid pace.

Elisha Gray and the Telephone,1-The first U.S. patent rights to a complete electrical device presumed capable of transmitting speech were granted on March 7, 1876, to Alexander Graham Bell. But at the time that patent was granted Bell had no, yet succeeded in transmitting articulate speech by means of the instrument therein described. That telephone consisted (as shown by his description and illustrations) merely of two tele-

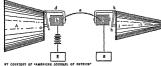

FIG 6 -TRANSMITTER (LEFT) AND RECEIVER (RIGHT) ILLUSTRATED IN BELL'S FIRST TELEPHONE PATENT, GRANTED MARCH 7, 1876

phone receivers, one designed to be used backward as a transmitter (fig. 6). The variable-resistance microphone type of transmitter, now universally used, was invented later (1877) by Emile Berliner and Thomas Edison as described below,

At one point in his patent Bell stated excellently in a single sentence the principle of the telephone as follows: "Thus when electrical undulations of different rates are simultaneously induced in the same circuit, an effect is produced exactly analogous to that occasioned in the air by the vibration of the inducing

munication during the past few years nas, however, brought this bodies" He went on to claim "The method of, and apparatus for, ideal measurably nearer to accomplishment. Present indications transmitting vocal or other sounds telegraphically as herein described

The device for transmitting such sounds which he described and illustrated in detail was the pair of telephone receivers, one of them performing the function of a transmitter It was this device to which his patent applied, not the principle upon which

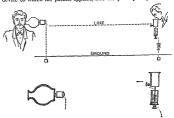

FIG 7 .- TRANSMITTER (RIGHT) AND RECEIVER (LEFT) OF GRAY'S CAVEAT, FILED THE SAME DAY AS BELL'S APPLICATION FOR A PATENT

he stated it to be based. For it is one of the fundamentals of patent law that only physical or practical embodiments of inventions are patentable, not abstract ideas, scientific principles, or phenomena of nature

Bell's application for a patent reached the patent office on Feb 14, 1876 On the same day Ehsha Gray filed what was known as a caveat, a type of document which is no longer used in patent procedure The caveat was in essence a formal notice of intent to perfect and file an application for a patent Gray's caveat, like Bell's application, described an electric telephone, fully as completely and explicitly as did Bell. Except for the pure accident of difference of procedure, the papers of Bell and Gray would have been of the same type, both applications for a patent or both caveats. The two men were on the same footing, neither having constructed, nor of course, successfully used, the instrument he was describing.

But more important than the difference in form was the difference in content of the two documents Grav's transmitter was not, like Bell's, a receiver operating in reverse. It is shown in fig. 7, enlarged in the lower right corner. To the chaphragm of Gray's transmitter was attached a rod, the lower end of which dipped in water. Vibrations of the diaphragm made by the voice of the speaker changed the immersion of the rod and thus the electrical resistance of the transmitter. The significance of this will be recognized by noting that the modern transmitter, invented in 1877 by Berliner and Edison, also utilized fluctuating electrical resistance as its principle of operation.

Bell had also briefly mentioned in passing the possibility of this type of transmitter in his own application but did not develop the idea nor even claim it as his own. Mere mention of a possible invention does not, of course, itself constitute an invention One must describe in detail, as Gray did for the liquid transmitter and as Bell did for the receiver-type transmitter, a practicable device for putting the idea into effect.

To Bell, however, goes full credit for first transmitting speech electrically in the U.S. On March 10, 1876, his assistant, Thomas A. Watson, heard over the wire Bell's now famous exclamation, "Mr. Watson, come here, I want you." The story is well known, having been retold in motion pictures and over the radio. A noteworthy point is that the transmitter which Bell used on this occasion (see fig. 8) was not the receiver-in-reverse on which his patent, granted three days before, gave him priority, but resembled very closely the liquid transmitter described and illustrated in such complete detail in Grav's caveat.

<sup>&</sup>quot;The following indicates the point of view of those who believe Eliaba Gray is entitled to share with Bell the credit for the invention of the telephone

FIG 8 --- TRANSMITTER WHICH BELL USED ON NARCH 10, 1876

by compromise out of court and the compromise given legal standing by a consent decree. In that compromise the Western Union which had purchased Gray's rights agreed to surrender these rights to the Bell company and retire from the telephone field in return for a substantial consideration. Thus the Bell company became the owners of Gray's rights during the life of the latter's patents

The Receiver -The receiver was at first the original telephone, for a single instrument, placed alternately to the mouth and the ear, was used for talking and listening. Later, two receivers constituted the telephone, either one of which could be used as transmitter and the other as receiver. Bell's first attempt to construct a receiver was made in June 1875. A reproduction of this instrument, made by Bell himself, is in the museum of the Bell laboratories in New York city. Similar receivers were previously made by Elisha Gray in 1874. He had demonstrated them before scores of competent electrical engineers and physicists in the U.S. and in England. On one of them he secured a British patent in July 1874, and a U S. patent in July 1875, 19 months and months respectively before Bell's first telephone patent of 1876. Continuous development of the receiver led to vast improvement in the naturalness of its reproduction of the voice.

The Transmitter .- Bell had a clear priority on the receiver type of transmitter, Elisha Gray had an equally clear priority on the liquid transmitter, at least in the United States. But the loosecontact microphone type of transmitter, perfected by Berliner, Edison and others listed below, had been devised, though naturally in a rather primitive form, by Philipp Reis of Germany in

having been attained with Gray's type of transmitter, he continued in his preference for the receiver type of transmitter. It was the only type which he exhibited at the Centennial exhibition in 1876, in his second telephone patent (no 186,787 of Jan 30, 1877) he resterated his preference for this type, and telephones made in 1878 by his assistant, Watson, for subscriber use (fig 9) were of this type In fact it was not until 1881 that he even disclosed his famous exploit of March 10, 1876 Up to that time he had kept it completely secret

In 1881 the so-called Dowd case was concluded This was the only occasion when the claims of Bell and Gray came into direct conflict in court It was settled

FIG. 9 .-- A TELEPHONE DESIGNED BY THOMAS A. WATSON IN 1878 FOR SUBSCRIBERS' USE. NOTE THE TWO RECEIVERS, EITHER ONE OF WHICH WAS TO BE SPOKEN INTO, THE OTHER APPLIED TO THE EAR

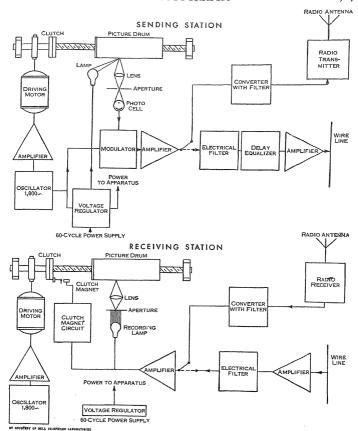

In spite of Bell's first success 1861 The fact that Reis thus transmitted speech electrically was attested by the written testimony of a dozen or more reputable men of science, who successfully participated in telephone conversations using Reis' instruments at that time In 1865 Dr Stephen Yeates of Dublin improved the performance of Reis' transmitter by causing a drop of water to adhere to the contact points while the transmitter was operating This antedated Gray's liquid transmitter and Bell's reproduction of it by more than ten years (See also Electricity; Microphone or Telephone TRANSMITTER, RADIO, SOUND; TELEGRAPH.)

TELEPHOTOGRAPHY, the electrical transmission of pictures, a branch of telegraphy sometimes called facsimile, dates back to Alexander Bain, who, in a British patent in 1843 outlined the principles involved. Workers in this field have included Arthur Korn in Germany, Edouard Belin in France and many others In the United States, Bell system engineers in the 1020s and 1930s made important advances in the machines and methods for transmitting pictures over telephone circuits. Work after 1935 by various groups in the U.S. led to machines of compact form with electrical features permitting satisfactory operation over long radio paths

The basic idea is to scan or examine an original picture, one elemental area after another, represent the shade or tone of each area by an electric current, and reproduce at the receiver each such area in its proper relative position. Modern machines scan the original by optical methods. Light reflected from the surface of an illuminated spot or elemental area enters a light-sensitive device, known as a photoelectric cell, which produces an electric current having a value proportional to the intensity of the light The original picture is moved at a uniform rate of speed and in a manner to be completely examined by the scanning light. As this light moves over the different portions of the picture, a current of varying value but of the same polarity is produced by the photoelectric cell. This is later converted into an alternating current of a character suitable for transmission over wire circuits or by radio.

Receivers of great variety have been devised. In one form the received currents cause a stylus or marking point to strike the record medium, such as moving paper, and make permanent marks. Other machines depend on the chemical or heating effects of electric currents and with these a stylus is always in contact with the surface on which the image is being recorded. Still other receivers employ photographic methods and the incoming electric current controls the intensity of a beam of light falling on moving sensitive film or paper. The first two methods have been

TELEPHOTOGRAPH OR ELECTRICAL FACSIMILE SYSTEM SCHEMATIC OF ARRANGEMENTS FOR SENDING AND RECEIVING

ments, and the received record is sometimes referred to as a black and white picture. In the third case the original may be a photograph having many tone values and the receiver produces the various shades of the original to give a record suitable for

reproduction in newspapers by the usual half-tone process A modern system is illustrated in schematic form in the figure. The original picture or record is wrapped around a drum at the sending station. This is usually rotated at a speed of about 100 revolutions per minute. It is moved along its axis under the scanning light by a nut engaging a lead screw having a patch about 100 threads per inch. The original is therefore scanned at the rate of 100 lines per inch using a lens and an aperture which serve to focus the reflected light from an area about one one hundredth of an inch across onto the photoelectric cell. Thus, each square inch of the picture may be considered as being divided into 10,000 elemental areas. As shown, the currents generated in the photoelectric cell vary or modulate the intensity of an alternating current produced by an electric oscillator having a normal frequency of about 1.8co cycles per second. As indicated it is amplified and, if the picture is to be transmitted over a long wire line, is passed through an electrical filter and a delay equalizer to put it into the best form for transmission over a circuit of this type. If, on the other hand, the picture is to be transmitted over a radio link, the alternating current of varying magnitude is passed through an electronic device called a converter, which changes it to an alternating current of varying frequency but of constant magnitude

The receiving station is provided with a drum and mechanism similar to that at the sending station. A sensitized film or paper is wrapped on the drum which is rotated at the same speed as the sending drum and in the proper phase, that is, the joining edges of the original as wrapped on the sending drum pass the scanning spot at practically the same instant that similar edges of the record film or paper wrapped on the receiving drum pass under the recording stylus or light beam When pictures are received over wire circuits the currents are amplified, passed through a filter to select the proper frequencies, and to a recording lamp of spetial design which emits light in proportion to the intensity of the exciting current This light, as the drum rotates and moves along its axis, completely exposes the recording film or paper. When the picture is received over a radio link, the picture current passes through a converter which changes the current of varying frequency to a current of varying magnitude to control the intensity of the recording lamp as was done for wire circuits. A special circuit for the control of a clutch magnet permits the receiving drum to be started in step or properly phased with the sending drum.

A frequently used picture size is 7 in, x II in. Pictures as large as 12 in, x 171 in. are sometimes handled. A common transmitting speed is 11 sq.in per minute or about 1,800 picture elements per second. For this speed of operation an electrical circuit capable of transmitting a band or group of frequencies at least 1,000 cycles wide is required. A wider band may be required for some transmission methods.

It is common practice to send from one original to a number of receiving stations, and machines which rotate at the same speed and cover the same picture area in a given time will work together though the received picture actually differs in size from the original. For simplification, machines are sometimes designed to be used either as senders or receivers

The distribution by telephotography of pictures of news value has now become an important service rendered by press associations to newspapers and others, and thousands of pictures are transmitted by this method each year. In the U.S. a nation-wide private wire network has been established exclusively for this purpose. Other private wire networks are used alternately for telephony or telephotography. News pictures are also frequently transmitted over ordinary telephone connections.

World War II emphasized the importance of the transmission of pictures by radio. Difficulties usually experienced in radio transmission have been overcome to a large degree by using the

used for transmitting line drawings, sketches and written docu- form of frequency modulation or frequency shift described above and shown in the figure

Many special arrangements and mechanisms have been devised by telegraph engineers for handling ordinary telegrams by fac-simile or telephotograph methods. These usually employ a form of record paper known as "teledeltos," in which the mark or impression results from an electric current passed through this paper from a stylus. (See also Photography; Telephone; Tele-(R. D. P.)

TELESCOPE, an optical instrument employed to view dis-

tant objects (Gr τήλε, far, σκοπείν, to see).

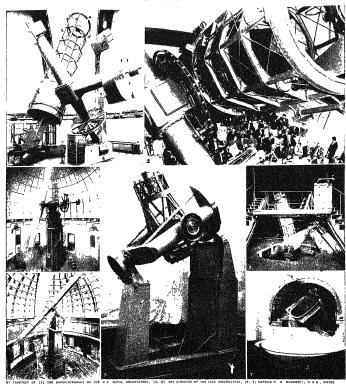

Early History.-The telescope was invented in Holland about 1608. The credit has been attributed variously to three individuals, Hans Lippershey and Zacharias Jansen, spectacle makers in Middelburg, and James Metius of Alkmaar (brother of Adrian Metius, the mathematician). The common story is that Lipper-shey, happening one day while holding a spectacle lens in either hand, to direct them toward the steeple of a neighbouring church, was astonished on looking through the nearer lens to find that the weathercock appeared nearer. Accordingly he fitted the lenses in a tube to preserve their relative distance and thus constructed the first telescone

Telescopes were made in considerable numbers and found their way over Europe soon after their invention. Galileo states that, happening to be in Venice about May 1609, he heard that a Belgian had invented a perspective instrument for making objects appear nearer and larger. The day after his return to Padua he made his first telescope by fitting a convex lens in one end of a leaden tube and a concave lens in the other end. A few days afterward, having succeeded in making a better telescope, he took it to Venice, where he communicated the details to the public, and presented the instrument itself to the doge Leonardo Donato The senate, in return, settled him for life in his lectureship at Padua and doubled his salary, which was previously 500 florins. Galileo devoted much of his time to improving the telescope. He conquered the difficulties of grinding and polishing the lenses, and soon succeeded in producing telescopes of greatly increased power. His first telescope magnified three diameters; he soon made instruments magnifying 8 diameters, and finally one magnifying 33 diameters.

With this last instrument Galileo discovered in 1610 the satellites of Jupiter, and soon afterward the spots on the sun, the phases of Venus, and the hills and valleys on the moon He demonstrated the revolution of the satellites of Jupiter round the planet, and gave rough predictions of their configurations, proved the rotation of the sun on its axis, established the general truth of the Copernican system as compared with that of Ptolemy, and fairly routed the fanciful dogmas of the philosophers These brilliant achievements, together with the immense improvement of the instrument under the hands of Galileo, overshadowed in a great degree the credit due to the original discoverer, and led to the universal adoption of the name of Galilean telescope for the

form of instrument invented by Lippershey.

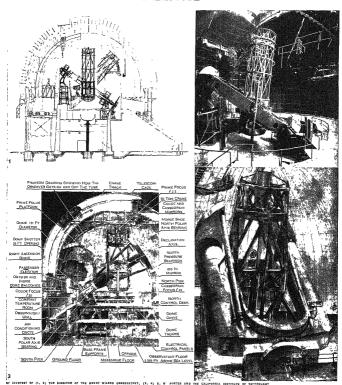

In the Galilean telescope the object glass is a convex lens and the eyepiece concave. Johann Kepler was the first to explain the theory and some of the practical advantages of a convex eyepiece in his Catoptrics (1611). The first person who actually constructed a telescope of this form was the Jesuit, Christoph Scheiner, who gives a description of it in his Rosa Ursina (1630). William Gascoigne pointed out one great advantage of the form of telescope suggested by Kepler, viz, the visibility of the image of a distant object simultaneously with that of a small material object placed in the common focus of the two lenses. This led to his invention of the micrometer and his application of telescopic sights to astronomical instruments of precision. It was not till about the middle of the 17th century, however, that Kepler's telescope came into general use, and then, not so much because of the advantages pointed out by Gascoigne, but because its field of view was much larger than that of the Galilean telescope. The first powerful telescopes of this construction were made by Christiaan Huygens, after much labour, assisted by his brother. With one of these, of 12 ft, focal length, he discovered the brightest of Saturn's

satellites (Titan) in 1655, and in 1659 he published his Systema originally educated for the church, Short attracted the attention Saturnsum, in which was given for the first time a true explanation of Saturn's ring, founded on observations made with the same instrument.

The sharpness of image in Kepler's telescope is very inferior to that of the Galilean instrument, so that when a high magnifying power is required it becomes essential to increase the focal length. G D Cassini discovered Saturn's fifth satellite (Rhea) in 1672 with a telescope of 35 ft. and the third and fourth satellites in 1684 with telescopes made by Campani of 100 and 136 ft focal length Huygens states that he and his brother made object glasses of 170 and 210 ft focal length, and he presented one of 123 ft. to the Royal Society of London Adrien Augout (d. 1691) and others are said to have made telescopes of from 300 to 600 ft focus, but it does not appear that they were ever able to use them in practical observations. James Bradley, on Dec. 27, 1722, measured the diameter of Venus with a telescope whose object glass had a focal length of 2121 feet. In these very long telescopes no tube was employed. They were termed aerial telescopes

Reflecting Telescopes .- It was not until the middle of the 18th century that these unwieldy instruments were supplanted by the achromatic telescope. Meanwhile the refracting type of telescope had a rival in the reflecting telescope invented by Sir Isaac Newton. It was, in fact, Newton who discovered what was the trouble with the refractor, which led to the need for excessive length. It had been supposed that the only imperfection in the image arose from the error known as spherical aberration, and the efforts of opticians were concentrated on devising lenses of suitable forms of curvature to correct this. In 1666 Newton discovered the different refrangibility of light of different colours, and he soon perceived that the fault of the refracting telescope was that the light of different colours followed different paths. so that if, for example, the telescope was focused sharply for blue light-the green image would be altogether out of focus and blurred He over-hastily concluded from rough experiments (Optics, bk. 1, pt. ii, prop. 3) "that all refracting substances diverge the prismatic colours in a constant proportion to their mean refraction." If this were true no combination of refracting substances could bend the path of the light without introducing colour, and therefore no improvement could be expected in the refracting telescope. He therefore turned his attention to the construction of reflectors. The form now known as the Gregorian reflector had been proposed by James Gregory in 1663; but he had not succeeded in constructing the instrument practically.

Newton, after much experiment, selected an alloy of tin and copper for his specula, and he devised means for grinding and polishing them. He did not attempt the formation of a parabolic figure on account of the probable mechanical difficulties, and he had besides satisfied himself that the chromatic and not the spherical aberration formed the chief fault of previous telescopes. Newton's first telescope so far realized his expectations that he could see with its aid the satellites of Jupiter and the horns of Venus. Encouraged by this success, he made a second telescope of 61 in. focal length, with a magnifying power of 38 diameters, which he presented to the Royal Society in Dec. 1671. A third form of reflecting telescope was devised in 1672 by Cassegrain. No further practical advance appears to have been made in the design or construction of the instrument till the year 1723, when John Hadley (best known as the inventor of the sextant) presented to the Royal Society a reflecting telescope of the Newtonian construction, with a metallic speculum of 6 in. aperture and 62s in. focal length, having eyepieces magnifying up to 230 diameters. The instrument was examined by Pound and Bradley, the former of whom reported upon it in Phil. Trans., 1723

Bradley and Molyneux, having been instructed by Hadley in his methods of polishing specula, succeeded in producing some telescopes of considerable power, one of which had a focal length of 8 ft.; and, Molyneux having communicated these methods to Scarlet and Hearn, two London opticians, the manufacture of telescopes as a matter of business was commenced by them. However, it was reserved for James Short of Edinburgh to give practical effect to Gregory's original idea. Born at Edinburgh in 1710 and of Colin Maclaurin, professor of mathematics at the university, who permitted him about 1732 to make use of his rooms in the college buildings for experiments in the construction of telescopes In Short's first telescopes the specula were of glass, as suggested by Gregory, but he afterward used metallic specula only, and succeeded in giving to them true parabolic and elliptic figures.

Achromatic Telescopes .- The historical sequence of events now brings us to the discovery of the achromatic telescope The first person who succeeded in making achromatic refracting telescopes seems to have been Chester Moor Hall, a gentleman of Essex. He argued that the different humours of the human eye so refract rays of light as to produce an image on the retina which is free from colour, and he reasonably concluded that it might be possible to produce a like result by combining lenses composed of different refracting media. After devoting some time to the inquiry he found that by combining lenses formed of different kinds of glass the effect of the unequal refrangibility of light was corrected, and in 1733 he succeeded in constructing telescopes which exhibited objects free from colour

The principal development of the achromatic refractor is due to John Dollond who invented it independently (Phil Trans, 1758) In principle his object glasses were of the pattern mainly used at the present day; viz , convex lens of crown glass combined with a concave lens of flint glass The concave lens is of less power than the convex so that the combination converges the light as a single convex lens would do; but the flint glass having much wider difference of refractive index for light of different colours, is able to correct the colour dispersion introduced by the more powerful crown lens. A triple objective, consisting of two convex lenses of crown glass with a concave lens of flint glass between them, was introduced in 1765 by Peter, son of John Dollond. This type is also employed in some modern telescopes.

The difficulty of making large disks of glass of the required transparency and homogeneity limited the aperture that was obtainable. The reflecting telescope was brought back into favour by William Herschel, who greatly developed the art of making mirrors of speculum metal. This is a hard brittle alloy of copper and tin, containing about one part (by weight) of tin to two of copper. It is difficult to cast and anneal, but will take a high degree of polish and has a moderately high reflecting power, which drops from about 70% in the red to 50% in the violet. Herschel's telescopes were much in demand for they were of better quality than any previously made. His two most famous telescopes were the 20-ft. telescope of 19-in. aperture, and the great 40-ft. telescope of 48-in. aperture He discovered the planet Uranus in 1781 with a 7-in, reflector, which enabled him to detect that its image, unlike the point image of a star, had a perceptible disk, Uranus had been observed with other telescopes on many previous occasions and taken to be a star In 1845 Lord Rosse erected the Parsonstown reflector of 6-ft. aperture; this was made possible by his great improvements in the technique of casting specula No larger speculum mirror has been made. With this instrument the spiral structure of the spiral nebulae was discovered.

The refracting telescope was brought back into favour in the first quarter of the 19th century after Joseph von Fraunhofer, who had learned from the younger Guinand how to make glass, succeeded in casting several disks of glass of excellent quality and in making lenses from them, computing the curves himself. The desire for greater and greater light-gathering power led to the construction of lenses of larger and larger aperture, culminating in the 40-in, refractor of the Yerkes observatory. Disks of ontical glass of so great a size, free from strains, striations, veins, bubbles and other troublesome defects are extremely difficult to cast and anneal. To keep aberrations small, the focal length must be great (that of the Yerkes refractor is 62 ft.), making the telescope unwieldy in use and requiring a large dome to house it. A practical limitation on size is moreover imposed by the impossibility of eliminating flexure from the lens, which must necessarily be supported only at the rim.

For instruments of larger aperture, the astronomer has perforce been compelled to revert to the reflecting telescope. The de-

velopment of the silver-on-glass mirror has avoided the difficulties inherent in the use of speculum metal. The discovery of a simple chemical process by which a thin film of silver could be deposited on a glass surface was due to Justus von Liebig; the application of this discovery to glass mirrors and the methods of making and testing such mirrors were due primarily to Jean Foucault in the 1860s The glass disk must be subjected to a long process of annealing in order to relieve all internal strains, but defects such as bubbles, veins or poor transparency are immaterial as the light does not pass through the disk. The disk is first ground and polished to a spherical shape, it is then converted into a paraboloid by the progressive reduction in the radius of curvature from the edge to the centre. The paraboloidal mirror is free from the spherical aberration of a spherical mirror The amount of material to be removed in the parabolizing is extremely small and tests are necessary after each spell of figuring, the mirror being allowed to acquire a uniform temperature before a test is made

The largest disk which has been successfully cast is of 200-in. diameter for the great reflector mounted at the top of Mt Palomar in California. This disk was made of a special pyrex glass with very high silica content and low coefficient of expansion. It was annealed for ten months; if it had been made of ordinary plate glass the annealing would have had to be extended over nine years. The low coefficient of expansion of the pyrex glass is an advantage when using the telescope, as the position of the focus does not change so much with change of temperature as with a mirror made of plate glass.

A freshly prepared silver film has a high reflectivity exceeding 90% throughout the visible spectrum. But on the short wave length side of 4.500 angstroms, the reflectivity falls at first slowly and then rapidly to a minimum value at 3,200 angstroms, at which wave length the film is practically transparent. The film tarnishes easily, with decrease in its reflecting power, but it can be readily replaced by direct deposition from a suitable chemical solution, which is poured into a bath formed by the mirror itself and a suitable edge band,

A process has been developed for coating glass mirrors with a film of aluminum by a vacuum distillation process. On exposure to the air the aluminum film rapidly oxidizes, giving a hard and fairly durable reflecting layer. The reflectivity of the aluminum film is nearly as high as that of a freshly deposited silver film and is free from the large fall in reflectivity in the ultra-violet of the silver film. The aluminized mirror has proved specially valuable in the investigation of celestial spectra in the ultra-violet region

The large mirror is supported at the back by a complicated series of counterpoised levers; by proper design, deformation of the mirror by flexure can be entirely avoided. The size of reflectors appears to be limited only by consideration of the expense, not only of making the mirror, but of providing a mount for its practical use. The expense increases, roughly speaking, proportionally to the cube of the aperture.

Introductory remarks on the general use of astronomical telescopes will be found under Astronomy: Practical Astronomy.

### THEORY OF THE TELESCOPE

It is important to realize that magnifying power is not the only quality, perhaps not even the chief quality, desired in a telescope. We have to pay attention to: (1) magnifying power; (2) resolving power; (3) light-grasp; (4) a wide field of good definition; and (5) suitability for making accurate measurement. Not all of these can be developed to perfection in the same instrument, and accordingly telescopes of different design are employed for different purposes. For example, the ordinary field glass is useless for viewing the stage in a theatre; and accordingly an opera glass is employed which gives a more brilliant though smaller image.

In general, resolving power and magnifying power go together, It is little use making the object appear larger if we do not at the same time sharpen the image so that greater detail may appear. We might be content to increase the resolving power (ie., sharpen the detail in the image) without magnification if that were possible; but optical laws forbid an increase of resolving power without a corresponding increase of magnification. The magnifying power of a telescope can be understood by reference to the theory of geometrical optics alone, to explain the increase of resolving power, reference must be made to physical optics (the wave theory of light) Light does not consist of strictly linear 1ays, but of a wave disturbance which tends to spread and blur any image that is being formed; this tendency to spread is not cured by any perfecting of the figures of the lenses and mirrors, but only by increasing the aperture so that a wider area of wave front is taken in and concentrated into the eye pupil The resolving power of a telescope (free from ordinary optical defects) is simply proportioned to the diameter of aperture of the object glass or mirror. But in order that the beam filling the object glass may be narrowed down on emergence from the telescope so as to enter the eye, the magnifying power must be not less than the ratio of the aperture of the telescope to the aperture of the eye pupil; if lower power is used an outer ring of the object glass is left unused so that its effective

aperture and resolving power are reduced. Refracting Telescopes,-In its simplest form the telescope consists of a convex lens (object glass) which forms an image of a distant object at its focus. This ing course of RAYS image is then magnified by another small when the eye lens is lens (eyepiece) which is used just as an CONVEX (OR POSITIVE) ordinary magnifying glass is used The

object glass is of long focus F, and the eyepiece of short focus f, and the ratio F:f is equal to the magnifying power of the telescope Since eyepieces are inexpensive it is usual to provide a number of them, so that different magnifying powers can be used, it may be noted that the smallest eyepieces have the highest power

The combination just described is Kepler's form of telescope The course of the rays is shown in fig. r. In Galileo's form the eye lens is concave (or negative), and is placed so as to intercept

the rays from the object glass before they reach the focus (fig. 2). This form gives an erect image, whereas in Kepler's telescope objects are seen upside down unless a second erecting eyepiece or prisms are added. In stellar observation we do not Fig 2,-- DIAGRAM SHOW much mind the inversion of the image and Kepler's form is always preferred.

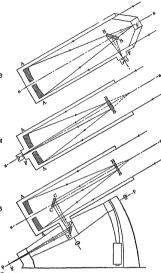

ING COURSE OF RAYS WHEN THE EYE LENS IS CONCAVE (OR NEGATIVE)

In all modern instruments both the evepiece and object glass are compound, consisting of at least two lenses. A single eye lens would generally give good enough definition at the centre of the field of view, but all the outer parts would be out of focus. Two well-known types of double eyepiece, the Huygens and the Ramsden, give a large flat field of view. The construction of eyepieces for the telescope and for the microscope is essentially the same problem. (See MICROSCOPE.) The use of two lenses in the object glass is necessary in order to correct the defect of colour dispersion already mentioned. In spite of improvements in the manufacture of optical glass, practically the same crown and flint glasses as those used by John Dollond in 1758 are employed in the largest modern telescopes. As a result of what is termed "irrationality of dispersion" no combination of crown and flint lenses will completely get rid of colour dispersion Accordingly in practice the achromatism is made as perfect as possible for the part of the spectrum that will chiefly be employed, viz., near the yellow light for visual work, and in the blue and ultra-violet for photographic work. For this reason separate telescopes are used for visual and photographic work

By using three lenses to form the object glass photovisual telescopes can be made sufficiently achromatic for all parts of the spectrum. The additional surfaces and thickness of glass, however, involve some loss of light; and the combination has the great drawback that its focal length changes very rapidly when the temperature drops at nightfall

Reflecting Telescopes .- The following are the various forms of reflecting telescopes:

The prime focus telescope is represented in fig. 3. This is the most efficient arrangement since the parabolic concave mirror AA focuses the light to a point on the axis as without the introduction of additional optical surfaces. Although the prime focus telescope came into prominence through the zoom. telescope, where the observer indes in a small cage suspended rigidly in the centre of the tube at the focus, this arrangement has also been used with smaller telescopes for direct photography when maximum efficiency is tequired.

FIGS 3-5 -- (3) PRIME FOCUS AND NEWTONIAN TELESCOPE (4) CAS-SEGRAIN TELESCOPE, (5) COUDE TELESCOPE

The Newtonian telescope is also represented in fig. 3. The only difference from the prime focus arrangement is that a flat mirror is used to bring the focus outside the telescope tube. The advantage of this form is that the focus F is readily reached by an observer located on a platform separate from the telescope.

The Cassegrain telescope is represented in fig. 4. The convex hyperbolic mirror BB which has a common axis with the concave parabolic mirror AB decreases the convergence of the rays from Ab Durnign the light to a focus at F behind the mirror AA. Since the effective focal length is the distance from F to the point where the rays ropiceted backward from F to BB extend and intersect the parallel incident rays, the focal length can be made much longer than the natural focal length of mirror AA.

The Gregorian telescope differs from the Cassegrain only in that the hyperbolic secondary mirror is replaced by a concave elliptical mirror placed on the opposite side of the prime focus point of mirror AA from where the Cassegrain mirror is placed. Although the Gregorian telescope was hastorically important, practical dificulties in making the elliptical mirror have caused this form to be abandoned in modern instruments in favour of the Cassegrain.

The Coudé telescope, represented in fig 5, has the advantage that the focus is brought completely outside the telescope. This is frequently accomplished by two flat mirrors, although one to three flat mirrors are employed on some forms of the Coudé arrangement As shown in fig 5, two flat mirrors CC and DD reflect the converging beam in such a manner that the focus is located at the base of the polar axis pp The convex hyperbolic mirror BB is similar to the Cassegrain form except that it is more convex and is located nearer to the prime focus point which causes the rays to come to a focus much farther from mirror BB. Since the focus remains at a fixed point regardless of the direction that the telescope is pointed, it becomes possible to use instruments to analyze the light that otherwise would be prohibitively heavy or exceedingly sensitive to the changing gravitational flexure experienced at the other focal positions. Since some light is lost at each mirror reflection, this system is less efficient, however, the advantages of the fixed focus often make this arrangement the most desirable A large fraction of modern astrophysical studies are made with this telescope arrangement.

Most modern reflectors are made so that they can be used alternatively in the Cassegrain, Newtonian or Could form by insetting alternatives small mirrors. But when used in the Cassegrain mane, different convex mirrors can be employed, giving different equivalent focal lengths. The mirror usually has an aperture star of about 9.5 Thus, for instance, a reflector of 5-ft. aperture may have a focal length of 25 ft. when observations are made at the primary or Newtonan focus. It may also be used as a Cassegrain for direct photography or for spectroscopic observations at a secondary focus near the lower end of the tube, with an equivalent focal length of 7.5 ft. The equivalent focal length of the Coulds arrangement may be 200 ft.

Photography.--When a photograph is to be taken the eyepiece is removed and the photographic plate is placed in the focal plane of the object glass or mirror. It is not a question of adding a camera to a telescope, but of turning the telescope into a camera, the main lens or mirror of the telescope acting as the lens of the camera In visual observation it is no great drawback if the definition falls off in quality toward the outside of the field of view, because the observer cannot pay minute attention to more than one object at a time; but in astronomical photography it may be a great advantage to have objectives giving good definition over a wide field many degrees in diameter This makes severe demands on the skill of the designer in correcting the various aberrations of the lens system, which usually increase rapidly with the distance from the centre of the field of view In general, a doublet, consisting of two similar pairs of lenses separated by a wide interval, is employed. The problem of constructing these wide-angle lenses is essentially the same as that of constructing a good camera lens for terrestrial photography (where a wide field is also necessary); and indeed a good portrait lens can be usefully employed in celestial photography. The fact that the whole instrument is of insignificant size is irrelevant when speed and not magnification is the main essential As is well known in terrestrial photography the speed depends on the ratio of the aperture to focal length, and not on the absolute dimensions of either; and this ratio can be made greater in a doublet than in an ordinary refractor or reflector.

Mounting.—In order that a telescope can be pointed to any desired point in the sky, it must be provided with two independent motions. The mounting of the early telescopes was of the altraimuth type, in which the telescope could be moved in altitude or in azimuth. In Sir Frederick Heischel's large instruments, for example, the telescope was suspended between two wooden faminevorks and missed or lowered in altitude by means of ropes and pulleys; the whole of the mounting was capable of being turned in azimuth. The disadvantage of this type of mounting is that to "follow" as air in its diurual motion across the sky the telescope must be continually moved both in altitude and in azimuth. The equatorial type of mounting, now universally used for large instruments, was introduced early in the 19th century; the main axis of the mounting is adjusted to be parallel to the axis of the earth and the telescope can be turned both about this axis, called the polar sais, and about a perpendicular axis, called the declination axis. When the telescope set upon a star, a uniform rotation of the polar axis at the rate of one revolution per sidercal day is all that is necessary to keep the star stationary in the field of view. The uniform continuous rotation can be given by clockwork controlled by a governor or some other ap-

be given by deckwork controlled by a governor or some other ap-propriate means or, more simply, where an alternating current supply of properly regulated frequency is available, by synchronous motor the property of the second of the property of the property of the tree difference from at the equational mountain grain to the tree difference from a difference of the property of the property to property of the property of the property of the property of the telescope being curred on a glout cross aux, mounted in this cadel the telescope being curred on a glout cross aux, mounted in this cadel of this type. In the second form of mounting, known as the German mounting, the polar axis is also supported at each end but the telescope is a mounted at the side of the polar axis on the dedunction has and of the property of the p

The English mounting is to be preserved not large newly instruments, because the bearings do not have to carry the additional load of a massive counterpose, and both ends of the polar axis are supported. The disadvantage is that a portion of the sky around the north pole cannot be observed. For the mounting of the great zool- nelecope, this disadvantage was avoided by making the upper bearing of the polar axis in the form of a gigantic househoe, 46 ft in diameter, enabling the telescope to be pointed enterly to the north pole.

Relative Advantages of Refractors and Reflectors.-Each type of instrument has some advantages not possessed by the other, and they are really complementary to one another in their uses. There are practical limitations to the aperture of a refractor, and for a given practical limitations to the aperture of a refractor, and for a given aperture the refractor is not so compact as the reflector because of its much greater ratio of focal length to aperture. The refractor is ideal for astrometric purposes, where precise measurements of position are required, its focus is less liable to change with changes of temperature than is that of a reflector With a refractor, a larger flat field of good definition can be obtained than with a reflector

The reflector has the advantage of compactness so that for a given The erhector has the avoyantage of compactness 80 that for a given appriare a much smaller dome is required. It is also more versatile appriare a much smaller dome is required. It is also more versatile by using different Casseguin mirrors. For all purposes where great light-taghtering power is required the reflector is ideal. It is also much more suitable for the observation (either visually or by photography) of funct extended objects, such as fann rebulke, for which a small ratio of lating extended objects, such as family nebulate, for work on a small rando of local length to appeture is required. Being perfectly achronatic, it work. It has the disadvantage that the images at a small distance from the axis suffer from the optical defect called comas, so that it gives only a small field of good definition; for this reason, and because of the changes of focal length with temperature, it is not to be recommended. for precise astrometric work

Composite Telescopes.-The previously described reflecting telescopes have all possessed a concave parabolic mirror that can produce a sharp focus in the absence of other lenses or mirrors. In order to avoid the natural aberrations of these systems, several new types of telescope were invented to greatly reduce or eliminate these disadvantages. In composite systems the mirror is unable to produce a good focus when used without the other elements. There are several im-

portant types

The Schmidt telescope, developed in 1931, uses a spherical mirror AA (refers to the general position of the milior shown in figs. 3-5) and a weak lens having a cross section as shown in exaggerated for and a weak mas daving a cross section as snown in exaggerated form in § 6. Since the mirror As is sphereal the prime focus image is blurred by spherical aberration. The corrector SS produces small deviations to the unceful light rays of an amount to exactly offset the spherical aberration of the mirror AA. To yield high definition over a wide field of view the corrector SS is ulways placed, a distance above the prime focus as the numror AA is below, which requires a telescope twice as long as the foral length of the mirror AA.

The Richey-Cretien and Schwartsschild telescopes are generally similar to the Cassegrain except that the mirrors are neither conic

sections nor spheres.

sections nor spheres.

The Maksutov telescope, developed in 1944, is basically similar to
the Schmidt telescope except that the aspheric thin lens is replaced by
a deep concave spherical meniscus lens that performs the same function
as the Schmidt corrector lens.

Although the focal surface is curved for most of the composite telescopes go that it is necessary to use film or thin glass plates bent to the proper curvature, these telescopes can be made with great optical speed and wide field of view, making them of great usefulness for photography of faint objects.

The 200-in. Telescope. The following are some details of the 200-in. telescope, the largest telescope ever constructed at the time of its

The telescope tube is in the form of a rigid hollow square centre section, with a strong rigid ring at each end. Each ring is attached to the central section by eight stiff 20-in diagonal I beams. The lower ring carries the mirro; and cell, weighing 30 tons. The mirror cell is

a cylindical box of welded steel, strongly braced, nearly 20 ft in dameter and weighing 10 tons. The upper cage carries a cylindrical housing, in which the auxiliary parrors are mounted, 22 ft in diameter and 12 ft high. The tube, excluding the nurror cell and upper cage, and 12 ft high. The tube, excluding the nurror cell and upper cage, in the upper cage can rapidly be brought into position for use by remote electrical control, the murrors which are not in use are swing back against the walls of the enclosing cylinder. The telescope can be dead at the punnary focus, with focal ratio 3; and focal length styling the companion of the companion o

TELESTLLA, Greek poetess, a native of Argos, one of the so-called nine lyric muses According to the traditional story, when Cleomenes, king of Sparta, invaded the land of the Argives in 370 ac, and siew all the males capable of bearing arms, Telessila, dressed in mer's clothes, put herself at the head of the women and repelled an attack upon the city of Argos. Of Telessila's poems only two lines remain, quoted by Hephaston, apparently from a Parthenion, or song for a chorus of maidens. Ser Pausiphas it, oa, 8, Plutarch, De Virtus, Multes um, 8, Clement of Alexandra Stromdai, tv, 10, p 531; Beigh, Poetae Lyrici Graeci, un; and especially Macan, Herodein ur-out, 13, 62 et seq. and notes.

TELESIO, BERNARDINO (1586-1588). Italian philosopher and natural scenetist, was born of noble parentage at Cosenza near Naples in 1508. After studying at Milan, Rome and Padus, he be against actack upon the study and Aristoclelanism which are the study of the study

Telesio was the head of the great south Italian movement which protested against the accepted authority of abstract reason, and sowed the seeds from which sprang the scientific methods of Tommaso Campanella and Giordano Bruno, of Sır Francis Bacon and René Descartes. He proposed an inquiry into the data given by the senses, from which he held that all true knowledge comes. Instead of postulating matter and form, he based existence on matter and force. This force has two opposing elements heat, which expands, and cold, which contracts These two processes account for all the diverse forms and types of existence, while the mass on which the force operates remains the same. The harmony of the whole consists in this, that each separate thing develops in and for itself in accordance with its own nature while at the same time its motion benefits the rest. The obvious defects of this theory. (1) that the senses alone cannot apprehend matter itself, (2) that it is not clear how the multiplicity of phenomena could result from these two forces; and (3) that he adduced no evidence to substantiate the existence of these two forces, were pointed out at the time by his pupil, Francesco Patrizzi His system is a forerunner of all subsequent empiricism, and marks the period of transition from authority and reason to experiment and individual responsibility. Besides the De Rerum Natura, he wrote De Somno, De his quae in aere fiunt, De Mars, De Cometis et Circulo Lacteo, De usu respirationis, etc.

TELESPHORUS, bishop of Rome from about 126 until about 137 St Itenaeus says that he suffered martyldom.

TELETYPESETTER is a name designating a group of devices for automatically operating slug line casting machines by means of code-perforated tape. The two principal units are (1) the perforator, having a keybaard similar to that of a typewriter, which is used to prepare code-perforated tape; and (2) the operating unit, which use this tape to operate automatically a slug line casting machine. Copy to be set in type is transcribed by the teletypesetier perforator operator into code-perforated tape. The code perforations in this tape provide all of the necessary controls for operating the keyboard of the line casting machine to select the matrices for composing the slugs and also for operating the elevator and controlling the duplex rail, simulating manual operation of the composing machine keyboard.

The operating unit, which is applied to slug line casting machines of Intertype, Linotype, or Linograph manufacture, manipulates the keys of the line casting machine keyboard under the control of the code-perforated tape prepared on the keyboard perforator. By the use of the teletypesetter operating unit controlled by tape, the output of the composing machine is increased over manual operation 50% to 100%, since the tape is fed automatically through the operating unit and the line casting machine is kept in continuous operation. The only attention required by the line casting machine is that slugs must be removed, and when the roll of tape is schasated a new one must be inserted.

Operation over Wires .- By the use of teletype printing tele-

graph apparatus, teletypesetter tape can be prepared at one point and transmitted over wires to be reproduced at any number of points, at any distance. The teletypesetter tape produced by the keyboard operator is run though a telegraph transmitter which translates the punched code combinations into groups of electrical impulses and transmits them over the wires. At the receiving station these electrical impulses operate simultaneously reperforators which reproduce the transmitted teletypesetter tape and teletype printers which typewite line for line copies of the galley proofs to be made from the type set by the received tape.

TELEVISION. The word "television" seeing at a distance, by common acceptance has come to mean the essentially instantaneous transmission, either by were or radio, of moving scenes and pictures it must be distinguished from the telescopes an optical instrument, by means of which a scene is viewed from a distance; from fassimie, which is the electrical transmission of still pictures; and from the simple transportation of moving picture films of a scene ta a distant point for reproduction.

Essentially three steps are involved in television, namely: (t) the analysis of the light image into electrical signals, (2) the transmission of the electrical signals to the points of reception; and (3) the synthesis of a visible reproduction of the original image from the electrical signals.

### HISTORY OF TELEVISION

The first practical means for analyzing a picture into a form suitable for electrical transmission was the Nipskow disk, proposed by P. Nipkow in 1884. This scanner consists of a circulai disk having a number of small holes arranged in a spiral about its centre as shown in fig. 1. A scanning disk is placed at the image plane of the potch-up device and at the viewing area of the receiver. As the disk rotates the holes move across the image field in succession, sweeping out a pattern of parallel lines. A light-sensitive cell, for example a large silver-caesium phototube, it coincide behind the disk in the pick-up device. In moving across cone element of the picture at any one time to reach the light-institute element of the picture at any one time to reach the light-time that is not accordance with the content of the picture, and produces a corresponding fluctuation in the current output of the tube

The varying current from the phototube is made to modulate a radio transmitter in much the same way that the varying current from a sound microphone modulates the transmitter of a radio broadcasting station. The television transmitter is also modulated with a timing, or synchronizing signal which may be in the form of an electrical pulse occurring each time a specified point on the scanning disk ussess a stationary index mark.

A radio receiver receives the signal from the transmitter and converts the modulated radio frequency signal into an electrical wave train which is identical with the signal supplied to the trans-

Sceneed image, field on the state of the sta

FIG. 1.-NIPKOW DISK FOR AN 18-LINE PICTURE

mitter Circuits then divide the output signal from the receiver into two parts, namely a synchronizing signal and the video signal. The video signal, as the name implies, carries the information about the light distribution in the original image by reproducing the current fluctuation of the phototube at the transmitter.

The video signal, after suitable amplification, controls the light output of a brilliant light source. A gaseous discharge lamp (eg., a crater lamp) whose brightness is proportional to the current supplied to it, actuated by the

video signal may serve as the light source, or the lamp may be of constant brightness and a light valve, such as a Kerr cell, controlled by the amplifier output be used to vary the light output of the light source.

A Nipkow disk rotates in front of his light source. The rate

and phase of rotation of the disk is controlled by the synchronizing signal in such a way that an aperture in the receiver's disk is at all times in the same relative position with respect to the

image area as the corresponding one in the disk at the transmitter. Since there is a one-to-one time correspondence between the positions of the apertures in the transmitting and receiving disk, and a similar correspondence between the amount of light passing through the respective apertures, a reproduction of the image at the transmitter will be seen in the plane of the disk at the receiver

Although the fundamental principles of mechanical television were laid down before the beginning of the 20th century, practical application of them was impossible before the invention, in 1907.

of the thermionic amplifier by Lee De Forest.

In the period from 1910 to 1930 considerable work was done in the field of mechanical television and many improvements were suggested. Successful demonstrations of television transmission were given by 1. L. Bard in Enghand and C. P. Jenkins in the United States in the early 1920s. These early demonstrations were more in the nature of silbioutets, but before the end of the decade half-tone pictures were presented by the above-named inventors, by E. F. W. Alexanderson and others.

The mechanical television system outlined suffers from a number of serous objections. Some of the important limitations are: (i) it is optically very inefficient; (a) mechanical components rotating at high speeds are involved; and (3) a high intensity light source which can be varied at the high frequences required for a good picture is very difficult if not impossible to realize in

practice.

In spite of the many improvements which were made on the basic mechanical system outlined, the limitations stated in the preceding paragraph were so formidable that I was never developed beyond the experimental stage. Nevertheless, various modifications of this system, which included lens dusks, mirror druns, etc., to increase the optical efficiency and reduce the size of the scanning means, and improved light sources and light valves to increase the brightness of the reproduced image, were used in many very successful experimental television transmissions. Thus work was invaluable in keeping alive the not inconsiderable interest in television developed the continuation of the continuation of the stage of the s

Although the extensive research on mechanical systems eventually Ber to the obtaining under very special laboratory conditions, of pictures whose quality and entertainment values were well above the essential minimum required of a practical television system, the final solution to the television problem was found in a rather different direction, namely through the use of

electronic pick-up and reproducing tubes.

As early as 1905 Boria Resung proposed the use of a Braun cathode-ray the as a means of reconstructing television images, and demonstrated by experiment that this was feasible. In 1911 and the state of the state o

Television developed rapidly under the impetts given it by the new electronic pick-up and viewing devices. By the latter part of the 1930s, just before World War II, regular programs were been considered to the 1930s, just before World War II, regular programs were being a considerable of the 1930s, just before World War II, regular programs were being a Chenectainy, N.V., Philadebbia, Pac, Chicago, III, and San Panaciso, Calif., in the United States; in England by the BBC Transcript, and also from a number of points in continental Europe. In the United States and England many thousand home receivers were in private hands and were in regular use receiving these programs. Frogram material included: sporting events, such as the outdoor pick-up of robtall, baseball and tennis, and indoor pick-up of hoxing, wreetling and hockey, news events, studio production of plays, denor excisias, musical shows and general enter-

tainment features as well as moving-picture film programs.

During the war years, 1940–45, commercial televasion activities were drastically curtailed However, research in the field of televasion conhuned because of its potential military value. After World War II television progressed at an accelerated pace, This is illustrated by the fact that before the end of 1953 there were 328 television stations in operation in the United States, serving more than 27,000,000 sets. In addition, more than 3,000,000 sets were in use in the remainder of the world, with regular television broadcasts in about 20 countries.

## THE FUNDAMENTAL PROBLEMS OF TELEVISION

The ordinary concept of a picture or image is that of a surface over which there is a more or less continuous distribution of varying light and dark, the distribution changing smoothly with time to conform with motion in the picture. Here the brightness is a function of the three independent variables, x, y and t, where x and y are the horizontal and vertical position of any point on the picture and t is the time. Obyously, such a distribution cannot be transmitted over a single electrical communication channel where the current or voltage transmitted is a function of time only.

In order to overcome this fundamental difficulty it is necessary to take advantage of certain physiological and psychological limitations of sight to reduce the amount of information which must be transmitted. These limitations are the finite resolving power of the eye and the persistence of vision. If a picture is subdivided into a large number of small elements, each element being uniformly shaded, the picture will still appear continuous, provided the elements are so small that they are not resolved by the eye. This procedure is, for example, employed in the making of half-tone reproductions. Thus a picture composed of a finite number of discrete elements is entirely satisfactory for viewing.

The illusion of continuous motion can be obtained, as is done in the case of moving pictures, by forming a series of static pictures in rapid succession, with each picture differing slightly from the preceding to correspond to the motion which has taken place in the scene during the interval between pictures. From this it will be evident that the information necessary to reconstruct a completely statisfactory visual representation of a scene which includes place to the continuous properties of the control of the values of a finite number of picture elements at a finite prigning conditions required for the transmission of moving pictures over an electrical communication change are the reformance.

The problem of analyzing a picture into information suitable for electrical transmission and later resynthesis does not have a unique solution. However, the process known as scanning is the only one which by the 1950s had proved to be satisfactory, and is

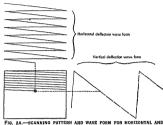

the only one that will be discussed in this article.

The process of scanning is that of exploring the image area by means of a sensitive analyzing element which moves in a continuous or discontinuous line covering the entire surface of the picture. In general the size of the sensitive exploring element is equal to or smaller than a picture element. The analyzing element as equal to or smaller than a picture element. The analyzing element as epocates either directly or indirectly an electrical signal which corresponds to the brightness of the area of the image at which it is located. As the analyzing element traces out the scanning pattern over the surface of the picture the electrical signal varies, forming a characteristic complex wave known as the video signal,

At the picture reproducer or receiver the reproducing elament moves over the viewing area in a scanning pattern which is geometrically similar to that at the transmitter. The brightness or its equivalent (i.e., optical transmission, reflectivity, etc.) of the reproducing element is a monotonic function of the instantaneous amplitude of the video signal. The motion of this element is so synchronized with that of the exploring element that when the instantaneous amplitude of the video signal associated with a particular point in the picture being transmitted reaches it, the reproducing element is at the corresponding point of the viewing area. Therefore a reproduction of the picture being transmitted is formed on the viewing area of the receiver.

One form of television scanning and means for reproduction has already been outlined in connection with the Nipkow disk.

Scanning patterns are characterized by the type of path described by the exploring and reproducing element. Thus somal scanning patterns are used in many detecting devices, while PPI radar uses a radial scanning pattern Parallel line scanning, almost exclusively, is used in television. Here the element sweeps out a series of straight parallel, nearly horizontal, lines covering the

VERTICAL DEFLECTION FOR SEQUENTIAL PARALLEL-LINE SCANNING

picture area. This pattern is obtained by displacing the element rapidly across the area in the horizontal direction and returning it even more rapidly to its original horizontal position. At the same time the element is moved slowly in the vertical direction so that many horizontal sweeps occur in the time it takes for it to cover the height of the picture. This is followed by a quick vertical return. If the horizontal and vertical displacements are plotted as a function of time they yield sawtooth waves which rise gradually and fall abruptly. The ratio of the horizontal to the vertical frequency of these waves is equal to the number of horizontal lines making up the pattern This type of scanning pattern is frequently designated as a raster.

The raster is characterized by the number of lines it contains, the ordering of these lines, and the repetition rate or frame frequency. In simple scanning the lines are laid down in sequence (fig. 2A). However, considerable advantage results from laving down the odd-numbered lines first and then the even-numbered lines. This is known as interlaced scanning and is illustrated in fig. 2B.

The scanning pattern at transmitter and receiver, the exploring and reproducing elements and the communication channel connecting them are symbolically illustrated in fig. 3.

With interlaced scanning the reproducing element moves over the area of the viewing field along slightly different paths twice during each frame. Therefore the field frequency is twice the frame frequency. The former determines the flicker frequency while the latter determines the repetition rate for continuity of

motion. In practice it is found that the flicker frequency must be two or more times the minimum repetition rate required to give the illusion of continuous motion if flicker is to be reduced

below the visual threshold. The illusion of continuous motion is obtained for a great many subjects with a repetition rate of 16 frames per second; however, some subjects show discontinuity

FIG. 2B .- SCANNING PATTERN FOR INTERLACED SCANNING

when the repetition rate is as low as this. The moving-picture in-

frame frequency) will equal the 60-cycle power line frequency which is standard for most of the United States For similar reasons a repetition rate of 25 frames per second was adopted for Great Britain to conform with a 50-cycle power system.

The number of lines making up the scanning raster determines the vertical definition of the picture. This is obviously true because two picture elements cannot be closer together in the vertical direction than the line spacing. It is, therefore, desirable to have as many lines per frame as is practical. However, other considerations, which will be discussed below in this section, indicate that there are both practical and fundamental advantages in keeping the number of lines to a minimum. The visual acuity of the human eye depends, of course, upon the brightness of the scene observed. However, a practical value of one minute of angle for a scene brightness which is high enough to cause no discomfort or fatigue is useful in estimating the number of lines required. Moving picture experience has indicated that the ratio of viewing distance to vertical height of picture should not be greater than eight, which corresponds to an angle of about seven degrees This in turn means that the number of lines should not be fewer than about 500 Television standards in the United States call for a ratio of horizontal line frequency to frame frequency of 525 However, the raster does not have the full 525 lines because some lines (5%) are lost during the vertical return time

The size of the exploring and reproducing element is related to both vertical and horizontal definition. For the present discussion, however, it will be assumed that the scanning element size is so small that it does not appreciably degrade the resolution

Neglecting the effect of the scanning element size, the horizontal definition is determined by the frequencies which can be transmitted through the communication channel. A signal frequency  $f_o$  corresponds to  $2f_o/(f_oN_v)$  black and white dots along a line, where  $f_0$  is the frame frequency and  $N_0$  the number of lines in the scanning pattern. This is the finest pattern of dots, or number of picture elements, that can be transmitted with a band width for

Finally it can be shown that the complex wave corresponding to the video signal formed by a real picture on the pickup device can be represented by a sum of simple waves of the type just

On the basis of the above, the frequency band required to transmit a rectangular picture having a vertical to horizontal aspect ratio of 3.4 and equal definition in the two directions can

be estimated as follows. the maximum number of black horizontal bars in a pattern of black and white bars is  $\frac{N_v}{2}$  where  $N_v$  is the number of lines in the raster. The number of vertical bars having a spacing equal to these will be  $\frac{4 N_v}{3 2} = N_h$ . Therefore the channel will have to transmit all the space of the

will have to transmit all frequencies up to the cutoff frequency  $f_o = N_h N_v f_o = \frac{4}{6} N v^2 f_o$ . For a 525-line picture the frequency band

is about 5,000,000 cycles. A more precise treatment leads to a slightly smaller required band width. Thus a 4- to 41-mc. band has been shown to be sufficient and is used in television broadcasting in the United States.

For the preceding discussion a simple image area, exploring element, communication channel and reproducing element were used to represent what is in actuality a very complicated electrical system. This was sufficient to establish some of the fundamental properties of television systems and to interpret optical requirements in terms of electrical characteristics. However, the representation must be expanded before any description of the physical components of the system or of its operation as a dustry adopted 24 frames per second, which was found to be the physical components of the system or of its operation as a satisfactory. In the United States a television repetition rate of 30 whole can be presented. A block diagram of the principal comframes per second was adopted as standard. The somewhat higher ponents of an electronic television system is given in fig. 4. The frame frequency was selected, not because it is required for con-tinuity of motion, but in order that the field frequency (twice camera, an amplifier chain which includes the monitoring and corsignal generator and the camera deflection generators

The complete television transmitter also includes an FM (frequency modulation) sound transmitting unit. Since this unit is essentially the same as the conventional FM broadcast transmitter it will not be further described in this article

The television receiver is shown in fig 4b It includes the antenna and radio frequency amplifier, the converter or mixer, the intermediate frequency amplifier, the second detector, the video

BLOCK DIAGRAM OF TRANSMITTER (a) AND RECEIVER (b)

amphifier and the viewing device. Associated with it are also the synchronizing separation circuits and the deflection generator for the viewing tube A separate intermediate frequency amplifier is provided for the sound channel, which is followed by a conventional FM discriminator and limiter and sound output system

In succeeding sections the various components making up the system will be discussed individually in some detail and only the general functioning of the system as a whole will be outlined in

The pickup camera consists of an objective lens for imaging the scene before the camera onto the pickup tube, the pickup tube itself, the preamplifier and the deflecting voke for moving the exploring element over the image area Several forms of pickup tubes are commonly used for television broadcasting. These include the iconoscope, the orthicon, the image iconoscope and the image orthicon A description of these tubes and the principles of their operation will be given in a later section

An optical image of the scene being televised is formed on the sensitive area of the pickup device or camera. This area is scanned by the exploring element and a video signal is generated corresponding to the light image. The video signal as generated by most pickup devices is extremely small, representing only a fraction of a microwatt of power or a few millivolts. Before the signal can be used to modulate the television radio transmitter it must undergo an amplification in voltage of nearly 1,000,000 times It also must have added to it the timing pulses needed to synchronize the receiver, and must be corrected for certain defects generated by the pickup camera. The amplification is ac-complished in several steps. To begin with, the preamplifier at the camera raises the level up to the point where it can be conveniently transmitted through a cable The signal is next amplified to monitoring level. Here the synchronizing signal is added and any correction of spurious signal is made. Also, in general, at this point monitoring viewing

tubes are provided which reproduce visible images of the scenes picked up by each of the cameras used for transmission of the program, so that the program manager can select which camera signal to use and otherwise direct the program.

The signal at monitoring level is still only a few volts and msufficient to modulate the transmitter. It is, therefore, further amplified to bring it to the several thousand volts required for modulation of the radio fre- Fig. 5 -- VIDEO SIGNAL: (G) AS quency carrier. The transmitter OBTAINED FROM PICKUP, (b) includes, in addition to the modulator, a carefully controlled oscillator and power amplifier which synchronizing signal

AFTER BLANKING OUT RETURN-LINE SIGNAL AND INSERTING BLACK LEVEL; AND (c) AFTER ADDING

recting units, the radio transmitter and antenna, the synchronizing generate the constant-amplitude radio frequency carrier oscilla-The modulator is arranged to vary the amplitude of this tion oscillation so that its envelope corresponds to the video signal

The modulated signal is then filtered through a special coaxial network to produce the single side-band radio frequency signal which is radiated from the transmitting antenna The frequencymodulated radio signal carrying the sound which is to accompany the picture is in general broadcast simultaneously from the same antenna.

As has already been pointed out, a frequency band of about 42 mc is required to carry the video information A carrier modulated with this signal would normally occupy a band width of o mc in the radio spectrum However, the single side-band filters reduce the band needed to about 5 mc. To this is added another megacycle to accommodate the sound channel and to ensure frequency separation between sound and picture, and between

TELEVISION CHANNEL

adjacent television channels, sufficient to prevent interference Thus a television channel must be 6 mc wide, with the video and audio signals distributed in it as shown in fig 6.

Obviously, a radio frequency signal of this band width must be transmitted at relatively high carrier frequency television is broadcast on short

waves, the channels lying in the radio spectrum above 40 mc. In the United States in 1953 12 television channels had been assigned by the Federal Communications commission between 54 and 216 mc., and 70 additional channels in the 470-800 mc, portions of the radio spectrum These frequency assignments are listed below.

Allocation of Communication Channels to Television (1953)

Channel regacycles				Channel megacycles			
54-60	channel	no.	2	180-186	channel	no.	8
6066	channel			186-192			
66-72	channel	no.	4	192-198	channel	no.	io
76-82	channel			198-204			
82-88	channel	no	6	204-210			
174-180	channel	no	7	210-216	channel	no	13
meracycles							
470-890 Ultrahigh-frequency channels 14-83							

Even the lowest frequency assigned to television is in the veryhigh-frequency part of the spectrum and its propagation characteristics are quite different from those of ordinary sound broadcast. The most important difference is that ultrahigh-frequency radiation is subject to almost no reflection or refraction by the air or the ion layers of the upper atmosphere Consequently, it is propagated in essentially straight lines. The service area of a television transmitter is, therefore, limited to the line-of-sight distance between the transmitting antenna and receiving antenna Actually the boundary of the service area is not sharp. However, the signal strength falls off very rapidly when the line-of-sight distance is exceeded. The line-of-sight distance d in miles can readily be calculated from the relation;

$$d=1.2(\sqrt{h_T}+\sqrt{h_R})$$

where  $h_T$  and  $h_B$  are the heights in feet of the transmitting and receiving antenna, respectively.

The receiving antenna is usually a modification of the conventional short-wave dipole. It is connected with the receiver by a transmission line designed especially to carry the high-frequency signal. At the receiver, the signal is combined with the signal from a local oscillator through the converter tube to form the intermediate frequency signal. The intermediate frequency signal resembles the original radio frequency signal in that it is a carrier oscillation whose amplitude is modulated (single side band) with the video wave. The intermediate carrier frequency is, howrier, being in practice in the neighbourhood of 45 75 mc

The intermediate signal is amplified and then rectified at the second detector The output of the second detector has a wave shape which is the same as that of the video signal at the pickup camera, but also includes the synchronizing signal The synchronizing signal is separated from the video signal by suitable filters and used to control the deflection generator which moves the scanning element in the viewing tube The video signal itself is supplied to the control grid of the viewing tube and governs the brightness of the scanning element. The various steps in the chain of events occurring between the pickup of the scene and its reproduction on the screen of the viewing tube will be discussed in greater detail in succeeding sections, in connection with descriptions of the various components making up the system.

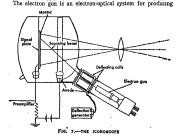

### TELEVISION PICKUP DEVICES

With the resumption of active public television broadcasting at the close of World War II a number of different types of pickup devices were available for this service. The principal types employed were the image orthicon, the orthicon, the iconoscope and the dissector tube. They are listed in approximate order of their sensitivity

All of these pickup tubes make use of photoelectric emission in converting the light image of the subject being televised into an electrical signal Photoelectric emission is the release of electrons from a surface when light or other radiation is incident on it. Almost all conducting materials exhibit this property to some extent However, certain complex chemical surfaces are very active in this respect, and it is these that are used in pickup tubes. The two most commonly employed photoelectric emitters are surfaces composed of caesium, caesium oxide and silver and surfaces composed of antimony, silver and caesium. The former have a high response to red light and a lower response to blue with a minimum response in the green portions of the spectrum. The second surface described has a very high blue response and low red sensitivity. In addition to the tubes listed above, the Vidicon, whose operation is based on the photoconductive effect and which found extensive application in industrial television in 1953, merits closer consideration.

The manner in which the photoelectric phenomenon is applied in the various types of pickup tubes is of course different, leading to different performance characteristics. Therefore, the construction and operation of each of these tubes will be described individually.

Iconoscope.-The iconoscope consists of an electron gun producing a fine electron beam and a photosensitive mosaic enclosed in a highly evacuated glass envelope. External to it is a magnetic deflecting yoke, with its driving circuit, which deflects the electron beam and a video amphier which raises the level of the output signal before supplying it to the television transmitter (fig. 7).

ever, much lower than that of the original radio frequency car- an extremely narrow, well-defined electron beam which impinges upon the mosaic in a spot a few thousandths of an inch in diameter A simplified diagram of the electron gun, together with its optical analogue, is illustrated in fig 8. Essentially this gun consists of two groups of electron lenses, formed by coaxial cylindrical electrodes. The first lens group, which includes the thermionic cathode and the control grid, concentrates the electrons from the cathode into a narrow bundle called the crossover. Optically, the crossover is the analogue of the exit pupil of the first lens system. The second lens images this crossover upon the

> The electron beam from the gun is deflected vertically and horizontally by varying magnetic fields produced by the deflect-

TICAL ANALOGUE

ing yoke, in such a way that the spot moves over the mosaic in a series of straight parallel lines forming the scanning raster. In the course of one frame period the entire surface of the mosaic is explored by the scanning spot. Figuratively speaking, the mo-

saic is the retina of the pickup tube It consists of a thin sheet FIG 8 -ELECTRON GUN AND OP. of mica or other dielectric, coated on one side with a conducting film known as the signal plate and on the other with vast numbers of minute silver globules or elements. Each of these globules is photosensitized with oxygen and caesium; also, each globule forms a condenser with the con-

by a signal lead which passes through the walls of the tube. When light falls on the mosaic the illuminated elements emit photoelectrons charging the condensers of which they form a part In other words, the action of the light is to cause the elements to acquire a positive charge which in turn traps an equal negative charge on the signal plate As the scanning beam passes over each element in turn, it returns it to an equilibrium potential releasing the stored charge. This change in charge of the elements induces a corresponding change in charge in the signal plate, and

ducting signal plate. The signal plate is connected to an amplifier

thus causes a current to flow in the signal lead. It will be noticed that photoelectrons are emitted by the silver elements during the entire time they are illuminated, and that the charge is stored until the scanning beam returns to discharge the element. This storage principle is characteristic of the iconoscope type of pickup tube, and results in an enormous gain in sensitivity over a nonstorage system. For example, with a scanning disk pickup, which is a typical nonstorage system, the photocurrent corresponding to one picture element only flows, in any one frame time, for a time equal to one frame period divided by the number of elements in the picture frame, while for the storage system the current flows for the entire frame time. Since there are about 350,000 picture elements in a television picture, this means there is available 350,000 times as much charge to represent a picture element in a storage device than in a nonstorage pickup system.

The mechanism by which the elements are returned to equilibrium in an iconoscope is quite complicated. Beam electrons. striking the elements with a velocity corresponding to about 1,000 v., cause them to emit secondary electrons in excess of the beam electrons If an element is at a negative potential with respect to the electrode in the tube which serves as collector of secondary electrons, more electrons leave the element than are supplied by the beam and the element becomes increasingly positive. increase in positive charge continues until the element reaches a potential such that most of the secondary electrons (which have only a few volts emission velocities) are turned back to the element and the current which leaves it equals the beam current arriving. This is the equilibrium potential of the element and, for a typical photosensitized silver element, may be one or two volts positive with respect to the secondary emission collector. If the element is more positive than this, the secondary emission current leaving will be less than the bombarding current and the

element accumulates negative charge until it reaches equilibrium. This method of establishing equilibrium for the elements has

Into method of establishing equilibrium for the elements has two important consequences (1) all of the returning secondary electrons do not reach the element from which they were emitted but instead are redistributed over the entire surface of the mosaic, and (2) the mean potential of the elements is relatively high with respect to the collector electrode with the result that the photoemission is to some extent inhibited.

As a result of the first effect some signal is lost because of a masking effect of the redistributed electrons. Furthermore, a spurious signal, termed "black spot" or "shading," arises from the nonuniformity of redistribution over the mosaic

The second effect reduces the efficiency of the mosaic as a photoemttet, which is undestrable, but it also leads to a response characteristic whose rate of increase of signal decreases with nocreasing light. The tube, therefore, does not become saturated or block at very high light levels. It is interesting to note that the eye has a somewhat similar characteristic.

Orthicon.—The orthicon is a beam scanning pickup tube employing a storage-type mossic simular to that of the iconoscope The electron gun, however, is arranged to produce a low-velocity electron beam, instead of the 1,000-V-velocity beam used in the iconoscope Fig. 9 illustrates the arrangement of components in an orthicon

When a photosensitized surface of the type used for the mosaic elements is bombarded by a very low-velocity beam the secondary

FIG 9 -- ORTHICON WITH MAGNETIC DEFLECTION

emission ratio is less than one; in other words, more electrons will arrive than leave. Under these conditions an insulated element becomes increasingly negative under bombardment until its potential becomes such that the beam electrons are repelled and can no longer reach the element. This potential is the equilibrium potential of the elements and is approximately equal to that of the cathode of the gun. This equilibrium potential is entirely modependent of the collector field in the vicinity of the element.

In darkness, the target or mosaic of the orthicon is driven to its equilibrium potential by the beam and electrons no longer reach its surface. If an area of the mosaic is illuminated, photoelectrons are emitted by the elements on which the light falls and these elements accumulate a positive charge with respect to their equilibrium condition. When the seaning beam passes over these elements is returns them to equilibrium potential, releasing the accumulated charge. This change of charge produces the video signal just as in the iconoscope. This mode of operation has several important consequences; thus there is no redstribution of electrons over the mosaic and consequently no spurious signal or black spot. Furthermore, the photoemission is saturated so that the photoediscion of electrons over the mosaic and consequently no issuit of signal resulting from the discharging or short-circuiting action of redstribution electrons; and the signal output is strictly propertional to the indent Illumination over the range of stable opera-

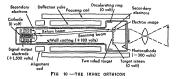

The first three items mentioned represent a superiority over the iconoscope. The Increase in efficiency results in about six to eight times greater sensitivity; that is, the orthicon will produce a satisfactory picture with one-sixth to one-eighth of the light required by an iconoscope. Freedom from shading or black spot eliminates the need of elaborate correcting circuits at the transmitter.

The fourth characteristic is to some extent disadvantageous, since at high light levels the tube becomes unstable as a result of the elements accumulating so large a positive charge that the

secondary-emission natio becomes greater than unity and equilibrium cannot be re-established. This means that care must be execused by an operator of an oithicon to avoid high light brightnesses great enough to produce instability.

The linear response characteristic makes it necessary to add contiast-correcting circuits to the amplifier chain to obtain a picture with pleasing tonal gradation. The CPS-Emitron, an orthicontype tube, was extensively used in England in the 1950s.

The Image Orthicon.—The image orthicon, as the name implies, includes the low beam-velocity gain and a storage-type mean. In addition, it has one stage of secondary emission image intensification and also a secondary emission multiplier to amplify the signal output. The use of these two types of multipliers to gether with the orthicon principle leads to a micreise in sensi-

tivity over the normal iconoscope of several hundred Fig. 10 illustrates the construction of the image orthicon

The image section consists of a photocathode upon which the light image falls and an electron lens system which focuses the electrons from the cathode onto the mosaic or target

The target is a very thin film of special glass which is sufficiently conducting so that there is an interchange of charge between the two sides The electron image from the photocathode falls on one side of the target while the opposite side is scanned by a low-velocity beam Close to the target on the image side is a fine-mesh screen (1,000 meshes per inch) which is positive by one or two volts with respect to the equilibrium potential of the This screen collects the image secondary electrons from the target, causing a positive charge to accumulate at areas where the image electrons strike the target. The very close spacing of the screen makes it possible to have a strong collector field at the target when the latter is at its equilibrium potential and at the same time to operate the screen at a small enough positive potential so that the target cannot, even under very intense illumination, be driven so far positive that its operation becomes unstable.

The low-velocity scanning beam removes the stored charge and returns the target to equilibrium exactly as does the beam in the orthicon. However, instead of obtaining the video signal from a signal plate as with the orthicon and iconoscope, it is obtained from the beam electrons which are turned back from the target. This electron flow is modulated by the inverse of the video signal, The returning electrons are directed into a secondary emission multiplier. The complex chain of operations involved in the process of converting a light image into a video signal in the image orthicon makes possible very high sensitivity. Some of the contributing factors are the high photoelectric sensitivity that is obtained with an image cathode as compared with the photosensitivity of a mosaic; the secondary emission intensification of the electron image at the target; the high efficiency of the low-velocity scanning beam; and the amphiication of the video output by the signal multiplier. Other important characteristics of this pickup device are the decreasing response as the light intensity increases (similar to the iconoscope rather than the orthicon), making the tube operative over a tremendous range of light values; freedom from shading or black spot since there is no redistribution of beam electrons; a relatively low maximum signal-to-noise ratio which means that while a good picture can be obtained at very low light levels, even at very high light intensities some noise may be visible in the picture.

the scene is low. Its sensitivity exceeds that of a camera film and approaches that of the eye. The great range of light values over which it is operative means that it is useful in following an outdoor scene-for example, a sporting event-from noon to well after sunset It has been important in televising indoor events, such as banquets, public meetings, etc , in normally lighted rooms Compared with an iconoscope the image orthicon will transmit a picture with less than one one-hundredth of the minimum light required by the tormer to reproduce the same scene

An image intensifier section has also been combined with the iconoscope to take advantage of the sensitivity increase resulting from the more effective photocathode and the secondary emission gain obtainable in this way This type of image multiplier iconoscope has been more widely used in England than in the United

States A signal multiplier in combination with the simple orthicon has also given good results, although it has not seen much service in actual television broadcasting.

The Dissector Tube.-The dissector tube differs from those described above in that neither electron beam scanning nor the storage principle is employed. The tube consists of a photocathode, an electron lens system for forming an electron image of the electrons from the cathode, deflecting means for moving the electron image horizontally and vertically, an aperture in the focal plane of the electron image and a secondary emission multiplier. The arrangement of the elements is shown in fig. 11.

As the electron image is swept across the aperture, electrons from it pass into the multiplier, where the electron current is intensified. The aperture size is so selected that it equals a picture element of the image, and the electron image is moved by the deflecting system in such a way that the aperture sweeps over

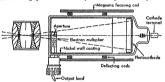

FIG. 11 --- THE IMAGE DISSECTOR

the image in a conventional interlaced scanning raster. The multiplier thus receives the photocurrent from each picture element in succession and the amplified output of the multiplier constitutes the video signal. The response of this type of pickup device is strictly proportional to the light intensity and it has no tendency to saturate or become unstable at high light levels. The picture reproduced by such a tube is completely free from shading or other spurious effects. However, the sensitivity of the dissector tube is much lower than any of the devices described in the preceding paragraphs because it does not employ the storage principle. Compared with the iconoscope, several hundred times as much light is needed to generate an equivalent picture with a dissector tube Therefore, its application is limited, in general, to projected pictures and well-illuminated studio scenes.

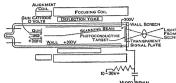

The Vidicon.-The four pickup tubes described above depend for their ability to generate a video signal upon photoemission. The Vidicon, while retaining the fundamentally important storage principle, differs in that it employs another photoelectric phenomenon, namely, photoconductivity.

Photoconductivity is the property of certain semiconductors and insulators of becoming more conducting when light is incident upon them. Cadmium sulphide, amorphous selenium, antimony trisulphide are a few examples of insulating photoconductors which, in varying degrees, are suitable for the light-sensitive target of a Vidicon camera tube

The construction of the Vidicon is shown schematically in fig. 12.

The image orthicon is very valuable wherever the light level of The light sensitive target is a thin film of photoconductive material deposited upon a transparent conductive layer which coats the glass end window of the tube The photoconductor is selected to have a spectral response suitable for the application in which the tube is to be used It also must be a material having a very high resistance in darkness.

An electron gun is mounted in the other end of the tube. This

OF AMERICA FIG 12.-THE VIDICON

gun is similar to that employed in an orthicon and produces a fine beam of electrons which reach the target with low velocity The beam is focused and deflected with magnetic fields produced by coals suitably disposed around the outside of the tube.

In operation, the conductive layer under the photoconductive target is made slightly positive with respect to the cathode of the gun As the electron beam from the gun scans the surface of the target, each element of area swept over is driven to cathode potential. As soon as the beam moves away from an area it starts charging positive due to the flow of current from the backing layer through the photoconductor. The rate at which a given area changes potential, and consequently the total charge accumulated during a frame time, depends upon the resistance of the photoconductor and consequently upon the intensity of light falling on When the beam returns to the area in question, the accumulated positive charge is neutralized by electrons from the beam as the area is driven back to equilibrium. The change of charge induces a corresponding change of charge in the backing layer. The current to effect this change of charge flows through the signal lead connecting the backing layer with the external circuit. The fluctuations in the signal lead current constitute the video signal.

It is evident from the foregoing discussion that the photoconductor is storing useful information from the incident light at each point of the target during the time of each frame. In fact, the operation of the Vidicon may properly be compared with that of the orthicon by merely substituting the internal photoeffect of the photoconductor for the photoemission of the latter.

The Vidicon has the advantage of extreme simplicity and can, consequently, be made very small. While this form of pickup device has the potentiality of very high sensitivity, in its state of development in the 1950s it was less sensitive than the image orthicon. Its sensitivity is adequate for average viewing, particularly where the device is used for industrial television, for which application the tube is eminently suited.

Sensitivity of Pickup Devices,-Without additional information, it might be thought that any one of the pickup devices described in this section could be used at any light level, however low, simply by increasing the gain of the amplifier which follows

However, there exists a fundamental limit to the sensitivity of each type of pickup device which determines the minimum light level for which a satisfactory picture can be obtained irrespective of the subsequent amplification. This limit arises from the fact that it is impossible to produce a current or voltage which is free from spurious fluctuations. When the video signal generated by a pickup device falls below a certain level, it will be masked by the spurious fluctuations.

These fluctuations are caused by the granular nature of elec-

tricity. A small current flowing in an electronic device or vacuum tube cannot be considered as the flow of a continuous medium, but rather as the motion of randomly distributed individual electrons. On this basis it can be shown theoretically (and confirmed experimentally) that associated with an electron current there will exist a fluctuation current whose root mean square value is proportional to the square root of the electron current Also, the conduction electrons in a metal or other conductor are in theimal equilibrium with the material itself and their random heat motion gives rise The root to a small voltage across the terminals of a circuit mean square value of this voltage is proportional to the square root of the resistance of the circuit and the square root of its absolute temperature Both the voltage fluctuation from resistors and the fluctuation in an electron current depend, furthermore, upon the frequency band transmitted by the circuit involved The root mean square value of each is proportional to the square root of the frequency band width Therefore, in a circuit or system where maximum sensitivity is sought, the band width should be the minimum compatible with other requirements pickup devices, vacuum tubes and amplifiers involve the flow of electron currents and resistive circuit elements these spurious fluctuation effects are basically unavoidable.

It might be pointed out that these fluctuation effects also are present in sound systems. They give rise to a his superposed on the desired audio output, an effect commonly known as "noise". This terminology of sound engineering is carried over into television engineering and the spurious fluctuations described above, although producing visual effects, are termed "noise."

In the reproduced picture noise appears as fine speakles or flakes of black and white scattered over the picture area and, when severe, makes the scene appear to be in the midst of a snowstorm. Even when the noise is not sufficient to mask the picture, it detracts from the quality of the reproduction. As the ratio of signal-to-noise increases the noise becomes less apparent until eventually it as below the visual threshold For a 500-line picture a signal-to-noise ratio of 30 to 50 yields a reproduction for which the noise is not in eventually sufficient for the first production for which the noise is not in eventually and the second of the picture as the signal-to-noise ratio of 30 to 50 yields a reproduction for which the noise is not in eventually sufficient for the picture as signal-to-noise ratio of 30 to 50 yields a reproduction for which the noise is not in eventually sufficient for the picture as signal-to-noise ratio of 30 to 50 yields a reproduction for which the noise is not in eventually sufficient for the picture and the picture and the picture are signal-to-noise ratio of 30 to 50 yields a reproduction for which the noise is not in eventually sufficient for the picture as the picture as the picture as the picture as the picture as the picture are the picture as t

It is interesting to note that in motion-picture practice an exact counterpart of "noise" exists in the grainness of a film. When weved from a distance which permits a goo-line resolution, the "sgnall-conse ratio" for commercial 35-mm motion-picture film is, in general, approximately 30 to 40. Therefore, a direct comparison between the sensitivity of a motion-picture film and a television pickup device is possible. The figure of ment most suitable for the purpose is

$$S = F^2/BA$$

where F is the F-number of the lens required, B the brightness of the scene (in foot-lamberts) and A the area (in square niches) of the film or sensitive target. The area of one frame of 3.5-mm. Him 3a + 4 in monor-picture studio practice employs a scene brightness of 500 foot-lamberts with an F/2 lens. This yields a figure of ment  $S = \frac{1}{N}$  for motion-picture film.

For the type 1850-A iconoscope the target area is about 17 in. and, to obtain the signal-to-noise ratio referred to above, a scena brightness of 500 to 1,500 foot-lamberts with an F/5.6 lens is required. A maximum figure of merit  $S=\frac{1}{2}\sqrt{10}$  can therefore be assigned to this type of pickup tube.

An orthicon with a 4 in.<sup>2</sup> target uses an F/2 lens and a brightness of 60 foot-lamberts which gives an estimated figure of merit of  $\frac{1}{3}$ . However, because of the character of the signal from the orthicon, a more realistic figure of merit is  $S = \frac{1}{13}$ .

The image orthicon has a figure of merit  $S=\frac{1}{2}$ , which is higher than any of the deviese mentioned above, including motion-pitch tent film. Here the target area is  $1 \circ 1n^2$  and with an F/2 lens a scene brightness of  $2 \circ 100$ -lamberts is required. This yields a figure of merit of 2, but this value takes no account of the character of the signal.

The image dissector tube, although capable of yielding an excellent picture, has a figure of merit of only  $\frac{1}{150,000}$  because no storage is involved.

### TELEVISION TRANSMITTING EQUIPMENT

Video Amplifier -The electrical signal generated by any of the pickup devices described in the preceding section is extremely weak, amounting at most to a few microwatts Before this signal can be used it must be greatly amplified. In order not to deteriorate the signal, the noise or spurious signal from the amplifier must be reduced to a minimum. As has already been pointed out, the frequency band covered by the video signal extends from frame frequency or 30 cycles to 4 or 5 mc or more and the gain of the amplifier must be constant over this hand. Furthermore, the phase shift through the amplifier must be a linear function of frequency. This requirement means that all the haimonics comprising the complex wave of the video signal must be delayed equally in time so that the signal will pass through the amplifier without distortion Compared with the ordinary audio amplifier. with a band width of 5,000 to 10,000 cycles, the video amplifier, with a band width nearly 1,000 times greater and the added requirement of constant time delay, presents some very special prob-

The amplification of the video signal is carried out in several steps At the pickup camers there is a preamplifier consisting of several stages which brings the signal level up to the point where it can be transmitted through a cable without loss in the signal-to-noise ratio. This cable carries the signal to the voltage amplifier where the level is again increased to a value high enough to actuate the viewing tube at the monitor. In this amplifier such special signals as those required to correct for shading, the synchronian signal (discussed in detail below) and the blanking signal are introduced.

After leaving the voltage amplifier the signal is again amplified to bring it to the level required by the radio transmitter which is to broadcast the picture.

Frequently this fundamental amplifier chain is supplemented by other amplifiers for practical reasons, such as location of equipment, supplementary monitoring, switching, etc.

The technical aspects of the design of the video amplifier are beyond the scope of this article and the reader is referred to the many publications on the subject for detailed information. Some of the salient features are the following the video amplifien is a vacuum tube amplifier having interstage coupling networks which are based on the circuits used in ordinary resistance-coupled amplifiers.

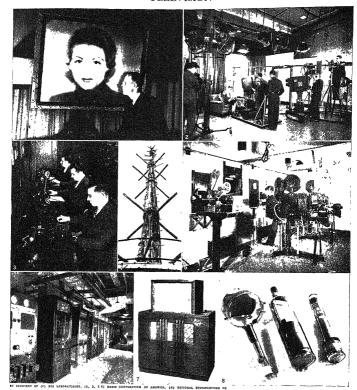

Radio Transmitter.—The television radio transmitter is simlar in principle to the conventional radio transmitter, but is modified in design in order to handle the very wide frequency band required for the video signal.

Insamuch as a band width of several megacycles is involved the transmission must be in the very-high-frequency or ultrabledfrequency region of the radio spectrum. Actually, television broadcasting in the United States in the 1950s was carried out in 2 very-high-frequency channels and 70 ultrabligh-frequency chan-

nels, each 6 mc, wide.

As with sound broadcasting, the video signal is transmitted as
a variation or modulation of the amplitude of an electrical oscillation whose frequency is constant. This frequency, who is
called the carrier frequency, determines the location of the transmission in the radio spectrum.

If the amplitude or envelope of a carrier wave is made to vary in proportion to a video signal having frequency components from to to 4\frac{1}{2}\text{ mc.} and the resultant complex wave is analyzed for its frequency content, it will be found to be composed of a band of frequencies extending from 4\frac{1}{2}\text{ mc.} above the carrier to 4\frac{1}{2}\text{ mc.} blow the carrier frequency. These two bands of frequencies, bying above and below the carrier, are known as side bands. It is sound broadcasting, the channel required would be twice the frequency band control to the frequency band control to the frequency band control to the frequency band control to the frequency band of the frequency band control to the frequency band of the band with single-side-band transmission the frequency band width of the radio channel required to transmit the carrier and one side band With single-side-band transmission the frequency band width of the radio channel required to transmit the video signal is equal to that of the video signal. This expedient is used in television

ransmission in order to make possible locating a greater number of televasion stations in a given region of the radio spectrum Ortolously the video signal modulating the carrier can be applied so hat a signal corresponding to white causes an increase in the molitude of the carrier, or so that a white signal causes a decrease in mightude. The former is known as positive modulation, the later as negative modulation. There are advantages and disadvanages to each of these systems Interference is more destructed frequery and the properties of the prop

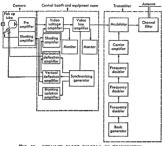

FIG 13.-DETAILED BLOCK DIAGRAM OF TRANSMITTER

ation is used in the United States and most of the rest of the vorld, while positive modulation is employed in England and in rance

The components of a typical television broadcast transmitter es shown in fig 13. The carrier frequency is obtained from a untra-crystal controlled oscillator. Inasmuch as it is difficult to btain the required high frequency directly from such an oscil-tor, the relatively low frequency output of the primary oscil-tor passes through several frequency multipliers which bring he frequency up to that specified for the carrier. The carrier is nea amphified by several sharply tuned radio frequency amplifier ages. When it has reached transmission power level it is supplied to the modulator stage where it is modulated with the video gnal. The modulated radio frequency signal then passes through filter which removes the unwanted side band. From there the gnal goes to the antenna from which it is midtated.

The antenna used for television broadcasting may be one of a umber of types. They differ from ultrahigh-frequency sound roadcasting antennas only in that they are not as sharply tuned ceause of the wide band of frequencies needed for peture transission. As in the case of the video amplifier, the great band width volved has presented many difficult problems in the development of the transmitter. It has necessitated the development of special ower tubes, designed in such a way that they are part of the axial line circuit of the transmitter with a minimum of inter-lectrode capacity so that they can be easily neutralized. For orther information in this field the reader is again referred to re literature on the subject.

Synchronization and Deflection—As has already been ointed out, the reconstruction of the television picture at the serior requires that the scanning beams of the pickup and lewing devices be in canct synchronism. Therefore, in addition providing generators which will produce the current and voltage waves needed to deflect the beams, means must be provided ar synchronizing the two.

The beams in both the iconoscope and viewing tube are deected by the magnetic field produced by electromagnetic coils in a yokes about their necks. Since the spots are required to move

at a uniform velocity across the mosalc and fluorescent screens respectively, and to return rapidly to their original position, the current wave shape supplied to the yokes must be asw-toohed, rising slowly to its maximum value and falling rapidly. The frequency of the saw-toohed were for horizontal deflection is about 15,000 cycles, for veitical deflection foe cycles (for interlaced scanning). Where the impedances of the yokes are essentially inductive the current wave shape can be obtained simply by applying a voltage pulse to them, the duration of which equals the scanning beam return time. The voltage pulse for this purpose is generated by a relaxation oscillator in combination with a suitable shaping circuit and amplifiers. Vertical and horizontal oscillators of this type are required at both the transmitter and receiver

Synchronization can be effected in two different ways. Both of them depend upon the use of a timing pulse which is transmitted

as part of the total picture signal.

One method employs a relaxation oscillator which is very sensitive to a triggering pulse during the time just prior to its generating its own pulse. The oscillator is adjusted so that its free-running speed is slightly lower than the required frequency It is, therefore, in its sensitive condution at the time of arrival of the synchronizing pulsés, so that the latter traggers it off.

The second method employs an oscillator whose output pulse frequency is proportional to the voltage applied to a control element of the oscillator. The control voltage for the oscillator is obtained by electrically comparing the time relation between the output pulse electrically comparing the time relation between the output pulse leads the synchronizing pulse. If the output pulse leads the synchronizing pulse, the control village will be in the direction to slow the oscillator requency control will be in the direction to increase the oscillator frequency

This automatic frequency control synchronizing system is less sensitive to random interference than that depending upon the

triggering action of a timing pulse.

The synchronizing signal is generated by a special circuit at the transmitter, ranged to produce a very accurately shaped pulse. This pulse is added to the video signal in the direction of black, so that the complete signal from the transmitter contains the synchronizing information Fig. 14 illustrates the wave shape of the synchronizing pulse used in the US as authorized by the Federal Communications commission. The pulse is also supplied to the deflection generator for the pickup device.

Since the synchronizing signal is in the direction of black, it can be used to bias off the scanning beams at the pickup tube and viewing tube during the return time, and thus to prevent deterioration of the picture quality by spurious lines. This procedure is known as blanking.

### TELEVISION RADIO RECEIVER

The television signal is received on a short-wave antenna and carried by a transmission line to the receiver. The antenna may be an ordinary half-wave dipole, consisting of a straight horizontal (for the horizontally polarized radiation used for television in the United States) conductor whose length is equal to one-half a wave length of the carrier. The conductor is divided in the centre and the two ends of the transmission line are connected across the break. The simple dipole just described is quite selective in response and, therefore, if the antenna is to be used to receive signals from the several channels in a television band it is advantageous to use an antenna having a broader response. Where the receiver is at some distance from the transmitters, it is frequently helpful to employ a reflector behind the dipole. The reflector used with a pair of dipoles consists of a pair of straight conductors approximately half a wave length long located between 0.2 and 0.25 wave length behind the dipole. Such a reflector increases the sensitivity of the antenna in the forward direction and reduces the effect of interfering signals coming from behind the antenna.

Where the receiver is on the fringe of the service areas of the transmitters from which pictures are desired, it may be necessary to use more elaborate antennas which have higher gain. The rhombic antenna has been found valuable for this purpose.

Care must be exercised in the selection of the antenna site, particularly in an environment of tall buildings, bridges, etc. This is because there is the possibility that radiation reflected from such structures may reach the antenna. Because of the greater distance travelled by the reflected signal, it will produce a second image displaced slightly with respect to the image of the direct signal. When such a double image, or ghost, occurs it can in general be

The audio carrier and side bands which accompany the video signal are also mixed at the converter with the sine wave from the local oscillator to form an IF audio signal. The separation between the IF video carrier frequency and the IF audio carrier frequency and the original frequency will be the same as the carrier separation of the original

radio signal, namely 45 mc. A frequent alternative is to amplify the sound signal along with the video signal in the video IF amplifier

Frequently one or more stages of radio frequency amplification precede the converter stage. This serves to increase the sensitivity of the receiver, and also acts as a shield to decrease radiation from the local oscillation through the receiving antienan.

Filters directly following the converter separate the audio and video signals and channel them into the audio and video intermediate amplifiers

From this point on the audio system is identical to that of a conventional FM receiver (see RADIO RECEIVER) and will not be discussed further in this article

The IF video signal is amplified by several stages of intermediate frequency amplification. Since the output of the converter is only a few microvolts and a signal voltage of 2 to 5 v should be available for the second

detector which follows the intermediate amplifier; the over-all gain of this amphitier must be almost 1,000,000. For an audio-frequency intermediate amphifier, this could be obtained with two or three stages; however, where an extremely wide band of frequencies is involved, the gain per stage is much lower and a well-made undeo intermediate frequency amphifier will employ five stages.

The second detector rectifies the IF video signal so that a low

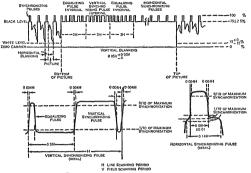

FIG 14 -- WAVE FORM OF SYNCHRONIZING SIGNAL

completely overcome by moving the antenna a few feet one way or another.

The transmission line carrying the signal from the antenna to

The transmission line carrying the signal from the antenna to the receiver may, in areas where the signal strength is great, simply be a twisted pair (similar to a twisted lamp cord) insulated with material which has relatively low electrical losses. Where the signal staggift is lower or where a very long transmission line is required, the losses in a twisted pair may be too great. Under these circumstances either a parallel

wire transmission line consisting of a pair of conductors separated by a thin ribbon of low loss dielectric or a coastal cable in the form of an inner conductor and an outer metallis sheath insulated from each other by low loss separators may be employed. The losses in the two forms of transmission line are about the same, mission line are about the same, rather expensive to install.

The radio receiver used for television is similar to the conventional superheterodyne broadcast receiver. The signal from the transmission line is modulated by or mixed with an oscillation which differs in frequency from the video carrier by 45-75 mc.

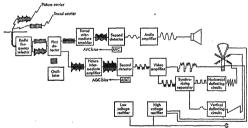

FIG. 15 .- BLOCK DIAGRAM OF RECEIVER, SHOWING WAVE FORM BETWEEN COMPONENTS

As a result of this process, a 45.75-mc. beat, modulated by the video signal, is generated. This is known as the IF or intermediate freenency video signal. The vacuum tube which performs this function is the converter or mixer. Usually a separate local oscillator-supplies the oscillation which is beat with the incoming signal, although circuits can be devised where the converter acts simultaneously as local oscillators.

pass filter (30 to 4,500,000 cycles) following it has an output wave form which exactly duplicates the original video signal which was supplied to the transmitter. The video signal includes, in addition to the information required to reconstruct the picture, pulses which are used to synchronize the horizontal and vertical deflection. These pulses are filtered out from the video signal and used to control the horizontal and vertical relaxation oscillators

of synchronization and deflection have been outlined in preceding sections.

The video signal supplied to the control guid of the viewing tube may be amplified by one or more stages of video amplification after leaving the second detector. This brings the signal level up to the value required, which langes from 20 to 100 v , depending upon the nature of the viewing tube

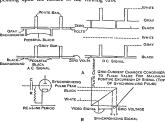

FIG 16 -D C SIGNAL RESTORATION (A) WAVE SHAPES FOR LIGHT AND FOR DARK BACKGROUND (B) RESTORER CIRCUIT

The output of a video amplifier of the type used in television is essentially an A.C wave, that is, the time integral of the amplitude over a complete frame (or several frames) is zero If such a signal were supplied directly to the viewing tube, the background level or average brightness of the reproduction of a dark scene would be about the same as that for a bright scene. This will be clear from a reference to fig 16a. However, the signal contains the information needed to determine the average scene brightness, in that the difference between the height of the synchronizing pulse and the picture signal itself is a measure of this value. Making use of this information, the picture is brought to its true brightness level by the D C restorer. In principle, the restoring circuit consists of a rectifier which charges a condenser to a voltage equal to the peak value of the synchronizing voltage, and adds the resultant D C. voltage to the picture as indicated in fig. 16b. The receiver is normally adjusted so that the synchronizing signal and the shoulder preceding and following it drive the viewing tube to cutoff (darkness) so that, during the return time of the deflection, an unwanted bright streak is not formed on the picture. Since the synchronizing signal is below the cutoff of the viewing tube this is sometimes termed "blacker than black" synchronizing The final signal from the chain of circuits described above, consisting of the picture signal with the D.C. or average brightness level added to it, is then supplied to the grid of the cathode-ray viewing tube. These tubes are described in some detail in the next section.

The receiver is provided with a number of controls which are used by the operator to adjust it to optimum performance. A channel selector switch tunes the set to any one of the several bands in the portion of the radio spectrum within which it is designed to operate. Associated with this is a fine tuning adjustment. This is of particular value in obtaining optimum adjustment of the audio channel. Controls governing the amplitude, distribution and centring of the deflection are generally semipermanent; however, vertical and horizontal synchronizing controls are frequently brought out for the convenience of the operator. The picture quality is governed by two adjustments. One of these controls the gain of the amplifier chain and is commonly (although somewhat incorrectly) called "contrast control." The second adjusts the level relative to the "black" shoulder of the synchronizing signal and is termed "background" or "brightness" control. It should be noted that this external background control does not take the place of the D.C. restorer, but is used in

which are part of the deflection generators. The basic principles conjunction with it. If it is adjusted so that a dark scene is only barely visible, the D C restorer will still cause the reproduction of a scene having a high average light level to be bright the external controls described above the receiver can be adjusted to give pictures having high entertainment and artistic values

#### TELEVISION VIEWING DEVICES

As has already been pointed out, even before World War II the cathode-ray tube had almost completely replaced all other means for reproducing television pictures The television cathoderay viewing tube consists of an electron gun and a fluorescent The gun screen enclosed in a highly evacuated glass envelope produces a narrow electron beam which is focused into a fine spot at the fluorescent screen. An external magnetic deflecting yoke driven by a deflection generator causes the spot to move across the screen in such a way as to sweep out a scanning raster. This laster is synchronized with that of the pickup device at the transmitter by methods which have already been described. The beam current and consequently the instantaneous brightness of the spot on the fluorescent screen is controlled by an aperture grid in the gun. The video signal from the transmitter is applied to this grid causing the spot brightness to vary in such a way that there is reproduced on the face of the viewing tube a duplicate of the picture at the pickup device Fig 17 illustrates the arrangement of elements in a cathode-ray viewing tube

Viewing tubes may be divided into two classes, direct-viewing tubes and projection tubes. These two types are the same in principle but differ in design for functional reasons. The directviewing tube has a large fluorescent screen on which the reproduced picture is observed directly. The projection tube, on the other hand, reproduces a small, very bright image, which can, by means of a suitable optical system, be projected onto a large screen similar to those used for home motion pictures

The guns producing the electron beam which scans the fluorescent screen in both types of viewing tubes are the same in principle as that described in connection with the iconoscope. They consist of a first lens system which includes the cathode, the control grid and the lens which forms the crossover, and a second lens imaging the crossover onto the screen. These guns. however, are required to deliver a much greater beam current than are those in pickup tubes and also to operate at a much higher voltage. This is because the power for the light produced by the screen comes entirely from the beam.

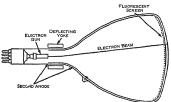

Fig. 17.—SCHEMATIC ARRANGEMENT OF ELEMENTS IN A CATHODE-RAY VIEWING TUBE

Small direct viewing tubes with screens 10 in. to 12 in. in diameter use guns operating at from 7,000 to 10,000 v. delivering a beam current of 100 µamp. or more. Larger tubes, up to 21 ft. in diameter, employ voltages twice as high and may have a screen brightness greatly exceeding that of an ordinary theatre motionpicture screen.

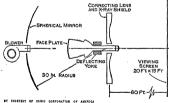

Since the brightness of a projection tube screen must be many times greater than that of a direct-viewing tube, the beam must deliver much more power. To obtain the power, the guns used are operated at a very much higher voltage. This voltage will urn from g to 50 kV, for tubes used in home receivers and may approach 100 kV. in theatre projection receivers. The beam current is also greater than that in even a large directly viewed tube. Just as with the pickup devices, the "spot" size at the screen must be small because overlapping of the scanning lines reduces vertical resolution. The very high beam current needed in viewing tubes make the spot size requirement very difficult to meet although this difficulty is somewhat reduced by the high voltage at which these purs operate.

The control characterastic of the grid in the first lens of the gun is very important. The control grid must be capable of varying the beam current from its maximum value to zero current (cutoff) upon the application of a relatively small range of voltages (e.g. 50 v.). It must present a high impedance to the driving crusts. Finally, it must be designed in such a way that the spot size is independent of beam current.

The fluorescent screen converts the energy in the electron beam into vasible light. Materials which are capable of performing this type of energy conversion at temperatures below in-candescence are known as phosphors. A great many inorganic and organic compounds are phosphors, but only a very few are at the same time sufficiently stable and efficient to be useful for television screen.

Early television screens employed natural willemate for their fluorescent sciens. This is a sinc orthositate which has a bright green luminescence under cathodo-ray hombardment. The screens were prepared by deposting a than layer of finely ground willemite on the inside glass end of the tube. As the study of phosphors progressed, it was found that synthetic will be produced with better colour, higher efficiency and more suitable characteristics. This material, though fairly suitafactory, was later replaced by zinc sulphide activators were even more efficient than synthetic willemite Furthermore, these materials can be synthesized in a variety of colours. By mixing blue and yellow sulphide phosphors in propei proportions, visually white screens can be produced.

Screens of the above-mentioned phosphors are in the form of a thin layer of the powdered material deposited on the glass face of the tube. Where the tube is to be operated at a high voltage  $(\epsilon, \epsilon, to k v, \sigma t move)$  the more surface of the screen may be covered by se extremely thin film of a light metal such as alumnum. This metal film, while dissipating some of the energy of the beam, performs a number of valuable functions. It increases the efficiency of the screen by reflecting toward the observer light is sainly

from the back of the screen which would otherwise be wasted sind also by maintaining full voltage on the screen. It increases contrast by preventing light being scattered by the inner walls of the bulb. It shields the screen from contamination during the proessing of the tube. Finally, it prevents, "burning" of the screen by loss formed along the beam path.

FIG. 18.-THEATRE TELEVISION PROJECTOR

In general, direct-viewing tubes are either mounted with the

fluorescent screen vertical so that the user sees the image on the screen directly or horizontally so that the observer may view the image reflected in a 45° mirror.

The projection tube requires a highly efficient optical system may be a reflecting system may be a conventional refractive system or it may be a reflecting system somewhat similar to the Schmidtpe objective. The latter has the advantage of greater optical efficiency since its effective aperture can be made greater than can that of a refractive system. Fig. 18 illustrates schematically a reflection-type theatte projection system. Heat the projection thus is mounted horizontally, facing a spherical mitror. The mirror images the fluorescent screen of the tube onto the viewing screen. An appear correcting lies is provided in the light path from the reflector to the viewing screen to reduce the image defects of the mirror.

#### TELEVISION BROADCASTING

A complete discussion of television program production and presentation is beyond the scope of this article. However, a few of the fundamental principles involved and the equipment required will be described.

Studio Programs.—The studio used for television programing resembles that used for sound broadcasting but is generally somewhat larger. Like the walls of a sound studio, those of a television studio are carefully treated to control reverberation. If the sound reflection is too small, the sounds picked up by the murcophones will be flat and unitareesting while if the reverbation is too great or has too long a time constant, it is difficult to obtain intelligibility.

The most important single item for the television studio is the provision for lighting. The light levels employed are fairly high, being of the order of 200 to 1,500 foot-candles incident upon the scenes being televised. Two types of lighting are required, diffuse overhead lights to provide even general illumination and spot or modelling lights to give the required dramatic effects by high lights and shadows. The overhead lights usually take the form of a large number of relatively small units right that a few large ones so as to avoid unwanted shadows. These units can be controlled in small banks to permit regulation of the amount and distribution of light in the studio. The spotlights are, in general, such that they can be located around the sets as required.

Where incandescent lights are used, they are a considerable source of heat. It is, therefore, essential to equip the studio with a large-capacity ventilating system and preferably with air conditioning. The high-intensity spotlights are usually provided with heat-shorbing filters to prevent overheating of the set by direct infra-red radiation.

The scenery and stage props used in television productions more nearly resemble those used for motion pictures than those used for the theatre. This is because the direction of viewing is strictly limited in the case of the theatre, while a movie camera or television camera may view the scene from any angle. However, the sets possess a number of properties which are distinctly characteristic of television. In general, they are simpler and bolder in their design, and depend upon over-all composition and atmosphere rather than minute detail to tell their story. The scenery must also be arranged in such a way that it can quickly and silently be changed or taken down without interfering with the view or sound of any other set in use at the time.

It is customary, in presenting a television studio production, to have all of the sets which are to be used located in different parts of one studio. This has been found to be more satisfactory than locating them in different studios, both from the standpoint of direction and of utilization of cameras. The sets must be arranged so that there is no interference between them and so that the cameras can be readily moved into all the positions required counters are used rather than a single unit. By employing more than one camera, it is possible to shift the direction of view rapidly and without interruption of the program. In particular, it permits changing from a distant view of the subject to a close-up without break. Again, when transferring from one studies set to

scene while another is being focused on a new set,

The cameras used in different studios differ in detail of design but in general are similar in principle. The pickup tube is so mounted in the camera that the objective lens images the scene dinectly on the mosaic of the tube. Usually objectives of various focal lengths will be required. For this reason turret lenses are most essential All of the lenses used must be of the same high quality as those employed in good cameras so that the optical system will not cause loss of image quality. The lenses should be fast but not excessively so because most action requires considerable depth of focus. Lens speeds between F/4 and F/7 are commonly employed.

As has already been mentioned, the camera includes such items of electrical equipment required for the operation of the pickup tube as the preamplifier and the deflecting yoke In addition to the electrical equipment associated with the pickup tube, motors are frequently provided for moving and raising the camera. Also, electrical communication means are arranged so that the camera operator is at all times in contact with the control 100m and program director

The camera must be equipped with an accurate view finder. Not only should it permit exact framing of the picture, but also it should indicate the sharpness of focus of the objective over the range of distances for which the camera is to be used. The widely used monitor-type view finder fulfils these requirements.

In order to ensure maximum versatility of the camera, it is mounted on a stlent, smooth-running dollie. Some are motor driven, but many are moved by hand Means for raising and lowering the camera are provided, as well as for tilting and rotating (panning) it about a vertical axis.

The microphones used for television resemble those used for sound motion pictures rather than broadcast microphones Boom microphones are employed which can be located directly over the actors without showing in the picture.

A great many special techniques have been developed for program production These combine modifications of motion-picture and theatre practice with new methods worked out especially for the television art. Like motion pictures, the stage set can be viewed from all directions and distances. Also, transfers can be made from one set to another without appreciable time delay, However, unlike motion-picture production, once the action has started it must continue smoothly and without interruption for the entire program-there can be no "retakes" or breaks in the sequence. Studio plays can frequently be effectively supplemented by scenes from motion-picture films This adds range and scope to the production without detracting from the almost undefinable spontaneity obtained with live talent. Model sets, animated figures and puppets can also be very effectively used

The variety of subject matter suitable for studio programs is very large indeed and includes plays, operas, musicals, variety acts. quiz programs, news and interviews and courses of instruction, to name only a few of the possibilities. It is very necessary to maintain close coordination among the various elements making up the production. For this reason a control room is usually located adjacent to the studio, containing the monitoring equipment and also having a large window overlooking the studio. The program producer and control operators are able to see the studio action directly through the window and at the same time watch the reproduced pictures from the several cameras on viewing screens of the monitors These directors are in communication with key individuals at the cameras and set by means of interphones and are thus in a position to supervise the entire production.

Film Pickup.-Material recorded on motion-picture filmseither special shorts or full-length feature films-is used extensively in television broadcasting. Obviously it is important to be able to use standard motion-picture film for this purpose, rather than special film. Otherwise the expense of recordings would seriously curtail their usefulness. Standard motion-picture film runs at 24 frames per second, and in order to prevent sound and action distortion, it must be used at this speed in television transmission. Therefore the problem exists of designing a projector

another, one camera can transmit the closing portions of one which permits the television transmission of 30 frames per second of a film running at 24 frames per second.

second of a him running at 24 Itames per second.

The most practical solution to this problem is a method which depends upon the storage properties of the teconoscope. A motion-precure projector is arranged to project an image of the film onto the mosaic of the teconoscope. A rotating shutter allows the picture to be flashed onto the mosaic country of the second The flash occurs during the return time of the seaning pattern (note the electron beam and teconoscope is biased to zero current during the relumn timely the return time of the seaning pattern (note the electron beam and teconoscope is biased to zero current during the relumn timely timely the relumn timely to the relumn timely timely the relumn timely timely to the relumn timely timely the relumn timely timely to the relumn timely tim duration is somewhat less than the return interval During this period unation is somewhat less than the return interval. During this period a charge image is accumulated on the mosaic. As the beam scans the mosaic, it converts this charge image into the video signal, the mosaic being in darkness during this time. The intermittent of the motionbeing in darkness during this time. The intermitting of the motion-picture machine is so constructed that every other frame remains in front of the lens 50% longer than the intervening frames Thus, one frame is before the lens a sec and is used for three flashes, and the next 2 sec, and is used for two flashes. It will be seen that the total time for two frames is a sec which equals the normal running time for two frames at 24 frames per second

uer wor trames at 24 trames per second
Unsully more than one projector is repensably arranged so that the

Outside Pickup .-- A great deal of very interesting television material is to be found in events occurring outside of the studio Some of them are scheduled, such as sporting contests, public celebrations and exhibitions Others, however, are spot occurrences which cannot be accurately predicted

The equipment required for this service includes, in addition to one or more cameras, monitoring units and means for relaying the picture to the central control room and main transmitter Suitable sound nicrophones must be provided to supply the sound which accompanies the picture and also a two-way communication system between the camera operator and the central control room

camera operator and the central control room.

The camera used for outside pickup must be capable of much higher sensitivity than those for studio. Therefore portable cameras are presented to the control of the contr lack of light With tubes such as the image orthicon this does not occur because the camera can continue to "see" almost as long as the human eve.

The cameras are of course made as compact and lightweight as possible so that they can be easily moved into position. A cable connects them to the monitor and relay transmitter. These may take the form of a number of small manually portable units which can be carried to almost any location When reduced to such small dimensions some same time made in performance and operating flewibility. However, units of this type are capable of providing high-quality television

DEADLESS the control and monitoring equipment used for such pickup may be very complete to provide for maximum flexibility. One very practical mobile unit which has given excellent service over a number of years may be described as an example. The equipment is housed in power generators, while the other includes the control and monitoring equipment for several (ameras and the cameras themselves. The equipment for several cameras and the cameras themselves. The cameras can be mounted on top of the video truck if desired, or can be located away from the truck and connected to it by cable. In the video truck are racks containing sight and sound monitoring equipment, cor-recting controls, synchronizing equipment, hine amplifiers and provi-sions for the intercommunicating system both to the cameras and to the main control room at the broadcast transmitter.

The transmitter truck contains all the equipment needed for an ultrahigh-frequency relay transmitter, including a highly efficient collapsible antenna. This transmitter is capable of maintaining good serva-

lapsible antenna. This transmitter is capable of maintaining good service over many miles

Television Networks.—As the television art develops, the prob-Television Networks.—As the television art develops, the proportion of chaining a number of stating of relaying programs over large distances will come increasingly into the foreground. Two means are available for forming ledevision networks. One of these is a chain of radio relay links, the other wise-frequency-band coaxial cables are used, each link consists of a receiver and transmitter which there exp the television signal from the preceding station and retransmit it to the one following. These transmitters and receivers are highly directional and operate at a much higher frequency than television becomes the early stages of television chaining, it there is every reason to believe that eventually they will be completely automatic.

Coaxial cables have also been found to be very satisfactory for inter-connecting television stations. The initial cost of installing cables for

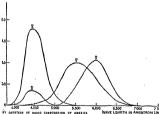

this purpose is high but, once installed, the operating expense and maintenance are low

In the years prior to and following World War II a great deal of in the years prior to and one-lowing world wat it a great dead or experimental work was done on both types of television chains. By the 1950s a network of coaxial cables and microwave links covered virtually all of the United States Television networks had also been established in England and in continental Europe

Colour Television .- An obvious goal of television is the obtainmed 4 a. 1 the commentation of the commentatio ing of a bright, high-definition picture in natural colours. Numerous methods of achieving this result suggested themselves to early workers

blue-sensitive centres.
The presence of on the tree types of sensory centres in the ere nake.
The presence of only three types of sensory centres in the ere nake.
The presence of the content, its green content and its blue content.
These colour components may be separated out, x.e., by passing the light from the object through appropriate red, green and blue filters.
original colour of the object. Strainfly, if the light flux passed through the filters falls on three photocolls, dectrical signals are generated which measure the red, green and blue content of the light.

There signals may be transmitted to another location and be employed there to reconstitute the original colour by controlling the excitation of red, green and blue phosphors in the proper proportion or of

BY COURTESY OF BASIC CORPORATION OF AMERICA FIG. 18,--INTERNATIONAL COMMISSION ON ILLUMINATION TRISTIMULUS SPECIFICATION OF SPECTRUM STIMULI. THE SPECTRAL RESPONSES OF THE SENSORY CENTRES OF THE AVERAGE HUMAN EYE MAY BE REGARDED AS LINEAR COMBINATIONS OF THE THREE CURVES

the same white phosphor, provided that appropriate red, green and blue filters are interposed between the phosphor and the wavevr. In all cases, the light elicited by the three signals is added to form the desired colour. The addition may take place by projection of the three lights in superposition on a screen; by placing the different-coloured brosphore demants as close together that they are not resolved by the

eve (a procedure similar to that employed in three-colour printing); or by presenting the three colour components in such rapid succession to the eye that persistence of vision merges them into a single sense impression

The last method is employed in the field-sequential system with red, green and blue filters rotates in front of the camera tube in synchronism with the field scan, so that picture signals corresponding to synchronism with the held scan, so that pacture signals corresponding to a red, a green and a buc component field are generated in succession a red, a green and a buc component field are generated in succession through a second filter disk or drum, rotated in exact synchronism with the disk at the transmitter. The viewer thus sees a red, a green and a blue component field of the scene televised in such input succession that the fields merge to form a shighe natural-colour preture of

The field-sequential system would require the threefold frequency band width to transmit a picture with the resolution and freedom from fincker characterizing black-and-white television. In order to ac-6-mc channel, the 1950 standards reduced the line number to ac-6-me channel, the 1950 standards reduced the line number to 495, the repetition site of a complete colour picture to 24 pictures per second, ably even more serious than this logs in picture quality was the lack of 'compatibility' of the field-sequential system. Since both is field frequency (144 instead of 60) and its line number (ago instead of 25) visual serious control of the with obsolescence if colour broadcasting would get under way on a large scale

large scale
An early realization of these difficulties led RCA to the development
of its simultaneous, compatible colour system, which uses the signal
amount of its simultaneous, compatible colour system, which uses the signal
arrangement for transmitting and receiving signals under these standards. With this compatible system a colour broadcast is received by
a colour receiver in natural colour and by a standard black-and-white
receiver in the proper half tones, with undaminabled resolution. This is
superposition. The frequency components of the colour signal are all
odd multiples of half the frame frequency. Consequently, they reverse
polarity in successive frames and have no effect on the brightness of
the picture averaged over two successive frames. The viewer of a
proper high highs and half forms in the picture, undisturbed by the
presence of the colour signal. In the colour receiver, on the other hand,
a special colour dector regenerates difference signals between the red,
green and blue component picture signals and the brightness signal,
dations of the brightness signal and the difference signals, family, yields
knescope, reproduce the televised scaes in natural colour on the viewing
screen. An early realization of these difficulties led RCA to the development

Fig. 20 shows the simultaneous generation of the red, green and blue component segnals by three camera tubes, an optical beam splitter serves to project the red, green and blue component pictures of the scene to be televised on their photosmatric surfaces. Industrial Television .- Television has been considered chiefly as a means for the distribution of visual entertainment and instruction from a central station. This is only one, though a very important one, of its functions More generally, television finds application whenever the best vantage point for whenever the best vantage point for the observation of a process of an object is not readily accessible. The maccessibility may be the result of remoteness or the inability of one observer to be in two or more places, of cramped quarters or the impossibility of many observers being at the same spot, of danger to life and limb or of discomfort resulting from excessively high or low temperatures, or it may be a matter of economy of time and effort In of economy of time and effort all these instances it becomes advantageous to place a television camera at the best vantage point and to link it to one or several receivers located at the most convenient points for observation. The to cover all such closed-circuit applications, in brief, virtually all forms of television apart from broadcast television

It is of interest to list a few of the es to which industrial television

had been put in the 19505.
In industry the remote observa-In industry the remote observation of furnaces and gauges in power

In commerce sales exhibits in department stores, surveillance of
banking activities, plant demonstrations for stockholders' meetings
In education distribution of demonstration factures to several
classes, closs-range viewing of experiments by large groups, demonstraclions with the microscope and micromanspulator, observations of Surgicial
operations, eventually also in colour or in three dimensions, by medical
students and visting physicians, viewing of feld manoeuvies by army

In research: study of biological microspecimens with enhanced contrast and with (e.g., ultra-violet) illumination to which the eye is meanitre, acceleration of routine measurements such as blood counts, observation of combustion processes; handling of radioactive isotopes

The major differences between industrial and broadcast television equipment reside in the camera and camera control. The industrial telesion camera must be compact, mexpensive, rugged and easy to operate.

value assume a must be compact, incremeity-rusgical and easy to convoice the plan plane and plan

located as much as 3,000 ft. from the control unit In combination with a light microscope, the Vidion camera forms a "television microscope," which presents pictures of a microscope, eventually with electronically enhanced contrast, on a large viewing screen. With special ultra-violet-enesitive Vidicous this permits the direct viewing of finest structural detail with ultra-violet illumination of direct viewing of finest structural detail with ultra-violet illumination. A simplified version of an industrial television system, the "TV byc," detailed power and desictions signals for the Vidion camera from a detailed power and desictions signals for the Vidion camera from a standard receiver, greatly reducing the cost of the system.

Several manufacturers produced field-sequential colour television chams with wide transmission channels (to or 18 me for example) to give the required high resolution. These have found use, in particular, in the transmission of surgical operations. Stero techniques have been found useful in the same application as well as in the manipulation of radioactive materials.

lation of radioactive materials

TELFORD, THOMAS (1757–1824), British evil enginer

TELFORD, THOMAS (1757-1844), British cutl engener was born at Westerkirk in Eakchle, Dumfriessher, Aug 9, 1757. At 15 he was apprenticed to a stonemason. He studied in his spare time, and published verses in the local prees In 1750 he want to Edinburgh, where he was employed in the erection of houses. In 1730 he was appointed engineer of the Ellesmer canal, for which he built the Chrk and Pont-y-Cysyllte aqueducts, and this work established his reputation as a canal engeneer.

Telford was commissioned by the British government to report on the improvement of communications in the Highlands of Scolland. He was appointed engineer for the Caledonian canal and for the construction of 20 min. Or roads, a great part through difficult country. He was employed on the improvement of the road between Carlisle and Glasgow, on plans for a system of roads through the more inaccessible parts of Wales, which included the magnificent superson bridge across the Menal straits, and the Conway bridge. The fisheries and industries of Scotland benefited by the improvement in the effected at many of the harbours, and list has been of procleanly work was more than the contract of procleanly work was more than the contract of the contrac

Clandon, 1949).
TELL, WILLIAM. The story of William Tell's skill in shooting at and striking the apple which had been placed on the head of his httle son by order of Gessler, the tyrannical Austrian ballist of Uri, is so closely bound up with the legendary history of the origin of the Swits confederation that they must be considered together. Both appear first in the 19th century, probably as resclie-of the war for the Toggenburg mehrenne (1446-59) class as resclie-of the war for the Toggenburg mehrenne (1446-59) class of China of Zirich, favoured the circulation of stories which assumed that Swis freedom was of immemorial antiquity, while, as the war was largely a struggle between the civic and rural elements in the confederation, the notion that the (tural) Schwyarrs were of Scandinavian descent at once separated then from and trassel them above the German inhabitation of the town.

The Tell story is first found in a ballad, the first nine stanzas of which (containing the story) were certainly written before 1474. It is probably to this that Melchior Russ of Lucerne (who began his Chronicle in 1482) refers when he excuses himself from giving the story. He narrates how Tell then stirred up his friends against the governor, who seized him and took him by boat to his castle on Lake Lucerne. A storm arose and Tell, on account of his great strength, was given the rudder, on his promise to bring the boat to land. He steered it toward a shelf of rock, called in Russ's time Tell's Platte, sprang on shore, shot the bailiff dead with his crossbow and, returning to Uri, stirred up the strife which ended in the battle of Morgarten. In these two accounts, which form the basis of the Uri version of the origin of the confederation, it is Tell who is the leader. We first hear of the cruelties of the Austrian bailiffs in the forest districts in the Bernese Chronicle of Conrad Justinger (1420), who makes no allusion to Tell. The Tell story and the "atrocities" story are first found combined in a manuscript, the White Book of Sarnen. They are contained in a short chronicle written between 1467 and 1476, probably about 1470, and based on oral tradition.

The task of smoothing away inconsistencies and rounding off the tale was accomplished by Giles Tschudi (q.v.), whose re-

cension was closely followed by Johannes von Müller in his History of the Confederation (1780) The final recension of Tschudi's Chronicle (1734-36), which differs in many particulars from the original draft preserved at Zurich, tells how Albert of Austria, in order to deprive the forest lands of their ancient freedom, sent bailiffs (among them Gessler) to Uri and Schwyz Their tyranny resulted in a 11sing, planned at the Ruth, on Nov 8, 1307, and led by Werner von Stauffacher of Schwyz, Walter Furst of Uri. Arnold von Melchthal in Unterwalden, each with ten companions, among whom was William Tell, to expel the oppressors On Nov 18 the Tell incident takes place (described according to the White Book version), and on Jan 1, 1308, the general rising. Tschudi thus finally settled the date, which had before varied from 1260 to 1334 He distorts the historical circumstances In his first draft he speaks of the bailiff as Gryssler -the usual name up to his time, except in the White Book and in Stumpff's Chronicle of 1548-but in his final recension he calls him Gessler, knowing that this was a real name Later writers added a few more particulars Johannes von Muller (1780) described the oath at the Ruth by the three (Tell not being counted in), and threw Tschudi's version into a literary form. Schiller's play (1804) gave the tale of a world-wide renown.

The general result of the researches of various students, J E Kopp, Vischer, Rochholz and others, has been to show that a mythological marksman and an impossible bailiff bearing the name of a real family have been joined with confused and distorted reminiscences of the events of 1245-47, in which the names of many real persons have been inserted and many unauthenticated acts attributed to them. T. von Liebenau has, however, shown (in an article reprinted from the Katholische Schweizerblatter in the Bollettino Storico della Svizzera Italiana for 1800) that in 1283 the Emperor Rudolf of Habsburg gave the right of receiving the tolls for escort over the St. Gotthard pass to his sons, the dukes of Austria The levying of these tolls gave rise to various disputes between the men of Uri and the bailiffs of the dukes of Austria and by 1319 (if not already in 1309) the claim to levy them was given up. These facts show (what could not hitherto be proved) that at the time when legend places the rising of Uri, Tell exploit, etc., the dukes of Austria really had disputes with Uri

The alleged proofs of the existence of a real William Tell in Uri in the 14th century break down hopelessly '(1) The entries in the parish regardst 2,0 at to the Tell chape's (2) That in the "hollow way" near Kussnacht was not known to Melchior Russ and is first mentioned by Tschudi (1572). (b) That on Tell's Platte is first mentioned in 1504 The document which alleges that this chapel was built by order of a Landsgemeinde held in 1388, at which 114 men were present who had been personally acquainted with Tell, was never heard of till 1750. The procession in boats to the place where the chapel stands may be very old, but is not connected with Tell till sout 1582. (c) The chapel at Bürglen is known to have been founded in 1582.

In general see two excellent works by Franz Heinemann, Tell Leonographie, reproductions, with text, of the chief representations of 'fell in art from 150' onward (Luceme, 1502), and Tell Bibbog aphie, (including that of Schiller's play), published in 1508 at Bern. See also W. Vischer, Die Soge von der Befreium 1508 at Bern. See also W. Vischer, Die Soge von der Befreium with a volume of documents 1250-1213 (Heilbronn, 1877); and P. Lang, Die Schweis, Fellipsiel (1524). (W. A B C; X)

TELLICHERRY, a seaport in the Malabar dustict of Madras state, republic of India, on the Southern milway between Cannanore and the French settlement of Mahê. Pop. (1957) do, oc. 0. It is healthful and picturesque town, built upon a group of wooded hills running down to the sea, and is protected by a natural breakwater of rock. It is the seat of the Government Brennan college, connected with Madras university. Ships are able to anchor z mil from the shore. The port has a pier and sea wall and can be used during the monsoon. Tellicherry was at one time defended by a strong mud wall and the old fort still stands north of the town. The East India company established a factory there in 1635 for the pepper and cardamont trade. For two years

(1780-82) the town withstood a siege by Hyder's general, and in the subsequent wars with Mysore, Tellicherry was the base for the ascent of the Ghats.

TELLURIUM, a chemical element and the third member of the sulphur family (symbol Te, atomic number 22, atomic weight 127 foi). It is a complex element, having eight stable isotopes with mass numbers, atranged in order of decreasing abundance, as follows 120, 128, 126, 125, 124, 123, 122 and 120. There are 14 artifically produced unstable isotopes, 4 of which have nuclear isomers. Unstable isomers of two of the stable isotopes have been produced. The United States Atomic Energy commission listed the following sotopes as available for distribution. Tell' 105 days), Tell' (12 days). Tell' (12 days). There are six electrons (52°, 59°) in the outermost man level.

In 1780 F J Muller von Renchesstein, in examining Transylvanuan gold marenls, suspected the presence of a new element in Westgolders and called it metallism problematicum or aurum poradoxum. In 1798 M H Klaproth extracted the element from the crude muneral and established its identity, giving the first differentation between the new element and antimony with which it had been confused. He named the element tellurum. It was not until 1832 that J J Berzelbus made a careful study of the chemistry of

the element

Occurrence.-Although widely distributed, the estimated percentage in the earth's crust is only 10-9. Rarely found as native tellurium, it commonly occurs as tellurides of copper, lead, silver, gold, iron and bismuth Typical minerals are sylvanite, (AuAg)-Te4, calaverite, AuTe2, muthmannite, (AuAg)Te, krennerite, (AuTe2), petzite, (Ag2AuTe2); tetradymite, Bi2Te2S, rickardite, CueTe, melonite, NiTe, and altaite, PbTe. Less common are the tellurites, telluric ochre, TeO2, durdenite, Fe2(TeO2)2 4H2O, and tellurates as montanite, Bi(OH), TeO, and ferrotellurate, FeTeO4. The tellurides occur with the sulphides of copper, silver, gold and nickel. Red tellurium sulphur of Japan contains 99 76% S, o 17% Te, o o6% Se and o or % As. Tellurium minerals are found in the United States, Canada, Mexico, South America, Sweden, central Europe, Northern Rhodesia, the U.S.S.R and Japan. The chief sources of tellurium are the slimes from copper and lead refineries and flue dusts from processing of telluride gold ores

Methods of Production .- The crude copper anodes used in the electrolytic refining of copper contain a high percentage of selenium and tellurium which was present in the ore. Upon electrolysis of the copper, the selenium and tellurium and other valuable elements (gold and silver) settle in the electrolyte as anode mud. Although procedures for the recovery of tellurium are not identical in this and other types of residues, the general principles include fusion with sodium carbonate and nitrate or extraction with sodium hydroxide, neutralization of the water solution of sodium tellurite to form precipitated tellurium dioxide and, finally, dry reduction of the tellurium dioxide by means of a mixture of flour and borax to form molten tellurium. An alternative method includes solution of the dioxide in hydrochloric acid and reduction with sulphur dioxide to form precipitated tellurium Tellurium appears on the market in the form of bars, as ground crystalline tellurium or as dry precipitated powder. Some tellurium has been redissolved in nitric acid (specific gravity 1.2) and crystallized as basic nitrate

Physical Properties .- Tellurium is a brittle, silvery white, metallic substance with density 6 24; it melts at 449.8° C and boils at 1,390° C.; its hardness is 2.3 (Mohs). It crystallizes in hexagonalrhombohedral prisms and is isomorphous with the stable gray modification of selenium Its allotropy is less well defined than that of either selenium or sulphur. It was presumed that amorphous and crystalline modifications of tellurium existed X-ray defraction has shown that precipitated tellurium is not amorphous but crystalline (hexagonal). Colloidal preparations are easily made by reducing dilute solutions of telluric acid with hydrazine or sulphurous acid, with or without protective colloids. Alpha particle bombardment of tellurium produces Xe132. The vapour of tellurium at the boiling point is diatomic Te2. Tellurium vapour lamps containing also mercury provide almost a continuous spectrum which approaches the characteristics of daylight. Transmission is in the red (7,200-5,950 A) 14.5%, yellow (5,950-5,650 A) 21-KK

22 5%, green (5,650–4,950A) 56% and blue (4,950–3.500 A) 7%.
Chemical Properties.—Tellurum occurs in Group VI of the
periodic system with oxygen, subphur and selenium. In the second
long series of 18 elements, it hes between antimony and iodine. Although strongly electronegative, tellurum is less so than selenium,
sulphur or oxygen. Tellurum exhibit valence states of −2, +2,
4 and +6 These are illustrated by (−2) hydrogen telluride
and the tellurides, (+2) tellurum monoxide and tellurum dichloride, (+4) tellurum dioxide, telluride and the tetra haldes, (+6) tellurites and the
tetra haldes, (+6) tellurium trioxide, telluric acid, the tellurites
and the hexafluoronde.

Compounds,-Hydrogen telluride (H2Te) is prepared by the action of hydrochloric acid on aluminum or magnesium telluride or by action of water on aluminum telluride (Al<sub>2</sub>Te<sub>3</sub>) Pure H<sub>2</sub>Te is reasonably stable but dry or moist reacts readily with oxygen to form elemental tellurium and water. Both melting and boiling points of H2Te are lower than those of water and H2Te is less polar Its solubility in water is at least o on moles per litre at 760 mm pressure. Hydrogen telluride is both a stronger reducing agent and a stronger acid than either hydrogen sulphide or hydrogen selenide The respective constants for the primary ionization of H2S, H2Se and H2Te are 1 15×10-7, 1 88×10-4 and 2 27×10-3 Like H2S and H2Se, H2Te has a very disagreeable odour and is very toxic. Sodium telluride (Na2Te) is prepared by a direct combination of sodium and tellurium in liquid ammonia; an appropriate excess of tellurium dissolves the precipitated Na2Te and yields a polytelluride (viz , Na2Te1-Na2Teb) Hydrogen telluride may be added to aqueous solutions of sodium hydroxide to form NaHTe or Na2Te Air or oxygen must be excluded since oxidation will cause complete precipitation of tellurium. The +2 valence is illustrated by tellurium monoxide (TeO) and tellurium dichloride (TeCla). The former is prepared by heating tellurium sulphite in vacuum at 200° C, the products being tellurium monoxide, TeO, and sulphur dioxide, SO2 Tellurium dichloride is prepared by the direct union of chlorine and tellurium, an excess of chlorine yielding the tetrachloride,  $TeCl_4(+4 \text{ valence})$ . Similar iodides and bromides have been prepared. All are solids at 25° C. The tetrachloride and the tetrabromide melt at 214° and 380° and boil at 414° and 421° C respectively The chlorides or bromides react rapidly with water according to the following type reaction, 2 TeCl2+2H2O=TeO2+ 4H++4Cl- Although only slightly soluble in water, tellurous acid, H2TeO3, and its salts are known. Ionization constants have been reported for tellurous acid;  $K_1 = 2 \times 10^{-3}$  and  $K_2 = 20^{-8}$ . Dissolved in strong acids,  $TeO_2$  forms the positive ion (TeOOH)+. The alkali tellurites are subject to air oxidation at elevated temperatures

Tellurium dioxide can be prepared by heating the trioxide above its melting point but is most commonly prepared by the ignition or neutralization of tellurium basic nitrate, 2TeO2.HNO3. The hexafluoride, telluric acid and the tellurates illustrate the +6 valence for tellurium. Contrasted with the other halides, the hexafluoride has a much lower melting and boiling point, -37 8° and -38 9° C respectively, and a much higher heat of formation, 315,-000 cal Othotelluric acid (HaTeOs) is easily prepared by the chromic acid oxidation of tellurium basic nitrate or the hydrogen peroxide oxidation of an acid solution of tellurium dioxide. A solubility curve for telluric and shows H:TeO4.6H2O the stable form below 10° C. and H2TeO4 2H2O the form crystallized above 10° C. Salts of the hypothetical acids pyrotelluric, H2Te2O7, and tetratelluric, H2Te4Om, are known Orthotelluric acid loses water upon heating. Conversion to tellurium trioxide, TeO3, is complete at 300° to 360° C. The conversion to metatelluric acid, HaTeO4, is considered doubtful. If orthotelluric acid is heated in a closed tube at 140° C., a viscous liquid, allotelluric acid,  $(H_2TeO_4)_{\eta,\eta}=c.$  2.9, is formed. Presumably the transition point between orthotelluric and allotelluric acid is 131° C. Allotelluric acid is a relatively strong acid and exhibits properties quite different from those of the ortho acid. It is soluble in alcohol and separates sulphur from sodium thiosulphate. Upon standing, aqueous solutions hydrolyze and form orthotelluric acid, HaTeOs. Two new acids have been reported, HeTeCle.2H2O, citron yellow, and HeTe-Bre, red. Both tellurites and tellurates form co-ordination compounds such as ammonium ditelluratohexamolybdate, potassium chromotellurate and ammonium triarsenatotellurate

Organic compounds vary in complexity from the relatively simple alkyl tellurides to the more complex cyclic compounds which contain tellurium in the ring There are simple aliphatic com-pounds of the types, R<sub>4</sub>TeX<sub>2</sub>, R<sub>4</sub>TeX and RTeX<sub>3</sub> Among the aromatic derivatives there are types R2Te, R2Te2, RTeR' J A. N Friend gave an excellent review of organic compounds of tellurium and their preparation

Uses .- Although comparatively large supplies of tellurium are available no single use has been developed which creates large demand for this element Early attempts to use tellurium in metallurgical products seemed to indicate that the addition of tellurium to the alloys of aluminum, tin, certain steels and cast iron gave undesirable properties. Apparently too much was added, for it has been reported that small concentrations of tellurium in aluminum alloys increases ductility, in tin alloys increases the hardness and tensile strength and in stainless steels increases the machinability. Appreciable increase in the depth of chill in iron can be obtained by addition of minute amounts of tellurium. The addition of 0.05% Te to lead increases its resistance to corrosion. In manganese-magnesium alloys tellurium increases resistance to corrosion. Tellurium has been used as a brightener in certain plating baths. A beryllium-copper-tellurium alloy has been reported. Selenium-copper and tellurium-copper alloys used to make arc tips for electric contacts possess antiwelding properties. Selenium and tellurium in copper or copper-rich alloys improve machinability without producing "hot shortness" Both are used in preference to sulphur. In tin-rich alloys like Babbitt metal the addition of tellurium refines the grain structure, aids casting and improves physical properties at high temperatures. Tellurium in hydrogenation and cracking catalysts, used for conversion of heavy oils to motor fuels, reduces carbon formation. The addition of o 1% to 2%. tellurium in rubber compounding improves resistance to heat, oxidation and abrasion and increases resiliency. Some organic tellurium compounds have germicidal properties and diethyl telluride possesses antiknock characteristics. This latter use has not been important since it is accompanied by a disagreeable odour Zinc tellurite has been patented as an antifouling paint. Tellurium has been used to a limited extent in colouring glass or porcelain, large colloidal particles giving a blue colour, small particles a brown colour and telluride a red to red-violet colour. Acid solutions of dioxide have been used as a dip for silver ornaments, giving a "platinum finish" to the metal. Soluble tellurium compounds are used in toning baths in photography. There are no common therapeutic uses for tellurium or its compounds at present. As little as 1 mm(micromole) of tellurium taken into the human system gives the breath a penetrating garliclike odour, which may appear in less than half an hour after the ingestion of the tellurium Although not well documented, 2 g. of tellurium as sodium tellurite may be a lethal dose. The use of colloidal tellurium as a fungicide and insecticide in wood preservation has been reported. This had not become common practice by mid-century.

In the 1940s and 1950s a variety of articles were published in technical journals on such topics as effect of tellurites on pyruvic dehydrogenase, catalyst in Kjeldahl digestion, effect on electrodes for the electrolysis of sodium chloride, grain growth of chromium steel, effect on hydrogen absorption by steel, effect on iron car-" bonyl, tellurites as poisons for enzymes, solution of tellurium mirrors by free radicals and the catalytic hydrogenation of shale oils. However, no new use was reported which would contribute to large-scale consumption of tellurium or its compounds.

Analytical.-Like selenium, tellurium is easily precipitated from dilute hydrochloric acid solutions by reducing agents such as sulphur dioxide or hydrazine hydrochloride. Two common reactions are used for the separation of tellurium from selenium; red selenium is precipitated from strong hydrochloric acid solutions, by sulphur dioxide, tellurium is not. Upon separation of the selenium by filtration, the solution is diluted and the tellurium precipitated by further addition of sulphur dioxide. The fusion of selenium and tellurium with potassium cyanide forms potassium selenocyanate. -KCNSe, and potassium telluride, KaTe, Bubbling air through a water solution of this mixture precipitates elemental tellurium. The addition of potassium iodide to a dilute acid solution of tellunum precipitates tellurium tetraiodide, TeI4, which is soluble in an excess of potassium iodide, forming K2TeIs Tellurium is commonly weighed as the element

Tellurous acid may be oxidized to tellurate by potassium permanganate. Tellurates are reduced quantitatively by titanous chlorade

TELPHERS: see MONORAILS AND TELPHERS

TELUGU, one of the five great Dravidian languages. The Telugu-speaking peoples occupy an area beginning north of Madras city and extending northwest to Bellary, where Telugu meets Kanarese, and northeast to near Orissa In many respects it occupies an independent position and can be characterized as the only descendant of the Andhra dialect of Old Dravidian.

See Bishop Caldwell, Comparative Grammar of the Dravidian Lan-uages, and Linguistic Survey of India, vol iv (1906). TEM, a people in northwest Dahomey speaking a language related to Kokomba. They live in extended family groups in com-

pounds in villages surrounded by a defensive wall. TEMBU (Ama-Tembu), a powerful Kaffir tribe, which has given its name to Tembuland, a division of Cape Colony southwest of Griqualand East. They are traditionally descended from Tembu, elder brother of Xosa, from whom most "Kaffirs" claim

TEMENOS, the Greek term in archaeology given to the enclosed sacred area around a temple or sanctuary

TEMPE, VALE OF, the ancient name of the gorge, through which the Peneus river (mod Salambria) reaches the sea from the plain of Lower Thessaly. Greek legend attributed this chasm to Poseidon; before it was riven, between Olympus and Ossa, Thessaly was a lake. It is about 41 mi. long, and toward the middle of the pass, where the rocks are highest, the precipices in the direction of Olympus fall steeply to the stream, but those which descend from Ossa are the loftiest, for they rise in many places not less than 1,500 ft. from the valley. It was a position easily defended, but has often offered a practicable entrance to Thessaly from the north; a number of castles (of which the ruins still exist) were built at different times at the strongest points. The mediaeval road follows sometimes one bank, sometimes the other; the railway is wholly north of the stream. Being still forested, with numerous lateral valleys, the gorge is unusually picturesque for Greece its beauty was famous in antiquity. Tempe was sacred to Apollo, to whom a temple was erected on the right bank. Every ninth year a sacred mission visited the valley to pluck laurel for the chaplets for the Pythian games.

TEMPERA, the name given to the painting processes in which the medium employed is an albuminous, gelatinous or colloidal material. Practically, this is equivalent to saying that any painting process in which a vehicle or binding material other

than oil is employed is tempera.

Alter a could be the first and the st

History.-The earliest known painting was undoubtedly of this nature. The wall paintings of ancient Egypt and Babylon and those of Mycenean Greece, as well as the mummy cases and papyrus rolls in the first named country, were executed in some form of tempera. The same is probably true of the wall paintings in Italian tombs. Yolk of egg, either alone or with the addition of a little vinegar, was the vehicle most generally used, but Temperance and Prohibition Organizations—In 1888 a temperance society was founded at Saratoga, NY, and nn 1813 the Massachusetts Society for the Suppression of Interperance and et as appearance. These seem to have been the entimerance and the sage and the superance and the sage and the same and the sage and the device of a pledge of abstunence had been introduced in 1800. The movement made rapid progress, manely under the influence of the churches In 1806 the American Society for the Promotion of Temperance was founded in Boston, and by sight there were 6,000 local societies in several states with more than 1,000,000 members. The campaign was, for the most part, directed against the use of distilled spirits only, and the proposal to include all alcoholic dranks in the pledge of total abstunence, though adopted by a few societies, was rejected in 1833 by the American society, but accepted in 1836 and retained thereafter

In Europe the earliest organizations were formed in Ireland A temperance club is said to have been started at Skibbereen in 1818. and others followed, but it was in 1820 that the organized movement began to make effective progress with the formation of the Ulster Temperance society By the end of that year there were 25 societies in Ireland and two or three in Scotland In 1830 the movement spread to Yorkshire and Lancashire, and supported a newspaper called the Temperance Societies' Record, according to which there were then 127 societies with 23,000 paying members and 60,000 associated abstainers. In 1831 the British and Foreign Temperance society was founded in London with the bishop of London (Charles Blomfield) for president and Archbishop John Sumner for one of the vice-presidents This important society, of which Queen Victoria became patron on her accession in 1837, came to an end in 1850, when the whole cause was under an eclipse The most remarkable episode in the temperance campaign at this period was the mission of the Rev. Theobald Mathew of Cork, commonly known as Father Mathew, greatest of all temperance missionaries He travelled through Ireland in the years 1838-42 and everywhere excited intense enthusiasm People flocked to hear him and took the pledge in crowds In 1841 the number of abstainers in Ireland was estimated to be 4,647,000, in three years the consumption of spirits fell from 10,815,000 to 5,290,000 gal. This was not all due to Father Mathew, because great depression and distress prevailed at the same time, but he exercised an extraordinary influence. In 1843 he went to England, where he had less (though still great) success, and in 1850 to America. He died in 1856, by which time the cause had fallen into a depressed state in both countries. In the United States a flash of enthusiasm of a similar but smaller character, known as the Washingtonian movement, had appeared. In 1845 a law prohibiting the public sale of liquor was passed in New York state but repealed in 1847; in 1851 Maine adopted prohibition.

The Church of England Temperance society, much the largest at miles of the church was founded in 1864 and reconstituted in 1873. It was incorporated in 1907, reconstituted again in 1911 and 1917, and recognized by the church assembly in 1923 It carries on an extensive publication department and educational course, spolice court and prison gate missions to seamen, travelling vans and ine-briate homes.

The United Kingdom alliance, founded in 1853, became the chief political organization. Its object was prohibition of the think trade, but it audopted the polity of local prohibition of the think trade, but it audopted the polity of local prohibition by means of local option. It began publication of the "national drink bill," a calculation of the national expenditure on alcohole liquors. Other legislative organizations in Britain are the National Temperance league, the British Temperance league, the National United Temperance Legislation league and others in Scotland, Ireland and Royal Naval Temperance society. International societies emurated are the World League Against Alcoholism, the World Prohibitive federation, the International Orders of Good Templars and the World's Woman's Christian Temperance union.

Thus temperance and total abstinence became the objects of the united efforts of education and legislation in many regions. This union was probably promoted in part by the fact that once a person has become an alcohol addict recovery usually requires total ab-

stinence. In later years the organized movement in many countries embraced both voluntary and compulsory abstinence and combined the inculcation of individual abstinence with the promotion of legislation for the reduction or suppression of the alcoholic liquor traffic. On the whole the latter predominated, particularly in the United States, where organized agitation made temperance or prohibition partly a political question and produced various experiments in legislation (See Promistrion) Besides combining the moral and the political elements the modern movements were characterized by the following features () international organization; (3) organized cooperation of women; (3) juvenile temperance; (4) teaching of temperance in schools and elsewhere, (5) scientific study of alcohol and incibriety.

International organization appears to have been started by the Order of Good Templars, a society of abstainers, formed in 1851 at Utica, N.Y It spread over the United States and Canada, and in 1868 was introduced into Great Britain Several years later it was extended to Scandinavia, where it became very strong Temperance societies had previously existed in Norway from 1836 and in Sweden from 1837, these seem to be the earliest examples on the continent of Europe The Good Templars organization also spread to several other European countries, to Australasia, India, South and West Africa and South America Several other international societies were founded, and international congresses were held, the first in 1885 at Antwerp, Belg. A World's Prohibition conference was held in London in 1909, attended by about 300 delegates from temperance societies in nearly all parts of the world. This conference resulted in the foundation of an International Prohibition federation, embracing every country in Europe with three or four minor exceptions, the United States, Mexico, Argentina, much of the British Commonwealth, China, Japan, Palestine, Tunisia and Hawaii.

Alcoholics Anonymous is an organization of former alcohol addicts who have recovered from this affliction and have become dual abstances. It is a national organization, started in the United States but gradually extended to other countries. The primary object of this organization is to aid, by education and personal service, other alcohol addicts to recover from their addiction.

Women's Organizations.—The organization of women, which has become international, dates from 1874, when the National Woman's Christian Temperance union was founded at Clevelard, O. It employs educational and social as well as political means in promoting legislation About 1883 Frances Willard, who had been the moving spirit of the union, carried this organization of women into other lands and formed the World's Woman's Christian Temperance union, which by the 1950s had branches in about 50 countries.

Javanile Groups.—The inclusion of children in temperance organization goes back to faq, when a society of inventile obstainers who had taken the piedge was formed at Leeds; it took the name of Band of Hope. The practice spread, and in 1874 n Band of Hope union was formed. Within the next century a number of such unions were established, in Sociand, Ireland and separate counties in England; the Bands of Hope were said to number 13,000 in

School Programs:—The teaching of temperance in schools, a feature of social education and moral programda, was began by private effort in 1852 when John Hope insuguated a regular weekly " visitation of day school is Edinburgh. In 1875, at the mvitation of the National Temperance league, Sir Benjamin Richardson wrote his Temperance Leation Book, which was adopted by many schools as a primer. In 1889 school teaching by travelling lecturers was taken up by the U.K. Band of Hope union, and the example was followed by many other societies which spent large sums on itherant lecturers. The Church of England Temperance society carried on similar work. In 1906 the board of education in Ireland made hygiene and temperance a compulsory subject in the public schools; in 1909 the English board issued a syllabus of temperance teaching; in Sootland courses in hygiene and temperance public schools; in 1909 the English board issued a syllabus of temperance teaching; in Sootland courses in hygiene and temperance were adopted by many local educational authorities. In the United States compulsory teaching of temperance is of much longer standing and more advanced. The question was first taken up by the

liquid obtained by boiling parchment or the skins of animals in water, which is practically the same thing as using glue Pliny mentions the use of milk as a medium

In more modern times it was the medium of the Italian primitives. Cimabue learned it from the Greeks, or so says Vasari. and Giotto, Filippo Lippi, Ghiilandajo, Botticelli and many others used it for their inspired works Raphael, Titian and Tintoretto probably used it, at least for underpainting. In northern Europe tempera was earlier supplanted by oil than in Italy, but many of the Flemish and German primitives employed it

Process.-The ground used by Cimabue, Giotto and their compatriots was usually gesso (plaster of Paris). Cennini gives very full instructions for the making of gesso panels a complicated process involving, first, the preparation of the panel of poplar, lime tree or willow wood, of which all the interstices were to be filled with a mixture of size and sawdust. The panel was then covered with old linen cloth held in position by more size On this surface the gesso grasso, or heavy plaster of Paris, ground in size, was spread with a spatula The gesso sottile or final ground, composed of thoroughly slaked plaster of Paris mixed with size, was then applied with a brush

Devotees of tempera painting as practised by the Italians are convinced, not only of its great permanency, but of its peculiar charm. To quote Miss Herringham, the translator of Cennini: "There is no doubt that while fresco and tempera produce a decorated space in itself pleasant and figures and other objects can be suggested in slight chiarosculo (q v.) without appearing unfinished or crude, this is not the case in oil painting, which seems incapable of giving that pleasantness to the surface of a wall and re-quires a completeness in values, tones and tactile qualities which makes the spectator look into the picture and forget the surface. Therefore the one art is monumental, where the surface must not be forgotten or obliterated and the other on the whole appears opposed to monumental painting."

Roger E. Fry, writing in the Burlington Magasine of the charm of classic tempera, says. "One may sum up the whole question of tempera as a medium by saying that, while it is more difficult than in oil painting to produce any effect at all, it is yet more difficult, almost impossible indeed, to produce with tempera those thoroughly ugly and uninviting surfaces which it requires profound science to avoid in the clayey mixtures of oil paint. Nothing would be likely to have a more restraining and sobering influence on our art than the substitution of tempera for oils as the ordinary

medium of artistic expression,' Modern Uses .- Egg tempera, the medium to which both of these laudatory comments apply, is doubtless a most charming medium and an exceedingly permanent one, as demonstrated by the apparently magnificent preservation of many specimens of very great antiquity. It does, however, as Fry points out, present many technical difficulties, principally because of its exceedingly rapid drying. "Transitions of colour" says Fry, "must be made by hatched strokes or else by continual laying one thin coat over another until the transition is produced." This was the practice of the early Italians. In these days of ready mixed colours. procurable anywhere, there is not much occasion for the keeping alive of the ancient practices. Occasionally, however, an artist uses them successfully for current work. In different fields, certain workers do find it desirable today to combine dry colours with a tempera medium. For example, commercial illustrators have discovered that it is possible, by the admixture of dry pigment with a gum arabic-glycerine compound, to obtain colour of much stronger intensity-saturation-than can be had in commercial water colour. This method of working has the advantage that the strength of the prepared colour is within the artist's control It is also claimed that it is possible to obtain a very even and flat tone and one that, because of the absence of reflections, is particularly adapted to photographic reproduction.

Doubtless there are many other forms of artistic endeavour in which use is made of tempera mediums with dry colour, as in some forms of modern fresco, for example, but tempera in its modern application is, like oil painting, almost entirely a matter

many other substances were also employed. Among them were the of the use of prepared colours. These are ground by the manufacturers in various colloidal, gelatinous or albuminous vehicles and sold put up in tubes, pans or pots, but, unlike oil, the products of different manufacturers differ so greatly in character as to necessitate completely different techniques The product of some colourmen is to be used with the addition only of water, while in other varieties the use of prepared "tempera mediums" is necessary These are, naturally, compounds similar to the vehicles in which the particular colours are ground. It may be noted that ordinary water colour, show-card colour and the like are, of course, strictly tempera, being ground in gum arabic and glycerine, although water colour is only characteristic of the tempera medium when used as gouache or body colour

As noted above, the products of different colourmen vary so radically that it is difficult to give any idea of present-day tempera technique. In common they all present the quality of opacity; they may be used upon a great variety of surfaces and, in most cases, the permanency of the results depends only upon that of the ground Because of their opacity they may be used to very great advantage on dark grounds-a method of painting which has much to commend it. Most of the temperas in the market, however, are subject to the rather serious objection that the colours become lighter in drying.

Except as used for underpainting, tempera painting of today is a direct process. Unlike oil the colour usually dries very quickly upon the ground and any alteration of a tone by "painting into" it is difficult to achieve successfully. This directness, this premier coup quality, is one of the charms of the medium and also makes it desirable for quick sketching

Most users of tempera today are in the habit of employing it very flatly, frequently in the form of spots or "lozenges, to speak, of clean colour applied to grounds which vary from gray or brown to black. This technique is highly characteristic of tempera painting as it is found in the water-colour shows of the United States But some forms of commercial tempera may be used in a manner which approaches oil in appearance and in which the broken quality of a partially mixed tone may be preserved For this type of painting very little or no medium is used; heavy water-colour paper is employed as a ground and this may be obtained in a variety of tints from white to black. A number of prominent artists still use tempera as the medium with which to commence paintings which are completed in oil.

Emil Carlsen, one of the most noted of those who employed this technique, used an absorbent canvas, certain commercial colours and a commercial egg medium. For the first painting he recommended the using of the colour thinly, with water as a medium. This completed, the canvas is allowed to dry for a day or two, is then given one or two coats of tempera varnish A, and again let dry for a few hours. The picture is now given a light wash of the egg tempera medium and the painting is continued, using egg tempera as the medium instead of water. The colours can now be used solidly but it is necessary to lay layer over layer and let them dry between times or the colour will crack "The result," said Carlsen, "is an extremely hard and light underpainting, that, if vamished with a good coat of tempera varnish, well dried, will hold up a piece of painting wonderfully and give it more luminosity in the picture's future than any other process.

It will be evident that the art of tempera painting is even more difficult to limit and define than is painting in oil. It is an art the technique of which varied greatly, as did the vehicles em-ployed, even in its classic period, and this is equally true as to the more or less sporadic revivals of the old processes which are employed today, while, as to the commercial tempera of the shops, the colours supplied by one manufacturer may possess radically different qualities and call for a totally different technique from those of another manufacturer, and still be equally desirable. But in this very lack of uniformity is an incentive to the artist who is seeking for an individual, a personal technique. Whether he seeks for this in the use of prepared products or in the study and application of the ancient methods he will find in tempera a number of subtle and illusive charms which will well reTECHNIQUE OF, PAINTS, CHEMISTRY OF )

TEMPERAMENT, in psychology, means a kind of lasting emotional mood or temper. Some people are habitually cheerful, others are as habitually melancholy, and so on The oldest known classification of temperaments is considerably more than 2,000 years old, and the names associated with that classification are still in daily use It originated with a Greek medical school known as the Hippocratic school (see Hippocrates and the Hip-POCRATIC COLLECTION), and was based upon a theory about the varying proportions of four junces (or "humours") in bodies (Latin temperare means "to measure") The four liquids in the body were alleged to be blood, phlegm, black bile and yellow bile And according as one or other of these four preponderates in the body of a person, there results the sanguine temperament (Latin sangus, blood), the phlegmatic temperament, the melancholic temperament (Gr. μελαγχολικός, with black bile) or the choleric temperament. The sanguine temperament is quick, predisposed to pleasant emotions, but weak and inclined to change quickly from one interest to another The phlegmatic temperament is slow, lacking in vivacity, but calm and strong. The melancholic temperament is predisposed to sad emotions, slow and weak The choleric temperament is predisposed to anger and emotionally quick and strong. (See Personality)

In Music.-Temperament is the manner in which the limited number of notes of a keyboard instrument are tuned or tempered, various methods being possible; e g., unequal temperament, meantone intonation and equal temperament. In the case of an instrument tuned in unequal temperament a few keys will be as near as possible to the mathematical ideal of just intonation, but all the other keys will be more or less seriously out of tune.

Thus supposing the key of C to be tuned in just intonation, with G tuned in consequence as a really exact fifth, this same G will not be in tune when it is required to serve, not as the fifth to C, but as, say, the third to E flat or the fourth to D. Hence therefore the adoption as a compromise of the system known as equal temperament, whereby these inaccuracies of intonation are equally distributed over all the keys, with the result that no one key is better than another but all are sufficiently in tune for practical purposes and can be used with equal freedom,

The mean-tone system was an unequal temperament that split the difference between the major tone (8. 9) and the minor tone (9: 10). It long had its warm advocates, but finally had to yield to the superior practical advantages of equal temperament.

(See HARMONY; MUSICAL NOTATION.)

TEMPERANCE. The word temperance, which strictly means moderation, acquired a particular meaning in connection with intoxicating liquor and is here used in that sense.

History.-Ever since man in some distant age first discovered the process of fermentation by which sugar is converted into alcohol and carbonic acid, and experienced the intoxicating effects of the liquor so produced, there has been a temperance problem. The records of the ancient oriental civilization contain many references to it, and from very remote times efforts were made by priests. sages and lawgivers in India, Persia, China, Palestine, Egypt, Greece and Carthage to combat the injury of drunkenness to the individual and society. But the evil appears never to have been so great or the object of so much attention in the ancient world as in western countries, especially in modern times. Two circumstances differentiate the modern problem: the greater use of distilled spirits as a beverage and the climatic conditions prevailing in the more

pay him for the search (See also Painting, Oil Painting, northern latitudes which are the home of western civilization There is reliable evidence that the excess consumption of alcoholic beverages is greater among the people in northern Europe and North America than among the people in southern Europe and other people living in warmer climates But it is not certain that the colder climate is an essential factor in this difference Northern peoples moving to warmer climates do not seem to decrease their alcohol consumption Also, the Jewish people have a very small percentage of excessive drinkers and alcohol addicts irrespective of the chmate in which they live

The intoxicating drinks used by the ancients were wines obtained from grapes or other fruits and beers from various kinds of grain. These products were not confined to the east, but were also known to the ancient civilizations of Mexico and Peru and even to primitive peoples who used the sugar-containing juices and other substances indigenous to their countries In the time of the Romans the barbarians of northern Europe used fermented liquors made from honey (mead), barley (beer) and apples (cider) in place of grape wine. All such drinks produce intoxication if taken in sufficient quantity, but their action is much slower and less violent than that of distilled spirits. This difference is the result of the greater concentration of the alcohol in the distilled spirits which leads to a more rapid absorption of the alcohol into the blood stream and to a higher concentration of alcohol in the blood The concentration of the alcohol in the blood determines the degree of intoxication of the individual

Potable distilled spirits were apparently not known until the 13th century. The distilled essence of wine or aqua vitae (brandy) is mentioned then as a new discovery by Arnaldus de Villa Nova. a chemist and physician, who regarded it, from the chemical or medical point of view, as a divine product It probably came into use gradually, but once the art of distillation had been mastered it extended to other alcoholic products in countries where wine was not produced Malt, from which beer has been made from time immemorial, was naturally used for this purpose Then came corn brandy in the north and east of Europe, rum from sugar canes in the Indies, potato spirit and, eventually, as the distillation process was perfected, rectified ethyl alcohol from almost anything containing fermented sugar or starch

The concentrated form of alcohol thus evolved long carried with it the prestige of a divine essence given to it in the middle ages when chemistry was allied to all sorts of superstitions. It had potent properties and was held to possess great virtue This view was embodied in the name "water of life," and was at one time almost universally held. Ardent spirit seemed particularly desirable to the people of the cold and damp regions of northern Europe, where people took to it with avidity and imbibed it without restraint when it became cheap and accessible That happened in England in the early part of the 18th century (see LICENSED VICTUALLER); and out of the bad results which followed there eventually arose the modern temperance movement. The legislature had been busy with the liquor traffic for more than two centuries previously, but its task had been the repression of disorder. drunkenness was a nuisance and had to be checked in the interests of public order. It is significant that though drunkenness had been prevalent from the earliest times, the disorder which brought about attempts at legislative control did not make its appearance until after the introduction of distilled spirits.

Intemperance was one of many problems which arose during the latter half of the 18th century to become the subject matter of social reform in the 19th. It was a question of individual health and social welfare. A breach had been made in the unthinking traditional belief in the virtue of alcoholic liquor by the experiences referred to; and medical thought, as soon as it began to be con-cerned with health as distinguished from the treatment of disease. took up the matter. In 1804 Thomas Trotter of Edinburgh, Scot , published a book on the subject which was an expansion of his academic thesis written in 1788. Benjamin Rush of Philadelphia, distinguished U.S. physician and politician who had studied in Edinburgh and London, wrote a striking paper on the subject in the same year, and soon after this the organized temperance movement was set on foot in the United States.

Temperance and Prohibition Organizations—In 1868 a temperance society was founded at Saratoga, NY, and in 1813 the Massachusetts Society for the Suppression of Intemperance and its appearance. These seem to have been the earliest organizations, though the device of a pledge of abstinence had been introduced in 1800. The movement made rapid progress, mainly under the influence of the churches. In 1816 the American Society for the Promotion of Temperance was founded in 1800 and the promotion of Temperance was founded in Booton, and by right proposed in 1900 and the proposition of the promotion of the promotion of the most part, directed against the use of distilled spirits only, and the proposal to include all alcoholic drinks in the pledge of total abstancer, chooling adopted by a few societies, was rejected in 1830 and retained thereafter.

In Europe the earliest organizations were formed in Ireland A temperance club is said to have been started at Skibbereen in 1818. and others followed, but it was in 1829 that the organized movement began to make effective progress with the formation of the Ulster Temperance society. By the end of that year there were 25 societies in Ireland and two or three in Scotland In 1830 the movement spread to Yorkshire and Lancashire, and supported a newspaper called the Temperance Societies' Record, according to which there were then 127 societies with 23,000 paying members and 60,000 associated abstainers. In 1831 the British and Foreign Temperance society was founded in London with the bishop of London (Charles Blomfield) for president and Archbishop John Sumner for one of the vice-presidents This important society, of which Queen Victoria became patron on her accession in 1837, came to an end in 1850, when the whole cause was under an eclipse. The most remarkable episode in the temperance campaign at this period was the mission of the Rev Theobald Mathew of Cork, commonly known as Father Mathew, greatest of all temperance missionaries He travelled through Ireland in the years 1838-42 and everywhere excited intense enthusiasm. People flocked to hear him and took the pledge in crowds. In 1841 the number of abstainers in Ireland was estimated to be 4,647,000, in three years the consumption of spirits fell from 10,815,000 to 5,290,000 gal This was not all due to Father Mathew, because great depression and distress prevailed at the same time, but he exercised an extraordinary influence. In 1843 he went to England, where he had less (though still great) success, and in 1850 to America He died in 1856, by which time the cause had fallen into a depressed state in both countries In the United States a flash of enthusiasm of a similar but smaller character, known as the Washingtonian movement, had appeared In 1845 a law prohibiting the public sale of liquor was passed in New York state but repealed in 1847; in 1851 Maine adopted prohibition

The Church of England Temperance society, much the largest at mid-soft nentury, was founded in 1862 and reconstituted in 1873. It was incorporated in 1907, reconstituted again in 1911 and 1921, and recognized by the church assembly in 1923 It carries on an extensive publication department and educational courses, police court and prison gate missions to seamen, travelling vans and in-chrate homes.

The United Kingdom alliance, founded in 1853, became the chife political organization. Its object was probibition of the drink trade, but it adopted the policy of local prohibition by means of local opton. It began publication of the "attional drink bill," a calculation of the national expenditure on alcoholic liquors. Other legislative organizations in Britain are the National Temperance league, the British Temperance league, the National United Temperance council, the National Temperance deceration, the Temperance Legislation league and others in Scotland, Ireland and Wales. There is also a Royal Army Temperance association and a Royal Naval Temperance society. International societies enumerated are the World League Aganst Alcoholism, the World Prohibitive federation, the International Orders of Good Templars and the World's Woman's Christian Temperance union.

Thus temperance and total abstinence became the objects of the united efforts of education and legislation in many regions. This union was probably promoted in part by the fact that once a person has become an alcohol addict recovery usually requires total ab-

stinence. In later years the organized movement in many countries embraced both voluntary and compulsory abstinence and combined the inculcation of individual abstinence with the promotion of legislation for the reduction or suppression of the alcoholic liquor traffic. On the whole the latter predominated, particularly in the United States, where organized agitation made temperance or primeter in legislation. (See Promistrion ) Besides emperance or primeries in legislation. (See Promistrion ) Besides combining the moral and the political elements the modern movements were characterized by the following features: (c) international organization; (c) organized co-operation of women, (d) juvenile temperance; (4) teaching of temperance in schools and elsewhere; (s) scientific study of alcohol and indirectly.

International organization appears to have been staited by the Order of Good Templars, a society of abstainers, formed in 1851 at Utica, N.Y It spread over the United States and Canada, and in 1868 was introduced into Great Britain Several years later it was extended to Scandinavia, where it became very strong. Temperance societies had previously existed in Norway from 1836 and in Sweden from 1837, these seem to be the earliest examples on the continent of Europe The Good Templars organization also spread to several other European countries, to Australasia, India, South and West Africa and South America Several other international societies were founded, and international congresses were held, the first in 1885 at Antwerp, Belg. A World's Prohibition conference was held in London in 1909, attended by about 300 delegates from temperance societies in nearly all parts of the world This conference resulted in the foundation of an International Prohibition federation, embracing every country in Europe with three or four minor exceptions, the United States, Mexico, Argentina, much of the British Commonwealth, China, Japan, Palestine, Tunisia and Haurari

Alcoholac Anonymous is an organization of former alcohol additts who have recovered from this affliction and have become dual abstainers. It is a national organization, started in the United States but gradually extended to other countries. The primary object of this organization is to aid, by education and personal service, other alcohol addites to recover from their addiction

Women's Organizations:—The organization of women, which has become international, dates from 1874, when the National Woman's Christian Temperance union was founded at Cleveland, O It employs educational and social as well as pellitical means in promoting legislation About 1885, Frances Willard, who had been the moving spirit of the union, carried this organization of women into their lands and formed the World's Woman's Christian Temperance union, which by the 1950s had branches in about 50 countries.

Juseuile Groups:—The inclusion of children in temperance organization goes back to 1847, when a society of juvenile abstainers who had taken the pledge was formed at Leeds; it took the name fopand of Eope. The practice spread, and in 1874 B B and of Hope, union was formed Within the next century a nulmber of such unions were established, in Scotland, Ireland and separate counties in England; the Bands of Hope were said to number 15,000 in

School Progrants—The teaching of temperance in schools, a feature of social education and moral propaganda, was begun by private effort in 1852 when John Hope haugurated a regular weekly visitation of day schools in Edinburgh. In 1875, at the invitation of the National Temperance league, Sir Benjamin Richardson wrote his Temperance Leason Book, which was adopted by many which was adopted by many other schools as a primer. In 1889 school teaching by travelling lecturers was taken up by the U.K. Band of Hope umon, and the expansive was followed by many other societies which spent large sums on litherant lecturers. The Church of England Temperance society carried on similar work. In 1906 the board of education in Ireland made hygiene and temperance compulsory subject in the public schools; in 1909 the English board issued a syllabus of temperance teaching; in Sootland courses in hygiene and temperance was adopted by many local educational authorities. In the United States compulsory teaching of temperance is of much longer standing and more advanced. The question was first taken up by the

that by teaching the physiological effects of alcohol to all children the problem of intemperance would be effectually solved, and a systematic political campaign was planned and carried out for the purpose of obtaining compulsory legislation to give effect to this The campaign was successful in New York in 1884, in Pennsylvania in 1885 and subsequently in other states Laws were passed in every state and territory making antialcohol teaching part of the curriculum in the public schools Teaching of temperance became compulsory in Canada except in Quebec and Prince Edward Island; in France in 1902, in Sweden in 1892, and in Ireland It became optional in Australia, South Africa, some parts of India, Belgium, Finland, Denmark, Norway, Germany and Switzer-

Scientific Study -- The physiology and pathology of alcohol consumption is a very large subject movement were medical men, and though the churches soon became the chief moving force, doctors continued to exercise an influence. Medical abstinence societies were formed in England, Germany, Belgium, the Netherlands, Norway, Sweden and Denmark (See also Prohibition, Local Option, Licensed Vict-UALLER, DISINTERESTED MANAGEMENT, LIQUOR LAWS AND LIQUOR CONTROL ) (A St, A J. Cn)

TEMPERATURE, INVERSION OF: see Inversion of TEMPERATURE

## TEMPERATURE OF BODY: SEE ANIMAL HEAT.

TEMPERING is the imparting of a certain degree of hardness to a tool or spring. The older practice was that of first hardening a tool to the limit, and then "letting it down," eg, allowing access of heat until a certain colour was shown on a part polished bright for observation, and then quenching in water or oil This method is still practised on a large scale, but with the use of furnaces and pyrometers the tempering heat can be raised accurately without going through the hardening process first. Tempering colours range from the bright vellow down to grey covering such tints as pure yellow, dark yellow, brown yellow, red brown, purple red, violet, cornflower blue, pale blue The bright yellow gives the hardest temper suitable for steel engraving tools and certain metal cutting tools, while at the other end of the range lie saws for wood and most springs. See also Annealing and HARDINING

TEMPLARS. The Knights Templars, or Poor Knights of Christ and of the Temple of Solomon (pauperes commulitones Christi templique Salomonici), formed one of the three great military orders, founded in the 12th century. Unlike the Hospitallers and the Teutonic Knights it was a military order from its very origin. Its founders were a Burgundian knight named Hugues de Payns and Godeffroi de St Omer, a knight from northern France, who in 1119 undertook the pious task of protecting the pilgrims who, after the first crusade, flocked to Jerusalem and the other sacred spots in the Holy Land They were quickly joined by six other knights and soon afterwards organized themselves as a religious community, taking an oath to the patriarch of Jerusalem to guard the public roads, to forsake worldly chivalry, "of which human favour and not Jesus Christ was the cause, living in chastity, obedience and poverty, according to the rule of St. Benedict, "to fight with a pure mind for the supreme and - true King."

To this nascent order of warrior monks Baldwin II., king of Jerusalem, handed over a part of his royal palace lying next to the former mosque of al-Aksa, the so-called "Temple of Solomon," whence they took their name. They had at first no distinctive habit, wearing any old clothes that might be given to them. Nor was their community exclusive. Their primitive rule seems to have enjoined them especially to seek out excommunicated knights, and to admit them, after absolution by the bishop, to their order, and they thus served a useful purpose in at once disciplining and converting the unruly rabble of "rogues and impious men, robbers and committers of sacrilege, murderers, perjurers and adulterers" who streamed to the Holy Land in hope of

Patrol lat 182, p 928).

Bernard of Clairvaux, De laude novae militue, cap. v (in Migne,

Woman's Christian Temperance umon in 1879, it was believed plunder and salvation. It was this rule which led later to the most important privilege of the order, the immunity from sentences of excommunication pronounced by bishops and parish priests

This practice might have brought them at once under the suspicton of the Church, and it soon became expedient to obtain the highest sanction for the new order and its rules. In the autumn of 1127 accordingly Hugues de Payns, with certain companions, appeared in Europe, where he was fortunate enough to secure the enthusiastic support of the all-powerful abbot of Clairvaux Grateful pilgrims had already begun to enrich the order, the De laude novae militiae, a glowing panegyric of this new and holy conception of knighthood, addressed by Bernard to Hugues de Payns by name, insured the success of his mission. In 1128 the council of Troves discussed and sanctioned the rule of the order

Rule of the Temple .- No ms of the original French Rule of the Temple (Règle du Temple) exists, but in essentials the later copies preserve the matter and spirit of the primitive Rule, and they prove that to the end the order was, in principle at least, submitted to the same strict discipline as at the beginning. Of a secret Rule, in spite of the most diligent research, no trace has ever been found It is now generally held that none ever existed The legend of its existence, so fatal to the order, is probably traceable to the fact that the complete Rule was jealously guarded by the chief office-bearers of the order

The Rècle du Temble in its final form as we now possess it contains the rules for the constitution and administration of the order; the duties and privileges of the various classes of its personnel, the monastic rules, regulations as to costume and as to religious services; rules for the holding of chapters, and a summary of offences and their punishment, the procedure at the election of a grand master and at receptions into the order, a definition of the relations of the order to the pope, and to other religious orders

At the head of the order was the master of the Temple at Terusalem (in Cyprus after the fall of the Latin Kingdom), known as the grand master. His authority was very great-except in certain reserved cases his word was law-but he was not absolute Thus in matters of special importance-alienation of the estates of the order, attack on a fortress, declaration of war, conclusion of an armistice, reception of a new brother-he had to consult the chapter, and was bound by the vote of the majority, nor could he modify or abrogate a decree of the council of the order without their consent. He had to obtain the consent of the chapter also to the nomination of the grand commanders of the provinces of the order; the lesser offices were absolutely in his gift. He was elected by a complicated process, a chapter summoned ad hoc electing a "commander of the election" and one other brother who, after vigil and prayer, co-opted two more, these four choosing another two, and so on till the number of the twelve apostles had been reached. A chaplain, representing Jesus Christ, was then added to complete the electoral college (See Curzon, Règle du Temple, p. xxxv.).

Of peculiar importance were the chaplains (fratres capellani), These did not originally form part of the order, which was served by priests from outside The bull Omne datum optimum of 1163 imposed on clerics attaching themselves to the order an oath of life-long obedience to the grand master; by the middle of the 13th century the chaplains took the same oath as the other brothers and were distinguished from them only by their orders and the privileges these implied (e.g., they were spared the more humiliating punishments, shaved the face, and had a separate cup to drink out of). The order thus had its own clergy, exempt from the jurisdiction of diocesan bishops and parish priests, owing obedience to the grand master and the pope alone,

It remains to be said that the brethren were admitted either for

life or for a term of years. Married men were also received, but on condition of bequeathing one half of their property to the order. History—Long before St. Bernard's death (1153) the new order was established in almost every kingdom of Latin Christendom, and every establishment was the recipient of rich endow-ments. Henry I., for example, granted them lands in Normandy; and Louis VII. in the latter years of his reign gave them a piece of land outside Paris, which in later times became known as the Temple, and was the headquarters of the order in Europe, and Stephen of England granted them the manors of Cressing and Witham in Essex, and his wife Matilda that of Cowley, near Oxford Spiritual privileges were granted to them by the popes as lavishly as temporal possessions by the princes and people Pope Adrian IV allowed them to have their own churches, Eugenius III added to these the right to have churchvards They were, moreover, as defenders of the Church exempted from the payment of tithes. Finally, they were exempted from the action even of general censures and decrees of the popes, unless mentioned in them by name Very soon the order refused to submit in any way to the ordinary jurisdiction of the diocesan bishops and formed in effect a separate ecclestastical organization under the pope as supreme bishop. The result was that, scarce twenty-five years after its foundation, the order was at open feud with bishops and parish pirests, and the popes found it necessary to issue decree after decree to protect it from violence and spoliation.

So long, however, as the attention of the papacy and of Christendom was fixed on the problem of recovering and safeguarding the Holy Land, the postuon of the Templars was unassailable and all efforts to curb the growth of their power vain The later history of the Templars is therefore the history of the CRUSADES (or P.).

Fall of Latin Kingdom .- There is something Homeric in the story of the fall of the Latin kingdom as related by the historians of the next century A French knight, Gerard de Riderfort, coming to the East in quest of fortune, attached himself to the service of the ambitious Raymond, count of Tripoli; looking for the hand of some wealthy widow in reward. Failing ignominiously in this, Gerard enrolled himself among the Templars, biding his time for revenge, and was elected grand master in 1184 Baldwin IV., king of Jerusalem, died in 1185, leaving the throne to his young nephew Baldwin V. the son of his sister Sibylla, under the guardianship of Raymond, whose term of office was brief, as the little king died in September 1186 This was Gerard's opportunity The Templars carried the body of their dead sovereign to Jerusalem for burial; and then, unknown to the barons of the realm, Gerard and the patriarch crowned Sibylla and her husband Guy de Lusignan, Raymond's rival This was the overthrow of Raymond's ambition; and both Latin and Arabic writers are agreed that the Christian count and the Mohammedan sultan now entered into an alliance. To break this friendship and so save the kingdom, Gerard and the grand master of the Hospitallers were sent north to make terms with Raymond. But the rash valour of the Templars provoked a hopeless contest with 7,000 Saracens. The grand master of the Hospitallers was slain, but Gerard made his escape with three knights to Nazareth (1st May 1187). In this emergency Raymond became reconciled with Guy; and Gerard placed the Temple treasures of Henry II, at his king's disposal. Once more it was the Templars' rashness that led to the disastrous battle of Hittin (4th July). Gerard and the king fell into the hands of Saladin, but were released about a year later; Raymond of Tripoli made his escape through treachery or fortune; and 230 Templars fell in or after the battle, for the fight was scarcely over before Saladin ordered all the Templars and Hospitallers to be murdered in cold blood. One after another the Christian fortresses of Palestine fell into the hands of Saladin Jerusalem surrendered on and-ard October 1187, and the treasures of the Temple coffers were used to purchase the redemption of the poorer Christians, part of whom the Templar warriors guarded on their sad march from the Holy City to Tripoh. Part of their wealth was expended by Conrad of Montferrat in the defence of Tyre; but, when this prince refused to admit Guy to his city, both the Templars and the Hospitallers from the neighbouring parts flocked to the banner of their released king and accompanied him to the siege of Acre (22nd August 1189). In his company they bore their part in the two years' siege and the terrible famine of 1190-91; and their grand master died in the great battle of 4th October 1189, refusing to survive the slaughter of his brethren.

On the capture of Acre Philip Augustus established himself in the palace of the Templars, who are, however, stated to have sympathized with Richard. The English king sold them the island of Cyprus to 100,000 besants, but, unable to pay the purchase money, they transferred the debt and the principality to Guy of Lusignan Richard consulted them before deciding on any great military movement, and in June 1192 they advocated the bold plan of an advance on Egypt rather than on Jerusalem It was in the disguise of a Templar and in a Templar galley that Richard left the Holy Land, after the failure of his own military schemes When Acre was recovered, the Templars, like the Hospitallers, received their own quarters in the town, which from this time became the centre of the order. On the death of Henry of Champagne (1197) they vetoed the election of Raoul de Tabarie, after the death of his successor Amalric they refused to renew the truce with Saladin's brother, Saif al-Din, and led an expedition against the Saracens before the arrival of the new king, John de Brienne, at whose coronation in 1210 William de Chartres, the giand master, was present. Seven years later, with the aid of Walter de Avennis and of the Teutonic Knights, they commenced the building of their fortress of Castle Pilgrim, near Acre, on a rocky promontory washed by the Mediterianean on every side except the east.

It was from this castle that in May 1218 the fifth cruside started for the expedition against Egypt. The Templars were the heroes of the sege of Damietta, at which William de Chaitres was slain, "First to attack and last to retreat," they saved the Christian army from annuhilation on 19th August 1219, and when the city surrendered (5th November) the only one of its twentyeight towers that had begun to gue way had been shaken by their engines. On the other hand, if was largely owing to their objections that John de Brienne refused the sultan's offer to restore Jerusalem and Palestine

From the very first the Templais seem to have been opposed to Frederick II , and when he landed at Acre (7th September 1228) they refused to march under the banners of an excommunicated man, and would only accompany his host from Acre to Joppa in a separate body. They were accused of notitying Frederick's intended pilgrimage to the Jordan to the sultan, and they were certainly opposed to Frederick's ten years' peace with Al-Kāmil, the sultan of Egypt, and refused to be present at his coronation m Jerusalem. On neither side was the treaty fully observed, and preparations were made in Europe for a fresh crusade. In the meantime open dissension broke out between the Templars and the Hospitallers, the former advocating negotiations with the sultans of Damascus and Kerak, the latter with the sultan of Egypt; and when Richard of Cornwall arrived (11th October) he had to decide between the two rival orders and their opposing policies. After some hesitation he concluded a treaty with the sultan of Egypt, much to the annoyance of the Templars, who openly mocked his efforts. On his departure, the three orders came to open discord. the Templars laid siege to the Hospitallers in Acre and drove out the Teutonic Knights "in contumellam imperatoris." They were successful on all sides. The negotiations with Damascus and Kerak were reopened, and in 1244 Hermann of Pengord wrote to the princes of Europe that after a "silence of fifty-six years the divine mysteries would once more be celebrated in the Holy City."

It was in this moment of danger that the sultan of Babylon called in the bathrones Kharizmians, whom the Mongol invasions had driven from their native lands. These savages, entering from the north, flowed like a tide past the newly built and impregnable Templar fortress of Safed, swept down on Jerusalem, and atnihilated the Chistian army near Gasa on October 18th, 1244. From this blow the Latin kingdom of the East never recovered; 600 mights took part in the battle; the whole force of the Templars, 300 in number, was present, but only 13 survived, and of 200 Hospitalizers only 16. The masters of both orders were slain or take prisoners, and Jerusalem was lost to Christendom once more. The havoc caused by the Kharizmians was alleged by pope in nocent IV. as the reason for again summoning Christendom to the rescue of the Holy Land. Recognizing the fact that the true

way to Jerusalem lay through Egypt, Louis IX, led his host to the banks of the Nile, being accompanied by the Templars Their master, William de Sonnac, attempted in vain to restrain the rash advance of the count of Artois at the battle of Mansura (8th February 1250), which only three Templars survived St Louis, when captured a few weeks later, owed his speedy release to the generosity with which the order advanced his ransom-

A new enemy was now threatening Mohammedan and Christian alike For a time the Mongol advance may have been welcomed by the Christian cities, as one after another the Mohammedan principalities of the north fell before the new invaders. But this new danger stimulated the energies of Egypt, which under the Mameluke Bibars encroached year after year on the scanty remains of the Latin kingdom. The great Frankish lords, fearing that all was lost, made haste to sell their lands to the Templars and Hospitallers before quitting Palestine for ever But they lost their power of resistance, and became so enfeebled as to welcome the treaty which secured them the plain of Acre and a free road to Nazareth as the result of the English crusade of 1272 While thus weak against external foes, the Templars were strong enough for internal warfare. In 1277 they espoused the quarrel of the bishop of Tripoli, formerly a member of the order, against his nephew Bohemond, prince of Antioch and Tripoli, and began a war which lasted three years In 1276 their conduct drove Hugh III . king of Cyprus and Jerusalem, from Acre to Tyre In the ensuing year, when Mary of Antioch had sold her claim to the crown to Charles of Anjou, they welcomed this prince's lieutenant to Acre and succeeded for the moment in forcing the knights of that city to do homage to the new king. Thirteen years later (26th April 1290) Tripoli fell, and next year Acre, after a siege of six weeks, at the close of which (16th May) William de Beaujeu, the grand master, was slain. The few surviving Templars elected a new master, and sailed for Cyprus, which now became the headquarters of the order

Power and Influence of the Order.-For more than a hundred years the Templars had been one of the wealthiest and most influential factors in European politics. If we confine our attention to the East, we realize but a small part of their enormous power. Two Templars were appointed guardians of the disputed castles on the betrothal of Prince Henry of England and the French princess in 1161 Other Templars were almoners of Henry III, of England and of Philip IV of France. One grand master was godfather to a daughter of Louis IX.; another, despite the prohibition of the order, is said to have been godfather to a child of Philip IV. They were summoned to the great councils of the Church, such as the Lateran of 1215 and the Lyons council of 1274. Frederick II.'s persecution of their order was one of the main causes of his excommunication in 1239, and his last will enjoined the restoration of their estates. Their property was scattered over every country of Christendom, from Denmark to Spain, from Ireland to Cyprus But the wealth of the Templars was due not so much to their territorial possessions as to the fact that they were the great international financiers and bankers of the age. The Paris Temple was the centre of the world's money market. In it popes and kings deposited their revenues, and these vast sums were not hoarded but issued as loans on adequate security. Above all, it was the Templars who made . the exchange of money with the East possible. It is easy, indeed, to see how they were the ideal bankers of the age; their strongholds were scattered from Armenia to Ireland, their military power and strict discipline ensured the safe transmission of treasure. while their reputation as monks guaranteed their integrity Thus they became the predecessors, and later the rivals, of the great Italian banking companies. To take interest (usury) was of course unlawful. The method of circumventing this seems to have been that the mortgagees paid to the mortgagors a nominal rent which was used towards the reduction of the debt. The difference between this and the real rent represented the interest. A document throwing a vivid light on the banking methods of the Templays and Hospitallers is a charter of Margaret, queen of the the order, and though promising an inquiry, doing his best to gastish, a.p. 1186, from the abbey of Fontevrault, printed in procrastinate. Philip determined to force his hand. All France

Calendar of Documents, France (1899), vol i, ed. J. H Round, No 1084

Suppression of the Order .- Never had the order of the Temple been to all appearance more powerful than immediately before its ruin Sovereign power, in the sense of that of the Teutonic Knights in Prussia or the Knights of St. John in Rhodes and later in Malta, it had never possessed, but its privileges and immunities constituted it a church within the church and-in France at least-a state within the state Philip IV, indeed, in pursuance of his policy of centralizing power in the crown, had from 1287 onwards made tentative efforts to curtail the power and wealth of the order, but soon his necessities forced him to a temporary change of policy In January 1293 the privileges of the order in and about Paris were confirmed and extended, and in 1207 Philip borrowed 5,200 livres tournoises from the Paris Temple. Then came the great quarrel with Pope Boniface VIII, and on the 10th of August 1303 the king signed with Hugues de Peraud, the general visitor of the French Templars, a formal treaty of alliance against the pope On the 6th of February 1304 Boniface's successor, Benedict XI., once more confirmed all the Templars' privileges, while Philip, for his part, appointed Hugues de Peraud receiver of the royal revenues and, under pressure of the disastrous campaign in Flanders, in June granted a charter exempting the order from all hindrances to the acquisition of property Two years later the king took refuge in the Temple from the violence of the Paris mob, and so late as the spring of 1307 was present at the reception of a new Templar

Yet for some two years past the king had been plotting a treacherous attack on the order. His motives are clear, he had used every expedient to raise money, had robbed and expelled the Jews and the Lombard bankers, had debased the coinage, the suppression of the Templars would at once rescue him from their unwelcome tutelage and replenish his coffers. He cherished also another ambition. The question of an amalgamation of the great military orders had often been mooted, the project had been approved by successive popes in the interests of the Holy Land; it had been formally proposed at the Lyons council of 1274, only to be rejected by the opposition of the Templars and Hospitallers themselves To Philip this scheme commended itself as an opportunity for bringing the orders under the control of the French crown; there was to be but one order, that of the "Knights of Jerusalem," of which the grand master was always to be a prince of the toyal house of France. Clearly, it only needed an excuse and a favourable opportunity to make him attack the Templars; and, once having attacked them, nothing short of their entire destruction would have been consistent with his safety. The excuse was found in the denunciation of the order for heresy and unspeakable immoralities by a venal informer; the opportunity was the election of a pope, Clement V., wholly devoted to the interests of the king of France.

For perhaps half a century there had been strange stories circulating as to the secret rites practised by the order at its midnight meetings, stories which probably had their origin in the extreme precautions taken by the Templars, originally perhaps for military reasons, to secure the secrecy of their proceedings, which excited popular curiosity and suspicion.

In the spring of 1304 or 1305 a certain Esquiu de Floyran of Béziers pretended to betray the "secret of the Templars" to James II. of Aragon The pious king, who had every reason to think well of the order, did not affect to be convinced, but the prospect of spoils was alluring, and he seems to have promised the informer a share of the booty if he could make good his charges. Esquiu now turned to Philip of France, with more immediate success. For the purpose of collecting additional evidence the king caused twelve spies to find admission to the order, and in the meantime sought to win over the pope to his views. Clement V. owed the tiara to the diplomacy of Philip's agents, perhaps to their gold; but though a weak man, and moreover a martyr to ill health, he was not so immediately accommodating as the king might have wished, expressing his disbelief in the charges against

was at this time under the jurisdiction of the Inquisition, and the Inquisition could act without consulting the pope The grand mousitor of France, William of Paris, was Philip's confessor and creature The way was thus open for the king to carry out his plan by a perfectly legal method. His informers denounced the Templars to the Inquisition, and the grand inquisitor-as was the customary procedure in the case of persons accused of heresy-demanded their arrest by the civil power. On the 1.4th of September 1307, accordingly, Philip issued writs to his bailis and seneschals throughout the kingdom, directing them to make preparations to arrest the members of the order

The Templars had for some time past been aware of the charges against them On the 6th of June 1306 Pope Clement had summoned Jacques de Molay, the grand master, from Cyprus to France, in order to consult him on the projected crusade. He had obeved the call, and, in an interview with the pope, had taken the opportunity to demand a full inquiry. They had, however, taken no measures to defend themselves, the sudden action of the king took them wholly by surprise; and on the night of Friday, the 13th of October 1307, their arrest was effected without difficulty. Jacques de Molay himself with sixty of his brethren being seized

in Paris

The Templars were caught in toils from which there was no escape To force them to confess, they were first tortured by the royal officials, before being handed over to the inquisitors to be, if need were, tortured again. In Paris alone thirty-six died under the process The result was, at the outset, all that the king could desire Of 138 Templars examined in Paris between the 19th of October and 24th of November, some of them old men who had been in the order the greater part of their lives, 123 confessed to spitting on (or "near") the crucifix at their reception Many of the prisoners confessed to all the charges, however grotesque But the most damning confession was that of the grand master himself, publicly made with tears and protestations of contrition and embodied in a letter (October 25) sent to all the Templars in France He had been guilty, he said, of denying Christ and spitting on the cross

To the pope, meanwhile, the proceedings in France were to the highest degree unwelcome. He had, indeed, become convinced, if not of the general guilt of the order, at least of the guilt of some of its members But the aftair was one which he desired to reserve for his own judgment, Philip's action he interpreted, rightly, as an encroachment of the civil power on the privileges and property of the Church, and his fears were increased when the French king, without consulting him, sent letters to King James of Aragon, Edward II. of England, the German king Albert and other princes, calling upon them to imitate his example On the 27th of October Clement issued letters suspending the powers of the Inquisition in France What followed is not clear, for the documentary evidence for these months is very defective; but on the 22nd of November the pope issued a bull calling on all kings and princes to arrest the Templars everywhere, his motive probably being to forestall the probable action of the secular powers and keep the affair in his own hands. All scruples and hesitations now vanished In England the Templars were arrested on the 10th of January 1308, in Sicily on the 24th of the same month, in Cyprus on the 27th of May; in Aragon and Castile the process was less easy, for the

Meanwhile, on the 26th of May, Philip had made his solemn entry into Poitiers, where the pope and cardinals had already assembled for the purpose of conferring with the king on the matter. After stormy debate, an arrangement was made. The king agreed to hand over to the papal commissioners the property and persons of the Templars; Clement, for his part, withdrew the sentence of suspension against the grand inquisitor of France and ordered an inquisition into the charges against individual Templars by the diocesan bishops with assessors nominated by himself. The examination of the grand master, of the grand visitor of

knights, forewarned, had put their fortresses into a state of

defence, notably their strong castle of Monzon, which was only taken after a long siege on the 17th of May, while the last of the

Templars' strongholds, Castellat, did not fall until Nov. 2nd.

France, and of the grand preceptors of Cyprus, Normandy and Aquitaine he reserved to himself Inquisition was to be made into the conduct of the order in each country by special papal commissions, and the fate of the order as a whole was to be decided by a general council, summoned at Vienne for the 1st of October 1311, when the question of the guilt of the order might be considered Meanwhile the pope and cardinals had elaborated the organization of the new inquisition. There was much confusion and delay, however, and the actual public trial did not begin till the 11th of April, 1310 Many Templars, trusting m the assurance implied in their citation, had volunteered to defend the order and withdrew their pievious confessions They were soon undeceived, the commission was packed with creatures of the crown The evidence given in Paris for or against the order was, it was soon found, used against the individual Templars on their return to the provinces; the retractation of a confession, under the rules set up for the diocesan inquisition, was punished with death by fire Sixty-seven Templars perished in this way during May 1310 Meanwhile Clement and Philip had come The pope condemned the Templars The council of Vienne met in October 1311 A discussion arose as to whether the Templars should be heard in their own defence Clement, it is said, broke up the session to avoid compliance; and when seven Templars offered themselves as deputies for the defence he had them cast into prison Towards the beginning of March Philip came to Vienne, and he was seated at the pope's right hand when that pontiff delivered his sermon against the Templars (3rd April 1312), whose order had just been abolished, not at the general council, but in private consistory (22nd March) On 2nd May 1312 he published the bull Ad Providam, transferring the goods of the society, except for the kingdoms of Castile, Aragon, Portugal and Majorca, to the Knights of St. John.

The final act of the stupendous tragedy came early in 1314. Jacques de Molay, the grand master, had not hitherto risen to the height of his great position; the fear of torture alone had been enough to make him confess, and this confession had been used to extract avowals from his brethren, subject as they were to unspeakable sufferings and accustomed to yield to the military chief Humiliation on humiliation had been heaped on the wretched man, public recantations, resterated confessions Before the papal commission he had flamed into anger, protested, equivocated-only in the end to repeat his confession once more .The same had happened before the commission of cardinals at Chinon; the audience with the pope, which he demanded, he had never obtained. On the 6th of May 1312 Pope Clement issued his final decision as to the fate of the Templars in general, that of the five great offices of the order he reserved in his own hand. With this a silence falls over the history of the Templars, the fate of the order had been decided, that of the individuals still under trial was of little interest to contemporary chroniclers. Then the veil is suddenly lifted. Jacques de Molay has found his wonted courage at last, and with him Gaufrid de Charney, the preceptor of Normandy, on the 14th of Maich 1314 they were brought out on to a scaffold erected in front of Notre Dame, there in the presence of the papal legates and of the people to repeat their confessions and to receive their sentence of perpetual imprisonment. Instead, they seized the opportunity to withdraw their confessions and to protest to the assembled thousands the innocence of the order. King Philip the Fair did not wait to consult the Church as to what he should do; he had them burnt.

A word must be added as to the significance of the work of the Templars and of the manner of their fall in the history of the world Two great things the order had done for European civilization: in the East and in Spain it had successfully checked the advance of Islam; it had deepened and given a religious sanction to the idea of the chivalrous man, the homo legalis, and so opened up, to a class of people who for centuries to come were to exercise enormous influence, spheres of activity the beneficent effects of which are still recognizable in the world. On the other hand, the destruction of the Templars had three consequences fateful for Christian civilization. (1) It facilitated the conquests of the Turks by preventing the Templars from playing in Cyprus he part which the Knights of St John played in Malta (2) It sartly set a piecedent for, partly confirmed, the ciuel criminal recedure of France, which lasted to the Revolution (3) It set he seal of the highest authority on the popular belief in witchraft and personal intercourse with the devil, sanctioned the exsedient of wringing confessions of such intercourse from the ccused by unspeakable tortures, and so made possible the hideous vitch-persecutions which darkened the later middle ages and, ven in Protestant countries, long survived the period of Refor-

On the question of the guilt or innocence of the Templars in espect of the specific charges on which the order was condensing pinnon has long been divided Their mnocence was maintained by the greatest of all their contemporaises, Dante (Pung xx 92), and by the historian Villain and others I minor erent times a certain heat was introduced into the discussion of the question owing to its having pen for centuries brought into the airna of party controversy, be-ween Protestants and Catholics, Gallicans and Ultramontanes. Freerement be the control to the control bullant defence of the older The challenge was taken up, among others, by the ornelizate F our lammer-Purgsaid who, in a paper shorts, by the ornelizate F our lammer-Purgsaid who, in a paper described to the control of the control uzued for the evistence of a secret doctrine based not on Grossteism use on the monotoness of ablant, of which Baybornet (Mahamet) use on the monotone (Mahamet) of the desired of the desired of the desired of the desired of the desired of the monotone of the order. The view was also taken by a succession of German scholars; in England, by C. G. Addison, and in France of German scholars; in England, by C. G. Addison, and in France in the contraction of the desired of Unitergoing des L'empeuirremorateurs (1988), maintainet mat the custom of denying Cainst and spitting on the cross was often, and im some provinces universally, practised at the reception of the brethien, "as coarse test of obedience, of which the original sense had parity been logotten, partly heretically interpreted under the influence of later hereases." TEMPLE, FREDERICK (1821-1902), English divine, archbishop of Canterbury, was born in Santa Maura, one of the Ionian Islands the son of Major Octavius Temple. He was educated at Blundell's School, Tiverton, and at Balliol College, Oxford The "Tractarian Movement" had set in five years before he went up to Oxford, but the memorable tract, No go, had not vet been written. After much discussion and reflection he drew closer to the camp of "the Oxford Liberal Movement." In 1842 he took a "double-first" and was elected fellow of Balhol, and lecturer in mathematics and logic. Four years later he took orders, and with the aim of helping forward the education of the very poor, he accepted the headship of Kneller Hall, which served at that time for the training of masters of workhouse and penal schools. But the experiment was not altogether successful, and Temple himself advised its abandonment in 1855. He then accepted a school-inspectorship, which he held until he became headmaster of Rugby in 1858. In the meantime he had attracted the admiration of the prince consort. and in 1856 he was appointed chaplain-in-ordinary to the queen In 1857 he was select preacher at his university

At Rugby Temple showed great energy and bold initiative, Whilst making the school a strong one on the classical side, he instituted scholarships in natural science, built a laboratory, and gave importance to that side of the school work. He had the courage also to reform the games, in spite of all the traditions of the playing fields. His school sermons were deeply impressive. they rooted religion in the loyalties of the heart and the conscience, and taught that faith might dwell secure amid all the bewilderments of the intellect, if only the life remained rooted in pure affections and a loyalty to the sense of duty Two years after he had taken up his work at Rugby Essays and Reviews appeared The first essay in the book, "The Education of the World." was by Dr. Temple. Temple refused, so long as the storm lasted, to comply with the request that he would repudiate his associates. and it was only at a much later date (1870) that he saw fit quietly to withdraw his essay. In the meantime, however, he printed a volume of his Rugby sermons, to show definitely what his own religious positions were. His appointment by Gladstone as bishop of Exeter in 1860 raised a fresh storm.

G. A Denison, archdeacon of Taunton, Lord Shaftesbury, and others formed a strong committee of protest, whilst Pusey declared that "the choice was the most flightful enormity ever perpetrated by a prime minister." At the confirmation of his election counsel was instructed to object to it, and in the voting the chapter was divided. But Gladstone stood firm, and Temple was duly consecrated on Dec. 21, 1869 On the death of Dr. John Jackson in 1885, he was translated to London, the appointment gave general satisfaction In 1884 he was Bampton Lecturer, taking for his subject "The Relations between Religion and Science" In 1885 he was elected honorary fellow of Exeter College, Oxford

Temple led a strenuous life as bishop of London. His normal working day at this time was one of fourteen or fifteen hours, and he was felt by many of his clergy and by candidates for ordination to enforce almost impossible standards of diligence and efficiency. The working classes instinctively recognized him as their friend. When, in view of his growing blindness, he offered to resign the bishopric, he was induced to reconsider his proposal, and on the sudden death of Archbishop Benson in 1896, though now seventysix years of age, he accepted the see of Canterbury.

As archbishop he presided in 1897 over the decennial Lambeth Conference In the same year Temple and his brother archbishop issued an able reply to an encyclical of the pope which denied the validity of Anglican orders. In 1900 the archbishops again acted together, when an appeal was addressed to them by the united episcopate, to decide the vexed questions of the use of incense in divine service and of the reservation of the elements. After full hearing of arguments they gave their decision against both the practices in question. During his archbishopric Dr. Temple was deeply distressed by the divisions which were weakening the Church of England; and many of his most memorable sermons were calls for unity. His first charge as primate on "Disputes in the Church" was felt to be a most powerful plea for a more catholic and a more charitable temper, and again and again during the closing years of his life he came back to this same theme. While speaking in the House of Lords on Dec 2, 1902 on the Education Bill of that years was seized with sudden illness, and, though he revived sufficiently to finish his speech, he newer fully iscovered, and died on Dec 5, 1902. He was interred in Canterbury Catherial Four days large 1902. He was interred in Canterbury Catherial Four days large 1902.

Archbishop Temple, by "Seven Friends," ed. E. G. Sandford (1906).

TEMPLE, RICHARD GRENVILLE-TEMPLE, 1st Each (1711-2779). English statesman, eldest son of Richard Grenville (d 1721) of Wootton, Buckinghamshre, was borm on Sept 26, 1711 His mother was Hester (c 1690-1752), daughter, and ultimately herress, of Sir Richard Temple, Bart. (1634-1697), of Stowe, Buckinghamshire, and asster of Richard Temple, Vascount Cobham, whose title she inherited under a special remainded in 1749, in the same year, her husband having been long dead, she was created Countess Temple. Her son, Richard Grenville, was educated at Eton, and in 1734 was returned to parlament as member for the borough of Buckingham In 1752,

Grenville, was educated at Eton, and in 1734 was returned to parliament as member for the borough of Buckingham. In 1753, on the death of his mother, he inherited her titles together with the estates of Stowe and Wootton, and took the name of Temple in addition to his own surname of Gienville By the marriage of his sater Heister with William Pitt, afterwards earl of Chatham, Temple's career was linked with that of his prother-in-law

In November 175t Temple became first lord of the admirally in the ministry of Devonables and Pitt. He solidated by George II, who dismissed both him and Pitt from admirated from the coaliton cannot for Newsatle and Pitt from a first proposal to the property of the property of the same year, Temple received the office of pruy seal. He alone in the calonet supported PIt's proposal to declare war with Spain in 1761, and they resigned together on Ct 5. From this time Temple became one of the most violent and factous of politicians, and it is difficult to account for the andacance which he exerted over his brother-fa-way. He was at variance with his younger brother, George Grenville, when the had no place in that mind the return April 1765, and had no place in that mind the property of the proposed provided from the presunded Pitt to request livering to you were reconciled before 1765, when Temple refused to join the government, and

By 1765, however, the old friendship between the brothers-inlaw was dissolving; and when at last in July 1766 Pitt consented to form a government, Temple refused to join, being bitterly offended because, although offered the head of the treasury, he was not to be allowed an equal share with Pitt in nonmating to other offices. Temple forthwith began to inspire the most virulent bless against Pitt; and in compunction with his brother George he concentrated the whole Graville connection in hostility to the government. After George Grewille's death in 1770 Lord Temple retired almost completely from public life. He died on Sept. 12, 1770

TEMPLE, SIR WILLIAM, Barr. (1628–1699), English statesman, diplomatist, and author, was born in London. He was the eldest son of Sir John Temple (1606–167). Inish master of the rolls, whose father was Sir William Temple (1555–1627), prevoved of Trinfly college, Dublin Temple was educated at the grammar-school at Bishop Stortford, and at the Puritan college of Emmanuel at Cambridge, where he came under the influence of Cudworth. In 1647 he started to travel abroad. In the Isle of Wight he met Dorrby Osborne, the daughter of the Royalist governor of Guernesy, Sir Peter Osborne; and though her family were opposed to the match, he married her in 1621.

In 1660 Temple sat in the convention parliament, and in its successor, at Dublin as member for Carlow. He removed to

England in 1663, attached himself to Arlington, secretary of state, and two years later was employed in various negotiations on the continent. In 1666 he became the English representative at the viceregal court at Biussels While the Dutch war continued, Temple's duties consisted chiefly in cultivating good relations with neutral Spain, which was threatened by the claims of Louis XIV, on the Spanish Netherlands Louis's designs became apparent in the spring of 1667, when he maiched an army into Flanders This event was one of those which led to the peace of Breda, and to the subsequent negotiations, which are Temple's chief title to fame. The French conquests were made at the expense of Spain, but were almost equally dangerous to the United Netherlands, whose independence would have been forfeited had Louis succeeded in annexing Flanders While the French were taking town after town. Temple made a journey into Holland and visited De Witt.

Temple had for some time pressed on his government the necessity of stopping the French advance, and had pointed out the way to do so, but it was not till December .667 that he received instructions to act as he had suggested He at once set out for The Hague, and in January .1668 a treaty was made between England and the Unted Netherlands, which, being joined shoitly afterwards by Sweden, became known as the Triple Alliance It was a defensive treaty, made against the encroachments of France. The skill and celetify with which the negotiations were conducted and the results of the treaty, reflect great credit on Temple. The French king was checked in mid-career, and, without a blow being struck, was obliged to surrender almost all his conquests.

Unfortunately the policy thus indicated was undone by Charles's personal policy embodied in the secret treaty of Dover which reversed the policy of the Triple Alliance (See CHARLES II) Meanwhile Temple had developed the good understanding with the Dutch by contracting a commercial treaty with them (February 1668), and had acted as English plenipotentiary at Auxla-Chapelle, where peace between France and Spain was made in May 1668 Shortly afterwards he was appointed ambassador at The Hague Here he lived for two years on good terms both with De Witt and with the young prince of Orange, afterwards William III The treaty of Dover led to Temple's recall, but Temple nominally held his post for another year He perceived, however, that his day was over and retired to his house at Sheen. In June 1071 he received his formal dismissal. The war with the Netherlands broke out next year, and was almost as discreditable to England as that of 1665 Want of success and the growing strength of the opposition in parliament forced Charles to make peace, and Temple was commissioned to carry through the change of front, After a negotiation of three days, carried on through the medium of the Spanish ambassador, the treaty of Westminster was made (February 1674).

As a recognition of his services Temple was now offered the embassy to Spain. This he declined, as well as the offer of a far more important post, that of secretary of state, but accepted instead a renewal of his embassy to The Hague. In the March following he was nominated ambassador to the congress at Nijmwegen; but, owing to the tortuousness of Charles's dealings, it was not till July 1676 that he entered that town. The negotiations dragged on for two years longer, for Charles was still receiving money from France, and English mediation was no more than a ruse. In the summer of 1677 Temple was summoned to England and received a second offer of the secretaryship of state, which he again declined. In the autumn of the same year he had the satisfaction of bringing about the marriage of William and Mary, an event which seemed to complete the work of 1668 and 1674. Louis still remaining obstinate in his demands, Temple was commissioned in July 1678 to make an alliance with the states, with the object of compelling France to come to terms. This treaty was instrumental in bringing about the general pacification which was concluded in January 1679.

This was Temple's last appearance in the field of diplomacy. His plan for the reform of the privy council failed. His name was removed from the list of the council in 1681, and thenceforward he lived in retirement, first at Sheen, and then at Moor Park

926 TEMPLE

pressed to take office, but refused His son became secretary at war, but committed suicide immediately afterwards. Temple died at Moor Park on Jan 27, 1699

Temple's works include An Essay on the Present State and Settlement of Ireland (1668), The Empire, Sweden, etc., a survey of the different Governments of Europe and their relations to England (1671), Ob-Governments of Delipse and their relations to England (1971), 100-servations spin: Essay upon the Original and Nature of Government (1672); Essay upon the Advancement of Trade in Ireland (1673) Some of these were published in the first part of his Miscellanea (1679). In the same year apparently his Poems were privately punted. In 1683 he began to write his Memori. The first

TEMPLE, WILLIAM (1881-1944), English divine, second son of Frederick Temple (q.v), archbishop of Canterbury, was born at Exeter on Oct 15, 1881, and educated at Rugby and at Balliol College, Oxford, where he was president of the Oxford Union. From 1904-10 he was fellow and lecturer in philosophy at Oueen's College, Oxford In 1914 he resigned the headmastership of Repton School, which he had held from 1910, to take charge of St. James's, Piccadilly. He was editor of The Challenge (1915-18). He resigned from St. James's in 1917, was made a canon of Westminster (1919) and in 1921 bishop of Manchester He was president of the Workers' Educational association (1908-24) In 1020 he became archbishop of York and in 1042 archbishop of Canterbury Temple died Oct 26, 1944.

TEMPLE, a city of Bell county, Texas, U.S., 73 mi. N. by E of Austin, on federal highway 81, and served by the Missouri-Kansas-Texas and the Santa Fe railway systems. Pop. (1950) 25,467. It is the trade centre and shipping point for a rich agricultural region, raising cotton, corn, small grains, grain soighums, fruits, vegetables and livestock. Industrial products are furniture, shoes, rock wool, shirts, cottonseed oil, feeds, woodworking machinery, window shades and blinds, blackboards, bottling-works and printing-shop products and others. Scott and White hospital and clinic, King's Daughters hospital and clinic, G.C. & S.F. railway hospital and McCloskey Veterans administration centre are in Temple. Fort Hood is 28 mi W Temple was founded in 1881 by the Santa Fe railroad and was chartered as a city in 1884.

TEMPLE, a word signifying, loosely, any enclosed space or structure erected for purposes of worship, or to protect a cult image or cult objects. In a figurative sense the word is used for (1) any shrine; (2) any building built in a style similar to that of a classic temple; (3) for the meeting houses of certain nonconformist denominations; (4) for synagogues; (5) for the meeting

places of certain fraternal orders

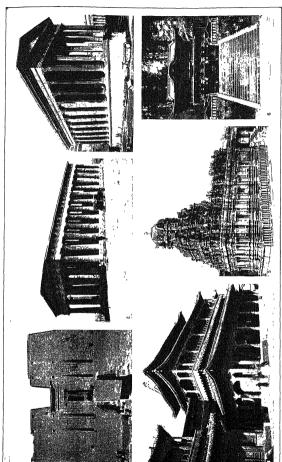

Cave Temples.-Although perhaps antedated by existing temple remains of the earliest Chaldean and Egyptian periods, a primitive type of cave temple culturally much earlier is that of certain cave temples of the Mediterranean basin, of which the most remarkable are those on the island of Malta, apparently dating originally to a neolithic culture, although undoubtedly in use for a thousand years afterwards. It is remarkable that in these temples. despite their early date (?5000 BC.), great care is shown in the decoration and finish of altar stones, doors and other important features, and that many steatopygous female statues were found in the temples. This, together with the large size and important position of many phallic stones, would seem to indicate that the temple was dedicated to a god or goddess of fertility, or perhaps to a pair. The most important sites are Hagar Kim, Hal Tarxien and Mnaidra. There is also at Hal Saffieni a large, neolithic series of caves which seem to have been both for habitation and worship; the presence of enormous numbers of human bones also indicates that part of it was used as an ossuary. The much later Egyptian cave temples at Abu Simbel (time of Rameses the Great) are merely highly developed descendants of such primitive

in Surrey. When William III. came to the throne Temple was cave structures, and the great groups of temple caves in India, as well as certain early cave temples along the Yangtse river. China. show that this tendency was wide spread

High Places .-- Not only do such primitive hill-top altars, common to many parts of western Asia, indicate the love for such positions, but also megalithic remains like those of Stonehenge (qv) indicate a similar feeling. It is noteworthy that even in China the great Temple of Heaven in Peking takes the form of a series of circular terraces, obviously pointing to a primitive desire to imitate hill forms, and the Assyrian ziggurat (q v ), as well as the Mexican and Central American pyramids are merely variant expressions of the same controlling emotion. This probably explains the situation of the temple at Jerusalem upon the hill top, and, combined with ease of military defence and love of architectural effect, the site of the temples of the Greek cities

Egyptian Temples .-- With the civilization of Egypt the structural temple assumes a controlling importance, for the cave temples of Egypt are exceptional and secondary. The developed Egyptian temple shows a complex type which is evidently the accretion of many stages. The earliest examples were probably simple, square or rectangular shrines of small size and with no openings but a door. Occasionally four columns supported the roof of flat stone. As worship grew more complex and wealth increased, additional halls were added in front of and around the original shrine, with a monumental, colonnaded hall open at the front, probably for the combined purposes of narthex (or vestibule) and prayer hall. Finally, a large court with entrance pylons of enormous size became part of the scheme, and by far the greater number of the Ebyptian temples existing show all of these elements. The result was characteristic, both the widest and the highest elements in the building were toward the front (pylons, forecourt, hypostyle hall) and the narrowest and lowest at the rear (the shrine) The mystical effect of this gradual narrowing down and darkening of the interior scheme is impressive In addition to these simple elements, the great temples of Thebes (Karnak and Luxor), representing the building of many generations and many dates, have the shrines surrounded with a maze of small rooms, courts and corridors, whose use is difficult to assign. The most perfect example of Egyptian temples, so well preserved that its ancient effect can be readily judged, is the late temple at Edfu (237-257 BC)

Western Asia.-The principal feature of Assyrian and Chaldean temples was the ziggurat (q v.) or stepped pyramid, with stairs or an inclined plane leading up to the terraces of the steps and the summit The walls were decorated with glazed brick or painted stucco, and in some cases, at least, each stage was dedicated to a separate divinity, as in the famous example at Babylon, in which each of the seven stages was dedicated to a separate planet. It is undoubtedly to a ziggurat that the biblical tradition of the Tower of Babel refers Besides a ziggurat the temple group comprised a court or courts and various rooms for priests and for the storage of temple treasures and archives Further west, on the Mediterranean coast, a different type occurs, in which a small, enclosed room is fronted with a monumental entrance, frequently flanked by columns This type is not only known from various small Phoenician models, but is also clearly represented in the biblical descriptions of the various temples at Jerusalem. The earliest description of Solomon's temple is that of I Kings, vi. 7, which, despite its completeness, is open to many interpretations and an enormous number of different restorations have been based upon it and indications found on the site. The essential elements are, however, clear and consist of a courtyard. a great altar of burnt offerings, traditionally placed upon the sacred rock now known as the sakhra, and the temple building itself. This was entered through a lofty porch or gateway of obviously Egyptian pylon type, which was flanked or fronted by two enormous free-standing columns, which were purely decorative or traditional and may represent a lingering of the same neolithic tradition that set the phallic stones in the Malta temples. Through the pylon one entered the naos (the holy place or hekal), 40 cubits long, 20 wide and 30 high (the cubit being roughly one and a half

TEMPLE ARCHITECTURE FROM THE 5TH CENTURY B.C. TO THE 17TH CENTURY A D

The great entrance pylons of the temple at Ediu (237–57 B.C.) These pylons embody, despite their late Polemais disk all of the magnificent grandeur of scale and claborate construction characteristic of Egyptient religious architecture.

Greek temples, on the other hand, sought and achieved repose and classic dignity through careful relationship of every potrion The Theorem at Ather, commisted before 421 B C and probably once dedicated to Relativative and Athers, is one of the best preserved before 421 B C.

The Yashamon gate of the tomb shrine of Ivemitar at Nikko, Japan, shows the graciousness, intricacy and occasional over elaboration typical of the Tokugawa style of the middle of the 17th century and vertical lines 3. The Roman variation of the classic tample form is well shown in the Maison Carries at Nipnes, France (c A D.). Its high potulour or base, entrance stops and superb Cornshinan order are typical of the governed layelines of the Roman against

feet). It was lighted by a row of lattice windows, probably a clerestory set high in the wall, like the somewhat similar clerestory windows at Karnak Behind the naos, and entered from it, was the Holy of Holies or debir, 20 cubits in all three dimensions Within this sanctuary was kept the Ark of the Covenant, flanked by two cherubim Surrounding the naos and sanctuary were three storeys of small chambers In the details described, this temple shows an interesting combination of forms with origins in all the surrounding countries Thus the pylon porch and the diminution of height from front to back are purely Egyptian, while the greater number of the ornamental motives (cherubin, etc.) are of Mesopotamian origin In construction, however, the combination indicated of stone, timber and metal is distinctively of the Mediterranean coast. The temple was destroyed (586 BC) and rebuilt 70 years later. largely in accordance with the older type, with certain differences, the most important of which was the use of a great curtain to separate the naos from the sanctuary and the existence of two courts instead of one In c 20 BC Herod built a third temple which was hardly completed in its entirety before the capture of the city and the razing of the temple by Titus (A D 70)

The Aegean World and Greece.—The Minoan civilization has left remains which indicate that both caves and high places were deemed sacred Representations on seals and wall paintings also show that small shinnes existed in great numbers, but up to the present time (1948) no large, monumental temples have been discovered The most ordinary type of Aegean shinn of pre-Greek date is well represented on a fresco in the palace at Knossos (6 1500 nc.), showing a wall surrounding a temenos or sacred area, planted with trees, and filled with two-shippers

In the early Hellenic Greek world it would seem that the temenos with its altar was the most common form of temple; the constructed building not appearing until two or three centuries had elapsed after the Dorian migration The earliest temples were of various forms, patterned on primitive dwellings, but the rec-tangular form was finally adopted and developed. The construction was apparently of sun-dried brick, with wall ends and openings cased in wood. A porch in front was early added, between solid end walls, which were the continuation of the side walls of the cella or enclosed portion. As building skill increased, and the need for larger and more splendid temples was felt, columns were added, first in one row down the centre, to decrease the unsupported span of the roof, and later in two rows, dividing the covered space into nave and assles. On the outside columns on the porch matched those within. Later, another porch was added at the rear, and finally a colonnade would be continued entirely around the building, giving the developed type which has been famous as the characteristic classic type ever since One of the earliest of large size, of which many remains exist, is the temple of Hera at Olympia (variously ascribed to many dates between the 10th and 7th centuries BC) Its stone foundations were obviously originally designed to carry sun-dried brick walls and its wood cased antae (q v.), or pilaster-like wall ends, and door nambs are of the most primitive type. It is reported by Pausanius that the original wooden columns of the colonnade were replaced by stone columns of various shapes and sizes during the entire history of classic Greece, differences in contemporary styles accounting for the relative delicacy or crudity of the columns. Naturally, the greater number of the architectural fragments found are of late date. By the middle of the 7th century B C the Greek temple type was thoroughly established and the ruined temple at Corinth, of this date, had a stone colonnade in which all the elements of the later perfected Doric order are found. There is also a large group of archaic temples in south Italy and Sicily, where the Greek colonies of the time had reached a high level of wealth and established civilization. Thus at Syracuse, at Segesta, Selinus, Agrigentum (Acragas) and Paestum there are many examples of archaic Doric temples of the late 7th and 6th centuries B.C. In all of these the columns are heavy and low, closely spaced and with widely projecting, heavily convex capitals, and the entablature above is heavy in proportion. Sculpture of a crude type appears during this period, notably in the metopes and the pediments, or gable ends.

The type of temple building thus set remained constant throughout the history of Greek architecture, although the refinements of taste and growing structural skill of the period succeeding the Persian wars led to the use of slenderer columns and more delicate entablatures. The typical temple was surrounded by a colonnade, usually with six columns at each end, and with 12 or more on the sides. The walls of the enclosed cella were usually separated from the columns of the colonnade by a space wider than that between the columns and, following the old tradition, frequently projected in front of the doorway proper, forming, as it were, a little subsidiary porch inside the main colonnade Within, the building was sometimes divided into two chambers, the larger in front, the smaller, rear chamber, being entered occasionally from the larger, but often, as in the Parthenon (447-438 BC), entered only from the rear porch. This rear chamber was frequently used as a treasury. The larger room was usually divided into a nave and aisles by two rows of columns, in most cases in two storeys, either with or without a gallery at the level of the lower entablature At the end of the nave, opposite the entrance, stood the statue of the deity, which might be either an antique and shapeless tree trunk, going back to prehistoric times, or the most perfect colossal work of a sculptor like Pherdias, whose gold and ivory statues of Zeus in Olympia and of Athena in the Parthenon at Athens were perhaps the two most ad-mired works of art of the ancient world The interior was probably lighted only by light entering through the door; this illumination, upon the rich colours of the painted architectural detail and the mass of votive offerings, and reflected from the white and gold of the statue, undoubtedly produced an effect of somble and impressive richness. The same richness of colour and sculpture decorated the exterior. The entablature glowed with deep blues and reds, against which the metope sculptures were sharply relieved In the pediments above, great groups of free-standing sculpture, brilliantly composed, gave an adequate crown. In some cases the exterior walls were probably painted, as well.

The typical Greek temple, however, consisted usually of more than a single building, which was only the most important feature of the temenos. The sacred enclosure might contain, as well, is smaller shrines of heroes or related deties, treasury buildings for gifts from special localities, like the treasures at Olympia and Delph, colonades, as at Argos; and, in special cases, halls for mysteries and the like. Thus, such temples or sacred areas as those at Eleusis, Argos, Delob, Delph and Olympia beginnerwast congeries of all sorts of buildings devoted to the common purpose and use of aiding in some way the cult, and usually representing many periods of Greek history down to, and even later than, the Roman conquest.

In Asia Minor the Ionian influence, working on the same basis, produced effects of a different type. Not only was the Ione order most commonly used in place of the Dorac, but also the sense of scale was different, and when the Dorac builders sought beauty through perfection of detail and every possible refinement, the Ionanas sought it through enormous size and lavish richness. Thus even the archaic temple of Artemis at Ephesus (early 6th century 8 c.) was of a scale scarcely ever attempted in Greece proper, prior to Roman times, and in the much later temples at Priene, Miclus and Sards, great size and scale was the controlling force.

Etruria and Rome.—Etruscan temples are little known except from literary descriptions and certain remains of terra-cottar revetments, or covering decorations for wooden members. It is well established that the cella was much shorter than in Oreek examples, approaching a square in plan, and that columns were limited to a porch in front, usually of great depth. The construction of the roof and entablature was apparently usually in wood, sometimes covered with terra-cotta plaques, and the spacing between columns was much greater than in Greek temples.

Roman temples, in plan, always retained the influence of their Ertuscan prototypes, and the great temple of junpier on the Capitoline hill preserved to the end its primitive Ertuscan lay outwide, shallow cells divided into three chambers, all opening out upon a deep, many-columned porch. The peripteral scheme, with columns on all four sides of the cells, appeared only in imperial 928 TEMPLE

times and was always rare, being reserved for the very largest and most monumental temples, such as the enormous double temple of Venus and Rome at Rome, designed for Hadrian, by Apollodorus of Damascus. The normal type, with a porch only in front, nevertheless, frequently had the cella walls decorated with pilasters or engaged columns Thus the temple of Fortuna Virilis at Rome (variously attributed to the beginning of the 2nd and the beginning of the 1st century B.C.), has a range of engaged columns around three sides of the cella, matching exactly the columns of the porch The same treatment, on a much larger scale, is found in the Maison Carrée at Nîmes (c AD 1), which is the most perfect example of a Roman temple extant Similarly based upon Etruscan tradition is the fact that all Roman temples were raised upon high podia (base or pedestal), whose side walls projected forward and received the ends of a great flight of entrance steps Roman temple interiors were usually both larger and more lavish than the interiors of Greek temples, and the larger examples were frequently vaulted with richly coffered barrel vaults This led also to a greater enrichment of wall design, and walls, beside being cased in rich marbles, were often enriched with pilasters or engaged columns, and further decorated with small niches pediment-crowned and flanked by columns. The most extraordinary examples of this type of development extant are the temples comprising the great group at Baalbek in Syria, the ancient Heliopolis (begun during the reign of Hadrian and completed early in the 3rd century). The cella of the temple of Bacchus, the smaller of the group, still remains, in large measure complete up to the cornice, and shows ranges of engaged Corinthian columns. and between them arched recesses below, and pedimented statue frames above. The great temple of Jupiter is chiefly remarkable for its enormous forecourt, colonnaded and with great niches, and in front of that an hexagonal court, and the colonnaded propylaea. Both of these temples have colonnades all around, in the Greek manner, and the same is true of the contemporary double temple of Venus and Rome at Rome, in which the surrounding colonnade was double. This temple is also remarkable for the two anses back to back in which the statues of the two divinities were placed. The side walls were treated with niches and columns in a way much resembling the Baalbek example. The surroundings of Roman temples never had the informal charm of the Greek temenos, but were usually surrounded by a rectangular courtyard with colonnades, like that of the temple of Venus and Rome, or the temple of Apollo in Pompeii (rebuilt c. AD. 65). Other temples were placed merely at street corners, like the temple of Fortune at Pompeii, of early imperial date, or the temple of Fortuna Virilis at Rome. Many temples were also placed in or facing the forum, which served, itself, as the temenos or sacred area.

Many exceptional types of Roman temples are found. Thus the temple of Vespasian at Brescia (A.D. 72) had three chambers in the cella with the six-columned portico in front of the central one projecting far beyond the small portices of the side chambers. That of Concord, at Rome (7 B.C. to A.D. 10) had the main entrance to the cells in the middle of one of the long sides, with a superb portico in front of it. Remarkable also is the great development of round temples, either of comparatively small size, like the temple of the Sybil at Tivoli (usually attributed to the beginning of the 1st century B.C.); the so-called temple of Hercules at Rome; or the so-called temple of Venus at Baalbek. in which the cells is surrounded with a portico of Corinthian columns, whose entablature is scalloped or star-shaped in plan. The most magnificent of the round temples is the Pantheon (q.v.) at Rome (A.D. 110-125), whose vast domed hall, over 140 ft. in diameter, is one of the most impressive interiors in the world-

Tassic Temples: Technical Definitions.—In architectural descriptions of the classic temple a number of technical words have become common. Many of these owe their origin to the work of Vitruvius, author of a complete Roman treatise on architecture of the time of Augustus. The most common of these terms descriptive of the general arrangement and of the position of columns may be shortly defined as follows:

A Those affecting general distribution of parts Prostyle—with a porch or portico in front

Amphiprostyle-with a porch or portico both at front and rear

Peripteral—with a colonnade completely surrounding the cella, either rectangular in plan, as in the typical Greek temple, or circular, as in the temple of the Sybil at Tivoh

Pseudoperipteral—with a porch or portico only in front, but with the exterior walls of the cella decorated by engaged columns or pilasters, as in the Maison Carrée at Nimes

B. Terms describing detailed arrangement or position of temple

In antis—columns placed between the pilaster-like decorations at the ends of the side walls of a naos or cella when these walls are projected forward beyond the front of the building to form a porch between them

Dipteral—with a double colonnade along the sides Pseudodipteral—with the columns of the side colonnade separated from the cella walls by a space wide enough to allow a double colonnade but without an inner row of columns.

Distyle, tetrastyle, pentastyle, hexastyle, octostyle, decastyle, etc—with two, four, five, six, eight or ten columns in front Such words composed of "style," with a Greek numerical prefix, may be multiplied indefinitely, to describe buildings or porticos with any number of columns

Indian Temples .-- Indian temples show clearly the development from sacred cave to free-standing structure. The earliest existing monumental temples are all rock-cut and developed with caves The earlier temples, such as those at Behar, and at Karli, near Bombay, show a great cave interior, divided by piers or columns into nave and aisles, with a small stupa, or solid masonry curve-topped structure enclosing a relic of Buddha, and a façade cut in the face of the rock, with doorway below and huge horseshoe-shaped window above, all in imitation of wooden construction A second common type of rock-cut temple consists of those in which, in addition to the shrine proper, there are great courtyards surrounded by cells for monks. These are known as viharas. The most remarkable groups of cave temples are those at Ajanta and Ellora In both there are temples of Buddhism and also Brahmanism, and the types of detail known as Dravidian and Jain are both found. The dates vary from the 2nd century B.C to the 6th and 7th centuries AD. The Dravidian and Jain constructed temples both show a power and heaviness of general mass with an amazing intricacy of carved detail that is more typical of rock-cut than free-standing structures, and the characteristic pyramidal towers, with their strongly marked horizontal mouldings and vertical projections have almost the character of artificial mountains and cliffs The rôle played by figure sculpture in its lavishness, its multitude of figures and their bold relief, is unlike that played in any other structural style, and without doubt owes much, also, to rock-cut prototypes. The plan type shows usually a vast rectangular enclosure entered through several monumental gateways, crowned with enormous, solid towers, Within are smaller enclosures and subsidiary buildings, and sometimes an additional closed court, also with monumental gates Near the centre is the shrine proper, containing the cult statue, sometimes approached by vast, colonnaded halls, and every exposed surface of the great towers and the interior columns and walls is covered with a rich network of sculpture and ornament.

East Indies—Indian influence is marked in the temple ruins found in scattered places through Cambodis, Burns, Java and nearby islands. All of the great temples are elaborations of the stips idea, and consist in essence of one or more stupas on raised terraces. Thus in the Shwo Dagon pagoda at Rangoon there are a multitude of small stupas crowned with high, spire-like finals, surrounding a contral stupa which rises to a height of over 350 ft., and the whole surface is heavily gilded. At Borobudur, Java, the great Buddhist temple (? the or 8th century a D) consists of a series of terraces around a hill ye of the had the top of which is a large stups aurrounded by of series ones. All of the stone himng of the terrace walls is covered united exquisite relief sculpture, not only illustrating the life of Buddha, but also containing many pictures of ordinary, every day events. The most remarkable of these eastern Buddhist temples is Angkor-Wat at Angkor in Cambodia (attributed to the 1st half of the 1st hentury, and apparently originally intended as a Brahmin temple, being converted to Buddhist uses later). This consists of three great symmetrical terraces with elaborate stars, consists of these great symmetrical terraces with elaborate stars, but the context of the star of the context of the sculpture and output production. The sculpture and output production of the context of the sculpture and output production. The sculpture and output production of the picture of some of the picture and column acquisits is noteworth character of some of the picture and column acquisits is noteworth character of some of the picture.

China and Japan.-Further east an entirely contradictory tradition governs temple design, that of the columned prayer halls of Japan and China The expression of this in China differs from that in Japan. The typical Chinese temple, whether Taoist or Buddhist, is basically symmetrical and rectangular. Through a gate-house, frequently vaulted, an outer court is entered, in which on either side of the main axis is a small tower, one containing a drum and the other a bell. Directly opposite is the main prayer hall of the temple, with many columns, and a richly beamed and coffered ceiling. Against the back wall is a large pedestal, usually supporting three statues, and in front of it a table-like altar with its ritual utensils. In temples of Confucius, a simple, richly decorated shrine replaces the statues . There is often, in addition, a court at the rear, with another hall shrine on its axis. In large groups, the number of courts and shrines is increased and additional halls at the sides of the courts. serve the purpose of chapels In Taoist temples, the most important shrine is sometimes in the centie of the court, and bell and drum towers are absent. There is also, at times, a long gal-lery containing statues of the 500 Lohans, or holy men. The architectural character varies with the locality Those in the north are full of the monumental grandeur of the Peking school. as in the temple of Confucius, or such monasteries in the western hills as that of Wo Fu Tsu (both of the Ming and subsequent dynasties) Those in the Yangtse valley are more picturesque, with exaggeratedly curved roofs, and slimmer supports, as in the 18th century Sheng Yan Sze monastery near Hangchow In those in the south, granite supports replace the wooden columns found further north. Roof ridges are of extraordinary intricacy and the wood carvings of the interiors exquisitely rich and delicate, as in the 18th century temple of the Chen family in Canton.

In Japan the elaborate formality of the typical Chinese temple is absent. In fact, the native Shinto temples are based upon exceedingly primitive house ideas, and are simple, rectangular buildings with heavily thatched roofs. Architectural effect is gained, however, through the monumental torni or gateways which cross the main entrance paths Many votive stone lanterns also decorate the grounds In the Buddhist temples the halls themselves are based entirely on Chinese prototypes, but the detail is typically Japanese in its composition and its mannered realism, and roof and cornice details are endlessly varied. In disposition there is little attempt at absolute symmetry Instead, there is a brilliant grasp of informal balance and composition, and a remarkable genius in adapting the exigencies of the plan to the picturesque hillside site so loved by the Japanese. Outstanding examples are the temples of the magnificent group at Nikko, largely of the 17th century, and the Hong Wanji temple at Kyoto. The genius for placing temples is well seen in the island temples that dot the Inland sea, especially those of the sacred island of Itaku Shima, near Hiroshima, where the chief temple was founded in 587.

TEMPLE BAR, an historic site in London, England. In more than one of the main roads, converging upon the city of London

a bar or chain marked the exta-nural jurisdiction of the Coproporation Temple Bar stood at the junction of the present Strand and Fleet street, over against the Law Courts A bar is first mentioned here in 1301, but the name is most familiar in its application to the gateway designed by Sir Christopher Were, which replaced an older structure on this spot in 1672. This was removed in 1378, and set up in 1888 at the entrance to Theobalds park near Cheshunt, Hertfordshire. A pedestal surmounted by a dragon or "griffin" marks the old site. When the sovereign is about to enter the city in state, whether by Temple Bar or elsewhere, the Lord Mayor, in accordance with ancient custom, presents the swood of the city to him, and he at once returns it. Formerly the bai or gate was closed until this ceremony was carried out

TEMPO (It), term used in muse signifying literally time, though in practice it has come to mean more often the speed at which a composition is, or should be, performed It is however still used in the other sense in such expressions as tempo or distance, meaning "in common time"; it keewse in tempo rubato (literally "robbed time"), meaning the slight deviations from strict time which the performer makes for expression (See Time).

TENANT: see LANDLORD AND TENANT

TEMANT-RIGHT, in law, a term expressing the right which a tenant has, either by custom or by law, agant has landlord for compensation for improvements at the determination of his tenancy. In England it is governed for the most part by statute, eg, the Agnoultural Holdings Act, 1923, and the Small Holdings and Allotiments Acts, 1908-76 (see ALLOTMENTS, LANDLORD AND TEMANT; SMALL HOLDINGS) A right to compensation for improvements is created in favour of tenants of business premises by the Landlord and Tenant Act, 1927. In Ireland tenant-light was a custom, prevailing particularly in Ulster, by which the tenant action, the control of the state of the

No custom giving rise to tenant-right seems ever to have existed in the United States, and no right of compensation in favour of

tenants exists apart from agreement or local statutes

TENASSERIM, a division of Lower Rutma, bordening one Siam Area, 37,644 sq mi. Pop (1941) 2.17,420, nucluding over 70,000 Christians, the great majority of whom are Karner, The beadquarters of the commissioner are at Moulmein. His divided into six districts: Toungoo, Salween, Thatôn, Amherst, Tavoy and Mergui It formed the tract south of Pegu conquesed from Burma in 1846, which was for many years known as the Tenasserim province. The southern extremity of the division approaches the insular region of Malaya, and it is fringed along its entire the state of the

TEN BRINK, BERNIKADD ESCUDIUS KONRAD (1841-29). German philologist, of Dutch origin, was born at Amsterdam on Jan. 12, 1841, and educated origin, was born at Amsterdam on Jan. 12, 1841, and educated origin, was born at Amsterdam on Jan. 12, 1841, and educated Dimedelorf, Münster and Bom. In 1870 he became professor of in Dimedelorf, Münster and Farland and Bernard origin or the Strath origin and Amsterdam 1870 in conjunction with W. Saturders in Jan. Martin and E. Schmidt, Quellen und Forschungen zur Sprache und Kulturgsschichte der germanischen Välker In 1871 he published Chauser: Studien zur Geschichte seher Entwickelung und zur Verskunst. He also published citical editions of the Prologue and Verskunst. He also published citical editions of the Prologue and Verskunst. He also published citical editions of the Prologue and Verskunst. He also published citical editions of the Prologue and Verskunst. He also published contical on the English Chauser study in the United Kingdom as well as in Germany, and to him was indirectly due the foundation of the English Chauser society. His Bectwilf-Untersuchungen (1888) proved a hardly less valuable contribution to the study of Early English Herstmer. His best known work is his Geschichte der englischen Literatur, (1889-93) (English hy H. Kermedy in Bohn's Standard Libratur), which was never completed, and broke off just before the Elizabethan period. He died al Strasbourg Jan. 29, 1892.

TENBY, a municipal borough in the Pembroke county parliamentary division of Wales, 10 mi, E of Pembroke by road Pop. (1951) 4,597 Area 1 8 sq mi Standing on a promontory on the south coast of Pembrokeshire overlooking Carmaithen bay to the east, the walled town is built of the gray limestone of the peninsula It has a harbour and two sandy beaches. The alternation of chiffs of grav limestone and Old Red Sandstone along this coast is very beautiful and Tenby, with its mild climate, is visited all the year round Tenby is first mentioned as a Danish fishing station, and the old Welsh name, Dinbych-v-Pysgod, means "the precipice of fishes." Flemish clothworkers came there in the early 12th century and a 16th-century Flemish house still exists Ruins of the castle (12th-13th century) stand on a hill northeast of the town. St. Mary's church is mostly 15th century The early charters were confirmed in 1580 and the 15th-century town walls repaired in 1588 when a Spanish invasion was feared During the 15th and 16th centuries Tenby traded by sea with Bristol and had wealthy mercantile families It declined after the Restoration until the coming of the railway.

Caldey, 2½ mi. S. of Tenby, is an island privately owned by a priory of Cistecian monks of the Strict Observance (Trappists)

who went there in 1929 from Chimay in Belgium.

TENCH (Tinca tinca). A cyprinid fish of Europe, Asia Minor and Siberia, greenish, with small scales and rounded fins thrives in weedy ponds. Specimens exceeding 8 lb. are rare The flesh is more palatable than that of most cyprinids

TENCIN. CLAUDINE ALEXANDRINE GUÉRIN DE (1685-1749), French author and leader in society, was born at Grenoble in 1685 It was her family's wish that she become a nun, but a life among the Parisian social and intellectual leaders of the day was more to her taste Many of France's prominent men were counted among her lovers; most illustrious was the regent, Philip, duke of Orléans. Her salon, frequented by such hterary lions as Bernard le Bovier de Fontenelle, Claude Adrien Helvetius and Charles Louis de Secondat de Montesquieu, became one of the most brilliant in the reign of Louis XV Her son, by Louis Camus, Chevalier Destouches, was Jean le Rond d'Alembert,

who, with Denis Diderot, collaborated on the Encyclopédie, A woman of imagination and intelligence, Mme, de Tencin acquired a reputation as an author of some stature. Among her books were Le Stège de Calais (1739), Les Mémoires du comte de Comminges (1735), Les Malheurs de l'amour (1747), Les Anecdotes d'Edouard III (pub. 1776) and Lettres au duc de Richelieu

(pub. 1806). She died in Paris in 1749

TENDER. (1) An adjective meaning soft, either physically or figuratively (Fr. tendre, Lat. tener, soft, allied to tenuis, thin). (2) A legal term meaning an offer for acceptance, particularly an offer in money for the satisfaction of a debt or liability or an ofter to pay or deliver according to the terms of a contract; for "legal tender" see PAYMENT. The term is also applied to an offer to do a specified piece of work or to supply certain goods for a certain sum or at a certain rate or to purchase goods at a certain rate Contracts for important works or for the supply of large amounts of goods are usually put out to tender in order to secure the lowest price. In this sense the word is from "to tender," to offer (Fr. tendre, Lat. tendere, to stretch out). (3) A "tender" is also one who "attends" (Lat. attenders, to stretch toward, to give heed to), and so is applied particularly to a small vessel which brings supplies, passengers, etc., to a larger vessel or which is used to take or bring messages, and similarly to a carriage attached to a locomotive engine on a railway, which carries fuel and water

TENDON OF ACHILLES, the large tendon at the back of the ankle. It is the tendon of the calf muscles which extend and invert, the foot, and is inserted into the heel bone (calcaneus). These muscles often become shortened, as a result of overdevelopment or sometimes of the continued use of high heels, or they may be congenitally short. This defect sometimes leads to fallen arches and foot pain so severe that the tendon has to be lengthened by and pot pair so severe that the tendon has to be tengthened by structed operation. This tendon is named after Achilles, a famous here of the Rojan war. According to Greek legend when Achilles was born his mother plunged him into the Styx. This made his

TO MARKET BY

whole body invulnerable except the part of the heel by which she had held him, and in this heel he later received a mortal wound

TENEBRAE, an office sung in Roman Catholic churches on the afternoon or evening of Wednesday, Thursday and Friday of Holy Week Durandus (vi. 72, n. 2) derives the name from the fact that "the church on these days cultivates darkness (tenebras colit)" in sorrow for the Lord's Passion, celebrating His exequies on three days since for three days He was dead, and it symbolizes the darkness that fell on the earth while the Sun of Justice was crucified

TENERIFE (TENERIFFE), the largest of the Canary Islands. area, 795 sq mi Of irregular shape, 60 mi long, 30 mi wide, it is the main portion of the Spanish province of Santa Cruz de Teneiife (pop 1950, 418,101) The celebrated peak locally known as the Pico de Teyde (or Teide), with its supports and spurs, occupies nearly two-thirds of the whole island It has a double top. the highest point, El Piton, is 12,192 ft above the sea, the other, Chahorra, connected with the first by a short narrow ridge, has a height of 9,880 ft. They are both orifices in the same grand dome

of trachyte, where snow lingers four months,

For more than one-half of its circumference the base of the true peak rises from an elevated but comparatively level tract On the southeast, south and southwest there is a high curved ridge overlooking the Pumice Stone plains and presenting a very steep face to the peak Between the ridge and the sea the slope is more gradual, and there are intervening tablelands. Peaks rise from the ridge, one of which (Guajara) attains the height of 8,900 ft Both El Piton and Chahorra have craters on their summits, from which issue steam and a little sulphurous vapour. The crater on El Piton is partly surrounded by a wall of lava, which has been made white by the action of sulphuious vapours The crater is about 300 ft across, with a depth of 70 ft The crater on Chahorra has a diameter of 4,000 ft , its depth is scarcely 150 ft The entrance to the Llano at a sort of natural gateway (called Portillo) between two basaltic hills, is about 7,000 ft above the sea Between two and three hours are consumed in crossing the Llano to the base of the cone, the lower part of which is ascended to a point 9,750 ft above the sea

To the northwest of the grand cone, several thousands of feet below Chahorra, there are many small cones of eruption, showing that the intensity of volcanic action was greatest on that side. Eastward from the ridge bounding the Pumice Stone plains extends a chain of mountains to the northeastern extremity of the island The highest peaks are Izana (7,355 ft ), Perejil

(6,027) and Cuchillo (5,467).

There is no record of eruptions from either crater of Pico de Teyde In 1795 a great quantity of lava was poured out from three vents on the eastern side, and in the same year lava streams issued from a crater near Gumar, halfway between Santa Cruz and the peak. In the year 1706 a vent on the northwestern side of the peak discharged a copious stream, which flowed down to the sea and nearly filled up the harbour of Garachico For three months in 1798 much lava and other volcanic matter were ejected.

Santa Cruz, the capital of Tenerife and of the Canaries, and Laguna, the former capital, are described in separate articles. A good road connects Santa Cruz and Orotava, a town on the north coast 25 mi. W N.W Date palms form a striking feature in the landscapes. The town of Orotava (pop. 1940, 5,635) is 1,040 ft. above the sea. The houses are solidly built, but the town has a deserted aspect. A stream of water is conducted through every street

Puerto de la Cruz (pop. 1940, 5,134) 3 mi, N. of the town, is a clean place. The streets are broad and the houses well built. (See also CANARY ISLANDS.)

TENGYUEH (Burmese MOMEIN), a town in the province of Yunnan, southwest China, near the Burmese frontier, with an estimated Chinese population of 18,000. It is situated at an elevation of 5,400 ft., in a region of heavy monsoonal rainfall, between the parallel north-to-south valleys of the Salwen and Irrawaddy. The town dates from the 14th century, when the Shan principality of Nankao was conquered by the Chinese, and Tengyueh was built as an outpost. The town lies on the old trade upper Irrawaddy valley Trade was formerly by mule transport: the journey to Yunnan-fu, over difficult country, took about 24 days, while Bhamo was a seven days' journey. The town was opened to foreign trade in 1897, but the actual customs opening did not take place until 1902 Tengyuch became of new importance after the outbreak of the war in 1937. The road from Bhamo through Tengyueh became a northern branch of the Burma road Trade more than doubled in 1939. The total customs revenue which had been a little over St \$300,000 before the war was St \$878,890 84 (\$104,403,44 US) in 1939. In 1942 the Japanese took Tengyueh but lost it in Sept. 1944.

TENIERS, the name of a family of Flemish artists who

flourished at Antwerp and Brussels during the 17th century DAVID TENIERS, the elder (1582-1649), was born at Antwerp, the son of Julian Teniers, a mercer who settled at Antwerp in 1558 He received his first training in the painter's art from his brother Juliaen, then studied under Rubens in Antwerp, and subsequently under Elsheimer in Rome; he became a member of the Antwerp gild of painters in 1606 Though he tried his skill in large religious, historical and mythological compositions, his fame depends chiefly on his landscapes and paintings of peasants carousing, of kermesse scenes and the like, which are marked by a healthy sense of humour, and which are not infrequently confused with the early works of his son David A large painting by the elder Teniers at St. Paul's church in Antwerp, represents the "Works of Charity" At the Vienna Gallery are four landscapes painted by Temers under the influence of Elsheimer, and four small mythological subjects, among them "Vertumnus and Po-mona," and "Juno, Jupiter and Io." The National Gallery has a characteristic scene of village life, "Playing at Bowls," a "Conversation," and a "Rocky Landscape." Other examples of his work are to be found at the galleries of Leningrad, Madrid, Munich, Dresden and Berlin ("The Temptation of St. Anthony"). He died at Antwerp on July 29, 1649

DAVID TENIERS, the younger (1610-1600), his more celebrated son, was born in Antwerp and was baptized on Dec. 15, 1610 Through his father, he was indirectly influenced by Elsheimer and by Rubens We can also trace the influence of Adrian Brouwer at the outset of his career. In 1637 Teniers married the ward of Rubens, Anne Breughel, the daughter of John (Velvet) Breughel. He became a "master" in the gild of St. Luke in 1633. The Berlin Museum possesses a group of ladies and gentlemen dated 1634. Some first-rate works—the "Prodigal Son" and a group of "Topers" in the Munich Gallery, and a party of gentlemen and ladies at dinner, termed the "Five Senses," in the Brussels Museum-are instances of the perfection attained by the artist when he was probably scarcely twenty. His touch is of the rarest delicacy, his colour at once gay and harmonious. He was little over thirty when the Antwerp gild of St. George enabled him to paint the marvellous picture now in the Hermitage Gallery in Leningrad the "Meeting of the Civic Guards" Correct to the minutest detail, yet striking in effect, the scene, under the rays of glorious sunshine, displays acquired knowledge and natural good taste. Another work of the same year (1643), now in the National Gallery, London, is "The Village Fête."

Teniers was chosen by the common council of Antwerp to preside over the gild of painters in 1644. The archduke Leopold William, who had assumed the government of the Spanish Netherlands, employed Teniers not only as a painter but as keeper of the collection of pictures he was then forming. With the rank and title of "ayuda de camara," Teniers took up his abode in Brussels in 1651. Immense sums were spent in the acquisition of paintings for the archduke. A number of valuable works of the Italian masters, now in the Vienna Museum, came from Leopold's gallery after having belonged to Charles I. and the duke of Buckingham. De Bie (1661) states that Teniers was some time in London, collecting pictures for the duke of Fuensaldana, then acting as Leopold's lieutenant in the Netherlands. Paintings in Madrid, Munich, Vienna and Brussels show what the imperial residence was at the time of Leopold, who is represented as conducted by Teniers and admiring some recent acquisition. No picture in the gallery is

route from Yunnan-fu to Bhamo, a Burmese trade centre in the omitted, every one being inscribed with a number and the name of its author, so that the ensemble of these paintings might serve as an illustrated inventory of the collection. Still more interesting is a canvas, now in the Munich Gallery, showing Teniers at work in the palace, with an old peasant as a model and several on-lookers When Leopold returned to Vienna, the pictures travelled to Austria. Teniers remained in high favour with the new governorgeneral, Don Juan, a natural son of Philip IV.

Shortly after the death of his wife in 1656 Temers married Isabella de Fren, daughter of the secretary of the council of Brabant, and strove to prove his right to armorial bearings In

1663 Teniers founded the Academy at Brussels.

Temers died in Brussels on April 25, 1690. David, his eldest son, a painter of talent and reputation, died in 1685. One of this third Teniers's pictures—"St. Dominic Kneeling before the Blessed Virgin," dated 1666—is in the church at Perck.

Blessed Virgin," dated 1666—is in the church at Perck.

TENISON, THOMAS (1636-1715), English archbishop, was born at Cottenham, Cambs., on Sept. 29, 1636 He was educated at Corpus Christi college, Cambridge, of which he became a fellow in 1659. After holding cures at Cambridge, where he gave devoted care to sufferers from the plague, and at Norwich, he was presented in 1680 by Charles II. to the vicarage of St. Martin's-in-the-Fields, London, where he endowed schools, established a public library, and was a champion of Protestantism during the reign of James II. Monmouth sent for him before his execution. Under William III, Tenison was in 1689 named a member of the ecclesiastical commission appointed to prepare a reconciliation of the Dissenters, the revision of the liturgy being specially entrusted to him. He preached a funeral sermon on Nell Gwyn (d. 1687) in which he represented her as truly penitent-a charitable judgment which did not meet with universal approval. He was made bishop of Lincoln in 1691 and archbishop of Canterbury in 1605 He attended Oueen Mary during her last illness and preached her funeral sermon in Westminster abbey. During William's absence in 1605 Tenison was appointed one of the seven lords justices to whom his authority was delegated. With Burnet he attended the king on his death-bed He enjoyed little favour with Queen Anne, but was a commissioner for the Union with Scotland in 1706. A strong supporter of the Hanoverian succession, he was one of the three officers of state to whom on the death of Anne was entrusted the duty of appointing a regent till the arrival of George I , whom he crowned on Oct 31, 1714. Tenison died in London on Dec. 14, 1715.

Tenison's works include The Creed of Mr Hobbes Examined (1670) and Baconia, or Certain Genuine Remains of Lord Bacon (1679). He was one of the founders of the Society for the Propagation of the Gospel.

TENNESSEE, popularly known as the "Volunteer state," is a south central state of the United States of America. It lies between the extremes of approximately 35° and 36° 41' N. and 81° 40' and 90° 18' W of Greenwich. Tennessee is bounded on the north by Kentucky and Virginia, on the east by North, Carolina along the line of the crest of the Unaka mountains to within 26 mi. of Georgia, where the boundary turns due south; on the south by Georgia, Alabama and Mississippi along the 35th parallel of north latitude; on the west by the Mississippi river, which separates it from Arkansas and Missouri. The extreme length of the state from east to west is 432 mi., and the extreme breadth is 115 mi., its area being 42,246 sq mi., of which about 700 are water surface The popular name "Volunteer state" was given to Tennessee because of its remarkable record in furnishing volunteers in the Mexican War.

Physical Features.—The state is popularly divided into three large divisions known as east, middle and west Tennessee. The first extends from the heights of the Unaka ridges along the North Carolina border, across the valley of the Tennessee nver to the heights of the Cumberland plateau. The middle section includes a part of the Cumberland plateau, all the Highland rim plateau and the Central basin, and extends westward to the Tennessee river. The western division includes the plateau region from the Tennessee river to the steep slope which overlooks the Mississippi flood plain, also a narrow strip of lowland which extends to the Mississippi river From a maximum elevation of 6 642 ft at Clingman's Dome near the North Carolina border, in Sevier county, the surface descends to 182 ft on the Mississippi river in Shelby county The mean elevation of the state is approximately ooo ft The general slope, however, is west by north The Unaka mountains, which occupy a belt 8 to 10 mi. wide along the state's eastern border, are a series of somewhat irregular ridges developed on complexly folded and faulted crystalline rocks. Sixteen peaks exceed 6,000 ft in height. That part of the Great Appalachian valley which traverses Tennessee is commonly known as the valley of east Tennessee It consists of parallel ridges and valleys developed by erosion on folded sandstones, shales and limestones, the valley quality predominating because the weak limestones were of great thickness. The valley areas vary in height from 600 ft. in the southwest to 1.600 ft in the northeast. In the northeast the ridges are more numerous and higher than in the southwest, where White Oak ridge and Taylor's mountain are among the highest, although Missionary and Chickamauga ridges are better known because of their association with hattles of the Civil War

Along the southwest border of the valley a steep escarpment, known as Walden's ridge, rises to the Cumberland plateau. This plateau has a mean elevation of about 1,800 ft, and a rolling topography, the northern portion sloping toward the northwest.

The western edge of the plateau is much broken by deep indentations of stream valleys, and drops suddenly downward about 1,000 ft to the Highland rim plateau, so named from the scarp which forms an encircling rim around the Central basin. It is fairly level generally, except where it is cut by river valleys The Central basin lies for the most part 400 to 600 ft. below the rim: a few hills or ridges, however, rise to the level of the rim. The basin is elliptical in form, extending nearly across the state from northeast to southwest with an extreme width of about 60 mi.: near its centre is the city of Murfreesboro, and Nashville lies in the northwest

Between the Central basin and the lower Tennessee river is the western Highland rim Westward from the lower Tennessee river the surface rises rapidly to the summit of a broken cuesta or ridge and then descends gently and terminates abruptly in a bluff overlooking the Mississippi flood plain. This is called the plateau slope of west Tennessee, which is part of the east Gulf coastal plain The bluff, 150 to 200 ft, in height, traverses the state in a rather straight course; between it and the meandering Mississippi, except at a few points where that river touches it, lie low bottom lands varying in width according to the bends of the river and containing numerous swamps and ponds. In the northern portion, principally in Lake county, is Reelfoot lake, which occupies a de-pression formed by an earthquake in 1811. It is 18 mi, long, has a maximum width of 3 mi., and is the only large natural lake in

The whole of the Appalachian province of Tennessee and the Southern portions of the Cumberland plateau, the Highland rim, and the Central basin are drained southward and westward by the Tennessee river and its tributaries. The valley of the lower Tennessee is drained northward by the same river. The northern portions of the Cumberland plateau, Highland rim and Central basin are drained northward and westward by the Cumberland river and its tributaries. The western slope of the east Gulf plans is drained directly into the Mississippi by several small streams.

The Central basin, the less elevated parts of the valley of east Tennessee, and parts of the outer portion of the Highland rim have a fertile soll of limestone origin. There are narrow strips of rich alluvium along many rivers. The soils on the mountains, on the ridges of the valley of east Tennessee and on the eastern slope of the east Gulf plains vary greatly, according to the rocks "为我们!

from which they are derived. In the Cumberland plateau, in the inner portion of the Highland rim and in the higher parts of the western slope of the east Gulf plains, the soil for the most part is sandy and thin

Tennessee has a delightful climate. The mean summer temperature varies according to elevation from 62° F on the Unaka mountains to 72° on the Cumberland plateau, or 75° in the valley of east Tennessee and on the Highland rim, 77° in the Central basin and about 78° on the east Gulf plains The mean winter temperature for each of these divisions values little from 28°. and the mean annual temperature ranges only from 57° in east Tennessee to 58° in middle Tennessee and to 60° in west Tennessee Usually the highest temperatures of the year are in July and the lowest in January. Killing frosts are rare between the third week in April and the middle of October, especially in the southern and western parts of the state An average annual precipitation of about 50 in is quite equally distributed over the state, and a little more than one-half of it is well distributed through the spring and summer months. The average annual snowfall is about 8 in The warm, moisture-bearing winds blow low from the south or southwest with a free sweep across the state in a direction nearly parallel with the trend of the mountains. The commingling of these winds with upper cold currents from the north gives rise frequently to westerly and occasionally to easterly winds

History.-What is now Tennessee was visited and claimed in turn by Spaniards. French and English. The final success of the English was achieved only after the desperate struggle which ended in the treaty of Paris of 1763 By its provisions France was driven from North America and the power of Spain was

greatly limited

The daring Spanish explorer Hernando de Soto reached the Mississippi river in 1541, at a high bluff occupied by Chickasaw villages, believed to be the present site of Memphis After a brief halt to collect food from the Indians and to build rafts. De Soto left the territory by crossing the Mississippi It was 132 years before another white man saw Tennessee

Jacques Marquette, the French missionary and explorer, in his voyage down the Mississippi by canoe in 1673, camped upon the western boider, and eight years later La Salle and his companions left Canada to complete the exploration of the river. La Salle built Ft Prud'homme in 1682 upon the Chickasaw bluff, near the present site of Memphis, but it was soon abandoned. Later the French built Ft Assumption, where Memphis now stands, and kept a garrison there, but made no attempt at colonization. The territory was a part of the English grant to Sir Walter Raleigh in 1584, and of the later Stuart grants, including that in 1663 to the proprietors of Carolina Tames Adair of South Carolina, a fur trades and explorer, is supposed to have been the first to go from the English colonies into Tennessee. A party of Virginians led by Thomas Walker (1715-94) in 1750 reached the Cumberland river and Cumberland mountains and named them in honour of the royal duke In 1756 or 1757 Ft. Loudon, named in honour of John Campbell, earl of Loudon, was built on the Little Tennessee river, about 30 mi. south of the present site of Knoxville, as an outpost against the French who were then active in the whole Mississippi valley, and was garrisoned by royal troops. The fort was captured by the Cherokee Indians in 1760, and both the garrison and the neighbouring settlers were massacred

Eastern Tennessee was recognized as a common huntingground by the Cherokees, Creeks, Miamis and other Indian tribes, The Iroquois of New York claimed much of the central portion by right of conquest, and the western section was the home of the Chickasaws.

By the treaty of Ft. Stanwix, in 1768, the Iroquois ceded whatever claim they had to the English, and in 1769 several cabins were built along the Holston and Watauga rivers upon what was thought to be Virginia soil.

A settlement near the present Rogersville was made in 1771, and in the next year another sprang up about the store of Jacob Brown on the Nolichucky. After the failure of the Regulator insurrection in North Carolina in 1771, hundreds of the Regulators made 

between Virginia and North Carolina showed the settlements to be in North Carolina, but that colony made no effort to assert junisdiction not to protect the settlers from Indian depredations

Therefore in 1772 the residents of the first two settlements met to establish a form of government since known as the Watauga association A general committee of 13 was elected to exercise legislative powers This committee elected from its members a committee of five in whom executive and judicial powers were lodged A sheriff, an attorney and a clerk were elected, and regulations for recording deeds and wills were made. Courts were held, but any conflict of jurisdiction with Virginia or North Carolina was avoided In 1775 the settlement on the Nolichucky was forced to join the association, and in the same year the land was bought from the Cherokee Indians in the hope of averting THOP

With the approach of the American Revolution, the dream of becoming a separate colony with a royal governor was abandoned, and on petition of the inhabitants the territory was annexed to North Carolina in 1776 as the Washington district, which in 1777 became Washington county, with the Mississippi river as the western boundary The population increased rapidly, and soon several new counties were created

During the American Revolution the hardy mountaineers under John Sevier and Evan Shelby did valiant service against both the royal troops and the loyalists in South Carolina, chiefly as partisan rangers under Charles McDowell (1743-1815) Maj Patrick Ferguson, with several hundred loyalists and a small body of regulars, made a demonstration against the western settlements; but at King's mountain in South Carolina, he was completely defeated by the Americans

After the American Revolution the legislature of North Carolina in 1784 offered to cede its western territory to the general government, provided the cession be accepted within two years The Watauga settlers, indignant at this transfer without their consent, and fearing to be left without any form of government whatever, assembled in convention at Jonesboro on Aug 23, 1784. and chose delegates to a later convention to form a new state, Meanwhile North Carolina repealed the act of cession and created the western counties into a new judicial district A second convention, in November, broke up in confusion without accomplishing anything; but a third adopted a constitution, which was submitted to the people, and ordered the election of a legislature This body met early in 1785, elected Sevier governor of the new state of Franklin (at first Frankland), filled a number of offices, and passed several laws in anticipation of an autonomous existence On account of the scarcity of a circulating medium more than 20 articles were valued and declared legal tender Among them were fox skins, 1s. 6d., beaver skins, 6s; bacon, 6d per lb., rye whisky, 2s. 6d. the gallon. Four new counties were created, and taxes were levied Later in the year another convention, to which the proposed constitution had been referred, adopted instead the constitution of North Carolina with a few trifling changes, and William Cocke was chosen to present to congress a memorial requesting recognition as a state. Congress, however, ignored the request, and the diplomacy of the North Carolina authorities caused a reaction. For a time two sets of officials claimed recognition, but when the North Carolina legislature a second time passed an act of oblivion and remitted the taxes unpaid since 1784, the tide was turned. No successor to Sevier was elected

Sevier was arrested on a charge of treason, but was allowed to escape, and soon afterward was again appointed brigadier-general of militia.

Meanwhile, settlers had pushed on farther into the wilderness. On March 17, 1775, Col. Richard Henderson and his associates extinguished the Indian title to an immense tract of land in the valleys of the Cumberland, the Kentucky and the Ohio rivers (see KENTUCKY). In 1778 James Robertson (1742-1814), a native of Virginia, who had been prominent in the Watauga settlement, set out with a small party to prepare the way for permanent occupation. He arrived at French Lick (so called from

their way into the wilderness A survey of the western boundary a French trading post established there) early in 1779, and in the same year a number of settlers from Virginia and South Carolina arrived Another party, led by John Donelson, arrived in 1780, and after the close of the War of Independence the immigrants came in a steady stream A form of government similar to the Watauga association was devised, and blockhouses were built for defense against the Indians Robertson was sent as a delegate to the North Carolina legislature in 1783, and through his instrumentality the settlements became Davidson county Nashville which had been founded as Nashborough in 1780, became the county seat Finally, in 1843, it became the state capital Robertson, the dominant figure in the early years, struggled to counteract the efforts of Spanish intriguers among the Indians, and when diplomacy failed, he led the settlers against the Indian towns

On Feb 25, 1790, North Carolina again ceded the territory to the United States government, stipulating that all the general provisions of the ordinance of 1787 should apply except that forbidding slavery Congress accepted the cession and, on May 26, 1790, passed an act for the government of the "Territory south of the River Ohio" William Blount was appointed the first governor, and in 1792 Knoxville became the seat of government The chief events of Blount's administration were the contests with the Indians, the purchase of their lands, and the struggle against Spanish influence.

A census ordered by the territorial legislature in 1795 showed more than 60,000 free inhabitants (the number prescribed before the territory could become a state), and accordingly a convention to draft a state constitution met in Knoxville on Jan 11, 1796 The instrument, which closely followed the constitution of North Carolina, was proclaimed without submission to popular vote. John Sevier was elected governor, and William Blount and Wilham Cocke United States senators In spite of the opposition of the Federalist party, whose leaders foresaw that Tennessee would be Republican, it was admitted to the union as the 16th state on

June 1, 1796.

With the rapid increase of population, the dread of Indians and Spaniards declined Churches and schools were built, and soon many of the comforts and some of the luxuries of life made their appearance. The question of a circulating medium was acute

VIEW OF REMPHIS FROM THE HISSISSIPPI RIVER FRONT

during the first half of the 19th century, and state banks were organized, which suspended specie payments in times of financial stringency." The bank of Tennessee, organized in 1838, had behind it the credit of the state, and it was hoped that money for education and for internal improvements might be secured from its profits The management became a question of party politics, and during the Civil War its funds were used to advance the Confederate cause The development of the western section along the Mississippi was rapid after the beginning of the century Memphis, founded in 1810, was thought as late as 1832 to be in Mississippi, and not until 1837 was the southern boundary, which according to the North Carolina cession was lat 35°, finally established. As in other river towns, the disorderly element in Memphis was large, and the gamblers, robbers and horse thieves were suppressed only by local vigilance committees The peculiar topographical conditions made the three sections of the state almost separate commonwealths, and demand for better means of communication was insistent. The policy of state aid to internal improvements found advocates very early, in spite of the Republican affiliations of the state, but a definite program was not laid out until 1820 when commissioners for internal improvements were appointed and an expenditure of \$150,000 was authorized In 1835 the state agreed to subscribe one-third to the capital stock of companies organized to lay out turnpikes, railways, etc., and four years later the proportion became one half. Though these agreements were soon repealed, the general policy was continued, and in 1861 more than \$17,000,000 of the state debt was due to these subscriptions, from which there was

Though Pres. Andrew Jackson was for many years practically a dictator in Tennessee politics, his arbitrary methods and his intolerance of any sort of independence on the part of his followers led to a revolt in 1836, when the electoral vote of the state was given to Hugh Lawson White, then United States senator from Tennessee, who had been one of Jackson's most devoted adherents. White's followers called themselves anti-Van Buren Democrats, but the proscription which they suffered drove most of them into the Whig party, which carried the state in presidential elections until 1856, when the vote was cast for James Buchanan, the Democratic candidate. The Whig party was so strong that James K Polk (Democrat), a resident of the state, lost its electoral vote in 1844. With the disintegration of the Whig party, the state again became nominally Democratic, though union sentiment was strong, particularly in east Tennessee There were few large plantations and few slaves in that mountainous region. while the middle and western sections were more in harmony with the sentiment in Mississippi and Alabama. In 1850 representatives of nine southern states met in a convention at Nashville (q,v) to consider the questions at issue between the north and the south. The vote of the state was given for John Bell and Edward Everett in 1860, and the people as a whole were opposed

The proposition to call a convention to vote on the question of secsion was voted down on Feb. 9, 286t, but after Fres Abrahm Lincoln's call for troops the legislature submitted the question of secsion directly to the people, and meanwhile, on May 7, 286t, entered into a "Millitary league" with the Confederacy. An overwhelming vote was cast on June 8 in favour of secsions, and on June 24 Gov. I. G. Harris (1818-97) issued a proclamation dockining Tennessee out of the union. Andrew Johnson, then a United States senator from Tennessee, refused to resign his seat, and was supported by a large element in east Tennessee. A union convention, including representatives from all the eastern and a few of the control of the con

The state was, next to Virginia, the chief battleground during the Civil War, and a historian has counted 456 battles and skirmashes that took place within its borders. In Feb. 1867, Gen. U. S. Grant and Commodore A.-H. Foote captured Ft. Henry on the Tennessee river and Ft. Donelson on the Cumberland. The Confederate line of defense was broken and Gen. D. C. Buell cocupied Mashville. Grant next ascended the Tennessee river to Flittsburg Landing, with the intention of capturing the Memphis and Charleston railway, and on April 6 and 7 defeated the Confederates in the battle of Shiloh. The capture of Island No. 10

in the Mississippi on April 7 opened the river as far south as Membis, which was captured in June On Dec. 31 and Jan 2 Gen William S. Rosscrans (Federal) fought with Gen. Braxton Bragg (Confederate) the bloody but indecisive battle of Stone river (Murfresboro). In June 1863 Rosscrans forced Bragg to evacuate Chattanogas. Biagg, however, turned upon his pursuer, and on Sept 19 and 20 one of the bloodhest battles of the war was fought at Chickannagas. General Grant then assumed commard, and on Nov 24-25 defeated Biagg at Chattanooga, Ints opening first most with ancess, but was shut up in Knowlile by Gen James Longstreet, who was not able, however, to capture the city, and on the approach of Gen W. T. Sherman retured into Virgina Almost the whole state was now held by Federal troops, and no considerable multary movement occurred until after the fall of Alianta in Sept. 1864. Then Gen J. B. Hood moved into Tensees, expecting Sherman to follow him. Sherman, however, sent reinforcements to Thomas and continued his march to the sea

Hood fought with Gen. John M Schofield at Franklin, and on Dec. 15-16 was utterly defeated by Thomas at Nashville, the Federals thus securing virtually undisputed control of the state.

After the occupation of the state by the Federal armies in 1862, Andrew Johnson was appointed military governor by the president (confirmed March 3, 1862), and held the office until he was inaugurated vice-president on March 4, 1865. Republican electors attempted to cast the vote of the state in 1864, but were not recognized by congress Tennessee was the first of the Confederate states to be readmitted to the union (July 24, 1866), after ratifying the constitution of the United States with amendments. declaring the ordinance of secession void, voting to abolish slavery, and declaring the war debt void Tennessee freed its slaves by an amendment to the state constitution ratified by a vote of the people on Feb 22, 1865, but suffrage was not conferred upon the Negro until two years later (Feb 25, 1867) The state escaped "carpet bag" government, but the native whites in control, under the leadership of William G Brownlow, exhibited almost every phase of the reconstruction policy All persons who had either directly or indirectly taken part in the war against the union or had given aid to the Confederacy were denied the right of suffrage. In the election of 1869, the acting governor, D W C Senter, ordered the election commissioners to issue to all actual citizens of the state permits to vote. The Democrats united with the conservative Republicans and Senter was easily elected. At the same time a Democratic and conservative legislature was elected, thus placing the state government again in the control of officers elected by the majority of the people. The Ku Klux Klan, originating in 1865 as a youthful prank at Pulaski, Tenn., spread over the state and the entire south, and in 1869 nine counties in the middle and western section were placed under martial law because of the Klan's activities against the Loval league and the Negroes.

A constitutional convention, which met in Jan, 1879, revised the old constitution, and the revusion became the present constitution when ratified by the people the following May. In 1873 a school law was passed which provided for state and country super-intendents and separate schools for white and coloured children and levred a state tax to aid in paying the expenses of these schools. Another progressive step was the final compounding of the old state debt at 50 cents on the dollar by an act of the legislature in 1883.

With the exception of the administration of Alvin Hawkins, 1881-83, the Democratic party controlled the executive office from 1871 to 1971 and again 1975-21 and after 1923. In 1920, for the first time since 1886, and again in 1928, the state gave its electoral votes to the Republican party but Franklin Roosevelt won Tennessee back to the Democratic fold in 1932, where it still remained at mid-century.

In 1904 the Adams law, prohibiting the sale of intoxicating liquors in towns of 5,000 inhabitants or less, was passed, largely through the efforts of the Anti-Saloon league; an act prohibiting the manufacture of intoxicating liquor in the state became effects.

The second second second second second

tive on Jan 1, 1910, in Oct. 1913 Gov. Ben W Hooper called a special session of the legislature and secured the passage of the so-called Nuisance act, designed to close every saloon in the state by enforcing the law forbidding the sale of intoxicating liquor within four miles of any school; in 1915 provision was made for removal from office of state, county or city officials who failed to enforce the prohibition laws; and on Feb 2, 1917, Gov Tom C. Rye signed a bill forbidding the importation of liquor. Tennessee nevertheless turned against prohibition and voted for repeal in 1933 In 1915 a law was passed providing for mothers' pensions. In 1917 the letting of prison labour to private contractors was prohibited, and an act was passed forbidding the limiting of the output of coal in order to increase the price In the same year a state budget commission was created On Aug 18, 1920, the house, by 50 to 46, voted for concurrence in the senate resolution (adopted on Aug 13 by 5 to 4) ratifying the proposed amendment to the federal constitution, providing for woman suffrage As the 36th state to ratify, Tennessee brought the number to the requisite three-fourths In national elections Tennessee is usually Democratic, although it voted Republican in the presidential elections of 1920 and 1928 Pres Harry S. Truman carried Tennessee by 67,488 votes in 1948 State developments, especially in the eastern part, were closely associated after 1933 with the Tennessee Valley authority.

Government.—With the exception of the administrative recognization made in 1923, few alterations have been made in the government of Tennessee since the present constitution was adopted in 1870, and this was only a revision of the state's second constitution, which was adopted in 1834. If placed all executive departments directly under the governor, and eliminated many independent boards.

Every attempt to amend or revise the existing constitution has been unsuccessful because of the difficult procedure involved in such changes Amendments may be proposed not oftener than once in six years by a majority of the members elected to each house of the legislature, but before an amendment can be adopted, it must be agreed to by two-thirds of the members elected to each house of the next succeeding legislature, and later by a majority of all the citizens of the state voting for representatives at the next regular election. The legislature may also submit to the people the question of calling a convention to amend or revise the constitution, and such a convention must be called whenever, upon the submission of this proposition, a majority of the votes are cast in favour of it The election of the governor, members of the general assembly and congressmen is held biennially in evennumbered years on the first Tuesday after the first Monday in November, but the election of judicial and county officers is held on the first Thursday in August.

The governor is the only state executive officer elected by the people. He is elected for a term of two years and is not eligible for more than three consecutive terms. There is no lieutenant governor, in case of a vacancy in the office of governor, the speaker of the senate becomes acting governor.

The secretary of state, the treasurer, and comptroller of the treasury are elected by a joint ballot of the senate and the house of representatives, each for a term of two years; the attorney general is appointed by the judges of the supreme court for a term of eight years. In 1923 the administrative system of the state was reorganized, 64 hoards, commissions, agencies, etc., being combined into nine departments, each with a commissioner at its head. There were in 1950 ten departments, insurance and banking, highways and public works; labour; institutions; agriculture; finance and taxation; public health; education; public welfare; and conservation.

Both senators and representatives are elected for a term of two years by counties or by districts having approximately the same population. The number of representatives is limited by the constitution to 99, and the number of senators to one-three humber of representatives. The legislature meets biennially, in odd-numbered years, on the first Monday in January, and the length of the session is limited by a provision that the members shall be paid four dollars a day, besides an allowance for travelling expenses, for a period not exceeding 75 days. When the governor calls an extra session they are paid for not more than 20 days. Bills of whatever character may onginate in either-house, but no bill can become a law until it has passed both houses by a majority of all the members to which the house is stitled under the constitution, and if the governor vetoes a bill it cannot become a law until it has again passed both houses by such a majority. The constitution provides that no minister or priest is eligible to a seat in either house of the legislature.

The administration of justice is vested in a supreme court, a court of civil appeals, chancery courts, circuit courts, criminal courts, county courts, justice of the peace courts, and, in certain cities and towns, a recorder's court The supreme court consists of five judges elected by the state at large for a term of eight years, one for each of the three grand divisions (eastern, middle and western) and two for the state at large. The judges designate one of their number to preside as chief justice The court has appellate jurisdiction only The court of civil appeals, which in 1907 was substituted for the court of chancery appeals, is composed of nine judges elected for a term of eight years This court has jurisdiction of appeals from equity courts in which the amount in controversy does not exceed \$1,000, except in cases involving the constitutionality of a Tennessee statute, a contested election, state revenue or an ejectment suit, it has jurisdiction also of civil cases tried in the circuit and common law courts in which writs of error or appeals in the nature of writs of error are applied for It may transfer any case to the supreme court. The state is divided into 14 chancery districts, in each of which a chancellor is elected for a term of eight years, and at every county seat in each district a court of chancery is held; exceptions are the 10th district, which has three chancellors, and the 15th, which has four. There are also ten crimmal judges, principally in the larger cities. and there is one probate judge in the city of Memphis. The state is also divided into 20 circuits, in each of which a circuit judge is elected for a term of eight rears, and at every county seat in each circuit a circuit court is held. In several of the counties the county court is composed of a county judge, elected for a term of eight years, together with the justices of the peace in the county, and in the other counties it consists of the justices of the peace alone, who elect a chairman Each county is divided into civil districts. varying in number according to population or other factors, and each district elects at least two justices of the peace for a term of six years; each county town or incorporated town also elects one justice of the peace. A recorder has concurrent jurisdiction with a justice of the peace.

The government of each county is vested principally in the county court. This body represents and acts for the county as a corporation; has charge of the erection and repair of county buildings; levies the county taxes, divides the county into highway districts; chooses a highway commissioner for each district for a term of two years; and chooses a superintendent of schools (except where these are chosen by popular ballot), a surveyor, a public administrator and public guardian, a board for the equalization of taxes, a coroner and a county physician or health officer, each for a term of two years, three commissioners of the poor for terms of three years (one chosen each year) and a keeper and sealer of weights and measures to serve during the pleasure of the court. A county trustee, whose duty it is to collect state and county taxes, and a sheriff are elected by the people of the county for a term of two years; a clerk of the county court and a registrar are also elected by the voters of the county for a term of four

The capital city of Tennessee is Nashville.

Population.—The population of Tennessee in 1790 was 35,-691; in 1830 it was 681,004; in 1870, 1,258,520; in 1910, 2,184,-789; in 1940, 2,915,841; and in 1950, 3,391,718. This last figure represents an increase of 12.0% over the population in 1940. The population per square mile in 1950 was 78 8, as compared with 69,5 in 1940, and with 50.7 for the U.S. in 1950.

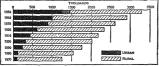

Of the 1950 population, 1,264,159 or 38 4%, lived in incorporated places of 2,500 or more, as compared with 35.2% in 1940 when these places constituted the urban area. The entire urban

population, under a new definition set up for 1050, which included also the thickly settled suburban area, or "urban finnge," adjacent to Memphis, Nashville, Chattanooga and Knoxville, and seven unincorporated places of 3,500 or more outside this fringe, amounted to 1,45,500, or 44 1% of the state total

The number of households in 1950 was 871,269, as compared with 714,894 in 1940 The average population pet household had

declined from 4.1 in 1940 to 3 8 in 1950

The population of the state was distributed by colcur and nativity in 1950 as follows: 83 4% native white, 05% foreign-born white; and 16.1% nonwhite, practically all Negro There were

Of the total number of employed males, 28 2% was engaged in agriculture, 9 3% in construction, 20.6% in manufacturing and 21.4% in transportation and trade

Finance—In common with the other states of the union, Tennessee has had a great increase in state expenditures. Also as in other states, highway expenditures rank first and educational second in importance.

The chief sources of revenue at mid-2-oth century were as follows: a general salest sar, motor car licences and other revenue of the highway department, a general property tax, a gasoline tax, a state tax on insurance companies, a sales tax on tobacco and alcoholic beverages, an excise text and an inheritance tax. Various privilege taxes, fines and forfeitures also help to augment the state's revenue.

Property taxes collected in 1948 amounted to \$1,792,000. State revenue in 1947 was \$127,967,000 or \$42 per capita; expenditures were \$123,700,000, of which \$100,420,000 was for operation, maintenance and interest and \$23,280,000 for outlays.

The gross debt in 1949 was \$97,469,000 (\$30.66 per capita).

Education and Charities.—The first steps toward the creation of a common school system for Tennessee were taken in 1823, when an act was passed setting aside for school purposes, the revenue and taxes accruing from public lands. From that beginning until the adoption of a uniform school code in 1925, more than 17000 different acts were passed pertaining to the educational system.

Under the new code the administration is vested in a state commissioner of education; a state board of education, consisting of the commissioner, the governor and nine other members, a county superintendent and a county board in each county; and in clies, city boards of education. The commissioner and the other members of the state bould are appointed by the governor. The county superintendent is elected biennally by either the county court or by popular ballot. The county board consist of seven members (unless otherwise provided), elected by the county court or by popular ballot, for a term of seven years, one returning annually.

The state board of education conducts examinations for county superintendents and issues certificates of qualification, classifies the high schools, maintains and controls the state colleges and establishes a salary schedule. No teacher may receive pay from the public-school funds unless he or she has received a certificate from the state commissioner of education

The quarterly county court has power to issue bonds, levy taxes and provide funds for buildings for the county schools The court is under obligation to maintain at least one four-year high school

within the county.

Public schools are free to all persons above the age of six years; attendance is compulsory between the ages of; and if ou lines high-school standing has been attained. Separate schools are manitained for the whites and for the Negroes. In 1948 the scholastic population between 6 and 18 years of age, inclusive, was 865,286 On the same date, 638,920 were enrolled in the public elementary and secondary schools. Of these, 463,611 were in county schools and 176,309 were in city schools. In 1946 there were 14,347 pupils enrolled in private and parochial schools. The average number of days attendance per pupil enrolled increased from 90 6 in 1910 to 140 in 1046.

From 1910 to 1946 the per capita expenditure for public schools based on population between 5 and 17 years of age, inclusive, in-

creased from \$6 71 to \$76 10.

The state provides for higher education in the University of Tennessee at Knoxville; Tennessee Polytechnic institute at Cookeville, East Tennessee State college at Johnson City, Mid-Tennessee State college at Murfreesboro: Austin Peav State college at Clarksville; and Memphis State college at Memphis. The Tennessee Agricultural and Industrial State College for Negroes is at Nashville Other schools maintained by the state are a school for the deaf at Knoxville; a school for the blind at Nashville, Tennessee Industrial school at Nashville, Tennessee Vocational school for girls at Tullahoma; a state training and agricultural school for boys at Nashville; a state training and agricultural school for Negro boys at Pikeville, and a vocational school for Negro girls at Nashville. Institutions of higher learning not under the control of the state are: George Peabody College for Teachers (see Peabody, George) and Vanderbilt university (nonsectarian) at Nashville; University of the South (Episcopal) at Sewanee; Southwestern at Memphis; Cumberland university (Baptist) at Lebanon; Union university (Baptist) at Jackson, Bethel college (Presbyterian) at McKenzie; University of Chattanooga (Methodist) at Chattanooga; Milligan college (Christian) at Milligan; Carson-Newman (Baptist) at Jefferson City; Lincoln Memorial university (nonsectarian) at Harrogate, Tusculum college (nonsectarian) at Greeneville; King college (Presbyterian) at Bristol; Maryville college (Presbyterian) at Maryville; Tennessee college at Murfreesboro; Lambuth college at Jackson; and Scarntt college (Methodist) at Nashville. Education for Negroes is provided by Fisk university at Nashville; Lane college at Jackson; Le Moyne college at Memphis; and Knoxville college at Knox-

The state maintains mental institutions at Knoxville, Nashville and Bolivar known as the Eastern, Central and Western state hospitals, respectively; and various schools, as mentioned above under Education. The main penitentiary is located at Nashville, and a branch, known as Brusby Mountain prison, is located at Petros in east Tennessee, where the prisoners are kept at labour principally in the state coal mines and on the farm.

The Fort Pillow state farm in west Tennessee at Cherry is primarily for first offenders. All charitable and corrective institutions are under the supervision of the state department of institutions.

Industry, Trade and Transport.—The interests of the state remain predominantly agricultural, though manufacturing is developing rapidly. The total land area in farms decreased from 17,90,000 as in 1936 to 17,858,973 cm 1936. The number of farms decreased from 25,6669 in 1935 to 234,431 in 1945; from 1910 to 1945 the average acrange per farm decreased from 3; 710 to 1945 the average acrange per farm decreased from 8; 10 fly 1936, 1957 to 1945. The sam population decreased from 1,271,708 in 1920 to 951,507 in 1945 of the 234,431 fainness in 1945; 206,603 were white and 27,539 were Negroes. Of all farmers in 1945; 50,663 were owners, 77,354 were tenands, and 350 were nanagers. In 1930 there were 11,113 women farmers. The total value of farm crops in 1934 was \$123,527,000, in 1948 it was \$327,058,000. In 1947 Tennessee ranked 23rd among the states of the umon in gross income from tarm products. The following table shows the comparative acreage, production and value of six important crops for 1939 and 1947.

	Cro	р		Year	Acreage	Production	Value
Indian core	1			1947	2,189,000	63,481,000 bu	\$142,832,000
				1939	2,635,000	52,700,000 "	38,908,000
Oats	٠			1947	230,000	6,095,000 "	6,704,000
				1930	85,000	1,445,000 "	621,000
Wheat				1947	346,000	5,190,000 "	12,456,000
				1939	358,000	4,117,000 "	3,409,000
Hay (all)				1947	1,855,000	2,297,000 tons	55,587,000
				1939	1,668,000	1,674,000 "	17,242,000
Cotton (lin	t)			1947	700,000	520,000 bales	84,251,000
				1939	707,000	449,000 "	20,200,000
Tobacco				1947	115,600	140,500,000 lb	58,616,000
				1039	120,300	110,167,000 "	15,735,000

The number of the principal domestic animals on Jan 1, 1949, were cattle 1,366,000; swine 1,269,000, sheep 279,000, hoises 133,000, mules 225,000 The total value of all livestock in Tennessee in 1945 was \$160,584,000

According to the forest service, department of agriculture, the acreage of national forests lying within the limits of Tennessee increased from 267,939 in 1925 to 555,789 in 1948 (287,000 in state and county foresis) In 1947, according to the bureau of mines, Tennessee ranked 24th among the states in the value of mineral products. Production in that year amounted to \$84,425,000 The principal products were coal, cement, copper, phosphate, clay products and stone The coal-producing area is a belt running from northeast to southwest, a little east of the centre of the state, production being reported in 16 counties. Valuable building marble is quairied in the eastern part of the state. Tennessee produces most of the copper mined in the southern states Its entire production of copper, gold and silver comes from mines worked primarily for copper in Polk county Rock phosphate is mined in five counties in the central and south central sections of The most important products in 1948 were coal, 5,910,000 short tons, worth \$33,214,000; stone, 8,011,360 short tons, worth \$12,932,537, cement 6,774,926 bbl., worth \$13,667,o6o; ferroalloys 144,599 short tons, worth \$11,072,047; rock phosphate 1,307,507 long tons, worth \$8,231,251, zinc 29,524 short tons, worth \$7,853,384. Other products of economic value are sand and gravel, lime, barite, lead, gold, silver and petroleum (see Petroleum)

Industry recovered from the 1933 low In 1933 there were only 1,561 manufacturing establishments employing 94,900 wage-earners, whereas in 1947 there were 3,246 establishments employing 192,357. The value added by manufacturing rose from \$172-939,000 to \$957,539,000. The chief industries in 1947 were textiles, with value added by manufacturing of \$171,949,000; purinting and publishming \$46,840,000; food processing \$132-489,000; primary metals \$85,040,000; faborized metals \$52,667,000; leather and leather products \$47,411,000; apparel and related products \$47,670,000.

The steam railway mileage of Tennessee increased continuously until 1920, when the total was 4,78, but by 1947 this had decreased to 3,491. The chief railways operating in the state in 1947 were: Louisville and Nashville, Nashville, Chattanoga and St. Louis; Southern; Tennessee Central; Illinois Central; and Gulf, Mobile and Ohio, 'In 1937 there were 293 mi. of electrical railway within the state, operated chiefly as city systems

The navigable waterways include the Mississippi, Tennessee and

The state highway department controlled 7,667 mi, of roadways in 1946, and local authorities 56,912 New surfacing placed from July 1, 1947, to June 30, 1948, amounted to 336 mi

July 1, 1047, to June 20, 1048, amounted to 356 mi Immonany—The best holography of material relating to Tennesce is Calium Margan McClinig Historical Collection (1921). TENNESSEE RIVER, the largest tributary of the Ohio river, USA. It is formed by the confluence of the Holston and the French Broad rivers 45 mi. above Knoxville, Tenn, flows south south-west to Chattanooga, there turns west through the Cumberland plateau and into the northeast corner of Alabama. continues west across the northern part of Alabama, turns north on the boundary between Alabama and Mississippi, and continuing north across Tennessee and Kentucky unites with the Ohio at Paducah. Its principal tributaries rise in the Appalachian mountains: the Holston and the Clinch on the mountain slopes that flank the Appalachian valley in western Virginia; and the French Broad, the Little Tennessee and the Hiwassee in the mountains of western North Carolina. The Tennessee itself is 652 mi, long, and with the Holston and the North Fork of the Holston forms a channel about 900 mi. long. Its drainage basin covers about 44,000 sq mi, and its low-water discharge at Paducah is 10,600 cu ft. per second. Its average fall is 0.79 ft. per mi.— 0.056 ft, from Knoxville to Chattanooga: 1.10 ft, from Chattanooga to Florence, Ala., and 0.39 ft. from Florence to its mouth. The banks are everywhere easily accessible except at Knoxville and Chattanooga, where, for short distances, high elevations rise precipitously, from the water; and as the banks are mostly of clay or rock the channel is permanent and the river is unusually free from silt.

The Tennessee is navigable by steamboats throughout its entire course of 652 mi for several months of the year.

In 1904 the federal government authorized the construction.

with private capital, of a lock and dam at Hales Bar to provide a channel 6ft deep between it and Chattanooga, the water-power to be used by the company furnishing the capital. The Colbert and Bee Tree shoals were improved by the Colbert Shoals lock and canal, opened in 1911. In 1917 the U.S. Government undertook the construction of a navigation power dam (Wilson or dam No 2), 95ft high at Muscle shoals (qv) and by 1926 the work had been completed, except the lock, at a cost of \$43,387,709 for construction and \$359,592 for maintenance A second lock and dam (known as No. 1), below Wilson dam, was completed and put in operation in March 1926, at a cost of \$960,515. The Federal Government had spent, up to 1927, about \$30,000,000, exclusive of the Muscle Shoals dams, on improving navigation on the Tennessee and its tributaries. The total commerce carried on the various sections of the Tennessee had, in 1925, an aggregate value of \$12,441,364; the commerce of its principal tributaries amounted

to \$142,959
TENNGLER, ULRICH, German jurist, was born in the served as chief clerk of Nordlingen, 1479-83, and afterwards, until his death, was governor of Hochstadt He died sometime in the first four months of 1511. He is noted chiefly as the author of the Layenspiegal (1509 and later editions After 1516 the work was frequently issued in editions containing also Sebastian Brant's Klagspiegal). This was a systematic encyclopaedia of popular jurisprudence, which had wide influence and for more than half a century was the authority in Germany for the settlement of legal

questions TENNIEL, SIR JOHN (1820-1914), knighted 1893, English humorous and satirical artist-specially identified with Punch -was born in London on Feb 28, 1820. Although he became a probationer, and then a student, of the Royal Academy, he soon left the schools, where at that time there was little teaching. In 1836 he sent his first picture to the exhibition of the Society of British Artists, and in 1845 contributed a 16-ft cartoon, Allegory of Justice," to the competition, held in that year, of designs for the mural decoration of the new Palace of Westminster For this he received a £200 premium and a commission to paint a fresco in the Upper Waiting Hall (or "Hall of Poets") in the House of Lords. He was already known and appreciated as a humorist, and his early companionship with Charles Keene fostered and developed his talent for scholarly caricature. In 1850 he was invited by Mark Lemon to fill the position of joint cartoonist (with John Leech) on Punch, in succession to Richard Doyle. His first "cartoon" was "Lord Jack the Giant Killer"; it showed Lord John Russell, whose letter on the "aggression" had recently been published, valuantly assailing with the sword of truth and liberty Cardinal Wiseman armed with a crozier. In 1852 we find Tenniel's first superb lion, and his first obituary cartoon Gradually he took over altogether the weekly drawing of the political "big cut," which John Leech was happy to resign into his hands in order to restrict himself to his pictures of life and character. Leech's work consisted for the most part of farce; Tenniel's was high comedy, and not infrequently tragedy; and the freedom of the humorist heightened the severer beauties of the satirist, When Leech died his friend continued his work alone, About 2,300 cartoons, innumerable minor drawings, double-page cartoons for Punch's Almanac and other special numbers, and 250 designs for Punch's Pocket-books, comprise the sum of Sir John Tenniel's work for the periodical in the service of which he spent the greater portion of his life. He retired in 1901 In 1874 he had been made a member of the Royal Institute of Painters in Water Colours. He died on Feb. 25, 1914.

The main quality of Sir John Tenniel's work is accuracy of drawing, precision of touch, grace and dignity of conception, and so far as such things can be compatible—geniality of satire. Tenniel raised the political cartoon into a classic composition, from which a sense of nobility is rarely absent. The beauty and statuesqueness of his ideal figures recall the influence, perhaps, of Cornelius and Overbeck-that German manner which was characteristic of many of our finer draughtsmen upon wood in the middle of the 19th century. But Tenniel's work is always original,

unforced and fresh; and it never suggests, what is the fact, that the artist's work is drawn exclusively from memory, and never from the model It may be mentioned that Tenniel's wonderful observation has been conducted, and his knowledge accumulated, literally through a single eye, the other having been lost during a fencing bout in his youth. It was in recognition not only of his ability as an artist in black and white, but of his service in infusing good humour and good taste into one phase of political life, that a knighthood was conferred upon him on Mr. Gladstone's recommendation in 1893. Without pronounced political opinions of his own, Sir John Tenniel adopted in his work those of his paper, of which the Whig proclivities were to some degree softened by his pencil. The political history not of England only, but to some extent of the world, of half a century appears in Sir John Tenniel's weekly cartoons, which are dignified by a number of types invented by the artist, the classic beauty of which may be looked for in vain in kindred work by any previous cartoonist (Take, for example, Sir John's famous picture of "Dropping the Pilot, which appeared in Punch on March 20, 1890, xcviii 150-51) Public exhibitions of Sir John Tenniel's work were held in 1895 and in 1900 Sir John Tenniel is also the author of one of the mosaics, "Leonardo da Vinci," in the South Court in the Victoria and Albert Museum, while his highly stippled water-colour drawings appeared from time to time in the exhibitions of the Royal Institute of Painters in Water Colours, of which society he was elected a member in 1874 As an illustrator on the wood-block he stands very high, his "Lalla Rookh" is perhaps the finest of all his work in point of conception, refinement, power and technical excellence

TENNON, in architecture, a projecting tooth, peg or lug, cut upon the end or edge of a structural member, and arranged to fit into a socket or mortice designed to receive it in an adjacent structural member, in order to strengthen and stiffen the connection between them.

TENNYSON, ALFRED TENNYSON, 1st BARON (1809-1892), English poet, was born at Somersby, Lincolnshire, on Aug. 6, 1809. He was the fourth of the 12 children of the Rev. George Clayton Tennyson (1778-1831) and his wife Elizabeth Fytche (1781-1865). The Tennysons were an old Lincolnshire family settled at Bayon's Manor. The poet's grandfather, George Tennyson, M.P., had disinherited the poet's father, who was settled hard by in the rectory of Somersby, in favour of the younger son, Charles Tennyson D'Eyncourt The rich pastoral scenery of this part of Lincolnshire influenced the imagination of the boy, and is plainly reflected in all his early poetry. At a very early age he began to write in prose and verse At Christmas 1815 he was sent to the grammar school at Louth, where he remained for five years, and then returned to Somersby to be trained by his father. In the rectory the boys had the run of an excellent library, and here the young poet based his wide knowledge of the English classics The news of Byron's death (April 19, 1824) made a deep impression on him. "It was a day," he said, "when the whole world seemed to be darkened for me"; he went out into the woods and carved "Byron is dead" upon a rock Tennyson was already writing copiously—he had constructed "an epic of 6,000 lines" at the age of twelve, composed a drama in blank verse when he was 14, and so on.

a tradition of the same of the same in

In 1827 Frederick Tennyson (1807-1898), the eldest surviving came "variable and his spirits indifferent" The earliest effect tions predominated), and who shared the surprising profits, £20 On Feb 20, 1828, Charles and Alfred matriculated at Trinity college, Cambridge, where Frederick was already a student poet subsequently told Edmund Gosse that his father would not let him leave Somersby till, on successive days, he had recited from memory the whole of the odes of Horace The brothers took 100ms at 12 Rose Crescent, and afterwards moved into Trumpington Street (now 157 Corpus Buildings) They were shy, and at first made few friends, but they gradually gathered selected associates around them, and Alfred grew to be looked up to in Cambridge "as to a great poet and an elder brother" by a group which included Richard Chenevix Trench, Monckton Milnes (Lord Houghton), James Spedding, W H Thompson, Edward FitzGerald, W H Brookfield, and, above all, A H Hallam (1811-1833) Charles Tennyson (1808-1879) afterwards took the additional name of Turner. He published four volumes of sonnets which have been highly praised In June 1829 Alfred Tennyson won the Chancellor's prize medal for his poem called "Timbuctoo" With great imperfections, this study in Miltonic blank verse displays the genius of a poet, in spite of obscurity both of thought and style. Here are already both richness and power But by this time Tennyson was writing lyrics of still higher promise, and, as Arthur Hallam early perceived, with an extraordinary earnestness in the worship of beauty. The results of this enthusiasm and this labour of the artist appeared in the volume of Poems, chiefly Lyrical, published in 1830 This book would have been astonishing as the production of a youth of 21, even if, since the death of Byron six years before, there had not been a singular dearth of good poetry in England Here at least, in the slender volume of 1830, was a new writer revealed, and in "Mariana," "The Poet," "Love and Death," and "Oriana," a singer of wonderful though still unchastened melody Through these, and through less perfect examples, was exhibited an amazing magmificence of fancy, at present insufficiently under control, and a voluptuous pomp of imagery, tending to an over-sweetness.

In the summer of 1830 Tennyson and Hallam volunteered in the army of the Spanish insurgent Torrijos, and marched about a little in the Pyrenees, without meeting with an enemy Tennyson came back to find his father ailing, and in Feb 1831 he left Cambridge for Somersby, where a few days later Dr. George Tennyson died The new incumbent was willing that the Tennysons should continue to live in the rectory, which they did not leave until six years later Arthur Hallam was now betrothed to Emily Tennyson (afterwards Mrs. Jesse, 1811-1889), and stayed frequently at Somersby. This was a very happy time, and one of great physical development on Alfred's part. He took his share in all kinds of athletic exercises, and it was now that Brookfield said, "It is not fair that you should be Hercules as well as Apollo." This high physical zest in life seems to have declined after 1831, when his eyes began to trouble him, and he became liable to depression The poetical work of these three years, mainly spent at Somersby, was given to the world in the volume of Poems which (dated 1833) appeared at the end of 1832.

This was certainly one of the most astonishing revelations of finished genius ever produced by a young man of less than fourand-twenty Here were "The Lady of Shalott," "The Dream of Fair Woman," "Oenone," "The Lotus-Eaters," "The Palace of Art," and "The Miller's Daughter," with a score of other lyrics, delicious and divine. The advance in craftsmanship and command over the matériel of verse shown since the volume of 1830 is astonishing. It was well that its publication was completed before the blow fell upon Tennyson which took for a while all the light out of him. In Aug 1833 Arthur Hallam started with his father, the historian, for Tirol. On the way young Hallam died suddenly (Sept. 15) of a broken blood-vessel at Vienna. His body was brought back to England, and buried on Jan. 3, 1834

Hallam's death affected Tennyson extremely. He grew less than

brother, uniting with his younger brothers Charles and Alfred, of Hallam's death upon his friend's at was not much published at Louth an anonymous collection of Peems by Two Brothers The I'vo' were Charles and Alfred (whose contribute) beginnings of the Ring and of I Memoram, over the Brothers The I'vo' were Charles and Alfred (whose contribute) beginnings of the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and of I Memoram, over the Ring and I Ring an both of which he meditated long In 1835 he visited the Lakes, and saw much of Hartley Coleridge, but would not "obtrude on the great man at Rydal," although "Wordsworth was hospitably disposed" Careless alike of fame and of influence, Tennyson spent these years mainly at Someisby, in a uniform devotion of his whole soul to the art of poetry. In 1837, to their great distiess, the Tennysons were turned out of the Lincolnshire rectory where they had lived so long They moved to High Beech, in Epping Forest, which was their home until 1840 The poet was already engaged, or "quasi-betrothed," to Emily Sellwood, but ten years passed before they could afford to marry. At Torquay, in 1838, he wrote Audley Court on one of his rare excursions, for he had no money for touring, nor did he wish for change; he wrote at this time, "I require quiet, and myself to myself, more than any man when I write" In 1840 the Tennysons moved to Tunbridge Wells, and a year later to Boxley, near Maidstone, to be close to Edmund Lushington, who had now married Cecilia Tennyson Alfred was from this time frequently a visitor in London.

In 1842 the two-volume edition of his Poems broke the ten years' silence which he had enforced himself to keep. Here, with many pieces already known to all lovers of modern verse, were found rich and copious additions to his work. These he had originally intended to publish alone, and an earlier privately printed Morte d'Arthur, Dora, and other Idylls, of 1842, is the despair of book-collectors Most of those studies of home-life in England, which formed so highly popular a section of Tennyson's work-such as "The Gardener's Daughter," "Walking to the Mail," and "The Lord of Burleigh"-were now first issued, and in what we have grown to consider a much higher order, "Locksley Hall," "Ulysses," and "Sir Galahad" To the older and more luxurious lyrics, as reprinted in 1842, Tennyson did not spare the curbing and pruning hand, and in some cases went too far in restraining the wanton spirit of beauty in its youthful impulse It is from 1842 that Tennyson took his place as the leading poet of his age in England Among the friends whom he now made, or for the first time cultivated, were Carlyle, Rogers, Dickens, and Elizabeth Barrett

Material difficulties now, however, for the first time intruded on Tennyson's path. He became the victim of a certain "earnestfrothy" speculator, who induced him to sell his little Lincolnshire estate at Grasby, and to invest the proceeds, with all his other money, and part of that of his brothers and sisters, in a "Patent Decorative Carving Company"; in a few months the whole scheme collapsed, and Tennyson was left penniless. He was attacked by so overwhelming a hypochondria that his life was despaired of, and he was placed for some time under the charge of a hydropathic physician at Cheltenham, where absolute rest and isolation gradually brought him round to health again. The state of utter indigence to which Tennyson was reduced greatly exercised his friends, and in Sept. 1845, at the suggestion of Henry Hallam, Sir Robert Peel was induced to bestow on the poet a pension of £200 a year. Tennyson's health slowly became restored, and in 1846 he was hard at work on The Princess; in the autumn of this year he took a tour in Switzerland, and saw great mountains and such "stateliest bits of landskip" for the first time. In 1849 nervous prostration again obliged him to undergo treatment at Prestbury: "They tell me not to read, not to think; but they might as well tell me not to live." Dr. Gully's water-cure was tried, with success.

The Princess was now published, in a form afterwards considerably modified and added to. Carlyle and FitzGerald "gave up all hopes of him after The Princess," or pretended that they did. It was true that the bent of his genius was slightly altered. in a direction which seemed less purely and austerely that of the highest art; but his concessions to public taste vastly added to the width of the circle he now addressed. The home of the Hallam's death affected Tennyson extremely. He grew less than tever willing to come forward and face the world; his health bemore, Browning and Macready, as well as older fitends, but be avoided "society" in fads, while making a tour in Cormula, Tennyson met Robert Stephen Hawker of Morwenstow, with whom he seems—but the evidence is uncertain—to have talked about King Arthur, and to have resumed his intention of writing an entic on that theme.

In his absent-minded way Tennyson was very apt to mislay objects: in earlier life he had lost the ms of Poems, chiefly Lyrical, and had been obliged to restore the whole from scraps and memory. Now a worse thing befell him, for in February 1850, having collected into one "long ledger-like book" all the elegies (In Memoriam) on Arthur Hallam which he had been composing at intervals since 1833, he left this only ms in the cupboard of some lodgings in Mornington Place, Hampstead Road By extraordinary good chance it had been overlooked by the landlady, and Coventry Patmore was able to recover it In Memoriam was published, in its original anonymous form, in May 1850 The public was at first greatly mystified by the nature and object of this poem, which was not merely a chronicle of Tennyson's emotions under bereavement, nor even a statement of his philosophical and religious beliefs, but, as he long afterwards explained, a sort of Divina Commedia, ending with happiness in the marriage of his youngest sister, Cecilia Lushington In fact, the great blemishes of In Memoriam, its redundancy and the dislocation of its parts, were largely due to the desultory manner of its composition. The poet wrote the sections as they occurred to him, and did not think of weaving them together into a single poem until it was too late to give them real coherency

On June 13, 1850, Tennyson was married at Shiplake to Emily Sarah Sellwood (1813-1866) Of this union no more need be said than was recorded long afterwards by the poet himself, "The peace of God came into my life before the altar when I wedded her." On Nov. 19, 1850, Queen Victoria appointed Tennyson poet laureate, in succession to Wordsworth. The salary connected with the post was very small, but it had a secondary value in stimulating the sale of his books. The young couple took a house at Warninglid, in Sussex, which did not suit them, and then one in Montpelier Row, Twickenham, which did better In April 1851 their first child was born dead. At this time Tennyson was brooding much upon the ancient world, and reading little but Milton, Homer and Virgil This condition was elegantly defined by Carlyle as "sitting on a dungheap among innumerable dead dogs". In the summer of 1851 was made the tour in Italy, of which The Daisy is the immortal record. Of 1852 the principal events were the birth of his eldest son Hallam, the second Lord Tennyson, in August, and in November the publication of the Ode on the Death of the Duke of Wellington.

In the winter of 1853 Tennyson took a little house and farm called Farrington, near Preshwater; in the Isle of Wight, which he leased at first, and afterwards bought; this beautiful place, ringed round with liexes and codars, entered into his life and coloured it with its deheate enchantment In 1854 he published The Charge of the Light Brigade, and was busy composing Mand and its accompanying lyracs; and this volume was published in July 1855, just after he was made D.C.L at Oxford he was received on this occasion, which may be considered his first public appearance, with a "temendous ovation." The reception of Mand from the critics, however, was the worst trial to his equanimity "which Tennyson had ever had to endure, nor had the future anything like it in store for him. He had risen in Mand far above his ordinary seeming of still provide the control of the contr

ties of expression which were scarcely intelligible to his readers. It is odd that this irregular poem, with its copious and varied music, its sphendid sweep of emotion, its unfailing richness of exture—this poem in which Tennyson ries to heights of human sympathy and mutuiron which he reached nowhere else, should have been received with hitter healthy, have been styled "the dead level of prose run mad," and have been reproved more than the state of the st

the Authuran traditions. He had now become an object of boundless personal curiously, being already difficult to find, and the centre of amusing legends. It was in 1857 that Bayard Taylos saw him, and carried away the impression of a man "fall and broad-shouldered as a son of Anak, with hair, beard and eyes of southern darkness." This period of retirement embraced a toru in Wales in 1857, a visit to Norway in 1858, and a journey through Portugal in 1850.

In 1857 two Arthurian poems had been tentatively and privately printed, as Enid and Nimue, or the True and the False, to see how the idylic form would be liked by the inner circle of Tennyson's friends In the summer of 1859 the first series of Idylls of the King was at length published, and achieved a popular success far beyond anything experienced before by any English poets, save perhaps Byron and Scott. Within a month of publication, 10,000 copies had been sold. The idylls were four in number, "Vivien" (no longer called "Nimue"), "Elaine" and "Guinevere"
These were fragments of the epic of the fall of King Arthur and the Table Round which Tennyson was so long preparing, and which he can hardly be said to have ever completed, although nearly thirty years later he closed it. The public and the critics alike were entranced with the "sweetness" and the "purity" of the treatment A few, like Ruskin, were doubtful about "that in-creased quietness of style", one or two already suspected that the "sweetness" was obtained at some sacrifice of force, and that the "purity" involved a concession to Victorian conventionality

Ugsed by the duke of Aegal, Tenayson now turned his attention to the them of the Holy Grail, though be progressed such that but fitfully and slowly. In 1861 he travelled in Auvergne and the Pyrenees, with Clough, who was to due a few months later; to this year belong "Helen's Tower" and the "Dedication" of the 1891st to the prince consort, These to his Memory. The latter led to Tennyson's presentation in April 1862 to the queen, who "stood pale and statue-like before him, na a kind of stately smocence," which greatly moved his admiring homage. From this time forth the poet enjoyed the constant favour of the sovereign, though he could never be moulded into a conventional courter He now put the Arthuran legends saids for a time, and devoted himself to the composition, im 1862, of "Enoch Arden," which, also contained "Sea Dreams," "Alymer's Pelel" and, above and law The Northern Farmer," the first and finest of Tennyson's remarkable studen in dule.

In April of this year Garibadi vasited Farrangford; in Feb 1865 Tennyson's mother date at Hampstead in her Sgth year, in the ensuing summer he travelled in Germany. The time slipped by with incidents but few and slight, Tennyson's populative in Great Sritan growing all the time to an extent unparalleled in the whole annals of English poetry. This universainty of fame led to considerable practical discomfort; he was besieged by sightseers, and his nervous treputation led him perhaps to exagerate the intensity of the infliction. In 1867 he determined to and bought some land on Blackdown, above Hadermore, tion a secluded corner of England; here Mr (afterwards Sir) James Knowles began to build him a house, ultimately named Aldworth. This is the time of two of his rare, privately printed pamphlets, The Windows, or, the Lowes of the Werner (1867), and The Victim

(1868)
The noble poem Lucretsus, one of the greatest of Tennyson's versified monographs, appeared in May 1868, and in this year The Holy Grail was at last finished; it was published in 1869, together with three other idylls belonging to the Arthuran epic, and various miscellaneous lyrics, besides Lucretius. The reception of this volume was cordual, but not so universally respectful as that which Tennyson had grown to expect from his adoring public. The fact was that the heightened reputation of Browning, and still more the sudden vogue of Swinburne, Morris and Rossetti (1866-70), considerably disturbed the minds of Tennyson's most ardent readers, and exposed himself to a severer criticism than he had lately been accustomed to endure. His next volume (1872), Grarth and Lynette and The Last Tournament, continued, and, Grarth and Lynette and The Last Tournament, continued, and,

offered a baronetcy by Gladstone, and again by Disraeli in 1874; in each case the honour was gracefully declined.

Beheving that his work with the romantic Arthurian epics was concluded, Tennyson now turned his attention to the diama. He put before him a scheme of illustrating "the making of England" by a series of great historical tragedies His Queen Mary, the first of these chronicle-plays was published in 1875, and played by Sir Henry Irving at the Lyceum in 1876 Although it was full of admirably dramatic writing, it failed on the stage Extremely pertinacious in this respect, the poet went on attempting to storm the theatre, with assault upon assault, all practically failures until the seventh and last, which was unfortunately posthumous. Meanwhile Harold, a tragedy of doom, was published in 1876; but, though perhaps the finest of its author's dramas, it was not staged During these years Tennyson's thoughts were largely occupied with the building of Aldworth. His few lyrics were spirited ballads of adventure, inspired by an exalted patriotism-"The Revenge" (1878), "The Defence of Lucknow" (1879)-but he reprinted and finally published his old suppressed poem, The Lover's Tale, and a little play of his. The Falcon, versified out of Boccaccio, was produced by the Kendals in 1879

In 1880, when he was over 70, he published the earliest of six important collections of lyrics, this being entitled Ballads and other Poems, and containing the sombre and magnificent "Rizpah" In 1881 The Cup and in 1882 The Promise of May, two little plays, were produced without substantial success in London theatres: the second of these is perhaps the least successful of all the poet's longer writings, but its failure annoyed him unreasonably In September 1883 Tennyson and Gladstone set out on a voyage round the north of Scotland, to Orkney, and across the ocean to Norway and Denmark At Copenhagen they were entertamed by the king and queen, and after much fêting, returned to Gravesend this adventure served to cheer the poet, who had been in low spirits since the death of his favourite brother Charles. and who now renewed his vigour. During the voyage Gladstone had determined to offer Tennyson a peerage. After some demur, the poet consented to accept it, but added, "For my own part, I shall regret my simple name all my life." On March 11, 1884, he took his seat in the House of Lords as Baron Tennyson of Aldworth and Farringford. He voted twice, but never spoke in the House In the autumn of this year his tragedy of Becket was published, but the poet at last despaired of the stage, and disclaimed any hope of "meeting the exigencies of our modern theatre" Curiously enough, after his death Becket was the one of all his plays which enjoyed a great success on the boards.

In 1885 was published another interesting miscellany, Tiresias and other Poems, with a posthumous dedication to Edward Fitz-Gerald. In this volume, it should be noted, The Idylls of the King was completed at last by the publication of "Balin and Balan"; it contained also the superb address "To Virgil." In April 1886 Tennyson suffered the loss of his second son, Lionel, who died in the Red Sea on his return from India The untiring old poet was steadily writing on, and by 1886 he had another collection of lyrics ready, Locksley Hall Sixty Years After, etc ; his eyes troubled him, but his memory and his intellectual curiosity were as vivid as ever. He was past 80 when he published the collection of new verses entitled Demeter and other Poems (1889), which appeared almost simultaneously with the death of Browning, an event which left Tennyson a solitary figure indeed in poetic literature. His latest drama, The Foresters, was produced in New York in March 1892, with Miss Ada Rehan as Maid Marian. During this year Tennyson was steadily engaged on "Akbar's Dream," "Kapiolani" and other contents of the posthumous volume called The Death of Oenone, 1892.

Soon after entering his eighty-fourth year, however, symptoms of weakness set in, and early in September his condition began to give alarm. He retained his intellectual lucidity and an absolute command of his faculties to the last, reading Shakespeare with obvious appreciation until within a few hours of his death. With the splendour of the full moon falling upon him, his hand clasping

as he then supposed, concluded *The Idylls of the King*, and for his Shakespeare, and looking, as we are told, almost unearthly the time being he dismissed it from his mind. In 1873 he was in the majestic beauty of his old age, Tennyson passed away at Aldworth on the night of Oct 6, 1892 Cymbeline, the play he had been reading on the last afternoon, was laid in his coffin, and on the 12th he received a public funeral at Westminster Abbey. Lady Tennyson survived until Aug 1896.

The physical appearance of Tennyson was very remarkable. Of his figure at the age of 33 Carlyle has left a superb portrait: "One of the finest-looking men in the world A great shock of rough, dusky, dark hair, bright, laughing, hazel eyes; massive aquiline face, most massive yet most delicate; of sallow brown complexion, almost Indian-looking, clothes cynically loose, freeand-easy, smokes infinite tobacco His voice is musical, metallic, it for loud laughter and piercing wail, and all that may he between; speech and speculation free and plenteous; I do not meet in these late decades such company over a pipe" He was unusually tall, and possessed in advanced years a strange and rather terrifying air of sombre majesty But he was, in fact, of a great simplicity in temperament, affectionate, shy, still exquisitely sensitive in extreme old age to the influences of beauty, melancholy and sweetness Although exceedingly near-sighted, Tennyson was a very close observer of nature, and at the age of eighty his dark and glowing eyes, which were still strong, continued to permit him to enjoy the delicate features of country life around him, both at Aldworth and in the Isle of Wight His Life, written with admirable piety and taste by his son, Hallam, second Lord Tennyson, was published in two volumes in 1897

No living poet has ever held England-no poet but Victor Hugo has probably ever held any country-quite so long under his unbroken sway as Tennyson did. As he recedes from us, however, we begin to see that he has a much closer relation to the great Georgian writers than we used to be willing to admit He is more the last of that great school than the first of any new one. The qualities in which he seems to surpass his immediate predecessors are exactly those which should be the gift of one who sums up the labours of a mighty line of artists. He is remarkable among them for the breadth, the richness, the substantial accomplishment of his touch; he has something of all these his elders, and goes farther along the 10ad of technical perfection than any of them. We still look to the earlier masters for supreme excellence in particular directions to Wordsworth for sublime philosophy, to Coleridge for ethereal magic, to Byron for passion, to Shelley for lyric intensity, to Keats for richness.

Tennyson does not excel each of these in his own special field, but he is often nearer to the particular man in his particular mastery than any one else can be said to be, and he has in addition his own field of supremacy This consists, perhaps, in the beauty of the atmosphere which Tennyson contrives to cast around his work, moulding it m the blue mystery of twilight, in the opaline haze of sunset: this atmosphere, produces an almost unfailing illusion or mirage of loveliness, so that, even where (as must sometimes be the case with every poet) the thought and the imagery have little value in themselves, the fictive aura of beauty broods over the otherwise undistinguished verse. In his luminous subtlety and his broad undulating sweetness, his relationship with Virgil has long been manifest; he was himself aware of it. But he was also conscious that his exquisite devotion to mere lucidity and beauty might be a snare to him, and a happy instinct was always driving him to a study of mankind as well as of inanimate nature.

Few English writers have known so adroitly as Tennyson how to bend the study of Shakespeare to the enrichment of their personal style. It should be added that he was a very deep and original student of literature of every description, and that the comparatively few specimens which have been preserved of his conversation contain some of the finest fragments of modern appreciation of the great poets which we possess. This is worthy of consideration in any attempt made to sketch the mind of a man who was above all other masters of recent literature an artist. and who must be studied in the vast and orbic fullness of his accomplishment in order to be appreciated at all.

The standard biography is Alfred, Lord Tennyson: A Memoir, by

Hallan, and Bayan Tempon. (s. vols., 1897), who also drived Tempon's Work with a memor in a 31, (2) vols.). A E Baker published a Concordance to the poetsed and dramatical works of Tempons in 1914 For bibliography see R. H. Shepherd, Temposomana (1865, new ed. 1894). For biography and criticism consult A. Lang, Afferd Tempons, 1917, A. C. Henson, The Life of Lord Tempons (1904). T. R. Lownsbury, Life and Teme of Lord Tempons (1904). Nicolson, Tennyson (1925)

TENNYSON-D'EYNCOURT, SIR EUSTACE (HENRY WM.) BART. (1868-1951), British naval architect,

was boin on April 1, 1868, and educated at Charterhouse and at the Royal Naval college, Greenwich. He was apprenticed at the Elswick works to which he returned as naval architect in 1902, after four years at Fairfield. He subsequently received an Admiralty appointment, which he held until 1924 He continued to advise the Admiralty on naval construction after his appointment as managing director of Armstrong Whitworth and Co's Newcastle shipyards Tennyson-d'Eyncourt was also closely as-sociated with the development of tanks during World War I He presided over the first Admiralty committee on the question, and in 1918 became vice-president of the Tank board He was responsible for the successful design and construction of many tanks He was created K.C.B. in 1917, a baronet in 1930, and elected F.R.S. in 1921. He died at Hailsham, England, Jan. 31, 1951.

TENREC (Tenrec ecaudatus), one of the largest representatives of the Insectivora, the length being from 12 to 16 in It is restricted to Madagascar. The coat consists chiefly of bristles and hairs, with an admixture of flexible spines, in the adult limited to the back of the neck. The general bue is brown tagged with yellow. From 12 to 16 or even 20 young are produced at a birth. In habits the tenrec is nocturnal; its home is in the brush in the mountain regions, and in the cool season it hibernates in deep burrows The long flexible shout is used to root up worms and grubs. and ground-insects form part of its nourishment When fat before hibernation, tenrecs are much valued as food by natives

(See INSECTIVORA.)

TENSOR ANALYSIS. The concept of tensors and the knowledge of some of their properties can be traced back to Karl Gauss, Georg Riemann and Elwin Christoffel, but their algebra and analysis have been shaped into a systematic method only recently, 1900, by G. Ricci and T. Levi-Civita, who coined for this powerful branch of mathematics the name of absolute differential calculus. Its chief aim is to construct and discuss relations or laws generally covariant; such, that is, as remain valid in passing from one to any other system of co-ordinates. This makes the subject of prime importance for differential geometry It has especially become the object of a very widespread interest after the advent of generalized relativity (1916), whose principal requirement is precisely such unrestricted covariance of physical laws. There are interesting applications of tensor analysis-both finite and infinite dimensional—to classical mechanics, quantum mechanics, fluid mechanics, elasticity and aeronautics.

Definitions, Algebra of Tensors.—Consider a continuous n-dimensional manifold or "space"  $S_n$  (see Manifolds), whose element or point  $P(x_i)$  is determined by assigning the values of nreal independent variables or co-ordinates  $x_i$ . Let  $Q(x_i+dx_i)$  be another point of  $S_n$ . Then the ordered point-pair  $P_i$ , Q or the set of differentials  $Ax_i$  is called a sector. (To begin with, the idea of "size" or "length" is foreign to this concept,  $S_n$  being thus far a nonmetrical manifold.) Let the x, be transformed into any other system of n co-ordinates  $x'_i$ , the former being continuous functions of the latter with continuous derivatives  $\partial x_i/\partial x'_k$  and non-

vanishing, finite Jacobian  $J = \left| \frac{\partial x_i}{\partial x'} \right|$ ; then  $dx_i$  are transformed into

$$dx'_{i} = \frac{\partial x'_{i}}{\partial x} dx_{\alpha}$$

to be summed over  $\alpha = 1$  to n, and vice versa,  $dx = (\partial x_i/\partial x'_{\alpha})dx'_{\alpha}$ (The convention will be adopted that every term in which an index occurs twice, is to be summed over all its values ) Any set this rule, se., into

$$A'_{\iota} = \frac{\partial x'_{\iota}}{\partial x} A^{\alpha}$$

form a contravariant tensor of rank one, the A' being its n combonents. For contravariant tensors upper indices are used, an exception being made for  $dx_i$ , the prototype of all such tensors Next, any n magnitudes A, which are transformed as the differentiators  $\partial/\partial v_i$ , ie, into

$$A'_{i} = \frac{\partial x_{\alpha}}{\partial x'} A_{\alpha},$$

form a covariant tensor of rank 1, lower indices being used for such tensors. These two kinds of tensors, of rank 1, are also termed vectors, e g , three-vectors, four-vectors (such as the relativistic four-velocity or four-potential, in space-time, S4), etc., according as n=3, 4, etc Similarly, any n2 magnitudes A. transformable into

$$A'_{is} = \frac{\partial x_{\alpha}}{\partial x'} \frac{\partial x_{\beta}}{\partial x'} A_{\alpha\beta}$$

form a covariant, and any  $A^{\iota}$  transformable into  $A^{\prime \iota \kappa} = \frac{\partial x^{\prime}_{\iota}}{\partial x_{\theta}} \, \frac{\partial x^{\prime}_{s}}{\partial x_{\theta}} \, A^{\alpha \theta}$ 

$$A'^{\iota \kappa} = \frac{\partial x'_{\iota}}{\partial x} \frac{\partial x'_{\kappa}}{\partial x_{0}} A^{\alpha \beta}$$

form a contravariant tensor of rank two Again, n2 magnitudes A.\* transformable into

$$A'_{i}^{\kappa} = \frac{\partial x_{\alpha}}{\partial x'} \frac{\partial x'_{\kappa}}{\partial x_{\alpha}} A^{\beta}_{\alpha}$$

are said to form a mixed tensor of rank 2, covariant in a and contravariant in & The extension to any rank is obvious. Any  $n^{r_1+r_2}$  magnitudes  $A_{ik}^{th}$  , with  $r_1$  lower and  $r_2$  upper indices, which are transformed according to the rule

$$\left( A^{ik}_{i\kappa} \quad \right)' = \frac{\partial x_{\alpha}}{\partial x'_{i}} \frac{\partial x_{\beta}}{\partial x'_{\kappa}} \cdots \frac{\partial x'_{i}}{\partial x_{\alpha}} \frac{\partial x'_{\kappa}}{\partial x_{b}} \cdots A^{ab}_{\alpha\beta} \quad . \tag{1}$$

form a mixed tensor of rank  $r=r_1+r_2$  This is the most general concept of a tensor

A tensor of rank zero, called also a scalar, is a single function of the x, invariant with respect to any transformations of coordinates, f'=f.  $A_{1x}$  is symmetrical if  $A_{1x}=A_{x1}$ , and antisymmetrical or a skew tensor if  $A_{ij} = -A_{ij}$ , implying  $A_{ij} = 0$  Similarly for At. Analogous definitions hold for mixed tensors, and for higher ranks. Symmetry and antisymmetry are invariant properties.

The transformed tensor components being linear homogeneous functions of the original ones, the sums of corresponding components of tensors of same rank and kind form again a tensor. Thus,  $A_i$ ,  $B_i$  being covariant vectors, so is  $A_i + B_i = C_i$ . Similarly,  $A_{ik} + B_{ik} = C_{ik}$ , etc. The addends, functions of  $x_i$ , must be taken at the same point of  $S_n$ . If a tensor vanishes in one, it will vanish also in any other co-ordinate system. Consequently, any tensor equation, if valid in one, holds also in any other co-ordinate system. This is the chief reason of the importance of tensors in pure geometry and physics.

The outer product of two tensors of ranks r and s, i.e., the array of n7+s products of their components is again a tensor, of rank r+s. Thus  $A_iB_k=C_{is_i}$ ,  $A_{is}B_k=C_{is_k}$ ,  $A_{is}B^k=C^k_{is_i}$ . The contraction, an operation of almost magical efficiency, applicable to any mixed tensor, consists in equating one of its r, lower to one of its  $r_2$  upper indices and summing over it from 1 to n. The result is again a tensor, with r1-1 covariant and r2-1 contravariant indices; e.g., a contraction of  $A_{ix}^{\lambda}$  gives  $A_{ix} = A_{i}$ , a vector;  $B_{ix}^{\lambda\mu}$ contracted once becomes  $B^{\lambda x} = B^{\lambda}$ , and this yields  $B^{x} = B$ , a

The inner product is the outer product (supposed mixed) contracted once or more. Thus, the inner product of  $A_i, B^i$  is  $A_i, B^r$ , a scalar; that of  $A_{ii}, B^i$  is  $A_i^i, B^r$ , a mixed tensor, and after a second contraction,  $A_{ii}B^{ii}=C_i$ , a mixed tensor, and after a second contraction,  $A_{ii}B^{ii}=C_i=C_i$ , a scalar. (Unlike A,B, A,B, is not invariant, it has no tensor character, and likewise for A\*B\*. Conversely, if A\*B\* is a scalar for any covariant of n magnitudes A', functions of the x, which are transformed by vector A<sub>n</sub>, B\* is a contravariant vector. Similarly, if A<sub>n</sub>B\* is A scalar for any covariant  $A_{ix}$ ,  $B^{ix}$  is contravariant. This is an efficient method of establishing the tensor character of a set of

m,  $\eta^{*}$ , etc., magnitudes Differentiation of tensors with respect to the co-ordinates yields, in certain circumstances, further tensors. If f as scalar function of the g, or scalar field  $g/(\partial_{1} - \eta_{1})$ , is a covariant vector, the gradient of f (but  $\partial^{0}f/\partial_{1}\partial_{1}\partial_{1}$ , is not a tensor, again, if d be an invariant,  $d_{1}/dh$ , is d, is not a tensor, again, if d be an extension f and f as the sector f for f and f and f are a vector f for f and f and f and f are a vector f for f and f and f and f and f and f are a sea as we tensor, the station of A. Finally, if A, be antisymmetric,  $B_{1,0} = \partial_{1}A_{1}/\partial x_{1} + \partial_{1}A_{1}/\partial x_{2} + \partial_{1}A_{1}/\partial x_{3}$  is again such a tensor, the scalars of f and f and f are the scalar f and f are the scalar f and f and f are the scalar f and f are the scal

In what precedes only such properties of tensors were treated as are independent of any metrical considerations, the space, being thus far a nonmetrical, amorphous manifold. Let now its metrics be fixed by laying down the fine-denent, a quadratic differential form with coefficients  $f_{aa} = f_{ab}$  prescribed functions of the x.

$$ds^2 = g_{is}dx_idx_i$$

to be considered as invariant and to serve as the measure of the squared size or length of the vector dx. Then, dx, being the contravariant, gw. will be covariant. Equivalently we may say that a certain symmetrical tensor, gw is being impressed upon Sx as the fundamental or metrical tensor, converting it into a metrical manifold, a Remannian space.

The minors  $g^{sc}$  of  $g = |g_{sc}|$ , divided by g, form again a symmetrical tensor, the contravariant metrical tensor, to be used along with  $g_{sc}$ . The outer product and contraction can be used in rais-

mg and lowering tensor indices. Thus  $g^{ad}A_{+}=d^{a}$  and  $g_{+}B^{a}=g^{a}$ . The  $angle \theta$  between two (copuncial) vectors  $d^{a}$  and B is defined by the invariant  $\cos\theta = g_{+}A^{a}B^{a}/dB$ , A, B being their sizes. The unit vector  $x_{+}=da,ds$  determines, locally, a direction in  $S_{a}$ . The angle between two directions  $x_{a}$ , y, is given by  $\cos\theta = g_{+}x_{+}\theta$ .

Integrals.—The integral  $f_{d_{2}}$ , ...,  $d_{m_{2}}$  briefly  $f_{d_{2}}$  de, catended over a region of  $S_{n_{1}}$  is transformed into  $f_{d_{2}}$  and the determinant g into  $g' = J_{g}$ . Consequently,  $f \vee gds$  is an invariant metricially impressed upon that region, its size or coolines (area, if m = 2). This concept is readily extended to any submanifold of  $S_{n_{1}}$  characterized by  $g_{n_{2}}$  as functions of  $m \sim n$  param

eters 
$$p_a$$
, the rôle of metrical tensor being taken over by
$$h_{ab} = g_{ia}(\partial x_b/\partial p_a)(\partial x_b/\partial p_b).$$

If, by a proper choice of the co-ordinate system, all components  $g_M$  are reducible to constants, the metrical space  $S_1$  is Euclidean or homaloidal (flat) This is but a very special case of a Riemannan space In general such a reduction is not possible, and  $S_4$  is non-Euclidean  $(v.\ intra)$ .

Differentiation of tensors, aided by metrics, yields an unlimited number of new tensors. The oldest of such is Riemann's set of four-index symbols, of 1861. The simplest metrically differential tensor, however, was discovered in 1869 by Christoffel. This is the covariant derivative of a vector A<sub>2</sub>.

$$A_{i,\kappa} = \frac{\partial A_i}{\partial x_i} - \{\omega, \lambda\} A_{\lambda_i}$$
 (3)

where  $\{\iota\kappa, \lambda\} = g^{\lambda\mu}[\iota\kappa, \mu] = \{\kappa\iota, \lambda\}$  and

 $[\iota \kappa, \mu] = \frac{1}{2} (\partial g_{\mu\nu}/\partial x_{\kappa} + \partial g_{\kappa\mu}/\partial x_{\nu} - \partial g_{\nu\kappa}/\partial x_{\mu})$ are Christoffel's symbols (not forming a tensor). Again,

$$B^{\lambda}_{,\kappa} = \partial B^{\iota}/\partial x_{\kappa} + \{\alpha\kappa, \iota\} B^{\alpha}$$

is a mixed tensor.

$$C_{,\nu\lambda} = \partial C^{\nu\kappa}/\partial x\lambda + \{\lambda\alpha, \iota\}C^{\alpha\kappa} + \{\lambda\alpha, \kappa\}C^{\kappa\alpha},$$
  
 $C_{,\nu\lambda} = \partial C_{,\nu}/\partial x^{\lambda} - \{\iota\lambda, \alpha\}C_{,\alpha\kappa} - \{\kappa\lambda, \alpha\}C_{,\alpha}$ 

are the covariant derivatives of  $C^{ix}$  and  $C_{ix}$ . The covariant derivative of  $g_{ix}$  itself vanishes identically. Noteworthy for their applications are

$$A^{i} = \text{Div}(A^{ii}) = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x_{i}} (\sqrt{g}A^{ii})$$
 and  $\text{div}(A^{i}) = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x_{i}} (\sqrt{g}A^{i})$ ,

the vector divergence of a skew  $M^a$  and the scalar divergence of  $A^a$ ,  $e_B$ , one group of Maxwell's equations is represented by  $DV(P^a) = C$ , where C is the four-current and  $F^a$  the electromagnetic skew tensor (as vector), the second group being expressed by equating to zero the "expansion" (v  $mpr_0$ ) of

Expressed by expansing between the most characteristic curves of the Geodesics, Null lines.—The most characteristic curves of the metrical  $S_a$  are its null or minimal lines, ds = o, and "shortest" curves or geodesics defined by  $\delta f ds = o$ , with fixed terminals The equations of a geodesic are

$$x_i + \{\alpha \beta, \iota\} x_{\alpha \beta} = 0,$$
 (6)

where -e d v/ds. They determine,  $e_s$ , in the case of space time, the motion of a free particle in the metrical, and gravational, field  $p_s$ . The null lines are imaginary or real according as (s) at a definite or nondefinite form. The former is the case of spaces proper as contemplated by the pure geometer, and the latter that of space time with one positive and there negative  $g_{ss}$ . The null lines of space time with one positive and there negative  $g_{ss}$  the finiteness or nondefiniteness of the quadratic form and its

under of menta (number of negative g, s) are invariant properties Parallel Displacement of Vectors—A furtiful contribution to tensor analysis, due to Levi-Civita (1917) is the concept of parallel displacement of a vector with respect to a curve. The metrical  $S_0$ , can in general be imagined as inbedded locally in a Euclidean space E of  $\frac{1}{2}u(s) + 1$ ) dimensions. Levi-Civita defined parallel displacement in  $S_0$  as a consequence of a parallel displacement in E. In spite of the ultra-spacial construction, parallelism is intrinsic, expressible by the  $S_0$ -metrics alone

If  $x_i = f_i(s)$  are the parametric equations of any chosen curve C, then the differential equations along C

$$\frac{dA^{i}}{ds} + \{\alpha\beta, i\} A^{\alpha}x^{\beta} = 0 \qquad (7)$$

with the initial vector  $A^{i}(s_0) = A^{i}_s$  determine uniquely a contraviant vector  $A^{i}$  at each point of the cuive. The vector  $A^{i}$  at the point corresponding to s=s is said to be obtained by a parallel displacement of the vector  $A^{i}_s$  this respect to the given curve  $C_s$  and is said to be parallel to  $A^{i}_s$ . Any two vectors generated as above, one at each point, are parallel with respect to  $C_s$ .

Let the required to construct a curve whose tangents follow from each other by parallel displacement along the curve-tiself. This gives the equations (6), so that the curve is a geodesic. The latter is thus throughout "parallel to itself"—an interesting generalization of the property of Euclidean straights. Accordngly, a vector transferred along a geodesic remains equally inclined to it.

If a vector X' be carried by parallel displacement along two different paths a, b from o to o; the two vectors at o1, equal in sue, generally differ in direction. One is parallel to X' via a, the other via b. In fine, parallelsm depends on the route of transfer or is nonintegrable (unless  $S_*$  is esentially Euclidean). Thus also, if the vector be carried around a circuit, it returns at O with its direction changed.

The covariant derivative (v-supra) of the vector is the tensor  $X_{ij\alpha}$ . Its covariant derivative  $X_{i,\alpha,\beta}$  is not symmetric in  $\alpha$  and  $\beta$ . A straightforward calculation shows that

$$X_{\iota,\beta,\alpha} - X_{\iota,\alpha,\beta} = R^{\kappa}_{\iota\alpha\beta}X_{\kappa_{\iota}}$$
 (8)

where  $R^{\kappa}_{\alpha\beta} = \frac{\partial}{\partial x_{\alpha}} \{ \iota \beta, \kappa \} - \frac{\partial}{\partial x_{\beta}} \{ \iota \alpha, \kappa \} + \{ \alpha \gamma, \kappa \} \{ \iota \beta, \gamma \}$ 

$$\mathcal{K}_{\alpha\beta} = \frac{\partial z_{\alpha}}{\partial z_{\alpha}} \{ \iota \mathcal{D}, \kappa \} - \frac{\partial z_{\beta}}{\partial z_{\beta}} \{ \iota \alpha, \kappa \} + \{ \iota \mathcal{D}, \kappa \} \{ \iota \mathcal{D}, \gamma \} - \{ \beta \gamma, \kappa \} \{ \iota \alpha, \gamma \}.$$
 (9)

This is the Riemann-Christoffel or curvature tensor whose vanishing is the necessary and sufficient condition for the reducibility of g<sub>to</sub> to a constant tensor, or the criterion of a homaloidal

(bucklidean) space Themann's Pour-Index Symbols and Curvature.—Riemann's own set of four-index symbols is the covariant tensor  $(\mu_1, \lambda_0) = R_{\mu\lambda} = g_{\mu\alpha}R_{\alpha\lambda}^*$ . Conversely,  $R^{\alpha}_{\lambda} = g_{\alpha\beta} = g_{\alpha\beta}R_{\alpha\lambda}^*$ . Conversely,  $R^{\alpha}_{\lambda} = g_{\alpha\beta} = g_{\alpha\beta}R_{\alpha\lambda}^*$ . A. Three more linear nore linear

relations hold between them. This reduces the number of inin Native (1944) is illuminating. One of the most interesting dependent symbols to  $\frac{1}{2}n^2(n^2-1)$ , e.g., six for a three-space, applications of non-Riemannian tensor analysis was made by twenty for an S4, and but one for a surface, say (12, 12). This symbol divided by g is a scalar of the surface, its Gaussian curvature (K ) (See DIFFERENTIAL GEOMETRY ) If a vector is parallelly displaced around a circuit on a surface, it returns with its direction changed by an amount equal to  $\int K d\sigma$ , the Gaussian curvature of the surface integrated over the surface area enclosed by the circuit As a consequence, the excess (over  $\pi$ ) of the angle sum in any geodesic triangle is  $\int Kd\sigma$ , a famous theorem due to Gance

In the case of three or more dimensions the curvature properties can no longer be expressed by a single magnitude, but require for their description the knowledge of the whole curvature tensor or the associated Riemann symbols. The concept of Gaussian curvature is now replaced by that of Riemannian curvature. This is, at any point O(v) of Sn, the set of Gaussian curvatures K of geodesic surfaces of all possible orientations laid through O. If haft be the metrical tensor of such a surface as submanifold, then  $K = \frac{1}{h} (12, 12)_{L}$ , the symbol to be calculated with  $h_{\alpha\beta}$ . This

and the determinant h can be expressed in terms of the tensor give of the manifold and the vector pair, &, n, fixing the orientation. The result is

$$K = \frac{(\iota \kappa, \lambda \mu) \xi^{\iota} \eta^{\kappa} \xi^{\lambda} \eta^{\mu}}{(g_{\iota \lambda} g_{\iota \mu} - g_{\iota \mu} g_{\iota \lambda}) \xi^{\iota} \eta^{\kappa} \xi^{\lambda} \eta^{\mu}},$$
 (10)

In general, K will depend on position and on orientation. in other words, with regard to curvature, Sn may be nonhomogeneous as well as anisotropic (e.g., space time within or around matter); but if K is everywhere isotropic, it is also constant throughout S, This is Schur's theorem By (10) the necessary and sufficient condition for isotropy of Riemannian curvature becomes  $(i\lambda, \kappa\mu) = K(g_{i\kappa}g_{\lambda\mu} - g_{i\mu}g_{\lambda\mu})$  or  $R^{\alpha}_{i\kappa\lambda} = K(\delta^{\alpha}_{\kappa}g_{i\lambda} - \delta^{\alpha}_{\lambda}g_{i\kappa})$  with constant K.

The tensor (9), being mixed, yields the contracted curvature tensor Range Rus which turns out to be symmetrical. Its scalar,  $R = g^{\mu}R_{\mu\nu}$ , is the curvature invariant of the manifold. For an isotropic n-fold, R = -(n-1)nK and  $R_{is} = g_{is}R/n$  A capital use of Rix was made by Albert Einstein for constructing the gravitational field equations,  $R_{i\alpha} - \frac{1}{2}Rg_{i\alpha} = -\kappa T_{i\alpha}$ , where  $\kappa \sim \text{gravita}$ tion constant, and Tig is the tensor of matter, embodying energy, momentum, and stress. The covariant derivative of Rix is connected with grad R by the n relations  $g^{\kappa\lambda}R_{\kappa\kappa,\lambda} = \frac{1}{2}\partial R/\partial x_{\kappa}$ , which were again utilized by Einstein and which follow from the identical relations  $(\kappa, \lambda \mu)_{,\nu} + (\kappa, \nu)_{,\mu} + (\kappa, \nu)_{,\mu} = 0$ . These remarkable identities, discovered by Luigi Bianchi, give also a very simple proof of Schur's theorem.

Non-Riemannian Tensor Analysis .- The year 1918 saw the beginning of epoch-making generalizations of the Riemannian tensor analysis. It was first observed that many of the results of the Riemannian tensor calculus were independent of the metric structure of the Christoffel symbols [14, h] in terms of the metrical tensor gives but were merely dependent on the law of transformation of the Christoffel symbols under a transformation of co-ordinates. There thus arose the fruitful conceptions of non-Riemannian geometries and tensor calculi in which the fundamental geometric object is not a metrical tensor gir but a linear connection with components  $\Gamma_{ii}^{\lambda}$ , which undergo the nontensorial transformation

$$\Gamma_{\alpha\beta}^{\gamma} = \Gamma_{\alpha}^{\lambda} \frac{\partial x_{\epsilon}}{\partial x_{\alpha}} \frac{\partial x_{\epsilon}}{\partial x_{\beta}} \frac{\partial x_{\gamma}}{\partial x_{\lambda}} + \frac{\partial^{2} x_{\lambda}}{\partial x_{\alpha}} \frac{\partial x_{\gamma}}{\partial x_{\lambda}}$$
(11)

under a transformation of co-ordinates x, to new co-ordinates x, This transformation law is the same as the one for the Christoffel symbols [u, h] in the Riemannian tensor analysis.

Both the symmetric case  $\Gamma_{ii}^{\lambda} = \Gamma_{ii}^{\lambda}$  and the asymmetric case have been studied in many papers and books. The numerous attempts at unified field theories in general relativity theory have often shown the need for further researches in non-Rie-mennian tensor analysis. A historical survey by E. Schrödinger

E. Cartan (1927) to the differential geometry of an n-dimensional continuous group manifold. There exist two fundamental asymmetric (nonsymmetric) connections which in turn define uniquely the symmetric linear connection with the property that the covariant derivative of the curvature tensor is zero. In the special case of a semisimple group, the group manifold reduces to a Riemannian space which is not necessarily of constant Riemannian curvature.

We cannot dwell here on the extensive developments of non-Riemannian tensor calculus in connection with projective and conformal differential geometries, non-Riemannian metric spaces

(Finsler spaces) and other related topics.

The development of non-Riemannian tensor analysis is associated with the names of L Berwald, E Bortolotti, E Cartan, A S Eddington, A Einstein, L. P Eisenhart, V Hlavatt, A D Michal, J. A. Schouten, E Schrödinger, T Y Thomas, D Van Dantzig, O. Veblen, H Weyl, J H. C. Whitehead and many others

General Tensor Analysis.-The differential calculus and theory of functions used in most of the topics discussed so far are classical (prior to 1906). The phenomenal rise of general function theory and topology in the decade 1927-37 was accompanied by a searching investigation of the foundations of differential geometry and tensor analysis in n-dimensional spaces. This necessitated the introduction of the theory of topological spaces into the treatment of co-ordinates and co-ordinate transformations. Only a beginning has been made in this important and difficult subject.

classical cases we now have an element v or these more genera matne-matical spaces—which in some instances may be function spaces or other infinitely dimensional spaces. The subject is still in its infancy, but there is a growing opinion to the effect that it will become one of the great branches of mathematics. There are numerous applications of general tensor analysis to the vibrations of elastic media and to the

there is a growing opinion to the effect that it will become one of the prest branches of mathematics. There are numerous applications of great branches of mathematics. There are numerous applications of earlier of the property of the pro

1832), lord chief justice of England, was born at Canterbury on

bury King's school and Corpus Christi college, Oxford, and entered at the Middle Temple in 1787 For several years he practised as a special pleader under the bar, and was finally called at the Inner Temple in 1796. He joined the Oxford cucuit and made rapid headway. In 1801 he was appointed recorder of Oxford In 1802 appeared his Law relative to Merchant Ships and Seamen, which is still an authoritative work. Its publication brought to him so much commercial and other work that in 1808 he was in a position to refuse a seat on the bench, this, however, he accepted in 1816, being made a judge of the court of common pleas On the resignation of Lord Ellenborough in 1818 he was promoted to the chief justiceship of the king's bench, and presided over several important state trials, notably that of Arthur Thistlewood and the Cato Street conspirators (1820) He was raised to the peerage in 1827 as Baron Tenterden of Hendon. Never a great lawyer and with no pretence to eloquence. Tenterden made his way by sound common sense and steady hard work. He was an uncompromising Tory, and had no sympathy with the reform of the criminal law carried out by Romilly, while he strongly opposed the Catholic Relief bill and the Reform bill. He died on Nov 4, 1832

See Foss, Lives of the Judges (1870).

TENTERDEN, a market town and municipal borough in the Ashford parliamentary division of Kent, England, 53 mi. ESE. of London by the S. railway. Pop. (1938) 3,431 Area 14 sq mi It lies on an elevation above the Newnill channel, a tributary of the Rother, whose flat valley, called the Rother Levels, was an estuary within historic times, and even as late as the 18th century the sea was within 2 mi. of Tenterden, which is a member of the affiliated Cinque Port of Rye The church of St Mildred is Early English and later, and its tall, massive Perpendicular tower is well known for the legend connecting it with Goodwin Sands. The story is that the abbot of St. Augustine, Canterbury, diverted the funds by which the sea-wall protecting Earl Godwin's island was kept up, in order to build Tenterden steeple, the consequence being that in 1099 an inundation took place and "Tenterden steeple was the cause of the Goodwin Sands" The church of High Halden, in the neighbourhood, is remarkable for its octagonal wooden tower constructed of huge timbers, with a belfry of wooden tiles (shingles), of the time of Henry VI

Tenterden (Tenterdenne, Tentyrden) figures frequently in contemporary records from 1300 onwards. In 1449 it was united to Rye, and granted a charter which, however, did not come into operation till 1463 under Edward IV In return for these and other privileges it was to contribute towards the services due from Rye as one of the Cinque Ports, In 1600 it was incorporated under the title of the "Mayor, Jurats and Commons" of the town and hundred of Tenterden, in the county of Kent, the members of the corporation ranking henceforward as barons of the Cinque Ports. A weekly corn market on Friday and a yearly cattle and wool fair on the first Monday in May were granted, both of which are held at the present day. In 1790 a contemporary writer mentions the market as being little frequented, whilst the fair was large and resorted to by all the neighbourhood. The size and importance of Tenterden can be estimated from a receipt of 1635 for £90 shipmoney, as compared with \$70 contributed by Faversham, and \$60 by Hythe. Under Edward III. several refugee Flemings settled in the town and established the woollen manufacture. By 1835 this trade had died out.

TENURE, in law, the holding or possession of land. The holding of land in England was originally either allodial or feudal. Allodial land was land held not of a superior lord, but of the king and people. Such ownership was absolute (see Allorum). The Saxon invasion tended, without doubt, to re-establish the principle of common village ownership which formed the basis of both Celtic and German tenure. In the later Saxon period, however, private ownership became gradually more extended. Then the feudal idea began to make progress in England, much as it did about the same time on the Continent of Europe, and it received a great impetus from the Norman conquest. When English law began to settle down into a system the principle of feudalism was

Oct. 7, 1762, the son of a hairdresser He was educated at Cantei-taken as the basis, and it gradually became the undisputed maxim of English law that the Sovereign was the supreme lord of all the land and that every one held under him as tenant (see FEUDAL-ISM). All tenures, except free and common socage tenures, were abolished by the Law of Property Act, 1925 (s 56), and provision has been made for the abolition of copyhold and customary tenure and the extinction of manorial incidents, with a saving for grand and petty serjeanty services (ibid. ss 128, 136, 139-143) The following modern cases may be consulted with regard to native tenures of land: In re Southern Rhodesia (1919) A.C. 211, 233 (aboriginal rights generally); Sobhn Za II v Miller (1926) A C 518 (West African), Amadu Tijani v. Secretary for Southern Nigeria (1921) 2 A.C. 399 (West African), A.G. for Quebec v. AG. for Canada (1921) I AC. 401 (Indian Reserves). but it should be noted that in several colonies the matter has been the subject of legislation. In the United States the term tenure ordinarily is used to denote the manner whereby lands or tenements are held, excluding lands held in fee simple As an example, a person may have a life estate or tenure in land, or a tenure for a term of years. (See also Estate; Land; Manor)

TEOSINTE (Euchlaena mexicana), a tall, stout, annual grass, native to Mexico, very closely allied botanically to maize (q.v.). Usually branching at the base, it grows in large clumps, with tassels (staminate flowers) like those of maize. The bundles of fruiting spikes, enclosed in husks, with the silk (long styles) hanging from the upper ends, are somewhat similar to the ears of maize. Teosinte is grown in Mexico as a fodder plant and sparingly in the southern parts of the United States as a soiling crop In Mexico hybrids of teosinte and maize are found, giving rise to the view that the two plants have developed from a common ancestral form

TEPIDARIUM, the warm room of a Roman bath (see BATHS), or a similar chamber in a modern bath establishment In the great imperial thermae at Rome the tepidarium constituted the large central hall and served, apparently, as a general lounge and meeting room as well as for bathing.

TEPLICE-ŠANOV or TEPLITZ-SCHÖNAU, a spa in Bohemia, in the valley of the Bilina It owes its popularity as a wateringplace to its mild climate and to the thermal mineral springs of the locality. The salme-alkaline waters, 79° to 122° F, are used almost exclusively in the treatment of gout, rheumatism and some skin complaints and are prescribed as an "after-cure" to Carlsbad, etc. Although traditionally beheved to have been known and used since the 8th century, the springs are not historically mentioned until the 16th century, and the function of the town as a watering-place is disappearing in face of the advance of industry, for the rich lignite field of Brux-Komotau-Teplitz led to the establishment of numerous manufactures Hardware, machinery, glass, pottery, chemicals, cotton and woollen goods are the principal products and in all of these Teplice has a brisk trade. Industrial life grew mainly in the suburbs. Pop. (1930) 30,911, of whom about 25,000 were Germans.

In 1938 the town was ceded to Germany by the Pact of

Munich.

TERAMO, an episcopal see of the Abruzzi, Italy, the capital of the province of Teramo, 16 mi. by rail W.S.W. of Giulianova, a junction on the Ancona-Brindisi railway. Pop. (1936) 16,229 (town); 33,796 (commune). The town stands on the left bank of the Tordino, where it is joined by the Vezzola, at an altitude of 876 ft. above sea-level. The cathedral has a Romanesque Gothic portal of 1332 by a Roman marble worker named Deodatus; it contains a splendid silver antependium by Nicolo da Guardiagrele (1433-48). The tower is fine. The church of S. Antonio is also in the Romanesque Gothic style. Under the church of S. Anna dei Pompetti remains of Roman houses and of the original cathedral have been discovered. Two miles away is an important astronomical observatory, presented to the State by Vincenzo Cerulli in 1917. The ancient Interamna Praetuttiorum was the chief town of the tribe of the Praetuttii.

TERAPHIM, a Hebrew word, found only in the plural, of uncertain etymology. The name appears to be applied to some form of idol (cf. Gen. xxxi. 19 and 30), but details as to its precise configuration, etc., are lacking. From I Sam xix 13, 16 it would seem that in the early monarchical period a regular place in every household was still reserved for the teraphim; while in the 8th century, Hosea (ii. 4) speaks of "ephod and teraphim" as essential elements in the national worship. Later the teraphim were banned by the prophets The meaning of the story in Gen. xxxv. 2-4 clearly is that the employment of teraphim was given up by Israel in order that they might serve Jehovah alone at Bethel. In Judges and Hosea the teraphim are closely associated with the ephod; both are mentioned in connection with divination (cf. 2 Kings xxni 24; Ezek xxi. 21 & 26; Zech x 2) In view of Ezek. xxi. 21 and Hosea iii 4, it is difficult to suppose that the teraphim were purely household idols See also EFHOD TERBIUM, a very rare metallic element (symbol Th, atomic

number 65, atomic weight 159 2) of the rare-earth group, was discovered by Mosander, who originally named the oxide erbia. The first pure compounds were obtained by G. Urbain in 1905 It is best separated from the other members of the group by the fractional crystallization of the bromates The ignition of terbium oxalate or sulphate gives a black peroxide which slowly dissolves on heating with mineral acids, giving almost colourless solutions characterized by a rather faint absorption band in the blue region (C. J.)

of the spectrum. See RARE EARTHS.

TER BORCH (or TERBURG), GERARD (1617-1681), Dutch subject painter, was born in 1617 at Zwolle, Holland. He received an excellent education from his father, also an artist, and developed his talent very early. The inscription on a study of a head proves that Ter Borch was at Amsterdam in 1632. In 1634 he studied under Pieter Molyn in Haarlem. A record of this Haarlem period is the "Consultation" (1635) at the Berlin gallery. In 1635 he was in London, in 1640 in Rome, when he painted the small portraits on copper of "Jan Six" and "A Young Lady" (the late Six collection, Amsterdam). In 1648 he was at Munster during the peace congress and executed his celebrated little picture, painted upon copper, of the assembled plempotentiariesa work which, along with the "Guitar Lesson" and a portrait of a "Man Standing," now represents the master in the National Gal-lery in London. The picture was presented to the nation by Sir Richard Wallace. At this time Ter Borch was invited to visit Madrid, where he received employment and the honour of knighthood from Philip IV., but, in consequence of an intrigue, it is said, he was obliged to return to Holland. He seems to have resided for a time in Haarlem, but he finally settled in Deventer, where he became a member of the town council He died at Deventer on Dec. 8, 1681

Ter Borch is excellent as a portrait painter, but still greater as a painter of genre subjects. He depicts with admirable truth the life of the wealthy and cultured classes of his time His colouring is clear and rich, but his best skill lies in his unequalled rendering of texture in draperies, which is seen to advantage in such pictures as the "Letter" in the Dutch royal collection, and in the "Paternal Advice" (known as the "Satin Gown")-engraved by Wille-which exists in various repetitions at Berlin and Amsterdam, and in the Bridgewater gallery. Hofstede de Groot enumerates 464 works by Ter Borch. Seven of these are at the Hermitage, 12 at the Berlin museum, seven at the Louvre; six at the Dresden museum, two at the Wallace collection and 15 at the

Amsterdam museum.

See Hofstede de Groot, Catalogue of Dutch Painters (1913).

TERCEIRA, an island in the Atlantic ocean, belonging to Portugal, and forming part of the Azores archipelago. Pop. (1940) 53,233; area, 153 sq.mi. Terceira, i.e., "the third," was so called as being the third island of the archipelago to be discovered by the Portuguese From its central position it was long the seat of administration, but its capital, Angra (q.v.), has lost much of its commercial importance. The other chief towns are Ribertinka (3,170), and Praia da Vitoria (2,029). See Azores.)

TEREBINTH, botanical name Pistacia terebinthus, a member of the family Anacardiaceae, usually a small tree, common in

the south of Europe and the whole Mediterranean area. It has a purplish grey bark and compound leaves with two to four pairs. and an odd terminal one. The very small numerous unisexual flowers are borne on panicles. The fruit is a small roundish bright red drupe with a scanty pulp. A liquid resinous exudation, known as Chian, Scio or Cyprus turpentine, is obtained by cutting the stem. Allied species include P lentiscus, the mastic tree and P. vera, which yields the pistache nut.

TEREDO. From time immemorial seafaring men have known and dreaded the shipworm, which bores into and destroys the stoutest timbers in the sea Nowadays, although the danger to ships is no longer to be feared, the timber of harbour works is still exposed to damage by the same pest. How serious the danger may become is shown, for example, by the outbreak of shipworm in San Francisco bay during the four years 1917-21 when the destruction of wharves and letties was estimated to have cost the enormous sum of 25 million dollars.

The writers of antiquity did not distinguish clearly between the marine timber worm and the wood-boring insect larvae of the land and they sometimes applied the name Teredo to both, but it was later restricted to the marine borer and is still in use as a general term for the shipworms, although in the nomenclature of zoological taxonomy it is the name of only one of the genera

forming the family Teredinidae.

It was Godfrey Sellius who, in 1733, first showed that Teredo is a bivaive molluse members of that group When its burrow in the wood is laid open it is seen to have a long worm-like body bearing at its inner end a pair of small shelly plates which represent the valves of the shell At the outer end, where the burrow narrows to a small opening, the body ends in a pair of siphons which can be extended from the surface of the wood and serve for the entrance and exit of the respiratory current of water. When the siphons are withdrawn the opening of the burrow is blocked by a pair of paddle-shaped plates of shell known as the pallets. The interior of the burrow is lined with shelly material which is usually merely a thin film but when exposed by the decay of the wood may be considerably thickened. The valves of the shell are nearly hemispherical, with a deep right-angled notch occupying the ventral half of the anterior margin. In the gap left by these notches is the round sucker-like foot with which the animal adheres now to one part and now to another of the interior of its burrow Parallel with the edges of the notch, the surface of each valve is marked with two sets of fine ridges which are seen under the microscope to be rows of minute teeth like those of a file. It is by means of these teeth that the excavation of the wood is effected. While the foot is adhering to the wood a rocking movement is imparted to the valves by alternate contractions of the anterior and posterior adductor muscles and the wood is rasped away as a fine dust This is swept into the mouth and passes into the stomach. It has been shown beyond doubt that the wood is acted on by the digestive ferments and utilized as food, but in addition the stomach is usually found to contain minute floating organisms drawn in with the respiratory current.

In some species of Teredo the eggs are discharged and float freely in the sea, in others they are retained in the gill cavity and pass through the early stages of their development before they are set free. In either case, the earliest stage is a free-swimming ciliated larva which soon develops a bivalve shell. After a time the larva settles on the surface of the wood, creeping about by means of a large tongue-shaped muscular foot. Settling on a suitable spot it begins to scrape away the wood with the edges of the valves and soon disappears below the surface. As the burrow deepens the body lengthens so that the siphons can protrude from the surface while the valves are working at the inner end. In temperate seas shipworms rarely exceed a foot in length but some tropical species may reach six feet.

Many species of shipworms have been described and grouped in a number of genera forming the family Teredinidae, but the taxonomy is not in a satisfactory condition and much more work is required before the limits of species or genera can be properly defined. What is of importance to the engineer is that the different species differ considerably in their physiological requirements. Thus while many species are only able to flourish in places where the salinity of the water is nearly the same as that of the open sea, the typical species Teredo navalis can survive a considerable reduction in the salinity and is enabled to invade estuaries and harbours where the influx of fresh water excludes other species It happens from time to time, as in the case of the San Francisco outbreak alluded to above, that a temporary increase of salinity resulting from reduced rainfall extends the brackish water area still farther, and thus allows T navalis to gain a footing in places where it had not previously existed

Numerous methods have been tried for protecting timber against the attacks of shipworms Metal sheathing for the hulls of wooden ships was employed in Greek and Roman times and copper sheathing came into extensive use in the 18th century At the present day the piles of harbour works are sometimes sheathed with metal or enclosed in concrete "jackets." methods, however, are only effective when the surface is completely covered A small space left unprotected may admit enough shipworm larvae to destroy completely the interior of the timber. Certain kinds of timber are comparatively resistant to shipworm attacks, but it appears that this resistance is only temporary and that no kind of wood is permanently immune Many methods for impregnating the wood with poisonous substances have been tried. the most effective being creosote Heavy impregnation with creosote greatly lengthens the "life" of timbers exposed to attack, but lasting immunity is not attained owing to the gradual washing out of the creosote from the wood

Besides the shipworms several species of Crustacea are the cause of serious damage to timber in the sea. The best known of these is the "gribble." a tiny 1sopod which burrows in the superficial layers of the wood, reducing them to a spongy mass which is easily washed away, exposing fresh layers to attack. It is common in European waters and has been found in many other parts of the world. The damage done by it is visible on the surface and is less likely to attain serious proportions without being noticed than is (W T C, X.) that caused by the shipworm.

TEREK, a river of Russia flowing from the Caucasus Range to the Caspian Sea, rising in glaciers on Mount Kasbek. It skirts the Kasbek group on the south and west, and flows through a series of gorges The most famous is the Darial gorge by which the Terek escapes to the plains on the north, its furious torrent flowing between wild granitic bare rocks and forming a contrast to the wooded limestone mountains beyond The Georgian military road, built 1811-64, passes through the gorge and enabled Russia to establish her rule among the wild Caucasian mountain tribes. Below Vladikavkaz at the foot of a vast declivity, it collects the waters of the Gusel-don, Fiag-don, Ar-don and later receives the Urukh, and the Malka, with its affluents the Cherek and Baksu. It then flows through the steppe country at the northern foot of the Caucasus to the Caspian, being joined before it reaches the delta by the Sunja, a tributary receiving the Chanti or Argun, and fed by numerous sulphur streams, one of them, the Melchihi, rising in five hot springs which affect the temperature of the Melchihi for some distance. In spite of losses by evaporation and irrigation, the Terek still has a sufficiently large volume to enable it to spread out in a great delta, with branches shifting in flood time and changing their relative importance. This delta stretches for 70 m. along the coast. The coast line, like that of the Volga delta, is encroaching on the Caspian, and old shore lines may be traced considerably west of the present coast. Fishing villages which in 1825 stood on the coast line were 10 m. inland in 1855 Among the more important irrigation canals are the Eristov and Kurskiy, fed from the Malka; plans are under considera-, tion for irrigation of part of the Nogal steppe, recently included in the Dagestan A.S.S.R. In its lower course the Terek flows above the level of the surrounding country.

TEREK PROVINCE: see Caucasian Area, North.

TERENCE (PUBLIUS TERENTIUS AFER) (c. 190-c. 159 B.C.), Roman comic poet, was born in Carthage and came to Rome as a slave in the house of Terentius Lucanus, a senator, by whom he was educated and manumitted. The little that is known of his life is almost entirely derived from a fragment of Suetonius, De viris illustribus. At Rome he was on friendly terms with Scipio Africanus the younger, C. Laelius, and Furius Philus. His six plays

were produced 166-160 BC After the production of the last he went to Greece, apparently to procure more of Menander's plays. From this voyage he did not return The place and manner of his death are very variously given.

His first play, the Andria, was produced in 166 B C The plot, which may be taken as typical, tells of the adventures of an Atheman girl, Pasibula, who is left in the charge of an uncle while her father goes abroad, how she is shipwrecked off the coast of Andros, where she is brought up, under the name of Glycerium, as the daughter of an Andrian, and returns to Athens; of her love affair with Pamphilus and its threatened frustration, and of her rediscovery of her father and her eventual marriage with Pamphilus, whose crafty slave, Davus, is as usual the mainspring of the plot. The play is an adaptation from two plays-a procedure known as contaminatio-of Menander, as we learn from the prologue 9 seq. "Menander wrote the Andria and the Permthia; he who knows either, knows both, for the plots are not very different, though they differ in language and style. The poet's enemies object to this and maintain that plays should not be contaminated (contaminari non decere fabulas). Their knowingness shows that they know nothing, for the same criticism applies to Naevius, Plautus and Ennius, whom the poet takes as his models, preferring their 'negligence' to the 'obscure diligence' of his detractors."
The opening scene is twice referred to by Cicero, who in De Inventione, i. 23, cites lines 50-53, 157, 168, and in De Oratore 40, hic parvae consuetudinis-faciet patri (Andr. 110-112).

His second play, Hecyra, or the Mother-in-Law, adapted from a play by Apollodorus, was produced in 165. The third, Heautontimorumenos, or the Self-Avenger, appeared in 163, the fourth, the Eunuchus (Eunuch), a "contamination" (cf., prol. 30 seq.) of two plays of Menander, the Eunuchus and the Kolax (flatterer), in 161, and in the same year also the Phormio, adapted from the Epidicasomenos of Apollodorus. His last play, the Adelphoe, or the Brothers, a "contamination" of the "Adelphoi" of Menander and the Sunapothneskontes of Diphilus, was produced in 160.

With regard to the economy of his plays, it is to be noted that Terence uses the prologue no longer to introduce a play by an exposition of the plot, but after the manner of the Aristophanic parabasis, chiefly to reply to his critics—cf. Andria, prolog. 5
"Nam in prologis scribunds operam abutitur Non qui argumentum narret sed au malevoli Veteris poetae maledictis respondeat;" i e., the poet wastes his labour in writing prologues, not to explain the plot, but to reply to abuse of a malevolent old poet (Lavinius Luscus, preferred by Vulcatius Sedigitus to Ennius as a comic poet. Aul. Gell. xv. 24).

The comedy of Terence, like that of his exemplars, is a comedy of manners. The reader is conscious of having travelled a long

way from the Olympian humour of Aristophanes. His meritpurity of Latinity-and his demerit-lack of comic power (vis comica)-are summed up in the famous epigram of Julius Caesar (Sueton Vita Terentii) :

Tu quoque, tu in summis, O dimidiate Menander, Poneris et merito puri sermonis amator Lenibus atque utinam scriptis aduncta forct vis Comica, ut aequato virtus polleret amore Cum Graecis neque in hac despectus parte iaceres, Unum hoc maceror et doleo tibi desse, Terenti,

(Thou too, O halved Menander, art placed among the highest and deservedly-lover of pure speech. And I would that to thy mild writings there had been joined comic power, so that thy excellence might have had equal honour with the Greeks and thou be not despised in that part. This one thing, Terence, thou lackest -to my distress and sorrow.) In his own time he appears to have been accused of plagiarism and also of receiving help in writing his plays from his friends-a charge which he several times refers to in his prologues and in that of the Adelphoe apparently admits to be true.

In using his Greek models, apart from "contamination" referred to above, he permits himself various liberties Names are altered, individual scenes remodelled, e.g., Eumechus, 539 seq. or abbreviated, cf. Hecyra, 835, and new characters, e.g., Charinus and Burria in the Andria, introduced.

The judgment of Caesar already quoted seems to have been

pretty generally endorsed in antiquity Vairo found his chief merit in the exhibition of character (in othesin Terentius boscit

pulmam); Cicero in his choice language

In another passage-De obtimo genere oratorum, i-Cicero speaks of Terence as generically differing from Accius; Horace, Epist, 11, 1 59 quotes as a received opinion that Caecilius (who, according to legend, Sueton Vit. Ter, encouraged the young poet) excelled in dignity, Terence in ait Ovid, Trist ii, 359 seq contrasts him with Accius Accius esset atrov, conviva Terentius esset Quintilian (x, 199) says that the Romans make a poor show in comedy . . . "though the writings of Terence are ascribed to Scipio Africanus-writings which in this kind are most elegant and could have been still more pleasing if they had been confined to trimeter lines"-a criticism which seems to refer to some departures in prosody from the strict Menandrian model According to Servius, Terence is preferred to the other comic poets solely on the ground of propriety, being in other respects inferior Aulus Gellius, xv, 24 has preserved some lines of Vulcatius Sedigitus, in which the Roman writers of comedy are arranged by him in order of merit, thus-Caecilius, Plautus, Naevius, Licinius, Atilius, Terence Turpilius, Trabea, Luscius and lastly, added, causâ antiquitatis. Ennius In England and on the continent, Telence has been popular and influential and imitations of his plays have been numerous, e g , the Andria was copied in the Conscious Lovers of Sir Richard Steele, the Heautontimorumenos in the All Fools of Chapman, the Eunuchus in Sedley's Bellamira, and La Fontaine's L'Eumague, the Phormio in Molière's Les Fourberies de Scapm, the Adelphoe in the same author's Ecole des Maris ress de Scapin, the Acasphoe in the same author's Looie des Acar's See Editio prince's Strasbourg (1470). R. Bentley (Cambridge, 1796), Fleckelsen (Leipzig, 1898). Editions of single plays are numerous TERENTIANUS, surnamed Maurus (a native of Maure-

tania), Latin grammarian and writer on prosody, flourished probably at the end of the 2nd century AD. His references to Septimius Serenus and Alfius Avitus, who belonged to the school of "new poets" (poetae neoterici or novelli) of the reign of Hadrian and later, seem to show that he was a near contemporary of those writers He was the author of a hexameter treatise in four books. on letters, syllables, feet and metres, of which considerable use was made by later writers. The most important part of it is that was made by later writers. The most important part of 11 is that which deals within extres, based on the work of Caesius Bassus Bassus Bestim, 18-21, see also Tended Latint, 91; with commentary by Saction, 18-21, see also Tended-schwing. Hart, of Roman Literature (Eng ti), 31; see also Tended-schwing. Hart, of Roman Literature (Eng ti), 31; see also Tended Latint, 18-21, and 18-21,

mouth. City population was 53,425 (1950) and municipio 93,352. It is situated on an open plain and is laid out regularly with broad straight streets and large squares. The town is characteristically Portuguese in appearance, its buildings being one or two stories in height, plastered and frequently coloured outside, with large rooms, thick walls and tile roofs to ensure coolness Its manufacturing industries include cotton mills, sugar refineries, a foundry and soapworks. A steamboat service, with small boats. maintains regular communication with Parnaiba, near the mouth of the river, besides which there are a number of independent freight-carrying boats. A railway connects Senador Furtado, across the river Parnaíba, with the port of São Luís on the coast of Maranhão. Teresina was founded in 1852, its site being originally called Chapada de Corisco, and was named after the Empress Teresa Cristina.

TERGESTE: see TRIESTE.

TERM, in logic, means the subject or predicate of a judgment (or proposition). It is, however, commonly used in a much wider sense so as to include also any word or combination of words that is capable of being used as the subject or predicate of a proposition. Of the different kinds of terms usually distinguished, the following are the most important. (a) Connotative terms are those which have a standard (or conventionally fixed) meaning. In this sense practically all terms except proper names are connotative. Non-connotative terms have no such fixed meaning. It is usual to restrict this distinction to concrete terms, on merely

primarily indicate or suggest the presence of something (though indirectly they may also imply the absence of something) Negative terms primarily indicate the absence of something (though indirectly, and perhaps rather vaguely, they may also imply the presence of something) (c) Singular terms are such as are applicable in the same sense to one object only (or to one group treated as one object) General terms are those which can be applied in the same sense to any one of a class (or kind) of obiects. (d) Concrete terms are those which denote anything that can be regarded as a whole having attributes and standing in various relations, even if it is not tangible (e.g., mind, character, logic, as well as table, chair, etc.) Abstract terms are the names of some attribute, aspect or relationship considered apart from the things in which it exists (e.g., size, beauty, friendship, etc.). (e) Relative terms are those the special function of which it is to draw attention to some definite relationship in which the object named stands to some other object (e.g., husband, wife, partner, etc.) Absolute terms are those which have no such special function, although the things named will as a matter of fact stand in all sorts of relationships to other things (eg, John Smith, table, chair, etc.) Relative terms usually go in pairs, for every relationship requires at least two terms—"parent" and "child," "brother" and "brother" (or "sister"), and so on (f) Collective terms denote groups of similar separate units as groups (e.g., "army." "company," "library," etc.). Non-collective (or unitary) terms denote units that are not groups of similar separate units (eg, "table," "chair," "house," etc ).

Of the above classifications or distinctions the first (a) is mainly concerned with verbal terms or names. The others are primarily concerned with differences in the way in which we think about things, even the same things it may be Sometimes a thing is regarded in all its individuality (as singular); sometimes as one of a kind (general); sometimes it is considered in relation to sometime else (relative), sometimes for its own sake (absolute), sometimes we think of what a thing is (positive), and sometimes of what it is not (negative); and so on, (See Logic and the

bibliography given there )

Dibliography given there:

A Term of Years, in English law, is the time during which an interest in an estate for life on for years is enjoyed, also the interest lastly, because such an interest must determine at a definite time. If the interest be for life, it is an estate of freehold; if for years, only a personal linterest in real estate, and so personally, even though the length of the term—for instance, 1,000 years—may far exceed in duration any possible life estate (See the Law of Property act, 1935) The same act gives power to enlarge the unexpired residue of a term of 200 years in certain cases into the fee simple, and the Places of Worship (Enfranchisement) act 1920 gives power to enlarge leases for

lives or even 21 years.

Terms, in the sense of a limited and certain period of time during which the law courts are open, used to affect only what were called in England the superior courts—that is, the king's bench, common

in England the superior course—time is, the Ampa weath, common, pleas and exchesped terms, Halay, Easter, Trithy, Michaelma, the average duration of each being about three weeks. By the Judicature act of 1875 terms were abidished so far as related to the administration of justice and sittings substituted. The dining terms at the Inns of Court correspond in point of time with the old terms and not with

Court correspond in point to some water up on a constraint of the sittings.

At the University of Cambridge the academic year is divided into these terms, Michaelmas, Lent and Easter; while at the University of these terms, Michaelmas, Lent and Easter; while at the University of and Trinity. School years now generally consist of three terms, divided and Trinity. School years now generally consist of three terms, divided. and Trinity. School years now generative consist or times terms, wavener by Christmas, Easter and summer holidays, the old half-years having gradually been abolished.

In Algebra, an expression not connected to another expression by the sign + or the sign —. For example, ab<sup>5</sup> is a single term (monal). (See Davidson and the sign + and the sign - ab<sup>5</sup> are to terms (binomial). (See Davidson - ab<sup>5</sup> are sign - ab

POLYNOMIAL.)
TERMINATOR, in astronomy, the bounding line between light and darkness on the apparent disc of the moon or of a planet. At places on the terminator the sun is either rising or setting.

TERMINI IMERESE (anc. Thermae Himerenses), a seaport town of Sicily, in the province of Palermo, 23 mi. E.S.E. of it by rail, Pop. (1931) 16,689, It was founded in 408 B.C. by the Carthaginians, after their destruction of Himera, in the vicinity of hot springs mentioned by Pındar (Od. xii, 19) which are usual to restrict this distinction to concrete terms, on merely still resorted to (temperature x10° F.). Agathocles (g.v.). was etymological grounds (b) Positive terms are those which born here. It was taken by Rome in the First Punic War, A Roman road ran from it to Catana Scanty remains of buildings of Roman times (baths, an amphitheatre and a so-called curia) exist in the upper part of the town, and outside it on the south are considerable remains of two Roman aqueducts.

TERMINOLOGY: See NAME

TERMINUS [Lat. a boundary stone], a stone or post which was set up in the ground with the following religious ceremonies A hole was dug and a fire lighted; a victim was sacrificed and its blood poured into the hole, together with incense and finits, honey and wine, and the ashes of the sacrifice. Then the boundary stone, which had been previously anomted and crowned with garlands. was placed upon the hot ashes and fixed in the ground. Any one who removed a boundary stone was accursed (sacer) and might he slam with impunity; a fine was afterwards substituted for the death penalty From this sacred object evolved the god Terminus On Feb. 23 (the end of the old Roman year) the festival called Termmalia, according to Wissowa a festival not of the god but of the boundary stones (termini), was held. The owners of adjacent lands assembled at the common boundary stone and garlanded each his own side of the stone. An altar was set up and offerings of cakes, corn, honey and wine were made Later a lamb or a sucking pig was sacrificed. The proceedings closed with songs to the god and a general merrymaking, in which all the members of the family and the servants took part

A similar festival was held at the old boundary of the Roman territory between the fifth and sixth milestone on the 10ad to Laurentum, When the Capitoline temple was to be built the auguries forbade the removal of

one of these termina (a houndary mark of some old precinct?) and it was enclosed within the walls of the new sanctuary, an indication of the immovability of such stones and of the permanence of the Roman territory,

Sec Wissowa, Religion und Kultus der Romer (2nd ed ), p. 136, W. W. Fowler, The Roman Festivals, p 324 (1899).

TERMITE, the name given to usually pale-coloured, softbodied insects living in large societies below ground or in other concealed situations. These so-cieties consist of wingless, sterile individuals generally of two types -the soldier and the workerand among them there develop reproductive forms, some of which are wingless, and others are endowed with two pairs of long. narrow, membranous wings. The latter individuals leave the colony in periodic swarms, cast their wings and proceed to establish new colonies. Termites form the scientific order Isoptera THE ROYAL PAIR OF TERMES NE-(see Insects) and are popularly MOROSUS, THE LARGER FIGURE (see INSECTS) and are popularly BEING THE QUEEN. THE SMALLER known as white ants, but as they

THE KING, FOUR TIMES THE AC- differ fundamentally from true TUAL SIZE ants and are rarely white, this designation is open to objection. Owing to their gnawing propensities these insects cause immense damage to the woodwork of buildings, and some species attack the roots of growing crops. For further information on termites see Social Insects.

TERMITE-PROOF CONSTRUCTION. Damage caused by termites to buildings or their contents can be prevented by proper construction of the buildings and chemical treatment of all wood with coal-tar creosote. Building codes are being revised in many American cities to require termite-proof construction. The

best rule is to make the foundations entirely of stone, brick or conciete, including stone or metal columns or pillars in the basement Basement floors should be of concrete on a gravel base Where it is impracticable to use these materials all wood used near the ground should be chemically treated. Complete dryness of the foundation and basement floors and walls is important. Since subterranean termites can not live or work without access to moist earth, it is only necessary to shut off this source of moisture to prevent damage by this type. Non-subterranean termites can be killed in infested wood by furnigation with hydrocyanic-acid gas

TERMONDE (Flem Dendermonde), a town in the province of East Flanders, Belgium, 25 mi S W. of Antwerp, at the junction of the Dender and Scheldt. Pop. (1939) 9,395. It was before Termonde that Louis XIV, in 1667, was compelled to re-treat through the opening of the dikes. The fortifications were demolished in 1910. The church of Our Lady contains two fine pictures by Van Dyck, and one masterpiece of Crayer's. The fonts are of the 12th century The town suffered greatly in World War I, the town hall and the church of Our Lady being much damaged.

TERN, sea birds forming the sub-family Sternmae of the gulls (Landas)

The largest British species is the Sandwich tern (Sterna sandvickensis), as big as a small gull, with a dark bill tipped with yellow, and dark legs. The common (S. hirundo) and Arctic (S. macrura) terms are only to be distinguished by the all-red bill of the latter, which is a bolder species with a more northern range, though both breed at Blakeney point in Norfolk The little term

-0

LEAST TERN (STERNA ANTIL-LARUM), SHOWING ITS NEST OF

(S. albifrons) is known by its white forehead and vellow bill. S caspia, the Caspian tern, is the largest species known, measuring 2ft. in length In addition to the last three British species, S dougalli, the Roseate tern, is also common to Europe and North America

In North America there also occur the noddy (qv), the sooty tein (S fuscata), and the black tein (Hydrochelidon nigra)

Terns breed usually on sand dunes and shingle banks and lay up to four eggs, two being the commonest number, great variation occurring with the season and the locality They are said by fishermen to damage the fishing, but this has been proved to be a mistake, the birds feeding largely

EGGS IN THE BACKGROUND on crustacea, insects and sand eels, which they obtain by plunging into the water from a height of 3-8ft, and emerging with the food in their bills. The male usually feeds the female while she is brooding, often accompanying the presentation with the same play ceremony used in courtship. In the same way, in courtship, food is often presented by the male.

About 75 species are known; the group is cosmopolitan.

TERNATE, the northernmost of the line of islands off the western coast of Halmaheira, Netherlands Indies, which stretch southwards to the Bachian archipelago. It has an area of 25 sq.mi., a width of six miles, and consists mainly of a conical volcano 5,600 ft. in height, with three peaks (Arfat, Madina and Kekan). its curious formation being due to many extremely destructive eruptions. Within the last four centuries there has been volcanic activity at Ternate on no less than 70 occasions, the worst recorded being the eruption in 1763, which overwhelmed the thriving little village and Ft. Takomi, which is situated on the north-west coast, and so completely devastated one slope with lava flow that it has since been known as Burnt cape (Batu Angus), whilst two small crater lakes were formed where the village stood. An eruption in 1840 destroyed nearly every house in the town of Ternate, and when A. R. Wallace was there in

canic activity.

1858 he experienced an earthquake and noted the destructive long as suited their purpose, and then, in their efforts to confine

effects of former shocks The northern half of the island has suffered most from vol-

There, lava streams have flowed down the mountain side right to the sea, and there are numerous bare tracts of land, but on the southern and eastern coast there is forest and luxuriant vegetation, with a good deal of cultivated land on the flat strip by the shore; vegetation extends even far up the mountain side.

Rice and maize are grown, also sago, coffee, pepper, nutmegs and fruit (good mangoes and durians), Ternate was once a leading centre of spice cultivation.

It has a population of 19,533, including 440 Europeans and Eurasians, 1,031 Chinese and 575 Arabs, the native population being of very mixed blood, probably Malay preponderating, but with Papuan elements, having a language of their own, written in the Arabic character, and Mohammedan by religion (also Crang Seracci descendants of natives converted to Christianity by the Portuguese).

Ternate is also the name of the administrative unit comprising all of Halmaheira and adjacent islands

The population of this district in 1930 was 178,487, including

649 Europeans and 3,680 Chinese and other foreign Asiatics. It forms part of the residency of the Moluccas

Ternate Town, population 7,126, hes on a flat strip of land on the south side of the island, at the foot of the mountain. It is a very picturesque settlement, the houses interspersed among a wealth of trees, with the volcano for a background, and, being close to other volcanic islands, one of which, Tidore, is so close that it helps to form the fine harbour of Ternate, and to the coast

of Halmaheira, it has magnificent views.

The port, which possesses piers and a coaling jetty, is a regular place of call for vessels of the Royal Packet Navigation company, affording frequent communication with Celebes, Amboina and New Guinea. This service was, of course, entirely disrupted by World War II.

Although it is the headquarters of a district. Ternate has only the shadow of its former greatness. Its trade is small (chiefly copra and nutmegs), its sultan before World War II was a pensioner of the Dutch government, and many of its inhabitants

fived by his bounty on his lands

History.-Ternate became known to Europe through the Portuguese, who settled there in 1521, and made it one of their chief spice-collecting centres. Conflict with the sultan, or king, as he was styled then, who objected to the establishment of a Portuguese spice monopoly, led to the expulsion of the Portuguese from the island in 1581. In the meantime, in 1579, Sir Francis Drake had called at Ternate, being received favourably by the king, and allowed to ship between four and five tons of cloves, but the visit was never followed up. Drake was much impressed with the wealth and state of the king of Ternate, and wrote, of his visit to the monarch. "The King had a very rich canopy with embossings of gold borne over him, and was guarded with twelve lances.

"From the waist to the ground was all cloth of gold, and that very rich; in the attire of his head were finely wreathed diverse rings of plaited gold, of an inch or more in breadth, which made a fair and princely show, somewhat resembling a crown in form; about his neck he had a chain of perfect gold, the links very great and one fold double, on his left hand was a diamond, an emerald, a ruby, and a turky (turquoise); on his right hand in one ring, a big and perfect turky, and in another ring many diamonds of a smaller size."

When the Dutch visited Ternate, at the beginning of the 17th century, the sultan, who was anxious to extend his power over the Moluccan islands generally, and even over a part of Celebes, arranged to give the Dutch a spice monopoly for their assistance against the Spaniards and Portuguese (Portugal had become incorporated with Spain and the Spaniards had reconquered Ternate). So Ternate rose to power and made many of the Moluccan islands, the eastern and northern part of Celebes and Buton, suzerain, but the Dutch bolstered up the power of Ternate only so

Moluccan spice cultivation to cloves in Amboina and nutmegs in the Banda ıslands, they destroyed the spice gardens of the northern Moluccas, Ternate included, causing Ternate to revolt, an example which was followed in neighbouring islands. They found it convenient (in 1683), to declare all contracts with Ternate void, and the chiefs who had looked to Ternate as their suzerain were informed that henceforth they would hold their lands directly from the Dutch

After that time, although the power of the sultan of Ternate as their vassal was recognized by the Dutch nominally, and he was given certain privileges regarding the native population, the executive, in Ternate, and throughout the lands of the residency, remained in Dutch hands

Ternate, as well as all the other islands on the west coast of Halmaheira, fell under Japanese occupation during World War

(E. E. L., X.)

TERNEPLATE: see Tin Plate and Terneplate TERNI (anc. Interamna Nahars), a town, episcopal see, and

capital of a province of Umoria, Italy, situated among the Apennines, 426 ft above sea-level, in the valley of the Nera (and Nar), from which the town took its distinguishing epithet, below its junction with the Velmo, and 70 mi N by E of Rome by rail Pop (1936) 37,295 (town), 68,890 (commune). It has important iron and steel works and iron foundries, at which armour plates, guns and projectiles are made for the Italian navy, also steel castings, machinery and rails, a royal arms factory, a large jute factory, a carbide factory, a wool spinnery, etc., and lignite mining. Terni lies on the main railway line from Rome to Foligno and Ancona, and is the junction for Rieti and Sulmona. Its most interesting buildings are the cathedral (restored in 1653 with remains of the earlier 13th century facade and an early crypt), and the Romanesque churches of S Pietro and S Francesco Its antiquities include traces of the city walls of rectangular blocks of travertine incorporated in the well-preserved mediaeval walls, remains of an amphitheatre, a temple, now the round church of S Salvatore, theatre and baths (?), and numerous inscriptions Five miles to the east are the falls of the Velino (Cascate delle Marmore), which took a very high place among European waterfalls; the cataract has a total descent of about 650 ft., in three leaps of 65, 330 and 190 ft, respectively.

The falls owe their origin to M Curius Dentatus, who in 272

BC. first opened an artificial channel by which the greater part of the Lacus Velinus in the valley below Reate was drained. They supply the motive power for the factories of the town and have

lost much of their former beauty.

Terni is the ancient Interanna (inter annes, "between the rivers," ie the Nar and one of its branches), originally belonging to Umbria, and founded, according to tradition in the year 672 B.C. The recent discovery of a neolithic village, and of cemeteries of the Villanovan period, with numerous inhumation graves of Picenes of 1200-1000 BC. (see Randall MacIver, Iron Age in Italy, 1927, 140-144) shows that the site was occupied much earlier. It is first mentioned in history as being, along with Spoletium, Praeneste and Florentia, portioned out among his soldiers by Sulla. During most of the middle ages and up till 1860 Terni was subject to the popes.

Terni was the scene of the defeat of the Neapolitans by the French on November 27, 1798

TERPANDER, of Antissa in Lesbos, Greek poet and musician. About the time of the Second Messenian War, he settled in Sparta, whither, according to some accounts, he had been summoned by command of the Delphian oracle, to compose the differences which had arisen between different classes in the state. He is regarded as the real founder of Greek classical music, and of lyric poetry; but as to his innovations in music our information is imperfect. According to Strabo (xiii, p. 618) he increased the number of strings in the lyre from four to seven; others take the fragment of Terpander on which Strabo bases his statement (Bergk, 5) to mean that he developed the citharoedic nomos

Frank Derivation of Santa to the Substitution of the Santa Santa Comment

(sung to the accompaniment of the cithara or lyre) by making the divisions of the ode seven instead of four

Fragments (the genuineness of which is doubtful) in T Bergk, Poetae Lyrici Gracci, in, see also O Lowe, De Terpandri Leibii aetate (1869), who places him about 676 B C

TERPENES. The terpense derive their name from oil of turpentine, from which source several of the earlier known member were obtained. Oil of turpentine is itself a generic term applied to the oils obtained from the looresans exued by several spots of trees. The word turpentine is a corruption of the Greek \*\*crousfilm\*\* meaning the semifluid resin of the terebuilth tree.

The tempenes are a group of bydrocarbons  $\langle q^+ v \rangle$  of the general formula (C.H.d.). The group is divided into subgroups—hemi-terpenes, C.H.d., true terpenes  $C_{\rm ad}H_{\rm sc}$ , assguiterpenes, C.H.d., diverpenes, C.H.d., and the polyterpenes, (C.H.d.). Of the polyterpenes, the traterpenes,  $C_{\rm ad}H_{\rm sc}$ , have now been extensively meetingsted. The terpenes and polyterpenes may be classified, according to their chemical structures as (1) acyclic or open-chain, and (2) cyclic compounds According to the number of rings in the structure they are classified as monocyclic, dicyclic or morg generally as polycyclic. (See CiteMistra  $V_{PQRIMC}$ )

There is only one hemiterpene, isoprene, and in this compound the carbon atoms are arranged as in I.

The true terpenes, and the higher terpenes and their derivatives, are nearly all built up from isoprete units arranged in a head to tail fashon, r./c, carbon atom t' of one unit is attached to carbon atom 4 of the previous unit as in II. This arrangement is also found in the cyclic terpenes. The arrangement of the isopreme units in monocyclic and dicyclic terpenes and also in one group of the secouterneese is shown in III. IV and V.

This isoprene rule for the structural formulas was first suggested by O. Wallach, and it is noteworthy that when isoprene is treated with sulphuric acid in acetic acid solution, a mixture of geraniol, ac-terpineol, 1:8-cuncole and a sesquiterpene is obtained. (See POLYMERIZATION)

Terpenes are widely distributed in the plant kingdom, in the essential oils obtained from the leaves, stems, flowers and, in some cases, the wood. The eleoresins exuded by certain trees and shrubs give, on distillation with or without the help of steam, the various kinds of turpentine which have long been known. The residue left after distillation constitutes rosm. The various turpentines obtained in this way are important sources of terpenes. One terpene alcohol, citroneliol, has been identified as the substance known as yucarol, the dooffierous principle produced by alligators. In the essential oils terpenes are very frequently associated with oxygenated derivatives, which, like the terpenes themselves, are nearly always built up from isoprene units. In a few cases the oxygenated compounds do not contain a multiple of five carbon atoms but their close structural relationship to the terpenes makes it reasonable to regard them as derived from the terpenes.

The essential oils have long been used as perfumes and in mediione and cookery. In the last use the essential oil is not usually extracted, the steen destination of the cooking process that the steen destillation. Among the medical uses may be mentioned that of ascandole for hookworm and sandalwood oil for a warely of sim disease. The oleversins, turpentures and rossns have long been used in painting, linoleum manufacture and wherever waterproofing and preservation are required

wnetever waterprooning must pleas, plant physiology is still incompletely understood. Their scent still test bases and so helps pollunation, but the scan still test bases and so helps pollunation, but the scan because the presence in leaves, stems and wood because the presence in leaves, stems and wood whomat also is uncertain. Schemes because the scan because

It is noteworthy that both forms of an optically active terpene are frequently found in nature. The sugars and other carbohydrates, amino acids, alkalotds and other optically active substances are usually found in only one form.

at Hamilton Protest — Largeme, B-meltylbutadiene, C.H., was first behannd in 1860 by Gerelle Williams by the distillation of cautchous. In 1883 Sir William A. Tilden obtained it by passing dipentene through a red-hot tube. It is a colouries liquid, boiling point 35 °C, density 0.69, and on long-standing at turns into a rubberlike substance as the result of nodymerization. This process

is accelerated by the action of heat or of various catalysts Many attempts have been made to prepare isoprene from sources other than rubber, but none has been commercially successful It has been prepared from paracresol via β-methyladipic acid, and its structural formula thus confirmed.

## TRIFE TERPENES

Most of the naturally occurring true tempeses,  $C_0H_{1a}$ , are colourleas, highly refractive liquids, builing at  $\tau_2 \circ ^2 - 18 \circ ^2$ . And with densities from 0.8 to 0.9. They are readily volatile in steam, practically insoluble in water but soluble in all proportions in common organic solvents like bearene, ether and ethyl alcohol. Aeral oxidation causes them to resinify and they are very reactive chemically, a dilute solution of potassium permanganate readily oxidizes them. They unite with hydrogen, hydrogen chloride, bromune, introsyl chloride, caone, etc. forming additive compounds, and the reactions may involve a change of molecular structure. The additive compounds often show ofs and trous isomerism.

These hydrocarbons are divided into four classes: (1) openchain or acyclic; (2) monocyclic; (3) dicyclic; and (4) tricyclic. The open-chain terpenes are not found naturally in any quantity but their coygenated derivatives are important, numerous and abundant

Myrcne, (CH<sub>2</sub>),C:CH.CH, CH<sub>2</sub> (C CH<sub>3</sub>),CH.CH<sub>4</sub>, lp., 169–168° C., as present in oil of bay verbens oil and other sources and can be obtained by thermal decomposition of pinene. It contains three double bonds and can be reduced to 2.6-dimethyl octane, six, atoms of hydrogen being taken up. At 3.30° C. It polymerizes. Ocimene, lp. 1.762–178° C. differs only in the arrangement of the double bonds and is found in the leaves of Ocimism Box Stations. It is reactly oxidized by air.

Monocyclic Terpenes.—These are more widely spread in nature and the naturally occurring members of the group are all derived from paracymene, VI, which can readily be reduced to paramenthane, VII. Derivatives of metameathane, VIII, do not occur in nature, but one of them, sylvestrene, a mixture of IX and an isomer, is obtained when Swedish pine-needle oil is distilled, and from other sources.

The carbon atoms in paramenthane and its derivatives are usually numbered as shown in VII. Double bonds are described as  $\Delta^1$  X,  $\Delta^{1/3}$  XI and  $\Delta^{1(7),2}$  XII, the symbol  $\Delta$  indicating a double

bond and the numeral the number of the carbon atom from which the double bond starts. In structure XII, in the text above, the figure 7 is bracketed to indicate that it marks the evocycle (outside the ring) carbon atom on which terminates the double bond

stating from carbon atom: Paramenthane exists in two forms, the exist and froms, according as the groups at carbon atoms; and 4, respectively are on the same aido, or on opposite sides of the ring. In compounds such as X and XII the molecule is dispumentic and the carbon atom at 4 is asymmetric. (See STEREOCHEMISTRY.)

Nearly all the true teapenes are liquid al ordinary temperatures, and identification is made easier when crystalline derivatives can be obtained. When the original teapene can be regenerated from the crystalline derivative, then this method can be used for the punification of the terpane. For these purposes considerable use has been made of the compounds formed by the addition of introsyl globride or nitrous fumes, giving respectively the nitrosocolionde and the nitrosite. When a hydrogen atom is attached to the same carbon atom as the nitroso group, an isonitrosy compound, on oxine, is formed and thus from the terpenes derivatives of related ketones can be obtained. The preparation of carvoxime from dipenteen entrosochloride is an example of this seatono. Pinene pairtosochloride was prepared by Sii William Tilden in 1875 and dipenteen entrosochloride in 1877.

and the distance of the control of t

250~250° C. It tendity combines with bromine to form a crystaline tetrabromide, Call-Half, from which, by the action of measum, the pure hydrocarbon has been obtained. On catalytic reduction paramenthane, Call-Is, is formed. By the action of a mixture of dilute sulphinic acid and acetic acid, a-terpineol acetate, Call-iO COCHs, is formed by the addition of acetic acid, which readily gives a-terpineol, Call-HoH, by hydrolysis a Terpineol adds on water and gives terpin hydrate, Call-HoH, other Half, the hydrated form of ar-sterpin, Call-HoH); is 8-dhydroxparamenthane. From terpin and from terpineol dipentene is readily formed by loss of water.

In 1904 W H Pekin, Jr., synthesized ce-terpined and from it prepared dipentine. This was the first synthesis of a naturally occurring terpene. The structure of terpined has been determined by a study of the products obtained on condation, a method greatly used to determine the structure of the terpenes, and the argument may be briefly indicated. The first product of oxidation, a keto-laction, Culfa(O<sub>2</sub>, containing the same number of carbon atoms as does terpined, was presumed to have the same general structural arrangement and gave, on further oxidation, terpenylic acid, CaH<sub>2</sub>O<sub>3</sub>, the liatione of a dibasic acid. This on reduction gave a dibasic acid, 3-fisopropylgituriar acid, XIII, whose constitution was proved by synthesis and which on oxidation reformed terpenylic acid, XIII of the card, XIII of the card, XIII of the card, XIII of the card

Thus the arrangement of eight of the ten carbon atoms in terpineol was determined, and is represented in XIII and XIIIa Terpenylic acid, XIIIa, was formed from the ketolactone by the

loss of two carbon atoms, and the conversion of a third into a camboxyl group. Presumably the carboxyl group marks the point of attachment of the two lost carbon atoms. The lectolaction therefore is formed from terpenylic and by the reverse change, by attaching two carbon atoms to the carboxyl group in terpenylic acid the keto group has also to be fitted in at this position because at disappeared with the two carbon atoms lost on oxidation. Structure XIV is therefore given to the ketolactions, because a compound of such a structure would be expected, by analogy with compounds of anomy astructure, to break down on oxidation, given the structure of the property of the compounds of anomy astructure, to break down on oxidation, giving in mind the relationship of terpined to paracymene, VI, the most probable structure for terpined is XV, the first attack of the oxidation gaven being at the double bond. By loss of water terpined gave depentency: the loss of water may give two products

and Markey of processing a second control of

(XVI and XVII), but in view of the existence of dipentene in optically active forms, the structure must be XVII

The study of the structure of the terpenes and their derivatives owes much to the work of Sir William Tilden, Adolf von Baeyer, O Wallach, W H Perkin, P Barbier, F Tiemann and F W Semmler

Other monocyclic terpenes are teapmolene. NVI, found in Manila elemi oil,  $\alpha$ -teapmone, in cardiamon oil,  $\gamma$ -terpenene in coriandei oil,  $\beta$ -phellandrene, in water fennel (Phellandriam questieum) oil,  $\alpha$ -tephellandrene, in oil of bitter fennel and in several species oil eucalyptus. They possess the same carbon skeleton as limonene and differ only in the positions of the two double bonds from the properties of the corient of the correction of the corient of the corient of the corient of the corient of the corient of the corient of the corient of the corient of the corient of the corient of the correction o

Dicyclic Terpenes.—These all contain two ring systems. One ring is the sax-membered ring found in the monocyclic terpenes, the other is founded by a "bindige" statung from carbon atom; and ending on carbon atom; a, 5, 6 i. I. Examples are Δ<sup>c</sup> carene, XVIII, bp 170° C. found in the oil of Puru longloida, sibinene, XIX, α-pinene, XXX, bp 150° C, and camphene, XXII, mp. 51° "52° C.

bp 158°-159° C, found in the oil from Abies sibusca and the only naturally occurring solid terpene a-Pinene is one of the most abundant and most thoroughly investigated terpenes and is the chief constituent of ordinary oil of turpentine. It was first analyzed by Antoine Lavoisier in the 18th century, but the correct molecular formula C10H16, was first given by J B A Dumas (1833) Earlier, m 1815, J B Biot, in the course of his early studies on optical activity in liquids, showed that French oil of turpentine was laevorotatory American and Russian oils are dextrosotatory Oxidation by air readily converts pinene to a viscid liquid and then to a resinous product. In the presence of air, water and sunlight, the first product is sobierol, XXII, in which it will be observed that the four-membered ring has been The smaller ring is often readily opened in dicyclic terpenes Pinene is especially easily converted to substances of different structures. When heated to 250°-270° C it is condifferent structures. When heated to 250°-270° C it is converted to dipentene, XVII. The action of hydrogen chloride at the ordinary temperature forms the so-called "pinene hydrochloride," a colourless crystalline solid, mp 132° C, that smells like camphor, and was first made by R. Kindt in 1802. This substance, also known as "artificial camphor," is now known to be bornyl chloride, and to have the structure XXIII. At -50° C a true hydrochlo-

ride of pinene is formed. The nitrosochloride, (C10H10ONCl)2, m.p. 215° C. with decomposition, is himolecular and was first pre-

paned by Tilden in 1875. By the auton of aniline it reforms expinene which can be prepared pure in this way. Capeful reduction by hydrogen and a catalyst gives pinane, C<sub>m</sub>H<sub>0</sub>, in which the double bond is now saturated. Pinene adds on water when tred with dilute acids the four-membered ring is broken and a-texpined with the control of the structure of pinene is based upon its relationship to terpined and to paracymene, and the formation of normal control of the cont

membered ring and its structure was deduced from its behaviour and confirmed by synthesis. The three-membered ning in carene, XVIII is readily opened to give derivatives of dipentene, XVIII, or of sylvestrene, IX. Sabinene behaves similarly and readily gives derivatives of dipentene. Camphene, tound in nature, is also formed when borrylene chloride gives up hydrogen chloride on treatment with alkali. The tournation of borrylene chloride from pinnene and of camphene from borrylene chloride are examples of the Wagner-Meerwein transformation. The tormation of camphene can perhaps be better undeststood by reference to structure XXV, which is formed if nom XXIII by breaking the bond between calubon atoms it and 6 and joining 6 to 2. This gives XXV which is only another way of writing XXI. Planar diagrams are somewhat misleading in these cases.

No tricyclic terpenes occur in nature but their derivatives do. Teresantalic acid, XXVI, is present in sandalwood oil

## OXYGENATED DERIVATIVES

The oxygenated derivatives of the open-chain or asyclic tepienes occur abundantly in nature, chiefly as alcholos and aldehydes, one ketone, artemian ketone, has been described. They are readily converted to cyclic compounds, generally by the action of acids, and these cyclic compounds are often identical with naturally occurring terpienes or their oxygenated derivatives. Thus nerol, XXVII, teadily gives a-terpinene The carbon to carbon double bond often shows special teactivity, adding such reagents any hydroxylamine and sodium bisulphite, which usually react only with the carbonyl or carbon-oxygen double bond. Several of the oxygenated terpienes apparently contain a mobile double bond and

behave as though they were mixtures of the two structures XXVIII and XXIX, where R represents the rest of the molecule.

The double bonds in these compounds often show cis-trans or generatical isomerism, thus geraniol, XXXa, and nerol, XXXb, form a pair, represented as in XXXa and XXXb where R represents the rest of the molecule. An important open-chain terpenelachol is citronellol, CaH<sub>20</sub> OH, (CH<sub>2</sub>)<sub>2</sub>C. CH.CH<sub>2</sub> CH<sub>2</sub> CH<sub>4</sub> C

## TEXTILE PRINTING

able process employed in Egypt for the colouring of tissues After pressing the material, which is white at first, they saturate it, not with colours, but with mordants that are calculated to absorb colour." When this was finished the cloth was "plunged into a cauldron of boiling dye" and "removed the next moment fully coloured." "It is a singular fact, too, that although the dye in the pan is of one uniform colour, the material when taken out of it is of various colours according to the nature of the mordants that have been respectively applied to it." Egypto-Roman bits of printed stufts from Akhim exhibit the use, some 300 years later than the time of Pliny, of boldly cut blocks for stamping figuresubjects and patterns on to textiles. Almost concurrent with their discovery was that of a fragment of printed cotton at Arles in the grave of St Caesarius, who was bishop there about AD. 542 Equal in archaeological value are similar fragments found in an ancient tomb at Quedlinburg These, however, are of com-paratively simple patterns. Other later specimens establish the fact that more important pattern-printing on textiles had become a developed industry in parts of Europe towards the end of the 12th and the beginning of the 13th century

The Rhenish Monks .- According to Forrer (Die Kunst des Zeugdruck (, 1898) mediaeval Rhenish monasteries were the cradles of the artistic craft of ornamental stamp or block cutting. In tare menastic mss earlier in date than the 13th century, initial letters (especially those that recurred frequently) were sometimes stamped from hand-cut blocks; and German deeds of the 14th century hear names of block cutters and textile stampers as those of witnesses. Between the 11th and 14th centuries there was apparently in Germany no such weaving of rich ornamental stuffs as that carried on in Spain and Italy, but her competitive and commercial instincts led her to adapt her art of stamping to the decoration of coarse textiles, and thus to produce rather rough imitations of patterns woven in the Saracenic, Byzantine and Italian silks and brocades. Amongst the more ancient relics of Rhenish printed textiles are some of thin silken stuff, impressed with rude and simplified versions of such patterns in gold and silver foil. Of these, and of a considerable number of later variously lived stout linens with patterns printed in dark tones or in black, specimens have been collected from reliquaries, tombs and old churches. From these several bits of evidence Dr Forrer propornds an opinion that the printing of patterns on textiles as carried on in several Rhenish towns preceded that of printing on paper. He proceeds to show that from after the 14th century increasing luxury and prosperity promoted a freer use of woven and embroidered stuffs, in consequence of which textile printing fell into neglect, and only-three centuries later it revived

Augsburg, famous in the 17th century for its printing on linens. etc., supplied Alsace and Switzerland with many craftsmen in

as to be irremovable by washing Plmy describes "a very remark- this process After the revocation of the edict of Nantes, French refugees took part in starting manufactories of both painted and printed cloths in Holland, England and Switzerland, some few of the refugees were allowed back into France to do the same in Normandy, manufactories were also set up in Paris, Marseille, Nantes and Angers; but there was still greater activity at Geneva, Neuchâtel, Zurich, St. Gall and Basle. The first textile-printing works in Great Britain are said to have been begun towards the end of the 17th century by a Frenchman on the banks of the Thames near Richmond, and soon afterwards a more considerable factory was established at Bromley Hall in Essex, many others were opened in Surrey early in the 18th century At Mulhouse the enterprise of Koechlin, Schmatzer and Dollfus in 1746, as well as that of Oberkampf at Jouy, led to a still wider spread of the industry in Alsace In almost every place in Europe where it was taken up and followed, it was met by local and national prohibitions or trade protective regulations and acts, which, however, were gradually overcome

Invention of Roller Printing,-Towards the end of the 18th century a revolution in the British manufacture of printed tex tiles was brought about through the invention of cylinder or roller printing from metal plates This is usually credited to Oberkampf of Touy, but it seems to have occurred also to a Scotsman named Bell, and was successfully applied in a large way about 1785 at Monsey near Preston From this and the calico-printing works at Manchester in 1763, and in Scotland in 1768, the present huge proportions of the industry in Great Britain have been developed.

It is hardly necessary to give in this brief account illustrations of the different types of patterns used in the various European countries. Typical specimens of East Indian painted and printed calicoes for coverlets and other draperies are shown in the Indian division of the Victoria and Albert Museum These are sus generis. and therefore differ from the bulk of Western prints on chintz. cretonne, etc, which together with a less quantity of printing on satın, silk, velvet, crêpe and the like are principally from adaptations of weaving patterns An interesting series of over 2,500 patterns, chiefly of this character, was made by M. Corimand between 1846 and 1860, and is preserved in the National Art. Library at South Kensington For many years of the latter part of the 19th century, William Morris designed and produced attractively ingenious floral and bird patterns, admirable in contrasts of bright colours, frequently basing his arrangement of cusply defined forms in them upon that of Persian

ment of Crispy Genner Cont.
